Background Info:	The Southern Pacific Transportation Company's (SPTCo) Sacramento Railyard Facility has been in operation since 1865. The site is approximately 240 acres. Inorganic and organic contamination are broadly distributed across a majority of the site. Additionally, liquid waste was historically disposed of in an industrial sewer system constructed over 100 years ago. On June 2, 1988, the Department and SPTCo entered into an Enforceable Agreement. A workplan and schedule for investigation and cleanup was finalized in October of 1988. Based on historical usage and known contamination the site was divided into six study areas: Central Shops and, Central Corridor, Car Shops Nine, Lagoon, Northern Shops, and Sacramento Station. The Ponds and Ditch consisted of the industrial wastewater disposal ponds and a ditch to convey wastewater to the Sacramento regional sewer system. Soils contaminated with metals, Volatile Organic Compounds (VOC's), Semi Volatile Organic Compounds (SVOC's), and Poly Nuclear Aromatics (PAH's) were remediated in May 1993. Groundwater contamination includes metals, and VOC's.

Background Info:	The Southern Pacific Transportation Company's (SPTCo) Sacramento Railyard Facility has been in operation since 1865. The site is approximately 240 acres. Inorganic and organic contamination are broadly distributed across a majority of the site. Additionally, liquid waste was historically disposed of in an industrial sewer system constructed over 100 years ago. On June 2, 1988, the Department and SPTCo entered into an Enforceable Agreement. A workplan and schedule for investigation and cleanup was finalized in October of 1988. Based on historical usage and known contamination the site was divided into six study areas: Central Shops (CSSA), Central

UP, DOWNTOWN SAC - NORTHERN SHOPS/DRUM S (Continued) **S105954432**

Corridor (CCSA), Car Shop (CSNSA), and Sacramento Station (SSSA). The Northern Shops Study Area consisted of storage buildings, a Frog Shop, Spring shop, Brass Foundry and a Drum Storage Area (a seperate RCRA unit) were unknown types and amounts of chemical were disposed of and stored on the ground. Soil contamination includes metals, Volatile Organic Compounds (VOC's), Semi Volatile Organic Compounds (SVOC's) including Poly Nuclear Aromatics (PAH's), and Total Petroleum Hydrocarbons (TPH). Groundwater contamination includes metals, VOC's, SVOC's, and TPH.

Background Info:	The Southern Pacific Transportation Company's (SPTCo) Sacramento Railyard Facility has been in operation since 1865. The site is approximately 240 acres. Inorganic and organic contamination are broadly distributed across a majority of the site. Additionally, liquid waste was historically disposed of in an industrial sewer system constructed over 100 years ago. On June 2, 1988, the Department and SPTCo entered into an Enforceable Agreement. A workplan and schedule for investigatio and cleanup was finalized in October of 1988. Based on historical usage and known contamination the site wa divided into six study areas: Central Shops (CSSA), Central Corridor (CCSA), Carshop Nine (CSNSA), Lagoon (LSA), Northern Shops (NSSA), and Sacramento Station (SSSA). The Central Corridor was used for boxcar cleaning, boxcar dis- mantling, boxcar sandblasting, and a saw mill utilized for lumber milling planing and woodworking. The soil is contaminated wth metals, Volatile Organic Compounds (VOC's), Semi Volatile Organic Compounds (SVOC's), Poly Nuclear Aromatics (PAH's), and Total Petroleum Hydrocarbons (TPH). Groundwater contamination includes metals, VOC's, SVOC's, and Total Petroleum Hydrocarbons TPH.

Background Info:	The Southern Pacific Transportation Company's (SPTCo) Sacramento Railyard Facility has been in operation since 1865. The site is approximately 240 acres. Inorganic and organic contamination are broadly distributed across a majority of the site. Additionally, liquid waste was historically disposed of in an industrial sewer system constructed over 100 years ago. On June 2, 1988, the Department and SPTCo entered into an Enforceable Agreement. A workplan and schedule for investigation and cleanup was finalized in October of 1988. Based on historical usage and known contamination the site was divided into six study areas: Central Shops and, Central Corridor, Car Shops Nine, Lagoon, Northern Shops, and Sacramento Station. The Sacramento Station was as a wheel foundry and depot. The

SP, SAC - SACRAMENTO STATION (Continued) **S101481755**

soil was contaminated with metals and Total Petroleum Hydro-
carbons (TPH). Groundwater contamination includes metals and
Semi Volatile Organic Compounds and Total Petroleum Hydrocarbons
TPH.

Site History:	In July 2013, while performing an asbestos removal action, a UST with an approximate capacity of 6,000 gallons was discovered underneath a concrete pad in the Northern Shops Study Area. UPRR removed the UST

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

and performed overexcavation of bunker fuel impacted soil during August and September 2013. The Downtown Sacramento Railyard is an approximately 240-acre site that was used for heavy industrial activities to maintain and repair trains. Groundwater is polluted with solvents (chlorinated volatile organic compounds or VOCs), metals and petroleum hydrocarbons that in a multi-zone plume currently approximately a half-mile long. Since March 1993 approximately 650 gallons of pure liquid phase fuel has been removed by bailing activities from the wells at the site. Since May 1995 approximately 400,000 gallons a day of polluted groundwater is pumped and treated to control migration and reduce concentrations. To date, approximately 840,000,000 gallons of contaminated groundwater has been pumped and discharged to the local wastewater treatment plant. Since August 1996 soil vapor extraction (SVE) of the major VOC source areas has effectively removed approximately 12,500 pounds of VOCs. During the period between 1994 and 2000, approximately 500,000 tons of impacted soil was removed from the site, and as much as 230,000 cubic yards of moderately impacted soil has been approved for consolidation in an on-site landfill currently under construction in the northwest corner of the property. The Central Valley Water Board is supporting the DTSC in the oversight of this cleanup. For more detailed information about the Railyards, please look under the individual SCP-sub areas. DTSC is lead designated agency. Water Board is lead support agency.

Potential Contaminants of Concern:	Total Petroleum Hydrocarbons (TPH)
Site History:	In the spring and summer of 2013 an area approximately 8 acres in size was excavated to remove bunker fuel impacted soils just above the water table, with impacts extending to the water table and beyond in some places. Free product removal occurred in one exposed groundwater area throughout the summer before backfill occured in the Fall of 2013. Residual bunker fuel impacts below the water table will be addressed in the Lagoon Groundwater Study Area Feasibility Study. The Downtown Sacramento Railyard is an approximately 240-acre site that was used for heavy industrial activities to maintain and repair trains. Groundwater is polluted with solvents (chlorinated volatile organic compounds or VOCs), metals and petroleum hydrocarbons that in a multi-zone plume currently approximately a half-mile long. Potential Media Affected:	Soil
Potential Contaminants of Concern:	Not reported
Site History:	The Southern Pacific Transportation Company's (SPTCo) Sacramento Railyard Facility has been in operation since 1865. The site is approximately 240 acres. Inorganic and organic contamination are broadly distributed across a majority of the site. Additionally, liquid waste was historically disposed of in an industrial sewer system constructed over 100 years ago. On June 2, 1988, the Department and SPTCo entered into an Enforceable Agreement. A workplan and schedule for investigation and cleanup was finalized in October of 1988. Based on historical usage and known contamination the site was divided into six study areas: Central Shops and, Central Corridor, Car Shops Nine, Lagoon, Northern Shops, and Sacramento Station. The Sacramento Station was used as a wheel foundry and depot. The soil was contaminated with metals and Total Petroleum Hydro- carbons (TPH). Groundwater contamination includes metals and Semi Volatile Organic Compounds and Total Petroleum Hydrocarbons TPH. Closure is for Soils only. Groundwater is being addressed as Site Wide cleanup for North and/or South Plume Groundwater Study Areas. DTSC is lead designated agency - Water Board is lead support agency 2/19/2013 - 9,000 gallon UST discovered during road work and excavation. 2/25/2013 - UST removed and some excavation occurred under 6th St ROW. Currently assessing extent of impact.

Potential Contaminants of Concern:	Other Chlorinated Hydrocarbons, Trichloroethylene (TCE), Vinyl chloride, Arsenic, Lead, Diesel, Gasoline, Waste Oil / Motor / Hydraulic / Lubricating, Polynuclear aromatic hydrocarbons (PAHs)
Site History:	Soil Cleanup Only. Groundwater being addressed under Lagoon Groundwater Study Area. The Southern Pacific Transportation Company's (SPTCo) Sacramento Railyard Facility has been in operation since 1865. The site is approximately 240 acres. Inorganic and organic contamination are broadly distributed across a majority of the site. Additionally, liquid waste was historically disposed of in an industrial sewer system constructed over 100 years ago. On June 2, 1988, the Department and SPTCo entered into an Enforceable Agreement. A workplan and schedule for investigatio and cleanup was finalized in October of 1988. Based on historical usage and known contamination the site was divided into six study areas: Central Shops (CSSA), Central Corridor (CCSA), Car Shop Nine (CSNSA), Lagoon (LSA), Northern Shops (NSSA) and Sacramento Station (SSSA). The Lagoon Study Area contains the former industrial waste water lagoon, an API oil/water separator overflow area, and the former location of a 50,000 gallon barrel oil storage tank. The soil and groundwater are extensively contaminated. Soil contamination includes metals, Volatile Organic Compounds (VOC's), Semi Volatile Organic Compounds (SVOC's) including Poly Nuclear Aromatics (PAH's), and total Petroleum Hydrocarbons (TPH). Groundwater contamination includes metals, VOC's, SVOC's, and TPH. Active removal of impacted soil vapor and groundwater has occurred at portions of the LSA, such as the former Drum Storage Area (DSA). Approval of plans to safely dispose of inert soils beneath an engineered cap and vegetative cover in the Northwest Corner was granted in March 2007, and construction is

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

currently underway. Date of Human Health Exposure control given as sate for Deed restriction date 7/11/2001. Soil Remedy has been started (excavations) and continues. Groundwater is being addressed outside of Lagoon study area in Lagoon Groundwater Study Area and/or South Plume Groundwater Study Areas. DTSC is lead designated agency - Water Board is lead support agency

Site History:	The Sand Piles Site was the location on the Southern Pacific Transportation company's Sacramento facility at which spent sand blasting grit was stored. Spent sand blasting material is now placed in drums and handled as hazardous waste. Remediation of the Site included the recycling of, as a component of asphalt, 2,341 tons of sand. Additionally 897 tons of material was disposed of at a Class I landfill and 236 tons of concrete, wood, and metal debris was disposed of at a Class III landfill. The Department's goal for cleanup was to achieve a level of total lead in the soils below 950 mg of lead/kg of soil. This goal was met. Levels of lead exceeding the STLC of 5.0 mg of lead/kg have been found at and adjacent to the to the previous location of the sand piles. The Department has determined that the remaining contamination is part of a general overall condition at the facility. This contamination will be addressed as part of the overall site investigation and remediation. Soil closure only -DTSC. Groundwater being addressed seperately as Site Wide issue in North and/or South Plume Groundwater Study Areas. DTSC is lead designated agency - Water Board is lead support agency

The Car Shop Nine was utilized for constructing rail cars, painting rail cars, sandblasting, general offices, and rail yard operations building. Five UST's were located in Car Shop Nine. The soil is contaminated with metals, Volatile Organic Compounds (VOC's), Semi Volatile Organic Compounds (SVOC's), Poly Nuclear Aromatics (PAH's), and Total Petroleum Hydrocarbons (TPH). Groundwater contamination includes metals, VOC's, and Total Petroleum Hydrocarbons TPH. Soil Cleanup only. Groundwater Plume being addressed as seperate OU -South and/or North Groundwater Plume Areas. DTSC recorded a deed restriction for future use. For deed restrictions visit Envirostore @ http://www.envirostor.dtsc.ca.gov/public/profile_report.asp?global_id= 34400009 Final Soil Remedy was implemented after May 2000. However, recent soil gas results being investigated further. DTSC is lead designated agency - Water Board is lead support agency

Potential Media Affected: Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern: Not reported
Site History: An approximately 9,000 gallon UST was discovered in February 2013 by the City of Sacramento during construction of the 6th St extension. At the time it was discovered, the tank contained approximately 6,900 gallons of water, residual bunker oil, and debris such as bricks, wood, and soil. The tank was removed by the City of Sacramento and over excavation of impacted soil was performed by the City and UPRR. The Downtown Sacramento Railyard is an approximately 240-acre site that was used for heavy industrial activities to maintain and repair trains. Groundwater is polluted with solvents (chlorinated volatile organic compounds or VOCs), metals and petroleum hydrocarbons that in

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

a multi-zone plume currently approximately a half-mile long. Since March 1993 approximately 650 gallons of pure liquid phase fuel has been removed by bailing activities from the wells at the site. Since May 1995 approximately 400,000 gallons a day of polluted groundwater is pumped and treated to control migration and reduce concentrations. To date, approximately 840,000,000 gallons of contaminated groundwater has been pumped and discharged to the local wastewater treatment plant. Since August 1996 soil vapor extraction (SVE) of the major VOC source areas has effectively removed approximately 12,500 pounds of VOCs. During the period between 1994 and 2000, approximately 500,000 tons of impacted soil was removed from the site, and as much as 230,000 cubic yards of moderately impacted soil has been approved for consolidation in an on-site landfill currently under construction in the northwest corner of the property. The Central Valley Water Board is supporting the DTSC in the oversight of this cleanup. For more detailed information about the Railyards, please look under the individual SCP-sub areas. DTSC is lead designated agency. Water Board is lead support agency.

Site History:	The Lagoon Groundwater Study Area includes the aquifer beneath the former industrial waste water lagoon, an API oil/water separator overflow area, and the former location of a 50,000 gallon barrel oil storage tank. The soil and groundwater are extensively contaminated. Soil contamination includes metals, Volatile Organic Compounds (VOC's), Semi Volatile Organic Compounds (SVOC's) including Poly Nuclear Aromatics (PAH's), and total Petroleum Hydrocarbons (TPH). Groundwater contamination includes metals, VOC's, SVOC's, and TPH. Active removal of impacted soil vapor and groundwater has occurred at portions of the LSA, such as the former Drum Storage Area (DSA). Approval of plans to safely dispose of inert soils beneath an engineered cap and vegetative cover in the Northwest Corner was granted in March 2007, and construction is currently underway. Groundwater Cleanup Only DTSC is lead designated agency - Water Board is lead support agency 3/18/2013 - Removal of petroleum impacted soils and groundwater began underneath Former Track 150 alignment

Site History:	The Southern Pacific Transportation Company's (SPTCo) Sacramento Railyard Facility has been in operation since 1865. The site is approximately 240 acres. Inorganic and organic contamination are broadly distributed across a majority of the site. Additionally, liquid waste was historically disposed of in an industrial sewer system constructed over 100 years ago. On June 2, 1988, the Department and SPTCo entered into an Enforceable Agreement. A workplan and schedule for investigation and cleanup was finalized in October of 1988. Based on historical usage and known contamination the site was divided into six study areas: Central Shops (CSSA), Central Corridor (CCSA), Carshop Nine (CSNSA), Lagoon (LSA), Northern Shops (NSSA), and Sacramento Station (SSSA). The Car Shop Nine was utilized for constructing rail cars, painting rail cars, sandblasting, general offices, and rail yard operations building. Five UST's were located in Car Shop Nine. The soil is contaminated with metals, Volatile Organic Compounds (VOC's), Semi Volatile Organic Compounds (SVOC's), Poly Nuclear Aromatics (PAH's), and Total Petroleum Hydrocarbons (TPH). Groundwater contamination includes metals, VOC's, and Total Petroleum Hydrocarbons TPH. Please also look in EnviroStore at: http://www.envirostor.dtsc.ca.gov/public/profile_report.asp?global_id= 34400009

Site History:	During construction of Railyards Boulevard, a contractor discovered an UST with an approximate capacity of 3,500 gallons buried below the ground surface. The UST contained soil and liquid exhibiting a strong odor. The contents of the UST are pending characterization. The Downtown Sacramento Railyard is an approximately 240-acre site that was used for heavy industrial activities to maintain and repair trains. Groundwater is polluted with solvents (chlorinated volatile organic compounds or VOCs), metals and petroleum hydrocarbons that in a multi-zone plume currently approximately a half-mile long. Site History:	South Plume Groundwater Study Area extends from north of the Central Shops south down to P Street. The groundwater impacts consist of both onsite and offsite contaminant plumes. A significant dissolved phase chlorinated VOC plume extends offsite to the south, beneath downtown Sacramento to approximately P Street. Impacted groundwater is being actively pumped and treated both onsite and near the southern

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

terminus of the plume, at a rate of approximately 400,000 gallons a day. Onsite Soil Vapor Extraction (SVE) of the major VOC source areas is also ongoing. Groundwater Only. Soils Not Applicable - soils addressed separately on Site. DTSC is lead designated agency - Water Board is lead support agency

Completed Date: 04/09/1998
Comments: 5YEAR -- THE 5-YEAR REVIEW FOR THE SOUTHERN PACIFIC TRANSPORTATION COMPANY, SACRAMENTO (SPTCO) BATTERY SHOPS STUDY AREA (BSSA) HAS BEEN REVIEWED AND APPROVED BY THE DEPARTMENT. THE REPORT WAS COMPLETED AS A TYPE IA REVIEW, AS RECOMMENDED BY DTSC AND CONSISTENT WITH OSWER DIRECTIVE 9355.7-02A. THE IA REVIEWS ARE APPLICABLE FOR SITES WHERE CLOSURE IS NOT COMPLETE AND NO SPECIAL CIRCUMSTANCES HAVE ARISEN SINCE THE REMEDIAL ACTION WAS PERFORMED THE BSSA SOILS WERE EXCAVATED AND DISPOSED OF OFFSITE TO REMEDIAT LEAD, CHROMIUM, AND ARSENIC SOIL CONTAMINATION FROM DISPOSAL OF SPENT BATTERY ACID INTO ONSITE DRY WELLS. AS PART OF THE APRIL 1990 FINAL REMEDIAL ACTION PLAN FOR BSSA, SPTCO WAS REQUIRED TO INSTALL AND MONITOR 5 GROUNDWATER MONITORING WELLS IN THE UPPER SAND ZONE TO EVALUATE THE POTENTIAL SOIL CONTAMINATION FROM THE BSSA IMPACTING GROUNDWATER. BASED ON THE REVIEW OF THE GROUND WATER MONITORING DATA, THE REMEDIATION PERFORMED FOR THE BSSA IS MEETING THE OBJECTIVE OF THE BSSA RAP/CP.

Completed Document Type: Unilateral Order (I/SE, RAO, CAO, EPA AO)
Completed Date: 06/02/1988
Comments: DHS gives Remedial Action Order.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Land Use Restriction
Completed Date: 06/28/1990
Comments: The deed restriction allows all uses of the property, although if the property is to be used for residential or educational purposes at ground level or the public as unimproved land (eg., park, open space, gardening), the owners and occupants shall take action so that public is not exposed to concentrations of lead greater than 174 mg/kg (or other standard determined by the Department to be protective of public health and the environment). The deed restriction limits excavation and disposal of soil without Department approval, and does not allow disturbance of the 2-foot clean soil cap.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Certification
Completed Date: 06/25/1990
Comments: Certified. Excavation and disposal of 262 tons of soil at class I landfill. Cleanup level of 950 mg of lead/kg soil was met.

Completed Document Type: CEQA - Responsible Agency Review
Completed Date: 05/07/2003
Comments: DTSC prepared a notice of determination (NOD) for Removal Action Workplan (RAW) for soil cleanup in six acres of the Central Shops Study Area of the Rail Yard. This plan would result in soil cleanup along a proposed new rail line corridor prior to moving the freight track. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comment were received by DTSC and addressed through a responsiveness summary.

Completed Document Type: CEQA - Initial Study/ Environmental Impact Report
Completed Date: 04/27/1995
Comments: California Environmental Quality Act (CEQA) Ground Water Removal Action (GWRA) -- The DTSC has approved the final California CEQA package for vertical and horizontal containment of an off-site groundwater plume emanating from the SPTCo-Sacramento Rail Yard off-site to the south, the South Plume. The CEQA package project is implementation of two Interim Remedial Measures (IRMs), the South Plume Source Control and the South Plume Margin Control. The South Plume Margin Control consists of a groundwater extraction system located on P Street in Sacramento for leading edge capture. The South Plume Source Control consists of a groundwater/soil vapor extraction and treatment system located within the SPTCo-Sacramento Rail Yard to capture identified sources. Removal Action Work Plan (RAW) Groundwater Removal Action (GWRA) -- A Removal Action Workplan was approved for two South Plume Margin Control. The South Plume Margin Control consists of a groundwater extraction system located on P Street in Sacramento. The South Plume Source Control is comprised of a groundwater/soil vapor extraction and treatment system located within the Central Shops Study area of the SPTCo-Sacramento Rail Yard. The Interim Remedial Measures (IRMs) are being implemented to control the lateral and veritcal migration of groundwater contaminated with volatile organic compounds. The groundwater

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

extraction system became operational on May 12, 2001.

Completed Date: 07/01/2005
Comments: DTSC approved the "Completion of Soil Remediation in 4.25 acre Main Freight Line Relocation within the Central Shops Area" on July 1, 2005. The RWQCB provided concurrence on July 8, 2005.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Risk Assessment Report
Completed Date: 12/01/2005
Comments: RP submitted inserts to the Draft HRA Report to update the conclusions to address DTSC's request for an indoor air evaluation. Conclusions were updated to indicate although no unacceptable risks are associated with the Central Shops and South Plume ground water under current conditions and land use, potential unacceptable risks may be associated with future land use, thus further evaluation with repect to soil and groundwater is required. This additional evaluation will be included in the Feasibility Study as part of the development of remedial goals for soil and groundwater. The future evaluation of VOCs will include all applicable exposure pathways including indoor air.

Completed Document Type:	Preliminary Endangerment Assessment Report
Completed Date:	11/08/2010
Comments:	On November 8, 2010, DTSC confirmed the completion of lead and asbestos abatement activities within several historic buildings within the Central Shops at the Sacramento Railyards. The abatement work was done in coordination with historic preservation requirements and under contract terms with the California Pollution Control Financing Authority (CPCFA) for Prop 1C Brownfields grant money. CPCFA had requested DTSC, as lead agency, provide oversight and confirmation of completion of the activities anticipated by the grant award. The purpose of the abatement was to conduct environmental mitigation of hazardous materials to practical levels that accommodate rehabilitation of the buildings, including general construction activities or intrusive access and use. Remedial goals that were established for lead and asbestos were achieved.

Comments: DES/RDIP -- DESIGN/REMEDIAL DESIGN IMPLEMENTATION PLAN. THE LAGOON STUDY AREA (LSA) IS APPROXIMATELY 434 ACRES OF THE 240 ACRE FORMER SPTCO RAIL YARD LOCATED IN DOWNTOWN SACRAMENTO. THE LSA WAS UTILIZED FOR AS AN INDUSTRIAL WASTEWATER LAGOON, OIL/ WATER SEPERATOR OVERFLOW AREA, AND FORMER LOCATION OF A 50,000 GALLON OIL STORAGE TANK. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOUNDS SVOCs, AND TOTAL PETROLEUM HYDROCARBON (TPH) IN THE LAGOON STUDY AREA, AND CENTRAL CORRIDOR STUDY AREA, AND CAR SHOP NINE STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.

Completed Date: 05/08/2003
Comments: RAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.

Completed Document Type: Design/Implementation Workplan
Completed Date: 05/22/2000
Comments: DES - The DTSC approved the Final Remediation Design and Implementation Report (RDIP) for Soil on May 22, 2000, for the Lagoon Study Area, 51 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP for remediation for the 239,640 cubic yards of contaminated soils consists of excavation, ex-situ vapor extraction, chemical stabilization and, off-site disposal. Imple-mentation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The preliminary costs of the

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

remediation is estimated to be $17,115,480.

Completed Area Name: Soil

Completed Document Type: Remedial Action Plan
Completed Date: 12/30/1998
Comments: RAP -- DTSC APPROVED THE FINAL RAP, DATED 12/28/98, APPROVED 12/30/98, FOR THE LSA 51 ACRES OF THE 240-ACRE SPTCO-SACRAMENTO RAILYARD SITE. THE APPROVED ALTERNATIVE FOR REMEDIATION FOR THE 239,640 CUBIC YARDS OF CONTAMINATED SOILS IDENTIFIED IN THE RAP IS EXCAVATION, EX-SITU VAPOR EXTRACTION, CHEMICAL STABILIZATION, ONSITE SECURE CONTAINMENT AND OFFSITE DISPOSAL. THE ONSITE DISPOSAL ALTERNATIVE INCLUDES DESIGN AND CONSTRUCTION OF AN ONSITE, 450,000 CUBIC YARD SOLD WASTE LANDFILL, PRIMARILY DESIGNED FOR RELATIVELY INERT METALS CONTAMINATED SOILS. THE LANDFILL WILL BE DESIGNED AND CONSTRUCTED AS A CLASS II LANDFILL. THE ONSITE LANDFILL HAS BEEN APPROVED WITH THE FOLLOWING REQUIREMENTS: NO LIQUIDS MAY BE DISPOSED ONSITE, ALL METAL CONTAMINATED SOILS WITH ORGANICS MAY ONLY BE PLACED IN THE LANDFILL IF THE ORGANIC CONSTITUENTS ARE ALL LESS THAN THRESHOLD VALUES, NO RCRA WASTES, AND NO CALIFORNIA HAZARDOUS WASTE THAT HAS NOT BEEN CLASSIFIED AS DESIGNATED WASTE. IMPLEMENTATION OF THE SELECTED ALTERNATIVE IS SCHEDULED TO BEGIN IN APRIL OF 2000 AND TO CONTINU THROUGH OCTOBER OF 2005. THE PRELIMINARY COST OF THE PROPOSED ALTERNATIVE IS EXTIMATED TO BE $20,315,000.

Completed Area Name: Soil

Completed Document Type: Remedial Investigation / Feasibility Study
Completed Date: 11/25/1997
Comments: RIFS -- Soil FS approved. LSA represents 51 acres of the 240 acre SPTCo- Sacramento Rail Yard. The approved RIFS has initially identified 51,965 cubic yards of contaminated soils that will require offsite disposal and 187,675 cubic yards of contaminated soils that will be disposed of onsite. The onsite disposal alternative includes design and construction of an onsite 450,000 cubic yard solid waste landfill, primarily designed for relatively intert metals contaminated soils. The landfill will be designed and constucted as a Class II landfill. The onsite landfill has been approved with the following requirements: no liquids may be disposed of onsite, all metal contaminated soils with organics may only be placed in the landfill if the organic constituents are all less than threshold values, no RCRA waste, and no California Hazardous Waste that has not been classified as designated waste. The preliminary cost of the proposed alternative, Alternative H, is $20,315,000. The final RAP is scheduled for completion in September 1998.

Completed Document Type: Removal Action Completion Report
Completed Date: 04/27/1995
Comments: RA (LSARA) -- The Interim Remedial Measure (IRM) is being implemented for remediation of soil contaminated with Volatile Organic Compounds (VOC's), Semi-Volatile Organic Compounds (SVOC's), and metals from operation and maintenance activities at the SPTCo-Sacramento Rail Yard. The IRM consists of excavation remediation of approximately 2500 cubic yards of contaminated soils from the Industrial Waste Water Lagoon. The contaminated soil will be stockpiled and treated at

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

the Drum Storage Area (DSA utilizing the existing DSA soil vapor extraction and treatme system to remediate VOC contamination. The VOC remediated soils will then be chemically stabilized/solidified to treat SVOC and metal contamination. The remediated/stabilized soil will then be disposed of at the ECDC Utah Landfill.

Comments:	RI/FS -- The Union Pacific Railroad Company has completed soil characterization of the former Southern Pacific Transportation Company - Sacramento Railyard Car Shop Nine Study Area (CSNSA). Groundwater contamination for the CSNSA will be addressed within the Lagoon Groundwater and Central Shops South Plume RI/FS and RAP. The CSNSA was utilized for constructing rail cars, painting rail cars, sandblasting, general offices and railyard operations buildings. Additionally, five Underground Storage Tanks were located at the CSNSA. During Phase I characterization, soil gas samples were collected from 11 locations, 31 soil borings were drilled and sampled, andgroundwater samples were collected from 24 locations. During Phase II, the final Phase 25 additional soil borings were drilled. Compounds of concern (COC'S) detected in the soil included VOC'S-VC and TCE, SVOC'S-PNA'S, Anthracene and Chrysene, TPH-#2 and

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

#6 fuel oil, oil and grease and extractable and metals-arsenic, Lead, Cadmium, and beryllium. The lateral and vertical extent of COC'S detected in the soil has been sufficiently defined for purposes of developing the soil, final remedial action objectives.

Completed Document Type:	CEQA - Notice of Exemption
Completed Date:	02/20/2003
Comments:	CEQA/NOE--DTSC prepared a Notice of Exemption (NOE) for an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/03. Public comments were received by DTSC and addressed through a responsiveness summary.

Completed Date:	04/17/2002
Comments:	CEQA - NOD -- The Department approved an Explanation of Significant Differences (ESD) on 4/17/02 to permit soil bioremediation treatment on-site. To meet the requirements of the California Environmental Quality Act, DTSC, in its role as the Lead Agency for the soil remediation of the site, has considered the Environmental Impact

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

Reports prepared for and certified by the City of Sacramento (City). DTSC has determined that the EIRs and supporting documents relied on for approval of the site soil Remedial Action Plans have adequately adddressed the potential impacts of the project proposed under the ESD. DTSC, using its independent judgement has determined that the project, in its approved form, will not result in a significant adverse effect on the environment. A Notice of Determination indicating the results of said findings has been filed with the State Clearninghouse of the Governor's Office of Planning and Research pursuant to Section 15096(i) of the State CEQA Guidelines.

Comments: RAP - ESD -- The Department has approved an Explanation of Significant Differences (ESD) on 4/17/02 to permit soil bioremediation treatment on-site. Soil remediation strategies

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

approved under the site Remedial Action Plans (RAP) includes excavation of impacted soil, treating certain soil prior to reuse or disposal, and loading all waste soil for off-site disposal to a landfill. Treatment options approved under the RAP did not specifically include bioremediation of soil. The enclosed ESD has been prepared to amend the site RAP administrative record to include bioremediation treatment of stockpiled soil containing petroleum hydrocarbon. The proposed change is protective of human health and the environment, complies with appropriate, applicable or relevant federal and state requirements and remains cost-effective.

Completed Document Type: Remedial Investigation / Feasibility Study
Completed Date: 10/05/1998
Comments: RI/FS - The Union Pacific Railroad Company has completed soil characterization of the former Southern Pacific Transportation Company - Sacramento Railyard, Central Corridor Study Area (CCSA). Groundwater contamination for the CCSA will be addressed within the Lagoon groundwater and Central Shops/South Plume Remedial Investigation/Feasibility Study (RI/FS) and Remedial Action Plan (RAP). The CCSA was utilized for boxcar cleaning and dismantiling, sandblasting, general offices, and a sawmill. Additionally, four

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

underground storage tanks (USTs) were located at the CCSA. During Phase 1 Characterization, soil gas samples were collected from 69 locations, 22 soil borings were drilled and sampled, and groundwater samples were collected from 12 locations. During Phase II, the final phase, 19 additional soil borings were drilled. Compunds of concern (COC's) detected in the soil included volatile organic compounds (VOCs) - vinyl chloride (VC) and Trichloroethylene (TCE), Semi-volatile organic compounds (SVOCs)- Polynuclear Aromatics (PNAs), anthracene and chrysene, Total petroleum hydrocarbons TPH-#2 and #6 fuel oil, oi and grease and extractable, and metal-arsenic, lead, cadmium, and beryllium. The lateral and vertical extent of COCs detected in the soil has been sufficiently defined for purposes of developing the soil, final remedial action objectives.

Completed Document Type: Remedial Action Completion Report
Completed Date: 04/28/1995
Comments: RMDL (GW2) -- The Ponds and Ditch Study Area (PDSA) groundwater extraction system has been modified and implemented to meet the requirements of the Remedial Action Plan and Closure Plan (RAP) for the Southern Pacific Transportation Company-Sacramento, Rail Yard PDSA. The original five well extraction system selected as the remedial alternative was modified to be a seven well extraction and treatment system after total Volatile Organic Compound (VOC) discharge levels exceeded the 100 parts per billion (ppb) total VOC level required for extraction and discharge into the Sacramento City sewer system. An original groundwater extraction well, exw-4, was identified as the primary source of VOC's. To address this, SPTCo installed two additional groundwater extraction wells, exw-6 and exw-7, and connected exw-4, exw-6 and exw-7 to the existing Drum Storage Area soil vapor/groundwater extraction system for treatment prior to discharge. The original PDSA groundwater extraction system was in operation on November 5, 1992. The complete, modified groundwater extraction system has been in operation since Aug. 15, 1994.

Completed Document Type: Remedial Investigation Report
Completed Date: 01/05/1994
Comments: RI/FS -- FOURTEEN GROUND WATER SAMPLES WERE COLLECTED DOWN GRADIENT, AT THE ESTIMATED MARGIN OF THE UPPER SAND ZONE GROUNDWATER PLUME. RESULTS FROM THE SAMPLING INDICATE THAT THE PLUME MARGIN IS WITHIN THE ESTIMATED MARGIN, COMPLETING CHARACTERIZATION AND ALLOWING TREATMENT BY THE EXISTING, MODIFIED GROUND WATER EXTRACTION SYSTEM. APPROX. COST OF THIS SAMPLING WAS $50,000 WHICH WAS PAID FOR BY THE RP.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Completion Report
Completed Date: 05/30/1993
Comments: FRA (SOIL) -- This final remedial action consisted of back- filling and compaction of an excavation with 11,000 cubic yards of imported clean fill and was completed May 30, 1993. In order to meet the RCRA Closure requirements for this unit, prior to backfilling an area of excavation, a post- remediation health risk assessment was required. The recently approved assessment has shown the site will not pose unacceptable risks, therefore allowing backfill of the excavation. Approx cost = $110,000 (RP funded)

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedy Constructed: Operating Properly & Successfully
Completed Date: 10/29/1992
Comments: FRA (GW1) -- A 5-well ground water extraction system was started up at the site. The system initially withdrew 250 gpm of water impacted by chlorinated solvents. The system evaluation conducted since the start-up has shown that augmentation will be required with at least two additional extraction wells and predischarge treatment to reduce contaminant concentrations to levels acceptable for discharge to the city of Sacramento sewer system for treatment at the publicly owned treatment works. Approx. 110,000,000 gallons pumped & treated this FY. Approx. cost = $250,000 (RP funded)

Completed Document Type: Land Use Restriction
Completed Date: 05/19/1994
Comments: The deed restriction indicates that the property can be used without restriction for: 1) industrial and commercial and 2) the landscaped and paved areas ancillary to the industrial, commercial or office structures that are covered with 2 feet of clean soil, if not used for play areas. Restricted uses include 1) excavation for any purpose other than remediation 2) residential, 3) public or institutional uses 4) educational 5) day care 6) parks, playgrounds water features, open space, yards, gardens and landscaped areas. Soil must be managed as approved by the Department and infrastructure improvements must be developed consistent with the Deed restriction. In the industrial or commercial use areas, where exposure to soils is possible, such as landscaped area or easements, the owner shall continually keep and maintain clean soil to such depth as the owner or occupant has demonstrated to the reasonable satisfaction of the Department to be protective of human health and the environment. If additional contamination is found during development, adequate measures must be taken to achieve permanent remediation and prevent unacceptable exposure to humans or the environment. The soil disposal shall be managed in accordance with all applicable state and federal laws. No water from below the surface shall be extracted or utilized in any way or consumed, although access will be allowed for groundwater monitoring and extraction systems for Union Pacific, it successors or agents, and the Department for monitoring, inspection, and other activities.

Completed Document Type: Land Use Restriction
Completed Date: 05/19/1994
Comments: The deed restriction indicates that the property can be used without restriction for: 1) industrial uses and 2) the landscaped and paved areas ancillary to the industrial, commercial or office structures that are covered with 2 feet of clean soil, if not used for play areas. Restricted uses include 1) excavation for any purpose other than remediation 2) residental, 3) public or institutional uses 4) educational 5) day care 6) parks, playgrounds water features, open space, yards, gardens and landscaped areas. Soil must be managed as approved by the Department and instructure improvements must be developed consistent with the Deed restriction. In the industrial use areas, where exposure to soils is possible, such as landscaped area or easements, the owner shall maintain the 2-foot clean soil cover. If additional contamination is found during development, adequate measures must be taken to acheive permanent remediation and prevent unacceptable exposure to humans or the environment. The soil disposal shall be managed in accordance with all applicable state and federal laws. No water No water from below the surface shall be extracted or utilized in any way or consumed, although access will be allowed for groundwater monitoring and extraction systems for Union Pacific, it successors or agents, and the Department for monitoring, inspection, and other activities.

Completed Document Type:	Remedial Action Plan
Completed Date:	05/08/2003
Comments:	RAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.

Completed Document Type: Remedial Action Plan
Completed Date: 02/16/2000
Comments: RAP - The DTSC approved the Final RAP, dated February 14, 2000, for the Northern Shops Study Area, which consists of 35 acres of the 240 acre SPTCo-Sacramento Rail Yard Site. The approved alternative for remediation for the 180,650 cubic yards of contaminated soils identified the RAP is excavation, land farming, chemical stabilization and, off-site disposal. Implementation of the selected alternative is schedule to begin in May of 2000 and to continue through October of 2005. The preliminary cost of the proposed alternative is estimated to be $14,353,374. CEQA/NOD - The DTSC approved the Notice of Determination for the LSA Final Amended (FARAP), and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP) on February 16, 2000.

Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 11/08/2010
Comments: On November 8, 2010, DTSC confirmed the completion of lead and asbestos abatement activities within several historic buildings within the Central Shops at the Sacramento Railyards. The abatement work was done in coordination with historic preservation requirements and under contract terms with the California Pollution Control Financing Authority (CPCFA) for Prop 1C Brownfields grant money. CPCFA had requested DTSC, as lead agency, provide oversight and confirmation of completion of the activities anticipated by the grant award. The purpose of the abatement was to conduct environmental mitigation of hazardous materials to practical levels that accommodate rehabilitation of the buildings, including general construction activities or intrusive access and use. Remedial goals that were established for lead and asbestos were achieved.

Comments: DES/RDIP -- DESIGN/REMEDIAL DESIGN IMPLEMENTATION PLAN. THE LAGOON STUDY AREA (LSA) IS APPROXIMATELY 434 ACRES OF THE 240 ACRE FORMER SPTCO RAIL YARD LOCATED IN DOWNTOWN SACRAMENTO. THE LSA WAS UTILIZED FOR AS AN INDUSTRIAL WASTEWATER LAGOON, OIL/ WATER SEPERATOR OVERFLOW AREA, AND FORMER LOCATION OF A 50,000 GALLON OIL STORAGE TANK. THE RDIP 2004 PROVIDES FOR EXCAVATIONS, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED VOLATILE ORGANIC COMPOUNDS SVOCs, AND TOTAL PETROLEUM HYDROCARBON (TPH) IN THE LAGOON STUDY AREA, AND CENTRAL CORRIDOR STUDY AREA, AND CAR SHOP NINE STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.

Completed Date: 05/08/2003
Comments: RAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.

Completed Date: 05/22/2000
Comments: DES - The DTSC approved the Final Remediation Design and Implementation Report (RDIP) for Soil on May 22, 2000, for the Lagoon Study Area, 51 acres of the 240 acre SPTCo - Sacramento Rail Yard Site. The approved RDIP for remediation for the 239,640 cubic yards of contaminated soils consists of excavation, ex-situ vapor

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

extraction, chemical stabilization and, off-site disposal. Implementation of the RDIP is scheduled to begin in May of 2000, and to continue through October of 2005. The preliminary costs of the remediation is estimated to be $17,115,480.

Completed Date: 12/30/1998
Comments: RAP -- DTSC APPROVED THE FINAL RAP, DATED 12/28/98, APPROVED 12/30/98, FOR THE LSA 51 ACRES OF THE 240-ACRE SPTCO-SACRAMENTO RAILYARD SITE. THE APPROVED ALTERNATIVE FOR REMEDIATION FOR THE 239,640 CUBIC YARDS OF CONTAMINATED SOILS IDENTIFIED IN THE RAP IS EXCAVATION, EX-SITU VAPOR EXTRACTION, CHEMICAL STABILIZATION, ONSITE SECURE CONTAINMENT AND OFFSITE DISPOSAL. THE ONSITE DISPOSAL ALTERNATIVE INCLUDES DESIGN AND CONSTRUCTION OF AN ONSITE, 450,000 CUBIC YARD SOLD WASTE LANDFILL, PRIMARILY DESIGNED FOR RELATIVELY INERT METALS CONTAMINATED SOILS. THE LANDFILL WILL BE DESIGNED AND CONSTRUCTED AS A CLASS II LANDFILL. THE ONSITE LANDFILL HAS BEEN APPROVED WITH THE FOLLOWING REQUIREMENTS: NO LIQUIDS MAY BE DISPOSED ONSITE, ALL METAL CONTAMINATED SOILS WITH ORGANICS MAY ONLY BE PLACED IN THE LANDFILL IF THE ORGANIC CONSTITUENTS ARE ALL LESS THAN THRESHOLD VALUES, NO RCRA WASTES, AND NO CALIFORNIA HAZARDOUS WASTE THAT HAS NOT BEEN CLASSIFIED AS DESIGNATED WASTE. IMPLEMENTATION OF THE SELECTED ALTERNATIVE IS SCHEDULED TO BEGIN IN APRIL OF 2000 AND TO CONTINU THROUGH OCTOBER OF 2005. THE PRELIMINARY COST OF THE PROPOSED ALTERNATIVE IS EXTIMATED TO BE $20,315,000.

Completed Area Name: Soil
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Investigation / Feasibility Study
Completed Date: 11/25/1997
Comments: RIFS -- Soil FS approved. LSA represents 51 acres of the 240 acre SPTCo- Sacramento Rail Yard. The approved RIFS has initially identified 51,965 cubic yards of contaminated soils that will require offsite disposal and 187,675 cubic yards of contaminated soils that will be disposed of onsite. The onsite disposal alternative includes design and construction of an onsite 450,000 cubic yard solid waste landfill, primarily designed for relatively intert metals contaminated soils. The landfill will be designed and constucted as a Class II landfill. The onsite landfill has been approved with the following requirements: no liquids may be disposed of onsite, all metal contaminated soils with organics may only be placed in the landfill if the organic constituents are all less than threshold values, no RCRA waste, and no California Hazardous Waste that has not been classified as designated waste. The preliminary cost of the proposed alternative, Alternative H, is $20,315,000. The final RAP is scheduled for completion in September 1998.

Completed Document Type: Removal Action Completion Report
Completed Date: 04/27/1995
Comments: RA (LSARA) -- The Interim Remedial Measure (IRM) is being implemented for remediation of soil contaminated with Volatile Organic Compounds (VOC's), Semi-Volatile Organic Compounds (SVOC's), and metals from operation and maintenance activities at the SPTCo-Sacramento Rail

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

Yard. The IRM consists of excavation remediation of approximately 2500 cubic yards of contaminated soils from the Industrial Waste Water Lagoon. The contaminated soil will be stockpiled and treated at the Drum Storage Area (DSA utilizing the existing DSA soil vapor extraction and treatme system to remediate VOC contamination. The VOC remediated soils will then be chemically stabilized/solidified to treat SVOC and metal contamination. The remediated/stabilized soil will then be disposed of at the ECDC Utah Landfill.

Completed Date: 02/21/2003
Comments: RAP/NWLSA--DTSC approved a RAP amendment for soil cleanup of an 11 acre portion of the Lagoon Study Area (LSA) of the railyard site. The Amendment to the 2000 Final Amended Industrial Wastewater Lagoon Remedial Action Plan for Soil changes the remedy for the northwestern corner of the LSA from excavation and offsite disposal to grading and capping with an engineered paved cover. Land use will be limited under a deed restriction. In compliance with CEQA, DTSC has prepared a Notice of Determination (NOD) for this project. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.

Comments:	CEQA/NOD--An NOD was approved for actions selected under a Remedial Action Plan Amendment prepared for soil remediation of an 11 acre Northwestern portion of the Lagoon Study Area. DTSC prepared an Initial Study Agency Checklist which relies on the City of Sacramento EIRs prepared for redevelopment projects which includes the Railyard. The NOD and supporting evaluations were made available for public review for 30 days from 2/25/03 to 3/27/03 and was presented at the 3/11/03 public meeting held at the Sacramento Amtrak Depot. A notice was displayed in the Sacramento Bee newspaper and a fact sheet was mailed to the site mailing list to provide information and announce the review period and a public meeting.

Comments: RI/FS -- The Union Pacific Railroad Company has completed soil characterization of the former Southern Pacific Transportation Company - Sacramento Railyard Car Shop Nine Study Area (CSNSA). Groundwater contamination for the CSNSA will be addressed within the Lagoon Groundwater and Central Shops South Plume RI/FS and RAP. The CSNSA was utilized for constructing rail cars, painting rail cars, sandblasting, general offices and railyard operations buildings. Additionally, five Underground Storage Tanks were located at the

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

CSNSA. During Phase I characterization, soil gas samples were collected from 11 locations, 31 soil borings were drilled and sampled, andgroundwater samples were collected from 24 locations. During Phase II, the final Phase 25 additional soil borings were drilled. Compounds of concern (COC'S) detected in the soil included VOC'S-VC and TCE, SVOC'S-PNA'S, Anthracene and Chrysene, TPH-#2 and #6 fuel oil, oil and grease and extractable and metals-arsenic, Lead, Cadmium, and beryllium. The lateral and vertical extent of COC'S detected in the soil has been sufficiently defined for purposes of developing the soil, final remedial action objectives.

Completed Document Type: CEQA - Notice of Exemption
Completed Date: 02/20/2003
Comments: CEQA/NOE--DTSC prepared a Notice of Exemption (NOE) for an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine, and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safely clean up asbestos if found during future soil excavation. A comment period for the project was held from 2/25/03 to 3/27/03. A public meeting was held on 3/11/03. Public comments were received by DTSC and addressed through a responsiveness summary.

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

Completed Date: 04/17/2002
Comments: CEQA - NOD -- The Department approved an Explanation of Significant Differences (ESD) on 4/17/02 to permit soil bioremediation treatment on-site. To meet the requirements of the California Environmental Quality Act, DTSC, in its role as the Lead Agency for the soil remediation of the site, has considered the Environmental Impact Reports prepared for and certified by the City of Sacramento (City). DTSC has determined that the EIRs and supporting documents relied on for approval of the site soil Remedial Action Plans have adequately adddressed the potential impacts of the project proposed under the ESD. DTSC, using its independent judgement has determined that the project, in its approved form, will not result in a significant adverse effect on the environment. A Notice of Determination indicating the results of said findings has been filed with the State Clearninghouse of the Governor's Office of Planning and Research pursuant to Section 15096(i) of the State CEQA Guidelines.

Completed Document Type: Design/Implementation Workplan
Completed Date: 07/29/2004
Comments: DES/RDIP -- DESIGN/REMEDIAL DESIGN IMPLEMENTATION PLAN. THE CAR SHOP NINE STUDY AREA (CSSA) IS APPROXIMATELY 35 ACRES OF THE 240 ACRE FORMER SPTCO RAIL YARD LOCATED IN DOWNTOWN SACRAMENTO. THE CSSA WAS UTILIZED FOR BOXCAR CLEANING DISMANTLING AND SANDBLASTING. A SAWMILL WAS UTILIZED FOR LUMBER MILLING, PLAINING, AND WOODWORKING. THE RDIP 2004 PROVIDES FOR EXCAVATION, STORAGE, TREATMENT, AND OFFSITE DISPOSAL OF APPROXIMATELY 120,000 CUBIC YARDS OF SOIL CONTAMINATED WITH VOLATILE ORGANIC COMPOUNDS (VOCs), SVOC, AND TOTAL PETROLEUM HYDROCARBON (TPH) IN THE CENTRAL CORRIDOR STUDY AREA, CAR SHOP NINE STUDY AREA, AND LAGOON STUDY AREA FOR WHICH REMEDIAL ACTION PLANS (RAPs) HAVE BEEN PREVIOUSLY APPROVED.

Completed Date: 04/17/2002
Comments: RAP - ESD -- The Department has approved an Explanation of Significant Differences (ESD) on 4/17/02 to permit soil bioremediation treatment on-site. Soil remediation strategies approved under the site Remedial Action Plans (RAP) includes excavation of impacted soil, treating certain soil prior to reuse or disposal, and loading all waste soil for off-site disposal to a landfill. Treatment options approved under the RAP did not specifically include bioremediation of soil. The enclosed ESD has been prepared to amend the site RAP administrative record to include bioremediation treatment of stockpiled soil containing petroleum hydrocarbon. The proposed change is protective of human health and the environment, complies with appropriate, applicable or relevant federal and state requirements and remains cost-effective.

Completed Date: 10/05/1998
Comments: RI/FS - The Union Pacific Railroad Company has completed soil characterization of the former Southern Pacific Transportation

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

Company - Sacramento Railyard, Central Corridor Study Area (CCSA). Groundwater contamination for the CCSA will be addressed within the Lagoon groundwater and Central Shops/South Plume Remedial Investigation/Feasibility Study (RI/FS) and Remedial Action Plan (RAP). The CCSA was utilized for boxcar cleaning and dismantiling, sandblasting, general offices, and a sawmill. Additionally, four underground storage tanks (USTs) were located at the CCSA. During Phase 1 Characterization, soil gas samples were collected from 69 locations, 22 soil borings were drilled and sampled, and groundwater samples were collected from 12 locations. During Phase II, the final phase, 19 additional soil borings were drilled. Compunds of concern (COC's) detected in the soil included volatile organic compounds (VOCs) - vinyl chloride (VC) and Trichloroethylene (TCE), Semi-volatile organic compounds (SVOCs)- Polynuclear Aromatics (PNAs), anthracene and chrysene, Total petroleum hydrocarbons TPH-#2 and #6 fuel oil, oi and grease and extractable, and metal-arsenic, lead, cadmium, and beryllium. The lateral and vertical extent of COCs detected in the soil has been sufficiently defined for purposes of developing the soil, final remedial action objectives.

Comments:	California Environmental Quality Act (CEQA) Ground Water Removal Action (GWRA) -- The DTSC has approved the final California CEQA package for vertical and horizontal containment of an off-site groundwater plume emanating from the SPTCo-Sacramento Rail Yard off-site to the south, the South Plume. The CEQA package project is implementation of two Interim Remedial Measures (IRMs), the South Plume Source Control and the South Plume Margin Control. The South Plume Margin Control consists of a groundwater extraction system located on P Street in Sacramento for leading edge capture. The South Plume Source Control consists of a groundwater/soil vapor extraction and treatment system located within the SPTCo-Sacramento Rail Yard to capture identified sources. Removal Action Work Plan (RAW) Groundwater Removal Action (GWRA) -- A Removal Action Workplan was approved for two South Plume Margin Control. The South Plume Margin Control consists of a groundwater extraction system located on P Street in Sacramento. The South Plume Source Control is comprised of a groundwater/soil vapor extraction and treatment system located within the Central Shops Study area of the SPTCo-Sacramento Rail Yard. The Interim Remedial Measures (IRMs) are being implemented to control the lateral and veritcal migration of groundwater contaminated with volatile organic compounds. The groundwater extraction system became operational on May 12, 2001.

Completed Document Type:	Risk Assessment Report
Completed Date:	12/01/2005
Comments:	RP submitted inserts to the Draft HRA Report to update the conclusions to address DTSC's request for an indoor air evaluation. Conclusions were updated to indicate although no unacceptable risks are associated with the Central Shops and South Plume ground water under current conditions and land use, potential unacceptable risks may be associated with future land use, thus further evaluation with repect to soil and groundwater is required. This additional evaluation will be included in the Feasibility Study as part of the development of remedial goals for soil and groundwater. The future evaluation of VOCs will include all applicable exposure pathways including indoor air.

Completed Document Type:	5 Year Review Reports
Completed Date:	04/09/1998
Comments:	5YEAR -- THE 5-YEAR REVIEW FOR THE SOUTHERN PACIFIC TRANSPORTATION COMPANY, SACRAMENTO (SPTCO) BATTERY SHOPS STUDY AREA (BSSA) HAS BEEN REVIEWED AND APPROVED BY THE DEPARTMENT. THE REPORT WAS COMPLETED AS A TYPE IA REVIEW, AS RECOMMENDED BY DTSC AND CONSISTENT WITH OSWER DIRECTIVE 9355.7-02A. THE IA REVIEWS ARE APPLICABLE FOR SITES WHERE CLOSURE IS NOT COMPLETE AND NO SPECIAL CIRCUMSTANCES HAVE ARISEN SINCE THE REMEDIAL ACTION WAS PERFORMED THE BSSA SOILS WERE EXCAVATED AND DISPOSED OF OFFSITE TO REMEDIAT LEAD, CHROMIUM, AND ARSENIC SOIL CONTAMINATION FROM DISPOSAL OF SPENT BATTERY ACID INTO ONSITE DRY WELLS. AS PART OF THE APRIL 1990 FINAL REMEDIAL ACTION PLAN FOR BSSA, SPTCO WAS REQUIRED TO INSTALL AND MONITOR 5 GROUNDWATER MONITORING WELLS IN THE UPPER SAND ZONE TO EVALUATE THE POTENTIAL SOIL CONTAMINATION FROM THE BSSA IMPACTING GROUNDWATER. BASED ON THE REVIEW OF THE GROUND WATER MONITORING DATA, THE REMEDIATION PERFORMED FOR THE BSSA IS MEETING THE OBJECTIVE OF THE BSSA RAP/CP.

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

Completed Date: 04/28/1995
Comments: RMDL (GW2) -- The Ponds and Ditch Study Area (PDSA) groundwater extraction system has been modified and implemented to meet the requirements of the Remedial Action Plan and Closure Plan (RAP) for the Southern Pacific Transportation Company-Sacramento, Rail Yard PDSA. The original five well extraction system selected as the remedial alternative was modified to be a seven well extraction and treatment system after total Volatile Organic Compound (VOC) discharge levels exceeded the 100 parts per billion (ppb) total VOC level required for extraction and discharge into the Sacramento City sewer system. An original groundwater extraction well, exw-4, was identified as the primary source of VOC's. To address this, SPTCo installed two additional groundwater extraction wells, exw-6 and exw-7, and connected exw-4, exw-6 and exw-7 to the existing Drum Storage Area soil vapor/groundwater extraction system for treatment prior to discharge. The original PDSA groundwater extraction system was in operation on November 5, 1992. The complete, modified groundwater extraction system has been in operation since Aug. 15, 1994.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Plan
Completed Date: 06/30/1994
Comments: ORDER -- the Department, after extensive efforts to negotiate an agreement with SPTCo, issued an Order to SPTCo for Operation and Maintenance of a groundwater extraction system at the Pond and Ditch site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Design/Implementation Workplan
Completed Date: 06/23/1994
Comments: DESIGN -- the Department approved SPTCo's Modified Pond & Ditch Extraction system: Final Design Report. The Final Design Report provides detailed plumbing and electrical plans and provides discharge requirements from the City of Sacramento and treatment requirements from the County of Sacramento.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Investigation Report
Completed Date: 01/05/1994
Comments: RI/FS -- FOURTEEN GROUND WATER SAMPLES WERE COLLECTED DOWN GRADIENT, AT THE ESTIMATED MARGIN OF THE UPPER SAND ZONE GROUNDWATER PLUME. RESULTS FROM THE SAMPLING INDICATE THAT THE PLUME MARGIN IS WITHIN THE ESTIMATED MARGIN, COMPLETING CHARACTERIZATION AND ALLOWING TREATMENT BY THE EXISTING, MODIFIED GROUND WATER EXTRACTION SYSTEM. APPROX. COST OF THIS SAMPLING WAS $50,000 WHICH WAS PAID FOR BY THE RP.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Completion Report
Completed Date: 05/30/1993
Comments: FRA (SOIL) -- This final remedial action consisted of back- filling and compaction of an excavation with 11,000 cubic yards of imported

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

clean fill and was completed May 30, 1993. In order to meet the RCRA Closure requirements for this unit, prior to backfilling an area of excavation, a post- remediation health risk assessment was required. The recently approved assessment has shown the site will not pose unacceptable risks, therefore allowing backfill of the excavation. Approx cost = $110,000 (RP funded)

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedy Constructed: Operating Properly & Successfully
Completed Date: 10/29/1992
Comments: FRA (GW1) -- A 5-well ground water extraction system was started up at the site. The system initially withdrew 250 gpm of water impacted by chlorinated solvents. The system evaluation conducted since the start-up has shown that augmentation will be required with at least two additional extraction wells and predischarge treatment to reduce contaminant concentrations to levels acceptable for discharge to the city of Sacramento sewer system for treatment at the publicly owned treatment works. Approx. 110,000,000 gallons pumped & treated this FY. Approx. cost = $250,000 (RP funded)

Comments: Wastewater disposal pond/ditch. Contaminants include Pb, toluene, TCE, PCE, 1,1-DCA, xylene, benzene, 1,1,1-TCA, and PAH. Groundwater contaminated with Ni, TCE, Cr, 1,2-DCE, and methylene chloride.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Land Use Restriction
Completed Date: 05/19/1994
Comments: The deed restriction indicates that the property can be used without restriction for: 1) industrial and commercial and 2) the landscaped and paved areas ancillary to the industrial, commercial or office structures that are covered with 2 feet of clean soil, if not used for play areas. Restricted uses include 1) excavation for any purpose other than remediation 2) residential, 3) public or institutional uses 4) educational 5) day care 6) parks, playgrounds water features, open space, yards, gardens and landscaped areas. Soil must be managed as approved by the Department and infrastructure improvements must be developed consistent with the Deed restriction. In the industrial or commercial use areas, where exposure to soils is possible, such as landscaped area or easements, the owner shall continually keep and maintain clean soil to such depth as the owner or occupant has demonstrated to the reasonable satisfaction of the Department to be protective of human health and the environment. If additional contamination is found during development, adequate measures must be taken to achieve permanent remediation and prevent unacceptable exposure to humans or the environment. The soil disposal shall be managed in accordance with all applicable state and federal laws. No

UP, DOWNTOWN SAC - CAR SHOP NINE (Continued) **S101300908**

water from below the surface shall be extracted or utilized in any way or consumed, although access will be allowed for groundwater monitoring and extraction systems for Union Pacific, it successors or agents, and the Department for monitoring, inspection, and other activities.

Completed Document Type: Land Use Restriction
Completed Date: 05/19/1994
Comments: The deed restriction indicates that the property can be used without restriction for: 1) industrial uses and 2) the landscaped and paved areas ancillary to the industrial, commercial or office structures that are covered with 2 feet of clean soil, if not used for play areas. Restricted uses include 1) excavation for any purpose other than remediation 2) residental, 3) public or institutional uses 4) educational 5) day care 6) parks, playgrounds water features, open space, yards, gardens and landscaped areas. Soil must be managed as approved by the Department and instructure improvements must be developed consistent with the Deed restriction. In the industrial use areas, where exposure to soils is possible, such as landscaped area or easements, the owner shall maintain the 2-foot clean soil cover. If additional contamination is found during development, adequate measures must be taken to acheive permanent remediation and prevent unacceptable exposure to humans or the environment. The soil disposal shall be managed in accordance with all applicable state and federal laws. No water No water from below the surface shall be extracted or utilized in any way or consumed, although access will be allowed for

Completed Date: 05/08/2003
Comments: RAP/ACP--DTSC approved an Asbestos Contingency Plan (ACP) prepared to amend the February 2000 Final Amended Industrial Wastewater Lagoon RAP, and February 2000 Final Central Corridor, Car Shop Nine and Northern Shops RAP for Soil. The ACP establishes the process to identify the presence of and safety clean up of asbestos if found during future soil excavation. In compliance with CEQA, DTSC has prepared a notice of exemption. A comment period for the project was held from February 25 through March 27, 2003. A public meeting was held on March 11, 2003. Public comments were received by DTSC and addressed through a responsiveness summary.

Completed Document Type: Remedial Action Plan
Completed Date: 02/16/2000
Comments: RAP - The DTSC approved the Final RAP, dated February 14, 2000, for the Northern Shops Study Area, which consists of 35 acres of the 240 acre SPTCo-Sacramento Rail Yard Site. The approved alternative for remediation for the 180,650 cubic yards of contaminated soils identified the RAP is excavation, land farming, chemical stabilization and, off-site disposal. Implementation of the selected alternative is schedule to begin in May of 2000 and to continue through October of 2005. The preliminary cost of the proposed alternative is estimated to be $14,353,374. CEQA/NOD - The DTSC approved the Notice of Determination for the LSA Final Amended (FARAP), and the NSSA, CSNSA, and CCSA Final Remedial Action Plan (FRAP) on February 16, 2000.

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Denver and Rio Grande Railroad/Southern Pacific Transportation Co.
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Denver/San Francisco, CO/CA
Project Revenue Source Desc:	The Department has budgeted $50,000 for oversight of the responsible parties cleanup activities. The RP has agreed to pay DHS oversight costs in the enforceable agreement on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	The site encompasses three RCRA sites under one Court Order. The Court Order time schedule was included in an Enforceable Agreement dated June 2, 1988. These entail (a) a battery storage and disposal area (including dry well disposal), (b) a 2000 square foot drum storage area (containing solvents) and (c) a grit blast waste pile area (containing over 3100 cubic yards of sand).
Hazardous Waste Desc:	Contaminants include (a) copper, lead and petroleum hydrocarbons at the grit blast area, (b) lead and acids at the battery storage and disposal area, and (c) lead and organic compounds at the drum storage area.
Threat To Public Health & Env:	Potential pathways of exposure include ingestion, inhalation and dermal contact at all three locations. Potential receptors include humans, mammals, birds and freshwater fish. The site is within one half mile of the Sacramento and American Rivers, and seasonal fluctuation of shallow ground water direction has been confirmed.
Site Activity Status:	A third round of soil and ground water sampling was completed in September, 1988. Results from these investigations will be used to modify the analysis of remedial alternatives presented in March, 1988. A Court Order was signed July

SP, SAC. - BATTERY SHOP (Continued) **S100833177**

30, 1987. The Order set a time schedule for a combined RAP/RCRA Closure. The time schedule in the Court Order was included in an enforceable agreement with DHS dated June 2, 1988. As an interim remedial measure it is proposed to centralize contaminated soils from the Battery Shop, Drum Storage and Sand Pile sites. Stockpiled wastes will be tarped. Drainage will also be collected down slope. Wastes will be stockpiled above visqueen to prevent percolation.

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Denver and Rio Grande Railroad
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Denver, CO
Project Revenue Source Desc:	The Department has budgeted $100,000 for oversight activities. The RP has agreed in the enforceable agreement to pay DHS oversight costs on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	This is an old locomotive works for the cleaning and refurbishing of coal and diesel engines and railcars. The works were established in 1865.
Hazardous Waste Desc:	Known contaminants in shallow ground water include heavy metals, petroleum hydrocarbons, inorganic solvents and organic solvents. Lead is a heavy metal of particular concern. Benzene is a likely petroleum hydrocarbon contaminant. Kerosene is a likely organic solvent contaminant. Another organic solvent likely to have contaminated the site is 1,1,1-trichloroethane.
Threat To Public Health & Env:	Potential pathways of exposure include ingestion, inhalation and dermal contact. Potential receptors include humans, mammals, birds and freshwater fish. The site is located within one half mile of the Sacramento and American Rivers. Shallow ground water flow is predominantly to the East. Wells serving Bannon Street residents have been tested for organics and metals. Results showed all wells to be uncontaminated by organics and metals.
Site Activity Status:	An enforceable agreement has been implemented between DHS and the RP. A scoping document has been submitted by the RP. A work plan and schedule for investigation and cleanup was submitted October, 1988. A number of underground tanks have already been removed and have received closure approval by the RWQCB.

CA BOND EXP. PLAN:

Reponsible Party:	RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Southern Pacific Transportation Company/Denver and Rio Grande Railroad
Project Revenue Source Addr:	Southern Pacific Building, 1 Market Plaza
Project Revenue Source City,St,Zip:	San Francisco/Denver, CA/CO 94105
Project Revenue Source Desc:	DHS has budgeted $50,000 for oversight activities. The RP has agreed to pay DHS oversight costs in the enforceable agreement on a quarterly basis. The responsible parties will pay all costs associated with cleanup.
Site Description:	Industrial waste water disposal ponds and an industrial waste water conveyance ditch are the focal points of this site investigation. A RAP/RCRA closure is required.

SP, SAC. - PONDS & DITCH (Continued) **S100833178**

Hazardous Waste Desc: Sludge and soil samples analyzed contained high concentrations of copper, lead, zinc, 1,1,1-trichloroethane, trichloroethane, tetrachloroethene, naphthalene, and bis (2-ethylhexyl) phthalate. Ground water contaminants include chromium, methylene chloride, 1,1-dichloroethane (ethylene chloride), and trans-acetylene dichloride (trans-1,2-dichloroethane).

Threat To Public Health & Env: Potential pathways of exposure include ingestion, inhalation and dermal contact. Potential receptors include humans, mammals, birds, insects, freshwater fish, nematodes, soil bacteria and grasses common to the Central Valley. The City of Sacramento has a domestic water intake from the Sacramento River located approximately one mile north of the site. Ground water is used by the State Printing Plant and Crystal Dairy for industrial purposes just north of the site. Wells serving Bannon Street residents have been tested for organics, metals and coliform organisms. Results showed all wells uncontaminated by organics and metals.

Site Activity Status: Sludge from both the ponds and ditch was excavated and disposed of at a Class I landfill in 1984 and 1985 as IRMs. Three rounds of remedial investigation have been completed at the ponds and ditch, the most recent in May, 1987. Bench scale testing of soil solidification and soil washing is now underway. Until a final design is approved, the extraction well near the ponds and ditch has been turned off. A final feasibility study (FS) was received in October, 1988.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Completion Report
Completed Date:	06/27/1996
Comments:	RA -- The property includes a small triangle of Southern Pacific Railroad property which was remediated and Certi- fied as part of the Sacramento Station Study Area. The remainder of the property, which is the subject of this Certification, was owned by the City of Sacramento. The City portion of the property was used as a vehicle park- ing, fueling, maintenance and repair facility for the Sacramento City Police Dept. Underground waste oil, motor oil, and antifreeze tanks were removed in early 1995 from the site under Sacramento County Underground Tank Program oversight. The property contained fill material from unknown sources. Soils were impacted by petroleum hydrocarbons, polycyclic aromatic hydrocarbons, and lead. Contaminated soils were excavated and trans- ported to a Class I or Class II landfill, as appropriate. Construction of a new federal courthouse is currently underway at the remediated site. 3.0 acres of land returned/released for reuse; 8,748 cu yds disposed to landfill.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Workplan
Completed Date:	04/30/1994
Comments:	RI/FS -- The City of Sacramento has conducted soil and groundwater investigation on their portion of the Courthouse property. The City has committed to taking soil excavated as part of construction to a Class III landfill, except soil found above established remediation standards. An area of soil contaminated with PAHs will be remediated. Groundwater extracted as part of construction will be treated, filtered and discharged to the storm/sanitary sewer system. (RP funded)

Completed Date: 10/18/1996
Comments: VCONS -- The property includes a small triange of Southern Pacific Railroad property which was remediated and certified as part of the Sacramento Station Study Area. The remainder of the property, which is the subject of this certification, was owned by the City of Sacramento. The City portion of the property was used as a vehicle parking, fueling, maintenance and repair facility for the Sacramento City Police Department. Underground waste oil, motor oil, and antifreeze tanks were removed in early 1995 from the site under Sacramento County Underground Tank Program oversight. The property contained fill material from unknown sources. Soils were impacted by petroleum hydrocarbons, polycyclic aromatic hydrocarbons, and lead. Contaminated soils were excavated and transported to a Class II or III landfill, as appropriate. Construction of a new federal courthouse is currently underway at the remediated site. The work was carried out under a Voluntary Cleanup Program (VCP) Agreement, Agreement #94-182. The project is now considered complete. In July 1995 a Deed Restriction (DR) was recorded w/Sacramento County. The DR prohibits extraction or use of groundwater and excavation of any soil without prior DTSC approval. Additionally, use of the land for farming, hospitals, schools, or for residential land use is prohibited. On August 29, 1995 contruction of the Federal Courthouse officially began. The $142 million dollar 380,000 square foot building will produce more than 1,000 new construction jobs and 200 permanent jobs. The Federal Courthouse is the first new federal building to be built in the City of Sacramento since 1961 and is the single biggest construction project in the City of Sacramento's history.

Reponsible Party:	NPL SITE CLEANUP WORKPLAN
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	The site is on the NPL and remedial actions are jointly funded by the State (10 percent) and federal (90 percent) governments. Bond monies were used to fund the State's share of the remedial action. The State and federal governments will seek cost recovery from any identified responsible parties.

JIBBOOM JUNKYARD (Continued) **S100833429**

Site Description: This is a former junkyard/transformer salvage yard. It is on the Sacramento River south of the confluence with the American River.

Hazardous Waste Desc: Polychlorinated biphenyls (PCBs), lead, copper, zinc and asbestos were found in soils at this site.

Threat To Public Health & Env: People coming in direct contact with contaminated soils from the site were the population at risk. The routes of exposure were dermal, inhalation, and ingestion. Approximately 11,000 cubic yards of contaminated soil were removed from this 2.3 acre site. The depth of excavation ranged from 1 foot to 30 feet below grade.

Site Activity Status: A draft feasibility study prepared under an EPA contract, was submitted in February, 1985. The final design analysis was completed in July, 1985. Remedial action was completed in May, 1987. The site is pending certification by EPA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Summary Details:

Conditions at listing December 1982): The Jibboom Junkyard covers 9 acres in Sacramento, California, on the floodplain of the Sacramento River. A metal-salvaging business operated on the site. Among other things, the company dismantled transformers and possibly asbestos-lined boilers. The original si e of the site is unknown, but it may once have covered about 35 acres. Portions of the original site are now occupied by motels and/or are a part of Interstate Freeway I-5.Soil sampling by the State in 1981 detected levels of heavy metals exceeding the State s Total Threshold Limit Concentrations. There were also indications of PCB contamination. The soil is highly permeable, and the aquifer is 35 feet below thesurface. The city s drinking water is taken from the river at the northwest corner of the site. The river is also used for recreation and irrigation. Status July 1983): In April 1983, EPA collected soil samples, and in May 1983 the State fenced the site to limit public access. In June 1983, deep core samples were collected to further determine the extent and nature of contamination on the site.

Site Description: The Jibboom Junkyard site is located in Sacramento, California on the east bank of the Sacramento River. The site is approximately 2000 feet downstream from the confluence of the American and Sacramento Rivers. The nine acre site is the former location of the Associated Metals Company salvage yard. The majority of the site, 6.7 acres, is now covered by Interstate 5 and the adjacent Jibboom Street. The remaining portion of the site, 2.3 acres, is a relatively flat open field, with one cluster of trees and no other surface structures or other objects present. The site lies within the 100 year floodplain of the Sacramento River. However, a California Department of Water Resources, Sacramento River Flood Control Project levee helps to protect the site from potential flooding. Situated in an industrial part of town, the site is approximately 4,000 feet from Old Sacramento, a historic downtown area, and approximately 6,000 feet from the State Capitol Building. At the northern edge of the site is an abandoned Pacific Gas and Electric Company (PG&E) steam electric power generating station that was constructed in 1912. Several motels are located to the north of the site along Jibboom Street. The closest of these motels is 400 feet from the site. A water intake structure is located 400 feet northwest of the site and 100 feet west of the levee bank of the Sacramento

JIBBOOM JUNKYARD (Continued) **1009966326**

River. This intake supplies water to the City of Sacramento Filtration Plant. This water filtration plant provides water for up to 50 percent of the city's population, approximately 145,000 people in downtown, western, and southern Sacramento. The filtration plant itself is 550 feet east of the uncovered portion of the site. Four hundred feet south and east of the site is a heavily industrialized area that has been in operation since the 1860's. Along the western edge of the site, on top of the levee, is a heavily used bike path constructed in 1983 as part of the Sacramento and American River Bikeway. There are no homes in the vicinity of the site. The only known residents in the area are members of a family who reside in a motel at the northern edge of the site. Groundwater beneath the site is used for industrial purposes only. There are no potable or agricultural uses of the groundwater in the area. The water is hydraulically connected to the Sacramento River. The river serves as a hydraulic connection, and presumably a barrier, to the potable groundwater that is on the western side of the Sacramento River. The groundwater beneath the site rises to within five feet of the ground surface for up to six months of the year. Flow direction is presumed to fluctuate biannually according to the river stage. Surface water over the covered portions of the site is collected in ditches on both sides of the freeway. This water is then pumped into the American River. Surface water from the remaining areas of the site either percolates into the ground or evaporates. The site is named for an unofficial landfill that was operated between the 1930's and the early 1970's along Jibboom Street to the north of the actual site. The nine acre site which was ranked for the National Priorities List (NPL) is defined by the boundaries of the operations at the now defunct Associated Metals Company yard. In 1863, Southern Pacific Transportation Company (SP) began operations at a 200 acre yard approximately 400 feet southeast of the site. This facility is a major locomotive overhaul facility for SP, and has historically handled large amounts of solvents, paints, sand blasting wastes (including wastes containing lead), petroleum, oils, and lubricants. In response to regulatory agency concern regarding the disposal of some of these materials, SP has begun an extensive soil and groundwater monitoring program. In 1912, PG&E constructed a steam electric power generating station north of the site. The station consisted of the main power generating building, three 12,000 barrel oil aboveground storage tanks on concrete pads with retaining walls, and two 200 barrel underground storage tanks. In 1957, PG&E ceased operations at this plant. By 1967, the three aboveground storage tanks had been dismantled and removed. The now historic PG&E building and the two underground storage tanks remain in place. Sometime prior to 1928, the City of Sacramento constructed a water filtration plant 150 feet due east of where the site would be located. This plant mixes treated water from the American and Sacramento Rivers to supply all 290,000 residents of Sacramento. A 1928 aerial photograph indicates that the Jibboom site was still wooded. By 1946, the original Jibboom Street alignment had been paved and the entire site had been cleared of trees. Disposal activities at the site were not evident. In 1950 or 1951, the property south of the power plant was purchased by the Associated Metals Company. The property was used for a metal salvage operation from this time until 1965. All grades of metal were salvaged, including railroad cars, army tanks, batteries, and some transformers. Although no inventories or records of operations at the yard are known to exist, a former employee indicated that there was on-site disposal of scrap metal as well as some direct discharge of transformer oils to the ground. Transformers were not frequently scrapped. This employee, who was the yard foreman, and historical aerial photographs have been the only sources of information regarding releases of hazardous materials at the Associated Metals yard. In 1965, the State of California Department of Transportation purchased all of the Associated Metals Company property for easement and

JIBBOOM JUNKYARD (Continued) **1009966326**

construction of I-5. No soils were removed, but the site was graded during freeway construction. By 1967, Jibboom Street was realigned to the present location. Between 1981 and 1985, EPA and the State of California Department of Health Services (DOHS) performed extensive on and offsite surface and subsurface soil sampling. In 1984, DOHS constructed a fence around the site. There have been no other response or enforcement activities to date. All of the contamination at this site appears to be the result of activities by the Associated Metals Company. The company is now defunct and all of its principals have deceased. California Secretary of State records indicate that neither Associated Metals Company nor Associated Iron and Metals, the only known alias of Associated Metals Company, were ever incorporated in the State of California. There are no known or suspected potential responsible parties at this site. While the State of California and the City of Sacramento currently own all of the land at the site, they were not owners or operators of the site at the time of disposal. Therefore, according to CERCLA Section 104(c)(3), the state is only liable for 10% of the remedial action costs. It is recommended that Trust Fund monies be used to fund the other 90% of the remedial action costs. A Record of Decision (ROD) addressing the overall site Operable Unit 01 (OU1) was completed in May 1985.

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used

JIBBOOM JUNKYARD (Continued) **1009966326**

to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Potential Media Affect: Aquifer used for drinking water supply
Potential Contaminants of Concern: Gasoline
Site History: The case was opened following an unauthorized release from an underground storage tank system at the subject site. Corrective action is underway as directed by the CVRWQCB. Corrective action may consist of preliminary site investigation, planning and implementation of remedial action, verification monitoring, or a combination thereof. A summary of the site history is available by clicking on either the "Cleanup Status History", "Regulatory Activities" or the "Site Maps/Documents" tab. For a complete site history the case file at the CVRWQCB should be consulted.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Description:	Substance was released from a cold storage plant. Substance was released from the refrigeration system. Fire Dept received complaints from passer by. 19 personnel, employees at a near by business had complaints . The 19 personnel at the near by businness sheltered in place. 4 personnel from a different location where transported to the hospital for observation. Co Hazmat has allowed plant to resume normal operations with plant personnel monitoring refrigeration system continuously. Substance has dispersed and there is no threat to the public at this time.

File Location:	Local Agency
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Diesel
Site History:	A number of soil and groundwater investigations have occurred at the Site since 1988. Five underground storage tanks (USTs) are reported to have been located at the Site. The reported USTs include three suspected USTs (Tanks A, E and D) and two 10,000-gallon diesel USTs. One of the 10,000-gallon USTs (Tank C) is reported to have been abandoned in-place, and the other 10,000-gallon UST (Tank B) was removed in 1991. Since 1989, twelve monitoring wells have been

GREYHOUND BUS TERMINAL (Continued) **S101300928**

installed at the Site. The monitoring wells include W-OHM, which was destroyed in 1991 during the removal of Tank B, and MW-1 through MW-11. An unknown thickness of free-phase diesel fuel was reported in well W-OHM during a December 1990 monitoring event. Groundwater monitoring at the Site has occurred since March 1996. Total petroleum hydrocarbons as diesel (TPHd) have been reported for groundwater samples from each site monitoring well except MW-10 and MW-11 at concentrations ranging from 50 to 160,000 micrograms per liter (8g/l). Total petroleum hydrocarbons as gasoline (TPHg) have also periodically been reported for groundwater samples collected from monitoring wells MW-1 through MW-9 at concentrations ranging from 50 to 950 8g/l. Benzene, toluene, ethylbenzene and total xylenes (BTEX) have been reported at concentrations ranging from 0.5 to 6.6 8g/l. Fuel oxygenate compounds (FOCs) have not been reported for any site groundwater sample with the exception of a single reported detection of 2.1 8g/l methyl tert-butyl ether (MTBE) for MW-5 in March 1996 and a single detection of 0.60 8g/l MTBE for MW-9 following its installation in October 2002. The March 1996 analysis for MW-5 was performed using the United States Environmental Protection Agency (EPA) Test Method 8020 and was not confirmed by subsequent EPA Test Method 8260 analysis. In response to a request for low risk closure, SCEMD indicated that the Site did not meet the requirements for low-risk closure, noting the presence of free-product in monitoring well W-OHM prior to its destruction in 1991. The SCEMD requested installation of either a remediation system or an additional groundwater monitoring well in the vicinity of the former location of W-OHM with annual groundwater monitoring to be performed until the current building is removed from the Site. Installation of well MW-9 in the vicinity of W-OHM occurred. TPHd was reported for MW-9 at 14,000 8g/l. Semi-annual sampling was directed. The SCEMD further directed that future groundwater monitoring events include well MW-3 from the Louie Brothers site located east of the Site on 8th Street (referred to as Louie MW-3). The second semi-annual groundwater sampling event of 2003 revealed that Louie MW-3 is paved over with concrete. SCEMD verbally requested that an evaluation of declining concentration trends be performed for each of the impacted groundwater monitoring wells at the Site. This evaluation was completed using the seasonal Kendall regression analysis software. The seasonal Kendall plots showed that each of the TPHd-impacted wells has an increasing slope with time, with the increases ranging from 17.13 8g/l per year (MW-2) to 111 8g/l per year (MW-8). The SCEMD also requested an evaluation of the relationship between groundwater elevation and TPHd concentration. This evaluation showed that the relationship between groundwater elevation and TPHd concentration in the impacted wells is not consistent between the individual wells for the data prior to 2000, but that from 2000 to date each well generally showed an increase in TPHd concentration relating to decreases in groundwater elevation. Based on the above trends, the consultants concluded that while the TPHd concentrations have remained relatively constant over time, the trends suggest that a continuing source of TPHd remains in the soils beneath the Site, most likely in the vicinity of the abandoned in-place and/or removed USTs. They further concluded that active remediation of these soils may be necessary to reverse the trends to show decreases in groundwater TPHd concentration with time. In March 2006, SCEMD determined that the site did not meet the Departments criteria for low risk closure because concentration trends are increasing. The

GREYHOUND BUS TERMINAL (Continued) **S101300928**

SCEMD further directed that the contaminated soil remaining in the vicinity of the abandoned in-place UST must be excavated during development of the Site and that if this does not occur prior to August 2008, another groundwater monitoring well is to be installed in the vicinity of the former Louie MW-3 well and quarterly groundwater monitoring must be resumed. The SCEMD in a letter dated April 17, 2006, directed the installation of the groundwater monitoring well east of the Site and resumption of quarterly groundwater monitoring. The SCEMD subsequently allowed deferment of the offsite well installation and continuance of semi-annual groundwater monitoring pending DBP Realty Partners, LPs assessment of the short-term use of the Site. The SCEMD, in a letter dated July 16, 2007, directed quarterly groundwater monitoring, the installation of two offsite monitoring wells to define the groundwater impacts beneath the Site and submittal of a feasibility study. On December 7, 2007,the consultants arranged for the installation of offsite groundwater monitoring wells MW-10 and MW-11. None of the tested analytes were reported above their respective method reporting limits (MRLs) for the groundwater samples collected from these wells. On February 6, 2009, the SCEMD approved annual monitoring for the Site. The site was again submitted for closure on September 17, 2010. Site still does not meet the closure criteria.

Site History: The case was opened following an unauthorized release from an underground storage tank system at the subject site. Corrective action is underway as directed by the CVRWQCB. Corrective action may consist of preliminary site investigation, planning and implementation of remedial action, verification monitoring, or a combination thereof. A summary of the site history is available by clicking on either the "Cleanup Status History", "Regulatory Activities" or the "Site Maps/Documents" tab. For a complete site history the case file at the CVRWQCB should be consulted.

US BROWNFIELDS:

Recipient name:	West Sacramento, City of
Grant type:	Assessment
Property name:	WHALEY PROPERTY
Property #:	058-320-091
Parcel size:	3.29
Property Description:	The property was vacant until a wharehouse was contructed at the site in the 1950s. The property was purchased by the current owner for the operation of gas station. This operation ceased in the late 1990s or early 2000s, and four underground storage tanks were removed from the site. The California Regional Water Quality Control Board required the owner to conduct groundwater testing following the removal of the tanks, and in 2008 a no further action letter was issued by the State for this site.

Agency Type: Private
SIC Code: 4213
SIC Code 2: Not reported
Primary Waste Type: Nonhazardous Solid Wastes/Influent or Solid Wastes that contain nonhazardous putrescible and non putrescible solid, semisolid, and liquid wastes (E.G., garbage, trash, refuse, paper, demolition and construction wastes, manure, vegetable or animal solid and semisolid waste).
Primary Waste: STORMS

FREDERICKSEN TANK LINES (Continued) **S105032981**

Waste Type2:	Not reported
Waste2:	Stormwater Runoff
Primary Waste Type:	Nonhazardous Solid Wastes/Influent or Solid Wastes that contain nonhazardous putrescible and non putrescible solid, semisolid, and liquid wastes (E.G., garbage, trash, refuse, paper, demolition and construction wastes, manure, vegetable or animal solid and semisolid waste).
Secondary Waste:	Not reported
Secondary Waste Type:	Not reported
Design Flow:	0
Baseline Flow:	0
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The facility is not a POTW.
Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Completed Document Type:	Site Screening
Completed Date:	12/06/1989
Comments:	SITE SCREENING DONE LETTER SENT TO REQUEST DOCUMENTATION OF CLEAN-UP (IF ANY).
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Preliminary Endangerment Assessment Report
Completed Date:	09/30/1992
Comments:	PEA completed. Low levels of CrVI were detected in the shallow (15ft) ground water (.023 ppm). Elevated lead and chromium seem in 1988 S&E investigation apparently were removed with a railroad spur sometime during the transfer of ownership. Remaining lead and chromium are at acceptable levels for the current and projected land use of commercial/ industrial. No further action required by DTSC. RWQCB informed of low CrVI levels.

Site History:	The property is currently occupied by the River City Baseball Group, the current owner and operator of the ballpark facility, a new multi-use open-air structure stadium that serves as the home for the Sacramento River Cats. Univar USA Inc. (Formerly Van Waters & Rogers) purchased the facility in 1959 for chemical storage and distribution operations, resulting in the storage, handling, and re-packaging of PCE; 1,1,1-TCA, acetic acid, acetone, Texanol, diesel, and propylene glycol. These chemical distribution operations at the site caused contamination of soil and groundwater with solvents, mostly PCE, TCE, vinyl chloride, cis-1,2-DCE and trans-1,2-DCE. Initial cleanup operations for soil and groundwater were incorporated into the stadium design during construction of Raley Field. Univar USA Inc. is primarily responsible for the environmental cleanup operations at the site. Site investigative activities were initiated in 1988 in response to potential leaks from Underground Storage Tanks (USTs). The USTs were subsequently removed in 1991 and since then, no chemicals have been stored in bulk at the site. Univar operated soil vapor extraction/air sparging from 1995 to 1997. In 1999, the system was decommissioned and a combination of in-situ bioremediation and groundwater extraction and treatment systems were installed. Groundwater is being amended with a food source (sodium lactate) and nutrients to stimulate the growth of indigenous bacteria for enhanced anaerobic dechlorination.

Description:	The site is located in West Sacramento, California, in Yolo County. It occupies 27.8 acres in Township 9 North, Range 4 East, M.D.B. & M. It is bounded on the west by Riske Lane and on the northwest by Ball Park Drive. South River Road forms the east and south boundaries of the site. During the site visits in 1989 and 2003, the Sacramento Engineering Depot site was occupied by numerous commercial and industrial facilities. No structures were identified to be of the definite DOD origin.
History:	In the 1942 the Army leased 27.8 acres from the Sacramento Northern Railway. The are was used by the Corps of Engineers, the former Pacific Division, as a closed storage area for the military supplies. The government constructed 18,051 square feet of shop space. Ten acres of gravel paving was added to the property. A directive dated 20 February 1945 authorized the acquisition of the property in a fee interest, in lieu of leasehold interest. At the end of the war, a military necessity was no longer required; thus the property was surplused 31 July 1947 and the lease cancelled defective 31 October 1947. Copies of the lease, a yard plans for the building and lease cancellation could not be found.

Background Info:

The Sacramento Housing and Redevelopment Agency (SHRA) site is located at 1920 Front Street in Sacramento. The site is located adjacent to the PG&E former manufactured gas plant and encompasses the location of a former lumberyard. Contamination was found at two areas on the site. The first area was in the Southewast portion of the site. A leaking underground storage tank was removed from teh first area in 1988 and contaminated soils were removed during December 1996. The second area was located in the southwest area of the site, identified as Risk Management Zone (RMZ) VIIIa in the 1991 Remedial Action Plan (RAP). Manufactured gas plant (MGP) products from the PG&E site, located south of the site, were deposited in this zone. A Remedial Action Order (RAO) was issued on 08/16/93.
A "Soil Excavation Workplan" was finalized in August 2001. The Soil Excavation Workplan satisfied the soil removal "Design" that was specified in the May 1991 RAP. The Workplan presented the design to remove approximately 700 cubic yards of polycyclic aromatic hydrocarbons (PAHs) contaminated soil from RMZ VIIIa. Contaminated soils were removed during November 2001.
The Final Groundwater Engineering Evaluation/Cost Analysis (EE/CA) and Remedial Action Workplan (RAW) for the Front & T Street Sites, Sacramento California was completed in April 2001. The report was prepared for the Front Street Joint Defense Group (JDG) that consists of the following sites: 1) PG&E Sacramento; former MGP; 2) Cal Trans I-5, Q Street Off-ramp; 3) SHRA - 1920 Front Street; 4) SMUD - Front and T Street. The RAW implements a monitored natural attenuation (MNA) remedy combined with continued operation of the pump and treat system on the PG&E Site. A contingent remedy, which will be implemented if Site conditions change, was funded as a part of the RAW. The RAW implements the groundwater cleanup objectives for all of the Front & T Street Sites.
PG&E has accepted responsibility for monitoring and maintenance of all implemented remedies at all the Front Street JDG sites. PG&E will continue to monitor the remaining groundwater contamination via a regularly scheduled sampling and monitoring

Completed Document Type: Removal Action Completion Report
Completed Date: 03/31/1997
Comments: RA -- Removal and disposition of 358 cu.yds. of soil contam- inated from a leaking underground gasoline tank. The ex- cavation was backfilled with clean pea gravel and oxygen release compound to enhance the bioremediation of any remaining contaminants.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Report
Completed Date: 05/23/2007
Comments: The draft Focused Feasibility Study was submitted on behalf of Pacific Gas and Electric Company (PG&E) for the Front and T Streets Sites. DTSC comments are scheduled to be provided by March 21, 2007.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Financial Assurance Documentation
Completed Date: 02/01/2008
Comments: Following a review by Project and Financial Assurance Unit staff, the initial deposit of $303,648.00 was verified. Four subsequent annual payments are scheduled to be made as specified in the O&M agreement. The future payments will be adjusted as specified in the agreement.

Completed Area Name: PROJECT WIDE

CA BOND EXP. PLAN:
Reponsible Party: RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company: Not reported
Project Revenue Source Addr: Not reported
Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: It is expected that Pacific Gas and Electric Company will fund the site characterization and remedial action. DHS entered into an enforceable agreement with the responsible parties. DHS has budgeted $100,000 for oversight/monitoring of cleanup efforts. DHS will recover 100 percent of direct costs plus staff costs and overhead related to the project. The responsible parties will pay all costs associated with remedial investigations and cleanup activities.
Site Description: A former "City Gas Plant" or coal and crude oil gasification facility was located at this site. The former facility manufactured gas from coal and later used crude oil as a raw material.
Hazardous Waste Desc: Coal gasification facilities typically generated "coal tar" or "lamp black" residues. These residues contained compounds known as either Polynuclear Aromatic Hydrocarbons (PNA) or Polycyclic Aromatic Hydrocarbons (PAHs). These wastes were either sold for recycling purposes or used to fill in depressions or ponds and then covered or paved over with the wastes left in place.
Threat To Public Health & Env: The site is currently fenced and locked; access onto the site is controlled by PG&E. All exposed contaminant deposits have been paved to control migration and exposure. The avenues of exposure are ingestion of contaminated ground water and inhalation of contaminated dust or direct contact with contaminated soils. Presently, inadvertent exposure is not probable since the contaminated shallow ground water is not used for domestic purposes. Exposure to contaminated soil would only occur if the asphaltic cap were disturbed during construction onsite.
Site Activity Status: Pacific Gas and Electric Company has informed DHS that it is investigating a number of sites to determine if PNAs are present. PG&E has completed a major portion of the field work for the Remedial Investigation of the Sacramento site. The Feasibility Study Report is being prepared which will evaluate remedial alternatives.

Completed Date:	09/16/2013
Comments:	DTSC PM change from Sam Martinez to Mary Gaspari. On Sept. 16, 2013, Sam sent an email informing everyone about the DTSC PM change. The official letter was mailed out on 9/18/2013.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Design/Implementation Workplan
Completed Date:	10/15/2012
Comments:	On This date, DTSC approved the Design & Implementation plan. The final version is dated October 5, 2012 with revised drawings dated October 10, 2012.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Remedial Action Implementation Workplan
Completed Date:	09/12/2012
Comments:	On this date, DTSC completed the formal review of a proposal to modify the remedial action for the subsurface soil. Rather than perform solidification and stabilization, the soil requiring treatment would only be solidified using Portland cement. DTSC also authorized the use of mixing using excavation equipment (bucket mixing). The treated material must comply with all other specifications in the RDIP.

PG&E - SACRAMENTO SITE (Continued) **S100833174**

Completed Date: 05/23/2007
Comments: The draft Focused Feasibility Study was submitted on behalf of Pacific Gas and Electric Company (PG&E) for the Front and T Streets Sites. DTSC comments are scheduled to be provided by March 21, 2007.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Manual
Completed Date: 08/10/2007
Comments: DTSC transmitted comments on the draft plan and requested a revised plan be submitted on March 30, 2007.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Manual
Completed Date: 08/07/2007
Comments: DTSC provided comments and direction for the revision of the Cap Plan. Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Well Decommissioning Workplan
Completed Date: 05/16/2007
Comments: The Soil Vapor Extraction and Treatment System (SVETS) was constructed in 1999 to address contaminants present beneath the CalTrans and SMUD parcels. The evaluation presented indicates that the SVETS has had a minimal effect on the remediation and is not performing as expected. The concentrations of the contaminants of concern detected in samples collected in 2005 are roughly equivalent to those detected in 1999. The proposal recommends the removal of the SVETS as it is not effective in attaining the goals set forth in the Remedial Action Objectives set forth in either the Remedial Action Plan (RAP) or the Final Groundwater Engineering Evaluation/Cost Analysis and Remedial Action Workplan (EE/CA RAW). DTSC concurred with the proposal to decommission the SVETS and requested notification of the commencement of decommissioning and any deviation or modification from this proposal.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Monitoring Plan
Completed Date: 12/13/2007
Comments: The SAP dated 11/16/7 which was submitted on of PG&E by ARCADIS was approved by DTSC. DTSC reviewed all portions of the document but did not review Appendix E, which is the current Health and Safety Plan, DTSC staff inspecting the Site will be familiar with applicable safety rules and procedures, DTSC does not offer approval of Health and Safety Plans.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Long Term Monitoring Report
Completed Date: 05/09/2007
Comments: DTSC reviewed the reported and concurred with the findings and recommendations.

Completed Area Name: PROJECT WIDE

PG&E - SACRAMENTO SITE (Continued) **S100833174**

Completed Sub Area Name: Not reported
Completed Document Type: Financial Assurance Documentation
Completed Date: 02/01/2008
Comments: Following a review by Project and Financial Assurance Unit staff, the initial deposit of $303,648.00 was verified. Four subsequent annual payments are scheduled to be made as specified in the O&M agreement. The future payments will be adjusted as specified in the agreement.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Implementation Workplan
Completed Date: 04/11/2008
Comments: On this date DTSC approved the subject work plan which describes the work proposed to collect analytical samples as well as media for use in potential bench-scale tests. The results of this investigation will be the basis for consideration of a remedial system enhancement. The objective of this work is to yield data for use in identifying a remedial technology that will more effectively reduce toxicity, mobility, volume, and time to remedy site than the current remedy.

Completed Document Type: Other Report
Completed Date: 10/16/2014
Comments: DTSC issued its approval of the 2nd Quarter 2014 Quarterly Monitoring Report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Treatability Study Report
Completed Date: 06/08/2010
Comments: The Treatability Study concludes that an admixture of 10% Portland cement and 4% granulated activated carbon will achieve the criteria set forth in the study. The study did not evaluate the contaminant capture over a range of mixtures. This is a data gap that will have to be addressed during the design phase should this remedy be selected for use at the site.

Comments: On this date the Operation, Maintenance & Monitoring Manual for the GWETS that was rehabilitated/relocated this year. This manual replaces the manual specified in paragraph 2.1.1 of the Operation & Maintenance Agreement.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Plan Amendment
Completed Date: 04/27/2011
Comments: DTSC approved the draft RAP for release on this date. The public comment period for the Draft RAP will commence on April 29, 2011 and will end on May 31, 2011. Fact sheets were mailed for delivery on the 29th and a public notice will be published on the 29th as well. A public meeting is scheduled for May 18 at the Towe Auto Museum in Sacramento. The Draft RAP proposes in-situ soil stabilization/solidification by the addition of Portland Cement and Activated carbon to the areas where the highest contamination is found in the vadose zone. The currently operating Groundwater remedy will continue to operate until RAOs are achieved. Modification of the remedy is necessary as the Ranney Collector, a nearby large volume well was decommissioned in 2009 and the contingent remedy was implemented.

PG&E - SACRAMENTO SITE (Continued) **S100833174**

Completed Document Type: Removal Action Workplan
Completed Date: 04/27/2001
Comments: RAW- The public comment period for the Draft Final Groundwater Engineering Evaluation/Cost Analysis (EE/CA) and Remedial Action Work Plan (RAW) for the Front & T Street Sites, Sacramento CA for the Front Street Joint Defense Group (JDG) ended on April 3, 2001 DTSC received no comment on the above mentioned document and therefore granted final approval for said RAW. The RAW calls for a monitored natural attenuation (MNA) remedy combined with continued operation of the pump and treat system on PG&E Site. A contingent remedy, which will be implemented if Site conditions change, is also funded as a part of this RAW. Implementation of this RAW is designed to meet the groundwater cleanup objectives for all of the Front & T Street Sites. These Sites include: 1) PG&E Sacramento - Former MGP 2) CalTrans I-5, Q Street Offramp 3) SHRA - 1920 Front Street and 4) SMUD - Front and T Street.

Completed Document Type: Well Decommissioning Workplan
Completed Date: 05/16/2007
Comments: The Soil Vapor Extraction and Treatment System (SVETS) was

PG&E - SACRAMENTO SITE (Continued) **S100833174**

constructed in 1999 to address contaminants present beneath the CalTrans and SMUD parcels. The evaluation presented indicates that the SVETS has had a minimal effect on the remediation and is not performing as expected. The concentrations of the contaminants of concern detected in samples collected in 2005 are roughly equivalent to those detected in 1999. The proposal recommends the removal of the SVETS as it is not effective in attaining the goals set forth in the Remedial Action Objectives set forth in either the Remedial Action Plan (RAP) or the Final Groundwater Engineering Evaluation/Cost Analysis and Remedial Action Workplan (EE/CA RAW). DTSC concurred with the proposal to decommission the SVETS and requested notification of the commencement of decommissioning and any deviation or modification from this proposal.

Completed Date: 04/11/2008
Comments: On this date DTSC approved the subject work plan which describes the work proposed to collect analytical samples as well as media for use in potential bench-scale tests. The results of this investigation will be the basis for consideration of a remedial system enhancement. The objective of this work is to yield data for use in identifying a remedial technology that will more effectively reduce toxicity, mobility, volume, and time to remedy site than the current remedy.

replaces the manual specified in paragraph 2.1.1 of the Operation & Maintenance Agreement.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Plan Amendment
Completed Date: 04/27/2011
Comments: DTSC approved the draft RAP for release on this date. The public comment period for the Draft RAP will commence on April 29, 2011 and will end on May 31, 2011. Fact sheets were mailed for delivery on the 29th and a public notice will be published on the 29th as well. A public meeting is scheduled for May 18 at the Towe Auto Museum in Sacramento. The Draft RAP proposes in-situ soil stabilization/solidification by the addition of Portland Cement and Activated carbon to the areas where the highest contamination is found in the vadose zone. The currently operating Groundwater remedy will continue to operate until RAOs are achieved. Modification of the remedy is necessary as the Ranney Collector, a nearby large volume well was decommissioned in 2009 and the contingent remedy was implemented.

Completed Document Type: Removal Action Workplan
Completed Date: 04/27/2001
Comments: RAW- The public comment period for the Draft Final Groundwater Engineering Evaluation/Cost Analysis (EE/CA) and Remedial Action Work Plan (RAW) for the Front & T Street Sites, Sacramento CA for the Front Street Joint Defense Group (JDG) ended on April 3, 2001 DTSC received no comment on the above mentioned document and therefore granted final approval for said RAW. The RAW calls for a monitored natural attenuation (MNA) remedy combined with continued operation of the pump and treat system on PG&E Site. A contingent remedy, which will be implemented if Site conditions change, is also funded as a part of this RAW. Implementation of this RAW is designed to meet the groundwater cleanup objectives for all of the Front & T Street Sites. These Sites include: 1) PG&E Sacramento - Former MGP 2) CalTrans I-5, Q Street Offramp 3) SHRA - 1920 Front Street and 4) SMUD - Front and T Street.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Treatability Study Workplan
Completed Date:	07/22/2009
Comments:	On this date, DTSC approved the Treatability Study Plan for the in-situ soil stabilization/solidification. The objective of the study is to determine the proper stabilization mixture that will achieve the following: Permeability equal to, or less than, 1 x 10-6 centimeters per second; Unconfined compressive strength equal to or greater than, 30 pounds per square inch; and Reduce leaching of contaminants to groundwater to concentrations below target criteria. Additionally, the study will qualitatively examine vapor generation, temperature increase during treatment, and encapsulation of non-aqueous phase liquids.

Background Info:	The PG&E Sacramento Site is a former manufactured gas plant that operated from 1873 to 1956 and produced gas from coal and petroleum as raw material. The contaminants found onsite are polycyclic aromatic hydrocarbons (PAH); total petroleum hydrocarbons (TPH); benzene, toluene, xylene, and ethylbenzene (B, T, X & E) and heavy metals in soil and groundwater. The site is currently paved to control soil migration and exposure. Groundwater contamination has not affected any domestic wells. PG&E signed an enforceable agreement with Department of Toxic Substances Control (DTSC) in March 1988. PG&E completed an onsite Remedial Investigation (RI) in March 1989 and offsite groundwater RI in June 1990. In October 1990, PG&E submitted an Feasibility Study and submitted the draft Remedial Action Plan (RAP) in November 1990. A final RAP was issued in May 1991. The proposed final remediation included excavation of highly contaminated soils and offsite disposal, capping of remaining contamination and a groundwater extraction and treatment system. Contaminated soil was removed in November 1991. The groundwater treatment plant for the site went online during August 1995. The system includes 4 extraction wells, 4 reinjection wells, 3 observational piezometers and a carbon filter treatment plant. The Final Remedial Investigation and Removal Action reports,completed on September 1999, concluded that under current site conditions, protection of human health and the environment is achieved and that additional groundwater

PG&E - SACRAMENTO SITE (Continued) **S101272813**

remediation is not necessary beyond the remedial processes in place.
The Final Groundwater Engineering Evaluation/Cost Analysis (EE/CA) and Remedial Action Work Plan (RAW) for the Front & T Street Sites, Sacramento, California was completed on April 2001. The report was prepared for the Front Street Joint Defense Group (JDG) that consists of the following sites: 1) PG&E Sacramento, Former MGP; 2) Cal Trans I-5, Q Street off-ramp; 3) Sacramento Housing and Redevelopment Agency-1920 Front Street; 4) SMUD - Front and T Street. The RAW implements a monitored natural attenuation(MNA) remedy combined with continued operation of the pump and treat system on the PG&E Site. A contingent remedy, which will be implemented if Site conditions change, was funded as a part of the RAW. The RAW implements the groundwater cleanup objectives for all of the Front & T Street Sites.
PG&E has accepted responsibility for monitoring and maintenance of all implemented remedies at all the Front Street JDG sites. PG&E will continue to monitor the remaining groundwater contamination via a regularly scheduled sampling and monitoring program.

Completed Document Type: Removal Action Workplan
Completed Date: 04/27/2001
Comments: RAW - The public comment period for the Draft Final Groundwater Engineering Evaluation/Cost Analysis (EE/CA) and Remedial Action Work Plan (RAW) for the Front & T Street sites, Sacramento, California, for the Front Street Joint Defense Group (JDG) ended on April 3, 2001. DTSC received no comment on the above mentioned document and therefore granted final approval for said RAW. The RAW calls for a monitored natural attenuation (MNA) remedy combined with continued operation of the pump and treat system on PG&E site. A contingent remedy, which will be implemented if Site conditions change, is also funded as part of this RAW. Implementation of this RAW is designed to meet the groundwater cleanup objectives for all of the Front & T Street Sites. These Sites include: 1) PG&E Sacramento - Former MGP 2) CalTrans I-5, Q Street Off-ramp 3) SHRA - 1920 Front Street and 4) SMUD - Front and T Street.

Completed Area Name: PROJECT WIDE

CALTRANS, I-5 Q STREET OFF-RAMP (Continued) **S109548227**

Completed Date: 06/27/1997
Comments: CEQA -- Prepared CEQA documents for a proposed Neg. Dec. Held a 30-day public comment period on proposed project. Received no comments, so Neg. Dec. was finalized on 6/27/97. RAW/SOIL -- Completed a Neg. Dec. under CEQA. Received no comments during the comment period. Approved the Removal Action Workplan which includes excavation of approximately 12,200 cu yds. of contaminated soil, installation of a seasonal soil vapor extraction system, and returning the surface to its current condition.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: * Land Use Restriction Monitoring Report
Completed Date: 02/24/2010
Comments: On this date DTSC amended the report to inclusde a brief discussion of the Front Street Well abandonment and accepted the findings of the 2009 LUC Inspection Report

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: * Land Use Restriction Monitoring Report
Completed Date: 01/24/2011
Comments: On this date DTSC accepted the Annual Land Use Covenant Inspection Report.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: * Land Use Restriction Monitoring Report
Completed Date: 01/21/2009
Comments: On this date DTSC concurred with the findings of the annual LUC inspection report. The site is being used in a manner consistent with the prohibitions and limitations specified in the LUC.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Land Use Restriction
Completed Date: 06/30/2006
Comments: On July 12, 2006 the fully executed Land Use Covenant was recorded in the office of the Sacramento County Assessor in Book 20060701 at Page 0999.

Completed Document Type: Operation & Maintenance Order/Agreement

CALTRANS, I-5 Q STREET OFF-RAMP (Continued) **S109548227**

Completed Date: 10/23/2007
Comments: The O&M Agreement is complete for the site. Financial assurance will be completed shortly.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 04/27/2001
Comments: RAW - The public comment period for the Draft Final Groundwater Engineering Evaluation/Cost Analysis (EE/CA) and Remedial Action Work Plan (RAW) for the Front & T Street sites, Sacramento, California, for the Front Street Joint Defense Group (JDG) ended on April 3, 2001. DTSC received no comment on the above mentioned document and therefore granted final approval for said RAW. The RAW calls for a monitored natural attenuation (MNA) remedy combined with continued operation of the pump and treat system on PG&E site. A contingent remedy, which will be implemented if Site conditions change, is also funded as part of this RAW. Implementation of this RAW is designed to meet the groundwater cleanup objectives for all of the Front & T Street Sites. These Sites include: 1) PG&E Sacramento - Former MGP 2) CalTrans I-5, Q Street Off-ramp 3) SHRA - 1920 Front Street and 4) SMUD - Front and T Street.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 06/16/1999
Comments: RA/SOIL - Excavation and removal of 18,550 metric tons of soil contaminated with PAH's and BTEX. Excavation was back filled with clean material and a soil vapor extraction system was installed to remove contaminants below the depth of excavation. The excavation was done jointly with SMUD.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 06/27/1997
Comments: CEQA -- Prepared CEQA documents for a proposed Neg. Dec. Held a 30-day public comment period on proposed project. Received no comments, so Neg. Dec. was finalized on 6/27/97. RAW/SOIL -- Completed a Neg. Dec. under CEQA. Received no comments during the comment period. Approved the Removal Action Workplan which includes excavation of approximately 12,200 cu yds. of contaminated soil, installation of a seasonal soil vapor extraction system, and returning the surface to its current condition.

Alternate Address:	FRONT & T STREETS

SMUD, FRONT & T STREETS (Continued) **S101482984**

Alternate City,St,Zip:	SACRAMENTO, CA 95814
Background Info:	The Sacramento Municipal Utility District (SMUD) site is located near the former intersection of Front and T Streets in Sacramento and adjacent to the California Department of Transportation (CalTrans) property. The SMUD site was discovered during the groundwater investigation for the PG&E -Sacramento site. Soil boring analyses indicated that site was a source of petroleum hydrocarbon contamination to the groundwater. The Department issued a Remedial Action Order on 08/16/1993 to SMUD and CalTrans. Contaminated soil was excavated at the SMUD and CalTrans sites during fall 1998. A seasonal soil vapor extraction system, to remove contaminants below the depth of excavation, began operations on 10/31/1999. This system operates on both the SMUD and the adjacent CalTrans site. The Final Groundwater Engineering Evaluation/Cost Analysis (EE/CA) and Remedial Action Work Plan (RAW) for the Front & T Street Sites, Sacramento, California was completed in April 2001. The report was prepared for the Front Street Joint Defense Group (JDG) that consists of the following sites: 1) PG&E Sacramento; Former MGP; 2) CalTrans I-5, Q Street Off-ramp; 3) SHRA - 1920 Front Street; 4) SMUD - Front and T Street. The RAW implements a monitored attenuation (MNA) remedy combined with continued operation of the pump and treat system on the P G & E site. A contingent remedy, which will be implemented if site conditions change, was funded as a part of the RAW. The RAW implements the groundwater cleanup objectives for all of the Front & T Street Sites. PG&E has accepted responsibility for monitoring and maintenance of all implemented remedies at all the Front Street JDG sites. PG&E will continue to monitor the remaining groundwater contamination via a regularly scheduled sampling and monitoring program.

Completed Document Type:	Removal Action Workplan
Completed Date:	04/27/2001
Comments:	RAW - The pubilc comment period for the Draft Final Groundwater Engineering Evaluation/Cost Analysis (EE/CA) and Remedial Action Work Plan (RAW) for the Front & T Street sites, Sacramento, California for the Front Street Joint Defense Group (JDG) ended on April 3, 2001. DTSC received no comment on the above mentioned document and therefore granted final approval for said RAW. The RAW calls for a monitored natural attenuation (MNA) remedy combined with continued operation of the pump and treat system on PG&E site. A contingent remedy, which will be implemented if Site conditions change, is also funded as a part of this RAW. Implementation of this RAW is designed to meet the groundwater cleanup objectives for all of the Front & T Street sites. These sites include: 1) PG&E Sacramento- Former MGP 2) CalTrans I-5, Q Street Off-ramp 3) SHRA - 1920 Front Street and 4) SMUD - Front and T Street.

CADA WAREHOUSE REDEVELOPMENT PROJECT (Continued) **S108744087**

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 11/21/2001
Comments: RAW/CEQA - A public comment period for the Removal Action Workplan (RAW) and Notice of Exemption (NOE) was held for 30 days beginning September 25, 2001 and ending on October 25, 2001. During the comment period, DTSC only received one written comment. DTSC has responded to the comment and has approved the RAW and NOE. Approximately 645 cubic yards of soil will be removed and transported to a landfill. DTSC anticipates excavation to be completed by April 2002.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Investigation / Feasibility Study
Completed Date: 05/04/2001
Comments: RI/FS - THE RI/FS HAS BEEN APPROVED AND A COPY OF THE APPROVAL LETTER HAS BEEN ATTACHED. CADA WILL BE SUBMITTING A REMEDIAL ACTION WORKPLAN TO DTSC FOR REVIEW.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 08/25/2004
Comments: RA (REMEDIAL ACTION) -- THE DEPARTMENT OF TOXIC SUBSTANCES CONTROL (DTSC) APPROVED THE 2004 CONSTRUCTION REPORT FOR THE CADA WAREHOUSE REDEVELOPMENT PROJECT. REMEDIATION ACTIVITIES OCCURRED IN THE SUMMER OF 2002 AND BETWEEN MAY AND JUNE IN 2004. THE REPORT DOCUMENTS THE REMEDIATION EXCAVATION ACTIVITIES THAT TOOK PLACE IN 2004. APPROXIMATELY 5000 CUBIC YARDS OF MATERIAL WAS EXCAVATED AND TRANSPORTED TO A CLASS II DISPOSAL FACILITY. AFTER COMPLETION OF THE EXCAVATION AND DISPOSAL ACTIVITIES, SEVERAL CONFIRMATION SAMPLES WERE COLLECTED FROM REMAINING SOIL ON THE PROPERTY. ANALYTICAL RESULTS INDICATE NO CONTAMINATION WERE ABOVE THE CONCENTRATION OF CONCERN ESTABLISHED BY THE HUMAN HEALTH RISK ASSESSMENT AT THE SITE.

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 02/25/2015

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

RCRA NonGen / NLR: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR US Hist Auto Stat: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000

Executive Summary

The United States Environmental Protection Agency, National Emission Standards for Hazardous Air Pollutants (US EPA NESHAP), 40 CFR Part 61 - Nov. 20, 1990, requires an owner or operator of a demolition or renovation project to thoroughly inspect the affected facility or part of the facility where the demolition or renovation operation will occur for the presence of asbestos-containing materials (ACM) prior to the commencement of that project.

This inspection report was requested by Ms. Laura Long with Blackburn Engineering.

The purpose of the inspection was to comply with US EPA NESHAP requirements and the Sacramento Metropolitan Air Quality Management District (SMAQMD) which has jurisdiction for this project site to determine if asbestos containing materials are present which may be impacted during an upcoming bridge replacement project. It is our understanding the bridge was constructed beginning in 1910.

The attached drawing(s) show approximate sample locations and also identify those bulk sample materials analyzed and found to contain asbestos greater than 1% with a (+) after the sample number. Materials analyzed and found to contain less than 1% asbestos or reported as none detected have a (-) after each sample number. Individuals who view the sample locations and associated results indicated with either a (-) or a (+) on the drawing to make determinations take the risk of misidentifying a material and may arrive at determinations which are in direct conflict with the written findings of this report. This use of the drawing and the information provided on it relating to individual sample results in determining if a material does or does not contain asbestos is not recommended.

Materials are classified in the tables of this report as regulated asbestos containing material (RACM), Category I (CAT-I) or Category II (CAT-II) ACM, or asbestos containing construction material (ACCM), which included collecting multiple samples of some materials.

This is a summary of the report. The report must be read in its entirety, and the reader must review all the detailed information provided in the body of the report prior to making any interpretations, or conclusions pertaining to the information. Any conclusions made by the reader about the information provided in the body of this report which are contradictory or not included in this report are the responsibility of the reader.

Asbestos

On May 5, 2015, Entek conducted a survey specific to the I Street Bridge and Roadway Approaches. The bridge control house was inaccessible at the time of the survey and was not included in this inspection.

The results of testing for asbestos during this survey indicate asbestos is present in the railing gaskets and the fastener sealants. Specifics pertaining to individual materials can be found in later sections of this report.

Lead

Entek investigated existing paints and applied coatings in an effort to determine if lead was present in these materials. The following paints contain more than 5,000 ppm (0.5%) or 1.0 mg/cm^2 lead and are classified as lead-based paint (LBP):

Silver Paint on Metal - Bridge Structure	36% Lead by weight
Black Paint on Metal - Bridge Structure	11% Lead by weight
White Paint on Metal - North East Approach	2.0% Lead by weight

If more than 100 square feet of these paints are impacted by a “trigger task”, prior notification to Cal/OSHA will be required.

Additionally, the gasket located at the base of the light boxes existing on the northeast approaches was determined by the laboratory to be pure lead. Use precaution when handling this material.

Introduction

This report presents results of an asbestos and lead survey performed by Entek which included all accessible areas of the I Street Bridge structure, located on I Street and spanning the Sacramento River. Also included were the roadway approaches leading to the bridge. The bridge control house was inaccessible and therefore not included in this survey.

I conducted this survey on May 5, 2015. I am a US EPA Asbestos Hazard Emergency Response Act (AHERA)-accredited building inspector, a Cal/OSHA Certified Asbestos Consultant (CAC) and a State of California Department of Public Health (CDPH) certified Lead Inspector/Assessor.

This report was prepared for Ms. Laura Long with Blackburn Engineering.

Structure Description

The I Street Bridge is a two-lane, historic steel truss swing bridge, constructed beginning in 1910. This bridge carries rail and automobile traffic over the Sacramento river between Sacramento and West Sacramento, California. As reported by the West Sacramento Historical Society (attached), the current bridge approach in West Sacramento was constructed in 1959. It is likely that the similar looking approach on the Sacramento side was built at the same time.

Asbestos Inspection and Sample Collection Protocols

Entek included all accessible areas of the I Street Bridge structure, located on I Street and spanning the Sacramento River. Also included were the roadway approaches leading to the bridge. The bridge control house was inaccessible and therefore not included in this survey.

Entek did not use any demolition methods to look within enclosed cavities during this investigation. Entek did include all suspect materials observed in, on, or associated with the

areas included in this report.

Bulk samples were collected of various materials suspected to contain asbestos by utilizing a power drill and coring tube, cutting the materials with a razor knife, or use of other appropriate hand tools.

Miscellaneous materials were collected from each homogenous area in a manner sufficient to determine whether the material is or is not ACM as required in 40 CFR Part 763, Asbestos-Containing Materials in Schools; Final Rule and Notice, published October 30, 1987.

Approximate locations of all samples collected during this inspection are indicated on the "Bulk Asbestos Material Analysis Request Form for Entek", which served as the chain of custody for the samples, and on the diagram attached to this report.

Asbestos Bulk Sample Results

There were several materials observed which are considered "suspect" under US EPA guidelines. Under current US EPA guidelines for conducting inspections for ACM, all "suspect" materials must be assumed to contain asbestos until otherwise determined by laboratory testing.

The samples of materials suspected of containing asbestos were submitted to Asbestech, a laboratory located in Carmichael, California. These samples were subsequently analyzed by polarized light microscopy (PLM) with dispersion staining. Asbestech is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP) for this analysis. Copies of Asbestech's laboratory reports and accreditations are attached.

US EPA NESHAP uses the terms RACM, CAT-I, & CAT-II when identifying materials which contain asbestos in amounts greater than 1%. Cal/OSHA uses the term ACCM which indicates a manufactured construction material contains greater than 0.1% asbestos by weight by the PLM method. This definition can be found in Title 8, 1529.

All samples found to contain <1% asbestos by PLM analysis which are not identified as containing >1% asbestos, classified as RACM, CAT-I, or CAT-II materials in the following results tables were additionally analyzed using the 400 point count (PC) method with analysis by PLM. This additional analysis is required by NESHAP and enforced by SMAQMD. The PC method analysis results were used only to verify a material did not contain >1% asbestos as a single layer material. A result reported as none detected or "trace" by the PC method only verified the initial PLM result of <1% and shall not be used to determine the identified material does not contain asbestos.

Neither OSHA or Cal/OSHA allow for composite sampling of wall system materials, and neither address the use of the PC method to confirm a material identified as containing <1% asbestos by the PLM method either contains <1% asbestos or is non-detected for asbestos. As a result, reporting of the asbestos content related to a composited material such as sheetrock/drywall and joint compound does not apply to determining if a material is or is not an ACM by OSHA or an ACCM by Cal/OSHA.

A total of 14 bulk samples were collected of all the materials considered to be "suspect", and which were observed during this investigation. Some of those samples contained multiple layers which were individually analyzed to determine their asbestos content. Analysis of all samples collected was by PLM with dispersion staining. Results of the analysis are listed in the following tables:

Suspect Materials Found or Known TO Contain >1% Asbestos (CAT-I)				
Sample ID#'s	**Suspect Material**	**Asbestos Content/Type (%) by PLM**	**Location**	**Total Estimated Quantity**
15-3531-02A	Gasket Beneath Rail	80-90% Chrysotile	West Roadway Approach	Approx 180 Square Feet
15-3531-08A	Gasket Beneath Rail	70-80% Chrysotile	Southeast Roadway Approach	Approx 200 Square Feet

NOTE: Any CAT-I or CAT-II materials identified in the previous tables which will be subjected to mechanical removal, must be considered RACM for the purposes of notification to SMAQMD/YSAQMD and classification of waste. Removal of any CAT-I or CAT-II materials prior to demolition of a structure is dependent upon how the materials will be impacted and if the impact will cause the materials to become friable. If any remaining CAT-I or CAT-II materials will become friable they must be removed prior to the initiation of demolition.

Suspect Materials Found or Known TO Contain <1% Asbestos (ACCM)				
Sample ID#'s	**Suspect Material**	**Asbestos Content/Type (%) by PLM/PC**	**Location**	**Total Estimated Quantity (Sq./Ln./Cu. Ft.)**
15-3531-03A	Fastener and Rail Sealant	<1% Chrysotile	West Roadway Approach	Approx 40 Square Feet

NOTE: Cal/OSHA regulates all materials containing greater than 0.1% asbestos. As a result, impact to materials identified as ACCM and ACM must be performed by properly asbestos trained personnel utilizing appropriate personal protection, work practices, as well as, properly constructed and demarcated work areas or containments, in accordance with Cal/OSHA asbestos regulations.

Suspect Materials Found NOT TO Contain Asbestos or Considered Non-Suspect				
Sample ID#'s	**Suspect Material**	**EPA AHERA "Suspected" ACBM**	**Asbestos Content**	**Location**
15-3531-01A, B	Concrete, West Approach	Miscellaneous	None Detected	West Approach
15-3531-04A	Silver Paint	Miscellaneous	None Detected	Bridge

Suspect Materials Found NOT TO Contain Asbestos or Considered Non-Suspect				
Sample ID#'s	**Suspect Material**	**EPA AHERA "Suspected" ACBM**	**Asbestos Content**	**Location**
15-3531-05A, B	Concrete, Bridge	Miscellaneous	None Detected	Bridge
15-3531-06A	Walkway Pavement	Miscellaneous	None Detected	Bridge
15-3531-07A, B	Concrete, Southeast Approach	Miscellaneous	None Detected	Southeast Approach
15-3531-09A, B	Concrete, Northeast Approach	Miscellaneous	None Detected	Northeast Approach
15-3531-10A	Gasket at Light Boxes**	Miscellaneous	None Detected	Northeast Approach

** This material was identified by the laboratory as being pure lead. Use precautions when handling.

US EPA AHERA uses three terms when determining the classification of a material for the purpose of sampling. These terms include miscellaneous, surfacing, and thermal system insulation (TSI).

Miscellaneous materials are building materials on structural components, structural members or fixtures, such as floor and ceiling tiles, and does not include surfacing material or TSI.

Surfacing materials are materials that are sprayed-on, troweled-on, or otherwise applied to surfaces, such as acoustical plaster on ceiling and fireproofing materials on structural members, or other materials on surfaces for acoustical, fireproofing, or other purposes.

TSI is material applied to pipes, fittings, boilers, breeching, tanks, ducts, or other structural components to prevent heat loss or gain, water condensation, or for other purposes.

The information provided in the tables of this report are for use by the Owner in determining where asbestos containing materials are located, and whether or not any future work may impact those materials. The information is also provided for use by any contractor who may perform work in areas impacting the materials listed in this report, and for use as appropriate by asbestos abatement contractors to provide costs related to work impacting ACM.

Any building materials which are considered "suspect" for containing asbestos which have not been identified in this report must be assumed to contain asbestos in amounts >1% until properly investigated and/or tested.

Materials commonly excluded from being suspected for containing asbestos include, but are not limited to: unwrapped pink and yellow fiberglass insulating materials or products, foam

insulation, bare concrete, wood, metal, plastic, or glass. All other types of building materials or coatings on the materials listed above are commonly listed as "suspect" and must be tested prior to impact by a Contractor. Work impacting these untested or newly discovered materials must cease until an investigation can be completed.

Asbestos Regulatory Requirements

US EPA

The property included in this survey report is located in Sacramento and Yolo Counties. Sacramento Metropolitan Air Quality Management District (SMAQMD) has been given authority for enforcement of the NESHAP regulations by means of their own rules (Rule 902 Asbestos). The Yolo Solano Air Quality Management District (YSAQMD) enforces the NESHAP regulations by means of Rule 4.3.

A demolition is the wrecking, taking out, or burning of any load supporting structural member. A renovation is everything else. 10 day written notification to the SMAQMD & YSAQMD is required prior to the performance of any demolition project regardless of asbestos being present or not. This notification would also apply to any renovation project which involves the wrecking, taking out, or burning of any load bearing structural member during a renovation as well.

There is a sufficient amount of ACM present to require a 10 day notification to the SMAQMD & YSAQMD be submitted prior to starting work which will impact materials identified as RACM or CAT-I and CAT-II materials if they are made friable. If more than 160 square feet, 260 linear feet or 35 cubic feet of RACM is planned for removal on the project, formal written notification to SMAQMD & YSAQMD is required.

Cal/OSHA

Disturbance of any ACM or ACCM could generate airborne asbestos fibers and would be regulated by Cal/OSHA. Cal/OSHA worker health and safety regulations apply during any disturbance of ACM or ACCM by a person while in the employ of another. This is true regardless of friability or quantity disturbed. Since it has been estimated more than 100 square feet of ACM does exist and will be impacted during the upcoming project, a licensed asbestos contractor, certified by the State of California, and registered with Cal/OSHA is required to perform the asbestos related removal work. Entek recommends a licensed asbestos contractor be used to remove ACCM even if less than 100 square feet of ACCM is being disturbed.

For compliance with Title 8, Section 341.9, the asbestos contractor must send written notice at least one day (24 hours) prior to start of any work which will impact any amount of asbestos to the local office for the State of California, Department of Occupational Safety and Health, and perform all work in accordance with Cal/OSHA requirements.

Lead Inspection and Sampling

Entek investigated existing paints and applied coatings in an effort to determine if lead was present in these materials.

Lead Sampling Results

A total of 7 bulk samples of the painted surfaces associated with the bridge and approaches were collected and submitted to Asbestech laboratory. These samples were subsequently analyzed by atomic absorption spectrometry (AAS). Results of the analysis are listed in the following tables:

Paints/Coatings/ Materials Determined to be Lead Based Paint (LBP)		
Paint/Coating Color or Material	**Lead Content (ppm / %)**	**Component/Location**
Silver Paint on Metal	360,000 / 36%	Bridge Railings
Black Paint on Metal	110,000 / 11%	Bridge Structure & Supports
White Paint on Metal	20,000 / 2%	Northeast Approach Railings

LBP - Materials/coatings/paints meeting the definition of lead-based paint as defined by the CDPH and the US EPA, currently defined as containing lead in concentrations equal to or greater than 1.0 mg/cm^2, 5,000 ppm, or 0.5% by weight.

Paints/Coatings/Materials Determined NOT TO Contain Lead	
Paint/Coating Color or Material	**Structure Component**
Silver Paint on Metal	Western and Southeast Approach Guardrails (Typical Round Rails on Concrete Berms)
Yellow Roadway Striping	Roadway
White Roadway Striping	Roadway

Paints determined “NOT TO” contain lead for the purposes of this report are those samples which when analyzed did not indicate lead to be present at or above the limit of detection for the analysis method used. This limit of detection was 50 parts per million (ppm). As a result, any paints shown “NOT TO” contain lead will not require any special training or work practices related to lead when impacted.

Lead Regulatory Compliance

Any upcoming project which may result in the disturbance of lead containing products or surfaces, but is not intended to remediate a lead hazard or specifically designed to remove LBP to reduce or eliminate a known hazard, would be considered “lead related construction work”.

Lead related construction work does not fit the classification of a "lead abatement project" under CDPH Title 17 regulations. "*Abatement*" is defined in Title 17, Division 1, Chapter 8, Article 1 as "any set of measures designed to reduce or eliminate lead hazards or LBP for public and residential buildings, but does not include containment or cleaning." A *lead hazard* is defined in Title 17, Division 1, Chapter 8, Article 1 as "deteriorated LBP, lead contaminated dust, lead contaminated soil, disturbing LBP or presumed LBP without containment, or any other nuisance which may result in persistent and quantifiable lead exposure."

Lead related construction work means any "construction, alteration, painting, demolition, salvage, renovation, repair, or maintenance of any residential or public building, including preparation and cleanup, that, by using or disturbing lead-containing material or soil, may result in significant exposure of adults or children to lead". (Title 17, California Code of Regulations, Division 1, Chapter 8, Article 1).

Currently, Cal/OSHA has not established a definition for LBP, nor have they established minimum concentrations where their regulations do not apply. Cal/OSHA regulates all construction activities involving materials containing lead, including LBP. These regulations are found in CCR, Title 8 Section 1532.1 (§1532.1) Lead in Construction.

Since Cal/OSHA has not established a concentration of lead in a product where their regulations do not apply, any disturbance to products containing lead come under the jurisdiction of Cal/OSHA and their regulations. Disturbance of paints/coatings or materials determined to be LBP may trigger a pre-work notification to Cal/OSHA if "trigger tasks" disturb 100 square feet or more of those paints/coatings or materials. Trigger tasks are described in Title 8 CCR 1532.1.

Limitations

Entek included all accessible areas of the I Street Bridge structure, located on I Street and spanning the Sacramento River. Also included were the roadway approaches leading to the bridge. The bridge control house was inaccessible and therefore not included in this survey.

As a result the information provided in this inspection report may not be used to extend the inspection results to areas not included in this report without additional review and sampling as necessary.

Entek did not perform any destructive sampling to look into existing cavities. As a result, it may be possible for materials to be hidden in these areas which are not included in this report. Entek also did not employ any destructive measures, including exterior areas covered with asphalt, concrete, or dirt.

If any new materials not listed as having been sampled, or listed as assumed for containing asbestos in this report are discovered, the new material must be assumed to contain asbestos until properly inspected.

Entek's policy is to retain a full copy of these written documents for three (3) years once the file is closed and final billed. At the end of the three (3) year period the written files will be

destroyed without further notice. It is suggested copies of the file(s) are maintained as per Blackburn Consulting's policy.

In an effort to help our environment, Entek will be providing only this electronic copy of the report and its attachments for your use. However, a hard copy will be provided upon request.

Thank you for choosing Entek for your hazardous materials needs. Please contact me at (916) 632-6800 or by email to jsmith@entekgroup.com if you have any questions regarding this report.

RE: Lead Hazard Evaluation Report (CDPH 8552 - 6/07)

To Whom it May Concern:

In a memorandum issued to all "California Department of Health Services Certified Inspector/Assessors and Project Monitors", by the State of California – Health and Human Services Agency, Department of Health Services (DHS), dated June 5, 2006, and signed by Mr. Paul Fitzmaurice, Chief, Lead Hazard Reduction Section, Childhood Lead Poisoning Prevention Branch, it was made clear that "... the on-site investigation, for compensation, of lead-based paint or lead hazards ..." includes "... conducting testing and/or sampling activities as part of a non- 'abatement' project (e.g. painting, remodeling, etc.)."

As a result of this directive, Entek Consulting Group, Inc. (Entek) is providing you with the current CDPH Form 8552 (6/07) documenting an inspection/assessment performed by Entek.

The investigation results being reported on the attached CDPH Form 8552 do not reflect a "Lead Inspection/Assessment" as defined in Title 17. As a result the "Other" box, in "Section 2 – Type of Lead Hazard Evaluation", is checked. This is being done to make it clear this investigation does not meet the definition of a "Lead Inspection/Assessment", and submission of the attached CDPH Form 8552 is not meant to reflect that it does.

CDPH Form 8552, Section 5 – Results of Lead Hazard Evaluation, does not allow for an appropriate option pertaining to the results of the investigation/assessment performed and being reported (i.e. for the purpose of compliance with Cal/OSHA, Title 8 1532.1. Lead), or an assessment being performed in an unregulated structure. While one of or more of the four boxes is checked to reflect the results of the inspection/assessment. The lead inspection/assessment was not required under Title 17.

This letter is not intended to disagree whether a CDPH Form 8552 must be submitted, but is for clarification as to the information included on the CDPH Form 8552, and its intended purpose, namely to reflect the goal of the services performed by Entek.

Sincerely,

Douglas R. Colley
V.P. Operations

West Sacramento Historical Society Document on the I Street Bridge

accessed on May 13, 2015 via
http://www.westsachistoricalsociety.org/userfiles/File/I%20Street%20Bridges.pdf

History of the I Street Bridge

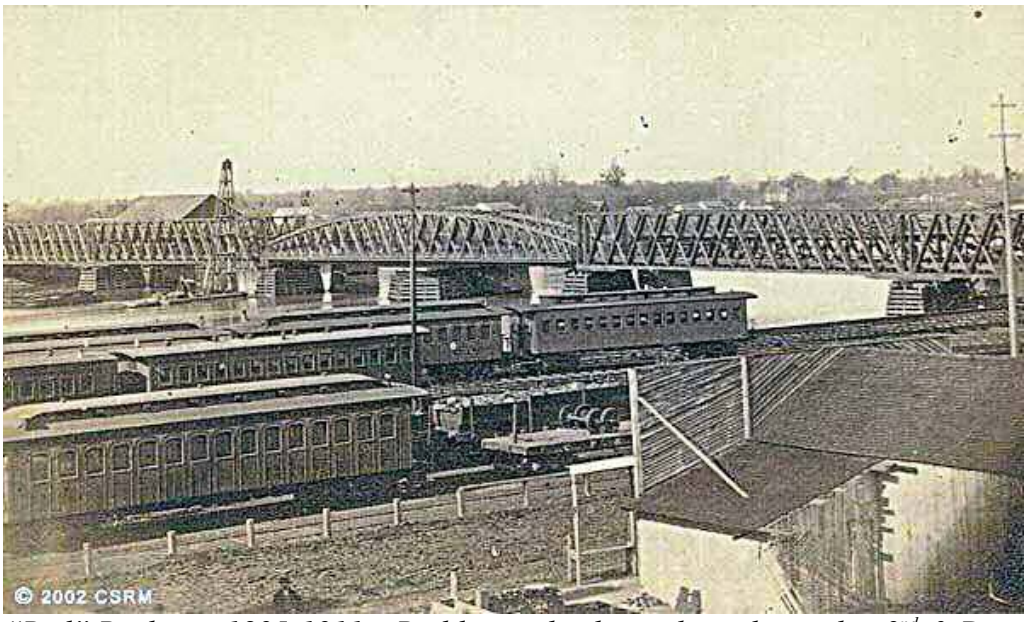
The first bridge across the Sacramento River at Sacramento was authorized by the State Legislature on April 3, 1857. It was a toll bridge of highway traffic only, and extended from Broad Street (now abandoned) Sacramento, to Ann Street (D Street) Washington, Yolo County. It was constructed by the Sacramento and Yolo Bridge Company, and was completed June 27, 1858.

The California Pacific Railroad Company (later consolidated into the Southern Pacific Railroad Company) in 1869 obtained a franchise to build a bridge 400 feet above the highway bridge, constructed by the Sacramento and Yolo Bridge Company, but as the California Pacific Railroad Company desired a location nearer Broad Street (now part of the S.P. Shop grounds at former China Lake), they built under the franchise of the Sacramento and Yolo Bridge Company.

The Sacramento River crossing from Washington was in process of construction December 29th, 1869, the date of the California Pacific consolidation with the SP.
This bridge carried the first railroad rack across the river. Trains entered Sacramento from the west on January 15, 1870. According to a newspaper report dated October 2nd, 1869, "It was the intention to build some 75 feet below the present location so as to pass into I street, but the Central Pacific Railroad Company raised objections, it has been decided to build as near to the old bridge as possible, and across the slough in entering the city." On February 8th 1878 another newspaper reported "Tolls of 1877 amounted to $9, 325, exclusive of railroad toll contract."

The S.P. purchased the bridge from the Sacramento and Yolo Bridge Company in 1878, and rebuilt it the same year, completing it December 5th 1878.

In 1893, the S.P. with the counties of Sacramento and Yolo began the construction of a joint bridge for railroad and highway use, which was completed in 1895 (Red Bridge). This bridge was situated about 300 feet down-stream or south off the present steel joint railroad-highway bridge, and consisted of a substructure of two piled abutments, five piled piers and seven dolphins. The eastern approach was a wooden viaduct for highway purposes. The side of incline was "E" Street in Washington.



"Red" Bridge 1895-1911 Building in backround was located at 2nd & D in Broderick.

Written by Frank Norton of Broderick year unknown (probably ca. 1960). Typed into MS Word document and photos added by Mickey Fausett

This bridge was removed as soon as traffic was routed over the new and present steel structure in 1911.

I St. Bridge ca. 1912 Looking East towards Sacramento (Photo taken from "dogleg" section.)

Because of increased vehicular traffic congestion on the bridge, a new sweeping approach to the Broderick side of the bridge was installed in 1959 by the state highway department. (Note: Present span)

Written by Frank Norton of Broderick year unknown (probably ca. 1960). Typed into MS Word document and photos added by Mickey Fausett

FINAL DRAFT

LOCATION HYDRAULIC STUDY

1. **Location:**

   District: Caltrans District 3
   County: Sacramento and Yolo
   Route: N/A

2. **Geographical References:**

   United States Geological Survey – Topographic Quadrangle, West Sacramento, CA 38°35'22"N 121° 35' 22"W

3. **Name of Stream:**

   Sacramento River

4. **Floodplain Description:**

   According to Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Number 06067C0160J, the I-Street Replacement Bridge traverses Special Flood Hazard Area (SFHA) "Zone AE", associated with the Sacramento River.

   According to FEMA, Zone AE corresponds to the 1% probability of exceedance (i.e. 100-year) floodplain that is determined in the Flood Insurance Study (FIS) by detailed methods.

5. **Description of Project:**

   The proposed project would construct a new bridge over the Sacramento River between the Cities of Sacramento and West Sacramento to replace the vehicle crossing that is currently provided by the existing I-Street Bridge. The bridge would connect C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento.

   The bridge would be approximately 860-foot long, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides. The bridge would include two fixed-span approach structure that tie into the Sacramento and West Sacramento banks of the river. The center span of the bridge would be an approximately 330-foot movable span that meets the United States Coast Guard requirements.

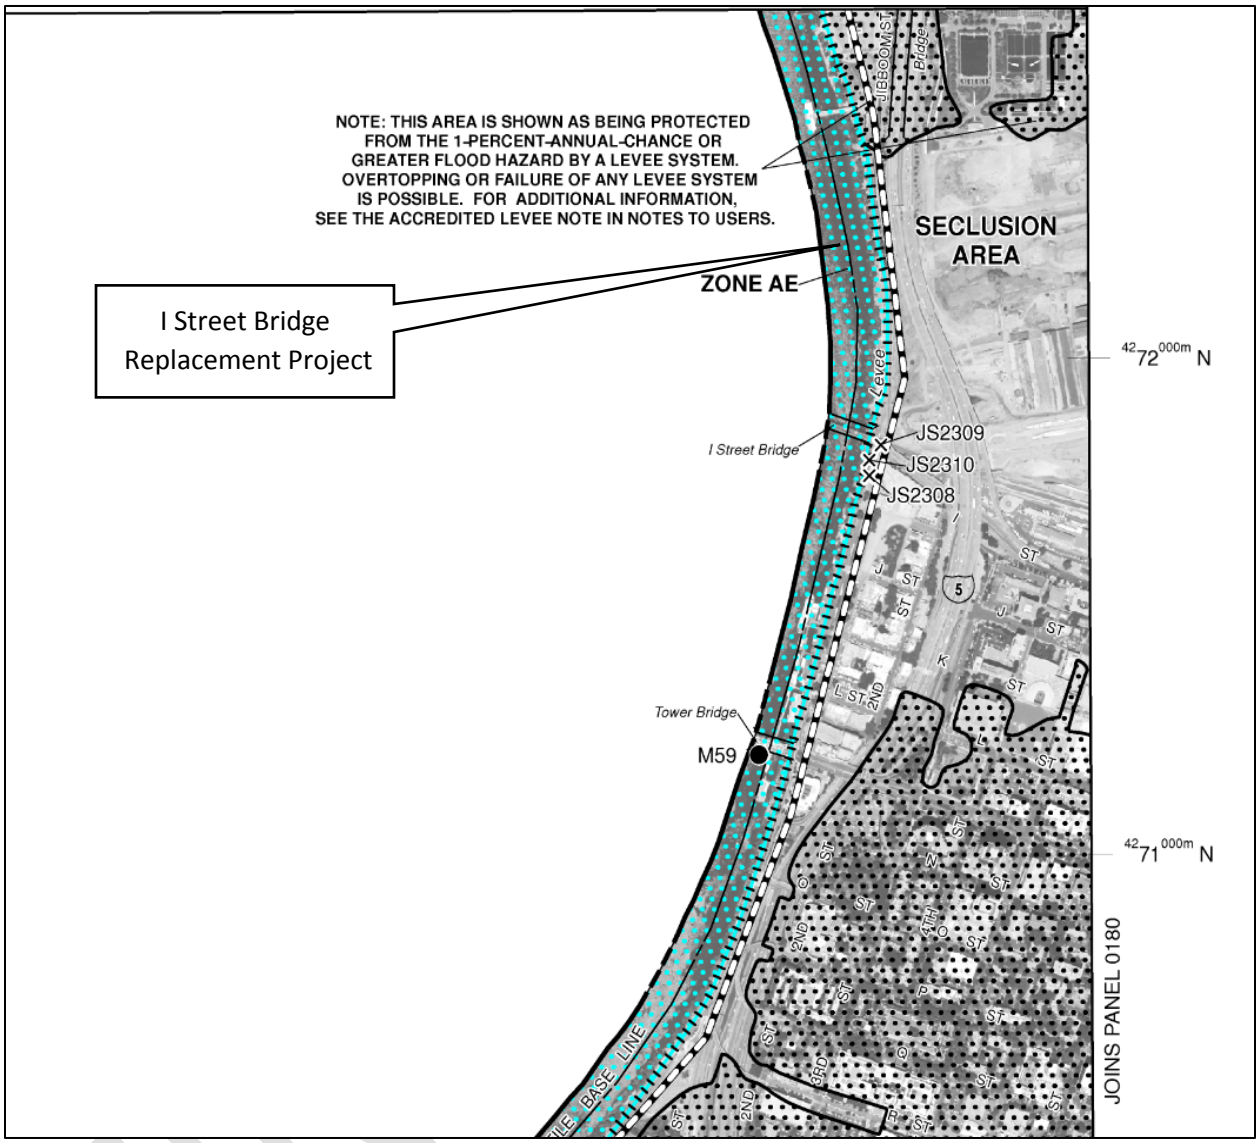
6. **Hydrologic:**

   Base Flood (Q100): Sacramento River – 120,000 cubic feet per second

   Water Surface Elevation for Base Flood: Sacramento River – 33.1 feet NAVD-88

FINAL DRAFT

7. Are National Flood Insurance Program (NFIP) maps and studies available?



Source: FEMA FIRM 06067C0160J, June 16, 2015

Figure 1 I-Street Bridge Replacement Project at Sacramento River (FIRM)

8. Is the highway location alternative within a regulatory floodway?

No. Although a detailed study was performed to establish the base flood elevations, a regulatory floodway was not determined for the Sacramento River.

9. Attach map with flood limits outlined showing all buildings or improvements within the base floodplain.

N/A

10. Base Flood Backwater Potential:

Residences	No
Other Buildings	Yes
Crops	No
Natural and Beneficial Floodplain Values	No

11. Traffic:

Current Average Daily Traffic (ADT)	12,730
Projected ADT (2040)	33,030
Emergency Supply or Evacuation Route	Yes
Emergency Vehicle Access	Yes
Practicable Detour Available	Yes
School Bus or Mail Route	Yes

12. Estimated duration of traffic interruption for base flood (Q100):

No traffic interruption is expected due to the base flood because the California Central Valley Flood Protection Board, California Code of Regulations Title 23, requires new bridge construction be designed with a minimum of 3 feet of freeboard, above the Sacramento River Flood Control Project Design (Design) floodplain. The Design floodplain at the project is 33.7 feet NAVD88, which is greater than the FEMA base flood elevation of 33.1 feet NAVD88.

13. Estimated value of base flood (Q100) flood damages:

There are no significant impacts to the existing floodplain, and no anticipated flood damages, because of the Project.
Roadway: $0
Property: $0
Total: $0

14. Assessment of Level of Risk:

Low

Floodplain Description:

According to Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Number 06067C0160J, the I-Street Replacement Bridge traverses Special Flood Hazard Area (SFHA) "Zone AE" associated with the Sacramento River.

According to FEMA, Zone AE corresponds to the 1% probability of exceedance (i.e. 100-year) floodplain that is determined in the Flood Insurance Study (FIS) by detailed methods.

1. **Description of Proposal:**

   The proposed project would construct a new bridge over the Sacramento River between the Cities of Sacramento and West Sacramento to replace the vehicle crossing that is currently provided by the existing I-Street Bridge. The bridge would connect C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento.

   The bridge would be approximately 860-foot long, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides. The bridge would include two fixed-span approach structure that tie into the Sacramento and West Sacramento banks of the river. The center span of the bridge would be an approximately 330-foot movable span that meets the USCG requirements.

Summary

S.1 Project Description

The City of Sacramento, in cooperation with the City of West Sacramento and the California Department of Transportation (Caltrans), proposes to construct a new bridge over the Sacramento River to replace the vehicle crossing that is currently accommodated by the existing I Street Bridge in order to remove a series of functionally obsolete or structurally deficient bridges (i.e., approach structures). The new connection also would reduce future traffic congestion, improve operations and safety, serve multiple modes of transportation, and comply with current American Association of State Highway and Transportation Officials, Caltrans, and local agency design standards.

One alignment is proposed for the new bridge over the Sacramento River. A new approximately 860-foot bridge, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides, is proposed. The bridge would include two fixed-span approach structures, approximately 200 feet and 270 feet in length, that tie into the Sacramento and West Sacramento banks of the river, respectively. The center span of the bridge would be an approximately 330-foot movable span that meets the USCG requirements. Roadway improvements on Railyards Boulevard in Sacramento and C Street in West Sacramento also are proposed. In both Sacramento and West Sacramento, two alternatives for portions of the roadway design are being considered.

- City of Sacramento Railyards Boulevard/Jibboom Street/Bercut Drive Intersection
  - Alternative 1—Signalized Intersection at Jibboom Street and Bercut Drive
  - Alternative 2—Roundabout Intersection at Jibboom Street and Bercut Drive

In the City of Sacramento, Alternative 1 consists of a signalized intersection at Jibboom Street and Bercut Drive, while Alternative 2 consists of a roundabout between these two intersections. Beyond the Jibboom Street and Bercut Drive intersections, the remaining project elements and limits in the City of Sacramento are similar under both alternatives.

- City of West Sacramento Residential Access
  - Alternative 1—C Street Connection to B Street
  - Alternative 2—C Street Connection to 3rd Street

In the City of West Sacramento, the proposed C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. Two alternatives are proposed for maintaining access to these parcels. Alternative 1 would construct a new connection to C Street, approximately 150 feet east of the C Street/3rd Street intersection,

that would extend north to B Street and then ultimately connect to the 3rd Street/B Street intersection. Alternative 2 would connect to the same location at C Street as Alternative 1, approximately 150 feet east of the C Street/3rd Street intersection, but would continue north approximately 300 feet, then make a 90-degree left turn, and connect to 3rd Street approximately 300 feet north of C Street.

S.2 Project Purpose and Need

The purpose of the project is to construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento. The project is needed in order to remove a series of functionally obsolete or structurally deficient bridges, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.

S.3 Summary of Impact on Natural Communities of Special Concern

Three types of natural communities of special concern were identified and mapped in the biological study area (BSA), including cottonwood riparian forest, riparian forest/shrub wetland, and perennial stream (Sacramento River). Riparian forest/shrub wetland and perennial stream also are considered waters of the United States and waters of the state. The temporary and permanent impacts on natural communities of special concern are summarized in Table S-1.

Table S-1. Permanent and Temporary Impacts on Land Cover Types in the Biological Study Area[a]

	Proposed Project with West Sacramento Residential Access Alternative 1[a]		Proposed Project with West Sacramento Residential Access Alternative 2[a]	
Land Cover Type	**Permanent and Indirect Impact Area (acres)**	**Temporary Impact Area (acres)**	**Permanent and Indirect Impact Area (acres)**	**Temporary Impact Area (acres)**
Cottonwood riparian forest[b]	2.49	1.93	1.45	1.66
Riparian forest/shrub wetland[b]	0.07	0.11	0	0
Perennial drainage[b]	1.85	0.10	1.85	0.10
Ruderal woodland	2.01	1.70	2.01	1.70
Landscaped	0.63	0.70	0.54	0.63
Developed/graded	8.18	6.55	7.70	6.36
Total	**15.23**	**11.09**	**13.55**	**10.45**

[a] There are no differences in impact acreage as a result of the City of Sacramento roadway design alternatives.
[b] These are natural communities of special concern.

S.4 Summary of Impacts on Special-Status Species

S.4.1 Special-Status Plants

The proposed project would not have the potential to affect special-status plant species based on the negative results of appropriately timed botanical surveys, the absence of suitable microhabitat (i.e., soil types), and species' elevation range requirements that are substantially higher than the elevation of the BSA.

S.4.2 Special-Status Wildlife

The following potential impacts on special-status wildlife species could result from project construction.

- All alternatives would result in direct effects to five elderberry shrubs that represent habitat for the valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) (a species federally listed as threatened), which also could result in injury to or mortality of beetles.
- Western pond turtles (*Emys marmorata*) (a California species of special concern) could be injured or killed by construction equipment and activities under all alternatives. Construction noise or activity could disturb turtles or cause them to avoid the BSA.
- All alternatives could result in the potential loss or disturbance of nesting Swainson's hawks (*Buteo swainsoni*) (a species state listed as threatened) and white-tailed kite (*Elanus leucurus*) (a species fully protected by the California Fish and Game Code) from construction noise and activity, if nesting in or near the BSA.
- All alternatives would result in the loss of nesting habitat for purple martin (*Progne subis*) (designated as a California species of special concern) on the approach structure leading from the I Street Bridge east to J Street.
- Construction activities under all alternatives, such as approach structure removal, tree removal and trimming, and construction noise and vibrations, could result in direct effects on western red bat and pallid bat (designated as California species of special concern), including the destruction of active roosts, loss of roosting habitat, loss of individuals, or roost failure.

S.4.3 Special-Status Fish

The following potential impacts on special-status fish species could result from project construction:

- Potential adverse effects on Sacramento River winter-run Chinook salmon (*Oncorhynchus tshawytscha*), Central Valley spring-run Chinook salmon (*O. tshawytscha*), Central Valley fall/late fall–run Chinook salmon (*O. tshawytscha*), Central Valley steelhead (*O. mykiss*), North American green sturgeon (*Acipenser medirostris*), Delta smelt (*Hypomesus*

transpacificus), longfin smelt (*Spirinchus thaleichthys*), Sacramento splittail (*Pogonichthys macrolepidotus*), and river lamprey (*Lampetra ayresii*) from underwater noise produced by pile driving and other in-water activities, increased turbidity and sedimentation, and potential discharges of contaminants.

- Temporary loss of aquatic habitat (substrate and water column) during construction for all fish species from temporary trestle piles and cofferdams (i.e., up to 4,197 square feet [0.095 acre] of substrate habitat and up to 77,213 cubic feet of water column habitat below the ordinary high water mark [OHWM]).
- Permanent loss of aquatic habitat (substrate and water column) for all fish species equal to the cumulative substrate area and water column habitat removed and displaced, respectively, from installing the new bridge piers (piers 2–5), rock slope protection (RSP), and piles for the new bridge fender system (i.e., up to 80,449 square feet [1.85 acre] of bank and substrate habitat and up to 32,650 cubic feet of water column habitat below the OHWM).
- Permanent loss of up to 890 linear feet of shaded riverine aquatic (SRA) cover vegetation (up to 513 linear feet on the City of Sacramento side of the Sacramento River and up to 377 linear feet on the City of West Sacramento side of the Sacramento River).
- Creation of approximately 55,000 square feet (1.26 acre) of permanent over-water structure (shade) on the Sacramento River where no over-water structure currently exists.
- Temporary adverse effects on designated critical habitat for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, North American green sturgeon, and Delta smelt from underwater noise, temporary impacts on aquatic habitat (substrate and water column) associated with temporary trestle piles and cofferdam installation and removal, temporary water quality impacts on the water column during in-water construction, net permanent adverse effects on the channel substrate and water column from new bridge piers, and net permanent gain in overwater structure (shade) on aquatic habitat in the Sacramento River.
- Potential temporary and permanent adverse effects on Essential Fish Habitat for Pacific salmon (Chinook salmon) from underwater noise, temporary impacts on aquatic habitat (substrate and water column) associated with temporary trestle piles and cofferdam installation and removal, temporary water quality impacts on the water column during in-water construction, net permanent adverse effects on the channel substrate and water column from new bridge piers, and net permanent gain in overwater structure (shade) on aquatic habitat in the Sacramento River.

S.5 Other Protected and Managed Biological Resources

S.5.1 Migratory Birds

All alternatives could result in the potential loss or disturbance of migratory birds from construction noise and activity, if nesting in or near the BSA.

S.5.2 Bats

Construction activities under all alternatives, such as approach structure removal, tree removal and trimming, and construction noise and vibrations, could result in direct effects on roosting bats, including the destruction of active roosts, loss of roosting habitat, loss of individuals, or roost failure.

S.5.3 Protected Trees

Under all alternatives, the proposed project would result in the removal of up to 93 trees that meet the criteria for the City of Sacramento Heritage Tree Ordinance or the City of West Sacramento Tree Preservation Ordinance.

S.5.4 Invasive Plants

The proposed project has the potential to introduce and spread invasive plant species to uninfected areas within and adjacent to the BSA. This would be of particular concern for natural communities of special concern, where non-native invasive plants could outcompete and replace native vegetation.

S.6 Permits Required

The following applicable federal and state permits and approvals could be required before construction of the proposed project. [1]

- Endangered Species Act Section 7: Consultation and Incidental Take Statement (USFWS and NMFS)
- Executive Order 11990: Protection of Wetlands (USFWS)
- Executive Order 12962: Recreational Fisheries (NOAA/NMFS)
- Executive Order 13112: Prevention and Control of Invasive Species (USFWS)
- Executive Order 13186: Migratory Bird Treaty Act (USFWS)
- Magnuson-Stevens Fishery Conservation and Management Act (NMFS)
- Clean Water Act Section 404: Permit for Placement of Fill (USACE)
- Clean Water Act Section 401: Water Quality Certification (Central Valley RWQCB)

[1] CDFW = California Department of Fish and Wildlife, NMFS = National Marine Fisheries Service, NOAA = National Oceanic and Atmospheric Administration, RWQCB = Regional Water Quality Control Board, SLC = State Lands Commission, USACE = U.S. Army Corps of Engineers, USCG = U.S. Coast Guard, USFWS = U.S. Fish and Wildlife Service

- Rivers and Harbors Act of 1899 Section 10: Permit for Work in Navigable Waters (USACE)
- Rivers and Harbors Act of 1899 Section 9 and General Bridge Act of 1946: Bridge permit (USGC)
- California Endangered Species Act Incidental Take Permit (possible) (CDFW)
- California Fish and Game Code Section 1602: Streambed Alteration Agreement (CDFW)
- California Fish and Game Code Sections 3503 and 3503.5: Birds and Raptors (CDFW)
- California Fish and Game Code Section 3513: Migratory Birds (CDFW)
- California Fish and Game Code Sections 3511, 4700, 5050, and 5515: Fully Protected Species (CDFW)
- California Code of Regulations Title 2 § 2002: Land Use Lease (SLC)
- City of West Sacramento Tree Permit

S.7 Mitigation Agreements

As part of the proposed project, the project proponent or their contractor will implement the avoidance, minimization, and compensation measures listed below (described in more detail in Chapter 4). These measures have been identified on the basis of natural resources that are present in, or have the potential to occur in or near, the BSA and the potential impacts that could result from the proposed project.

- Measure 1: Install Orange Construction Fencing between the Construction Area and Adjacent Sensitive Biological Resources
- Measure 2: Conduct Environmental Awareness Training for Construction Employees
- Measure 3: Conduct Periodic Biological Monitoring
- Measure 4: Compensate for Temporary Effects to and Permanent Loss of Cottonwood Riparian Forest (including SRA Cover)
- Measure 5: Protect Water Quality and Prevent Erosion and Sedimentation in Drainages and Wetlands
- Measure 6: Compensate for Permanent Loss of Riparian Forest/Shrub Wetland
- Measure 7: Compensate for Loss of Perennial Stream
- Measure 8: Avoid and Minimize Impacts on Valley Elderberry Longhorn Beetle
- Measure 9: Transplant Elderberry Shrubs That Cannot Be Avoided
- Measure 10: Compensate for Impacts on Valley Elderberry Longhorn Beetle Habitat
- Measure 11: Conduct Preconstruction Surveys for Western Pond Turtle and Allow Turtles to Leave Work Area Unharmed
- Measure 12: Conduct Focused Surveys for Nesting Swainson’s Hawk prior to Construction
- Measure 13: Conduct Tree Removal during Non-Sensitive Periods for Wildlife

- Measure 14: Monitor Active Swainson's Hawk Nests during Pile Driving and other Construction Activities
- Measure 15: Conduct Preconstruction Surveys for Nesting Migratory Birds, Including Special-Status Birds, and Establish Protective Buffers
- Measure 16: Avoid and Minimize Impacts on Purple Martins during Construction Activities
- Measure 17: Avoid and Minimize Impacts on Nesting Birds and Roosting Bats from Demolition of Approach Structures
- Measure 18: Create Purple Martin Replacement Habitat
- Measure 19: Implement a Monitoring and Management Plan for Purple Martins
- Measure 20: Conduct Preconstruction Surveys for Roosting Bats and Implement Protective Measures
- Measure 21: Replace Bat Roosting Habitat Lost from Demolition of Approach Structures
- Measure 22: Monitor Bat Replacement Habitat
- Measure 23: Conduct All In-Water Construction Activities between May 1 and November 30 and during Daylight Hours Only
- Measure 24: Implement Measures to Minimize Exceedance of Interim Threshold Sound Levels during Pile Driving
- Measure 25: Develop and Implement a Hydroacoustic Monitoring Plan
- Measure 26: Monitor Turbidity in the Sacramento River
- Measure 27: Implement Cofferdam Restrictions
- Measure 28: Prepare and Implement a Fish Rescue and Relocation Plan
- Measure 29: Prevent the Spread or Introduction of Aquatic Invasive Species
- Measure 30: Minimize or Avoid Temporary Construction Lighting and Permanent Bridge Lighting from Directly Radiating on Water Surfaces of the Sacramento River
- Measure 31: Purchase Channel Enhancement Credits for Impacts on Critical Habitat
- Measure 32: Compensate for Loss of Protected Trees not in Riparian Habitat
- Measure 33: Avoid the Introduction and Spread of Invasive Plants

Chapter 1 Introduction

The City of Sacramento, in cooperation with the City of West Sacramento and the California Department of Transportation (Caltrans), proposes to construct a new bridge over the Sacramento River to replace the vehicle crossing that is currently accommodated by the existing I Street Bridge in order to remove a series of functionally obsolete or structurally deficient bridges (i.e., approach structures). The new connection also would reduce future traffic congestion, improve operations and safety, serve multiple modes of transportation, and comply with current American Association of State Highway and Transportation Officials, Caltrans, and local agency design standards.

The project is subject to state and federal environmental review requirements because of use of federal Highway Bridge Program (HBP) funds from the Federal Highway Administration (FHWA). Accordingly, project documentation is being prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The City of Sacramento is the lead agency under CEQA, with the City of West Sacramento as a responsible agency, and Caltrans is the lead agency under NEPA. The FHWA's other responsibilities for environmental review, consultation, and any other action required in accordance with applicable federal laws for this project will be carried out by Caltrans under its assumption of responsibility pursuant to 23 U.S. Code (USC) 327.

This project is included in the Sacramento Area Council of Governments (SACOG) 2035 *Metropolitan Transportation Plan/Sustainable Communities Strategy* (MTP/SCS).

The proposed project is located over the Sacramento River between the cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge (Figure 1-1). The project limits starting within the City of Sacramento consist of Railyards Boulevard from 200 feet east of Bercut Drive on the east, continuing west over the Sacramento River into the City of West Sacramento along C Street, and terminating approximately 100 feet west of the 5th Street intersection. The project limits also extend along Bercut Drive approximately 500 feet north of Railyards Boulevard, along Jibboom Street 550 feet north of Railyards Boulevard and 300 feet south of Railyards Boulevard, along 3rd Street 50 feet north and south of C Street, along 4th Street 50 feet north and south of C Street, and along 5th Street 50 feet north and south of C Street. The total length of the project is approximately 0.42 mile along C Street and Railyards Boulevard.

1.1 Project History

1.1.1 Purpose and need

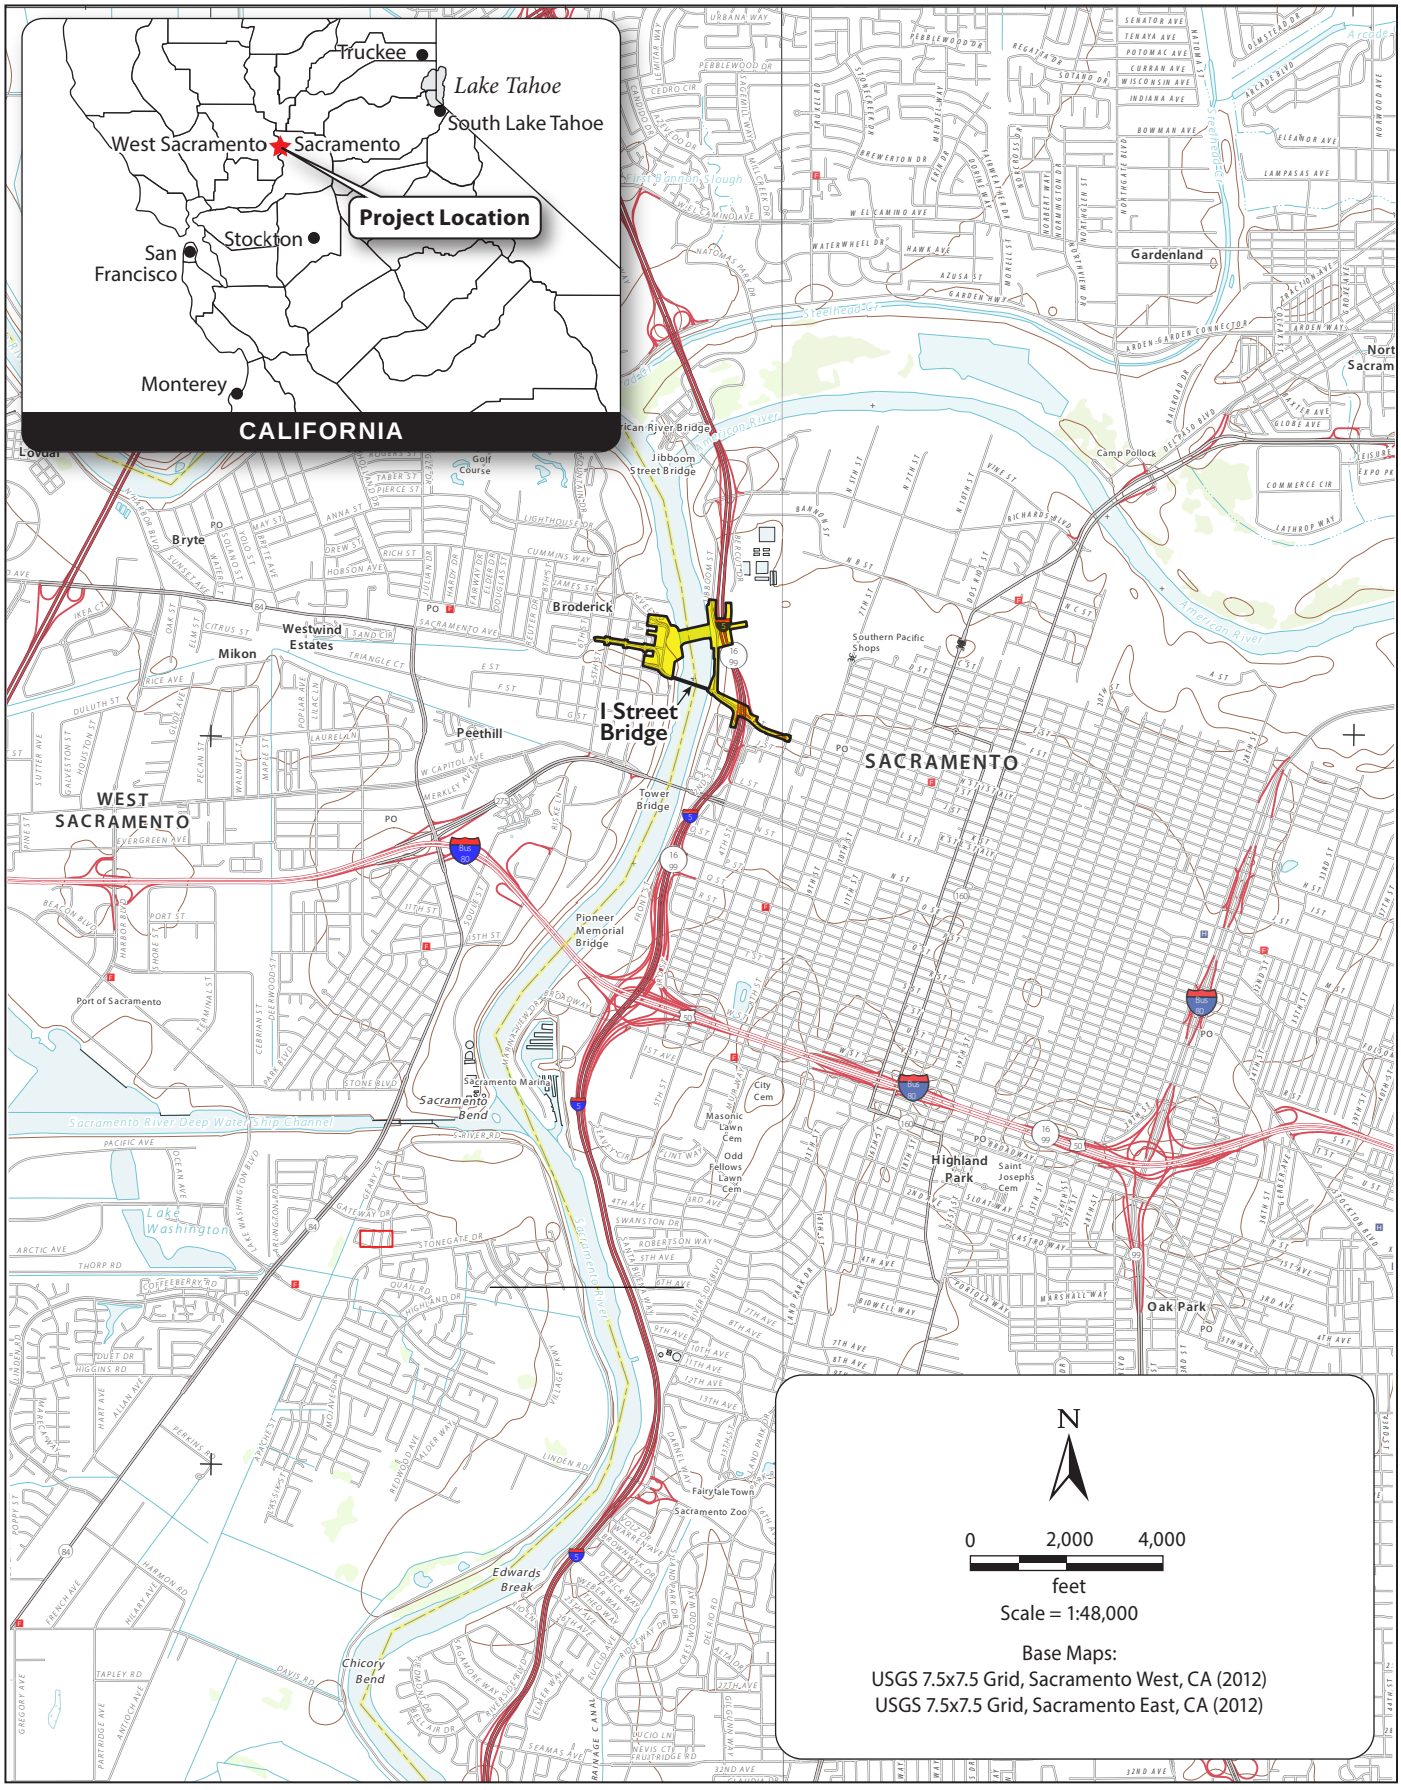
The proposed project would construct a new bridge over the Sacramento River between the cities of Sacramento and West Sacramento to replace the vehicle crossing that is currently provided by the existing I Street Bridge. Construction of the proposed project has independent utility; the project is not dependent on other projects or improvements to meet the purpose and need.

Termini for the proposed project were developed through an iterative process involving engineering design and traffic operations analysis. Preliminary design concepts were tested with the traffic operations analysis model to evaluate how lane configurations influenced peak-hour conditions.

1.1.1.1 Purpose

The purpose and objectives of the project are listed below.

- The project should construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.
- The new bridge should meet the requirements of the Neighborhood Friendly Bridge definition that the City of Sacramento City Council adopted by resolution on October 18, 2011, which is defined by the following elements.
  - A facility whose primary function is local connectivity rather than regional travel and primarily serves short local trips.
  - A bridge which serves all users, including motorists, bicyclists, pedestrians, low energy vehicles, and public transit riders.
  - A bridge with aesthetics and dimensions which are architecturally pleasing and contextually appropriate for the adjacent neighborhoods.
  - A bridge that does not exceed or expand the already-planned capacity of the approach roadways (i.e., no widening of approaches just to accommodate bridge flows).
  - A facility which is designed with a target speed equal to or less than the approach roadways.
  - A bridge which reduces the growth in vehicle miles traveled in the adjacent communities.
  - A bridge that does not connect directly to streets which are primarily residential in character.



Graphics ... 00203.14 (6/19/15) AB

Figure 1-1
Vicinity Map

  - A bridge that is consistent with the Need and Purpose statement [the adopted Sacramento River Crossings Alternatives Study statement] as articulated.
- In addition to the Neighborhood Friendly Bridge definition, the project should include pedestrian and bicycle facilities in the new public crossing that meet Americans with Disabilities Act (ADA) requirements, and facilitate connections to and from the new crossing and the Sacramento River Parkway and Riverfront Park trails.
- The proposed project also would need to construct a movable bridge that satisfies the vertical clearance and river navigation requirements of the U.S. Coast Guard (USCG).
- The project design should not preclude future addition of a streetcar, a separate, stand-alone project being developed by the Cities of West Sacramento and Sacramento.
- The new bridge also is intended to improve the connectivity to, and accessibility of, businesses, recreational areas, and new or redevelopment opportunity sites located in the urban core of Sacramento and West Sacramento.

1.1.1.2 Need

The project is needed for the following reasons.

- The existing I Street Bridge does not fully comply with current design and traffic operation standards due to the following conditions.
  - I Street Bridge limits or restricts traffic capacity and multimodal use. The current bridge width is not sufficient to provide adequate traffic operations, bicycle lanes, or the ability for transit service across the bridge.
  - The I Street Bridge and the four associated approach structures are on the federal eligible bridge list for federal funds for replacement and/or rehabilitation through the HBP. The I Street Bridge has been classified as functionally obsolete, and the existing approach structures have been classified as structurally deficient. The Cities of Sacramento and West Sacramento have decided to pursue replacement through the HBP.
- As adopted by the Sacramento City Council, new crossings of the Sacramento River between the City of Sacramento and City of West Sacramento shall be Neighborhood Friendly. In coordination with staff from the City of West Sacramento and SACOG, the definition for a Neighborhood Friendly Bridge was developed by the City of Sacramento and the Sacramento City Council adopted the definition by resolution in October 2011. The replacement bridge structure is required to be consistent with the Neighborhood Friendly Bridge definition.
- In addition to the Neighborhood Friendly Bridge requirements, lack of ADA compliance, non-standard and non-continuous sidewalks, and lack of bicycle facilities discourage walking and bicycling on the existing I Street Bridge.

- Section 9 of the Rivers and Harbors Act requires any local, state, or federal agency planning to construct a bridge over a navigable waterway to apply for a bridge permit through the USCG. The USCG requires the new bridge to meet or exceed the existing vertical clearance along the river, which is currently set by the US 50 Pioneer Bridge. In order to comply with the Neighborhood Friendly Bridge definition and meet the USCG requirements for navigation clearance, the new bridge will need to be movable.
- The SACOG MTP/SCS identifies that a proposed streetcar will cross over the new bridge from Sacramento to West Sacramento. While the streetcar will be a separate, stand-alone project, the bridge design must not preclude the future addition of a streetcar.
- Limited connectivity to the riverfront reduces the potential to achieve planned urban development and redevelopment of opportunity sites identified in the adopted plans of Sacramento and West Sacramento.

1.2 Project Description

This section describes the proposed action and the design alternatives that were developed to meet the identified need through accomplishing the defined purpose(s), while avoiding or minimizing environmental impacts. The alternatives under consideration are one bridge alignment for the new bridge over the Sacramento River and two alternatives for portions of the roadway design in Sacramento and in West Sacramento.

- City of Sacramento Railyards Boulevard/Jibboom Street/Bercut Drive Intersection
  - Alternative 1—Signalized Intersection at Jibboom Street and Bercut Drive
  - Alternative 2—Roundabout Intersection at Jibboom Street and Bercut Drive
- City of West Sacramento Residential Access
  - Alternative 1—C Street Connection to B Street
  - Alternative 2—C Street Connection to 3rd Street
- No-Build (No-Project) Alternative

The proposed project is located in Sacramento and Yolo Counties, over the Sacramento River and between the Cities of Sacramento and West Sacramento, and approximately 1,000 feet north of the existing I Street Bridge (Figure 1-1). The total length of the project is approximately 0.42 mile along C Street and Railyards Boulevard. The purpose of the project is to construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento in order to remove a series of functionally obsolete or structurally deficient bridges, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.

1.2.1 Build Alternatives

One alignment is proposed for the new bridge over the Sacramento River. A new approximately 860-foot bridge, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides, is proposed. The bridge would include two fixed-span approach structures, approximately 200 feet and 270 feet in length, that tie into the Sacramento and West Sacramento banks of the river, respectively. The center span of the bridge would be an approximately 330-foot movable span that meets the USCG requirements. Roadway improvements on Railyards Boulevard in Sacramento and C Street in West Sacramento also are proposed. In both Sacramento and West Sacramento, two alternatives for portions of the roadway design are being considered. Figure 1-2 depicts the proposed project and the roadway design alternatives, described below.

- City of Sacramento Railyards Boulevard/Jibboom Street/Bercut Drive Intersection
  - Alternative 1—Signalized Intersection at Jibboom Street and Bercut Drive
  - Alternative 2—Roundabout Intersection at Jibboom Street and Bercut Drive

In the City of Sacramento, Alternative 1 consists of a signalized intersection at Jibboom Street and Bercut Drive, while Alternative 2 consists of a roundabout between these two intersections. Beyond the Jibboom Street and Bercut Drive intersections, the remaining project elements and limits in the City of Sacramento are similar under both alternatives.

- City of West Sacramento Residential Access
  - Alternative 1—C Street Connection to B Street
  - Alternative 2—C Street Connection to 3rd Street

In the City of West Sacramento, the proposed C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. Two alternatives are proposed for maintaining access to these parcels. Alternative 1 would construct a new connection to C Street, approximately 150 feet east of the C Street/3rd Street intersection, that would extend north to B Street and then ultimately connect to the 3rd Street/B Street intersection. Alternative 2 would connect to the same location at C Street as Alternative 1, approximately 150 feet east of the C Street/3rd Street intersection, but would continue north approximately 300 feet, then make a 90-degree left turn, and connect to 3rd Street approximately 300 feet north of C Street.

1.2.1.1 Common Design Features of the Build Alternatives

The proposed project would construct a new bridge over the Sacramento River between Sacramento and West Sacramento to replace the vehicular crossing that is provided by the existing I Street Bridge. The project would facilitate vehicular and multimodal traffic over the river in order to reduce traffic congestion, improve safety, and remove a number of structurally

deficient or functionally obsolete bridges that have reached the limit of their design life. While the existing I Street Bridge over the Sacramento River would remain in-place, the approach structures leading up to the bridge from both directions would be demolished. See Figure 1-2 for a depiction of the project limits and the approach structures that would be removed.

The Sacramento River is considered to be a navigable waterway of the United States. Under the provisions of the General Bridge Act of 1946, as amended, the USCG must approve proposed location and plans for bridges over navigable waters of the United States prior to commencing construction. In order to comply with the adopted Neighborhood Friendly Bridge definition and the USCG requirement to maintain navigation along the river, the new bridge is proposed to be a movable bridge.

Common design features of the build alternatives are listed below.

New Bridge Construction and Roadway Modifications

Bridge Construction

The proposed project would construct a new bridge over the Sacramento River. The total bridge length would be approximately 860 feet long, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides of the bridge. The bridge would include two fixed-span approach structures that tie into the Sacramento and West Sacramento banks of the river and are approximately 200 feet and 270 feet in length, respectively (see Figure 1-3). The center span of the bridge would be a movable span that meets the USCG requirements. The movable span is anticipated to be approximately 330 feet in length. The bridge soffit elevation would be set 3 feet above the 200-year water surface elevation to comply with the Central Valley Flood Protection Board (CVFPB) freeboard requirements.

The two fixed-span approach structures would be 72 feet wide, with a superstructure depth (or total bridge thickness) of approximately 6 feet. Each approach structure would be a two-span bridge. The abutment at one end of the structure would be constructed on the banks of the river, a center pier would be placed within the river approximately around the existing bank toe of slope, and the other end of the approach structure would be constructed on the piers for the movable span.

Based on coordination with the USCG, the movable span would provide a 278-foot clear channel opening approximately centered at the middle of the river. As such, the movable span has been identified as a vertical lift bridge, which would raise the bridge to a minimum vertical clearance of 59 feet over the maximum river elevation of 31 feet (measured to the NGVD 29 vertical datum). The truss depth of the movable span would be approximately 40 feet, with 6 feet of the structure being below the bridge deck and 34 feet above the bridge deck. The vertical towers

Figure 1-3
Proposed I Street Bridge: Plan View, Profile, and Elevation

would be approximately 130 feet tall, measured from the bridge soffit elevation. The vertical towers would be approximately 33 feet in thickness and the same width as the bridge deck. The total bridge width on the movable span would be 81 feet.

Due to the existing soil conditions, the bridge would be constructed on deep pile foundations. The abutments for the fixed-span approach structures at the river bank would consist of approximately 50 piles per abutment that are driven or cast-in-drill-hole (CIDH), to a depth of approximately 70 feet below the original ground elevation. The center piers for the two fixed-span approach structures (located approximately at the bank toe of slope in the river, below the ordinary high water mark) would consist of 50 driven or CIDH piles per pier that are approximately 70 feet below the original ground elevation. If driven piles are selected for either the abutments or piers, the piles would be precast concrete or steel. The foundations for the movable span would consist of four large-diameter cast-in-steel-shell piles per pier. Each pile would be 9 feet in diameter, extending approximately 140 feet below the original ground elevation.

Erosion control measures would be installed around the proposed bridge foundations to prevent future scour at the bridge supports. It is anticipated that rock slope protection (RSP) would be installed around the bridge abutments and piers within the water to control erosion.

A bridge fender system also is planned around the movable span piers to protect the piers from errant watercrafts that are navigating along the river. The fender system would include approximately 30 driven concrete or wooden piles around each of the movable span piers. The piles would be driven to a depth of approximately 30 feet below the original ground elevation.

Temporary Falsework

Temporary falsework platforms (trestles) would be required to construct the proposed bridge foundations and approach structures. The platforms would be constructed during the first construction season using temporary piles within the river. Each temporary platform would include approximately 80 driven steel piles; the piles would be either 16-inch diameter or 16-inch H piles. Once installed, the temporary trestle piles would remain in the river throughout the duration of construction and would be removed in the second construction season following completion of construction. In addition, temporary cofferdams would be required to construct the bridge piers within the water. The cofferdams would consist of temporary sheet piles installed around the individual piers. The sheet piles would be installed and removed with a vibratory hammer. Dewatering inside the cofferdams would be required.

Bridge Construction Sequence

Figure 1-4 shows the sequencing of construction activities. All in-water work would be conducted between May 1 and November 30 during the two construction seasons. This schedule is intended to reduce the number of construction seasons to construct the bridge.

Roadway Modifications

City of Sacramento

In Sacramento, Bercut Drive would be modified from Railyards Boulevard north approximately 500 feet. Bercut Drive would be designed to have two northbound lanes at the Railyards Boulevard intersection, tapering down to one northbound lane at the northern project limits, and one southbound lane. Improvements to Bercut Drive south of Railyards Boulevard are not part of, nor needed for, the proposed project and would be constructed if needed as part of a separate future project.

Proposed improvements on Jibboom Street would extend 550 feet north of Railyards Boulevard. The roadway would consist of one travel lane in each direction, on-street Class II bike lanes, sidewalk along the west side of the roadway, and retaining walls of various heights along both sides of the road. Extension of Jibboom Street south of Railyards Boulevard is not included with, nor needed for, the proposed project and would be constructed if needed as part of a separate future project.

The proposed roadway profile for Railyards Boulevard would be approximately 6 feet higher than the original ground elevation at the Jibboom Street intersection. The profile adjustment is needed in order to satisfy the CVFPB requirements to provide 3 feet of clearance between the 200-year-flood water surface elevation and the bridge soffit (or low chord of the bridge).

City of West Sacramento

Between the bridge touchdown location along C Street in West Sacramento and the 4th Street/ C Street intersection, the roadway would consist of one westbound travel lane, two eastbound travel lanes (the two eastbound travel lanes would taper down to one eastbound lane east of the 3rd Street intersection), a center left-turn lane, on-street Class II bike lanes, on-street parking along the north side of the roadway, and sidewalks along both sides of the roadway. As the roadway through this section currently consists of the proposed number of travel lanes, the widening through this area is primarily needed to support the Class II bike lanes and wider sidewalks.

Along C Street between 4th Street and 5th Street, the roadway would consist of one travel lane in each direction, left-turn lanes, on-street Class II bike lanes, and sidewalks along both sides of the

Figure 1-4
Construction Schedule

road. All of the improvements through this section would be accommodated within the existing roadway limits.

Class I Bikeway and Levee Modifications and Improvements

City of Sacramento

The existing Class I Sacramento River Parkway along Jibboom Street would be reconstructed approximately 500 feet north and 300 feet south of Railyards Boulevard as part of the proposed project. In order to maintain a continuous off-street Class I path along this section, the path would be grade-separated under the proposed bridge structure. Cyclists and pedestrians approaching Railyards Boulevard in either direction would have the option to continue along the path under the new structure, avoiding the need to cross the roadway. Cyclists and pedestrians who are traveling along the path also would have the option to connect to Railyards Boulevard and cross over the proposed bridge into West Sacramento or turn east into Sacramento. Due to the limited horizontal clearance between the river and the Interstate 5 (I-5) viaduct structure, retaining walls would be needed along the path to account for the vertical elevation difference between Jibboom Street and the path that continues under the proposed bridge structure. The maximum retaining wall height along the bike path would be 16 feet.

City of West Sacramento

The proposed project would require improvements to the existing levee along the West Sacramento side of the river, where the proposed bridge alignment would connect to C Street. The existing levee does not meet current standards required by Title 23 of the California Code of Regulations (CCR). Extending approximately 300 feet north and south of the proposed C Street alignment, the levee cross-section would be reconstructed to meet current design standards, which would require 3:1 side slopes on the landside and waterside of the levee, and a 20-foot-wide crown at the top of the levee. The levee improvements also would include a slurry cutoff wall extending to a depth of 110 feet below the original ground elevation. In addition, the proposed roadway profile would be approximately 6 feet higher than the original ground elevation as it crosses over the levee. In order to maintain access to the levee for inspection and maintenance services, access roads would be constructed from the new roadway to the top of the improved levee section. The proposed grading for the levee would require relocation of the existing water tower that is located along 2nd Street, just north of the proposed C Street alignment. The tower would be relocated to the northwest, approximately 43 feet from its existing location.

The new levee maintenance road also would serve as the future Class I River Walk Park trail extension in West Sacramento. Similar to the trail improvements proposed as part of the project in Sacramento, the trail would be grade-separated under the proposed bridge structure. Cyclists

and pedestrians approaching C Street in either direction would have the option to continue along the trail under the new structure, avoiding the need to cross the roadway. Cyclists and pedestrians who are traveling along the trail also would have the option to connect to C Street to cross over the proposed bridge into Sacramento or head west on C Street.

Storm Water Drainage Management

Drainage for the proposed roadway would be conveyed to the existing storm drain system installed within Railyards Boulevard and C Street. Railyards Boulevard currently drains storm water to the east along the roadway and then into a retention basin south of Railyards Boulevard. C Street drains storm water west along the roadway and then ultimately south beyond the project limits.

As is standard with all construction projects, the contractor would be required to install temporary best management practices (BMPs) to control any runoff or erosion from the project site into the surrounding waterways. These temporary BMPs would be installed prior to any construction operations and would be in place for the duration of the contract. The removal of these BMPs would be the final operation, along with project site cleanup.

Structure Demolition and Roadway Modifications

Following completion of the new bridge connections at Railyards Boulevard and C Street, traffic would be diverted to the new bridge, and the four existing approach structures to the I Street Bridge would be removed. Bridge numbers 24C0364L, 24C0364R, 22-0033, and 22C0154 would be demolished and the foundations would be removed to a depth of 3 feet below the original ground elevation. Encroachment permits from Caltrans and Union Pacific Railroad would be needed to complete the bridge removal. The existing I Street Bridge is owned and operated by Union Pacific Railroad and would continue to remain in-place and used by trains following construction of the new bridge.

As part of the removal of the existing approach structures, the project would include modifications to I Street within the City of Sacramento from the southbound I-5 on-ramp east to the 5th Street intersection. The modification would include signing and striping revisions, demolition of existing roadway sections that are no longer required, and removal of bridge abutments and foundations.

Staging, Storage, and Proposed Access during Construction

Two staging areas would be used to store materials and equipment during construction, such as pipe materials, precast manholes and drop inlets, steel girders, piles, and rebar, along with the construction equipment when not in use. One area would be located south of Railyards Boulevard under I-5 in Sacramento; the other area would be located west of the landward side of

the levee, south of the new bridge location in West Sacramento. The staging area located along Railyards Boulevard would be accessed via the existing intersection at Jibboom Street. The staging area in West Sacramento would be accessed via the existing 2nd Street connection at 3rd Street, south of C Street. The staging areas would be in use throughout the construction duration; the areas would be returned to their pre-project conditions at the completion of the project.

Utility Relocations

A number of public and private utilities would need to be relocated or adjusted to grade as part of the project, including existing water, sewer, gas, electric, and communication facilities within Jibboom Street, Bercut Drive, C Street, and 2nd Street.

Traffic Management and Detours during Construction

While most of the project would be constructed outside of existing roadways, some areas would require temporary detours or staged construction.

Along Jibboom Street at the proposed Railyards Boulevard intersection, the new roadway profile would be raised approximately 6 feet above the original ground elevation. To maintain access to the existing Jibboom Street viaduct south of Railyards Boulevard during the roadway construction, a temporary access road would be needed. The proposed temporary access road would connect to the existing Jibboom Street viaduct abutment approximately 350 feet south of Railyards Boulevard. The temporary road would then continue under I-5 and connect to the Railyards Boulevard/Bercut Drive intersection. The temporary road would require placement of temporary fill material and a roadway structural section that would be removed after construction of the new bridge. Traffic traveling north along Jibboom Street would continue north along Bercut Drive to access the Richards Boulevard/I-5 interchange.

In order to complete the improvements at Jibboom Street and Railyards Boulevard, Jibboom Street would be closed to traffic approximately 600 feet north of Railyards Boulevard. Traffic traveling south along Jibboom Street to continue over the existing I Street Bridge into West Sacramento would be detoured over to Bercut Drive at Richards Boulevard. Traffic would then use the temporary access road to connect to the Jibboom Street viaduct structure. The temporary access road would be in place for approximately 2 years, after which traffic would use the new roadways and new bridge.

The Sacramento River Parkway trail along Jibboom Street also would require temporary re-routing during construction. The temporary alignment for the trail would follow the temporary Jibboom Street alignment south of Railyards Boulevard. Cyclists and pedestrians would then continue following a detour north along Bercut Drive to Richards Boulevard, where they could

then connect back to the Parkway on the west side of I-5. The detour would be in place for approximately 2 years.

During construction, traffic along C Street would be maintained along the existing approach structure until the new bridge is constructed.

Project Construction Sequence

New bridge and roadway construction would occur first, followed by demolition of the four approach structures that connect to the existing I Street Bridge. Once the new bridge and roadways are constructed, traffic would be diverted to the new bridge in order to allow demolition adjacent to the existing bridge. Construction of the project is expected to take approximately 30 months.

Property Acquisition

The project would require temporary and permanent property acquisitions along C Street, 3rd Street, and 2nd Street within the City of West Sacramento and along Railyards Boulevard, Jibboom Street, Bercut Drive, and I Street within the City of Sacramento.

Along C Street, temporary and permanent acquisitions would be required along the south side of the roadway to accommodate the construction of standard shoulders, bike lanes, and sidewalks—from the intersection of 4th Street to the Sacramento River.

Along 3rd Street and 2nd Street, temporary and permanent acquisitions would be needed from the Union Pacific Railroad on the south, to just north of the B Street intersections, for construction of the proposed roadway and levee improvements.

Along Railyards Boulevard, Jibboom Street, and Bercut Drive, temporary and permanent acquisition would be needed from the current state-owned right-of-way for I-5, for construction of the roadway. In addition, temporary and permanent acquisitions would be needed along Jibboom Street for the proposed temporary detour road and Class I bikeway improvements.

Temporary acquisition would be required along the existing I Street connection to facilitate removal of the existing viaduct structures. Due to the limited space available in Old Sacramento, it is anticipated that construction activities would occur from the parking lot at the intermodal station.

1.2.1.2 Unique Features of Build Alternatives

In both the City of Sacramento and the City of West Sacramento, two alternatives for portions of the roadway design are being considered.

City of Sacramento Railyards Boulevard/Jibboom Street/Bercut Drive Intersection

Alternative 1 consists of a signalized intersection at Jibboom Street and Bercut Drive, while Alternative 2 consists of a roundabout between these two intersections. Beyond the Jibboom Street and Bercut Drive intersections, the remaining project elements and limits are similar under both alternatives.

Alternative 1—Signalized Intersection at Jibboom Street and Bercut Drive

Under Alternative 1, Railyards Boulevard would be extended west over the Sacramento River; east of Bercut Drive. Railyards Boulevard would consist of two westbound lanes and one eastbound lane. Between Jibboom Street and Bercut Drive, Railyards Boulevard would consist of two westbound lanes and three eastbound lanes; two eastbound lanes would be trapped into left-turn lanes onto Bercut Drive, and one eastbound lane would continue along Railyards Boulevard. West of the Jibboom Street intersection, Railyards Boulevard would consist of one lane in each direction.

Alternative 2—Roundabout Intersection at Jibboom Street and Bercut Drive

Under Alternative 2, Railyards Boulevard would be extended west over the Sacramento River. East of Bercut Drive, Railyards Boulevard would consist of two westbound lanes and one eastbound lane. Between Jibboom Street and Bercut Drive, Railyards Boulevard would consist of a roundabout with two lanes in each direction. One westbound lane would be a trap onto northbound Jibboom Street, and one westbound lane would continue onto the new bridge. One eastbound lane would be trapped into left-turn lanes onto Bercut Drive, and one eastbound lane would continue along Railyards Boulevard. West of Jibboom Street, Railyards Boulevard would consist of one lane in each direction.

City of West Sacramento Residential Access

The new C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. Two alternatives are proposed for maintaining access to these parcels.

Alternative 1—C Street Connection to B Street

Alternative 1 would construct a new connection to C Street approximately 150 feet east of the 3rd Street intersection. The new access road would be 30 feet wide, extend north to B Street, and then ultimately connect to the 3rd Street/B Street intersection. This alternative would require right-of-way acquisitions from six individual parcels and removal of two structures. One structure is located on APN 010-101-010 and appears to be an individual residence. Another structure is located on APN 010-101-013 and appears to be an apartment building that supports up to four individual apartments. As B Street currently is constructed along the existing levee, the roadway improvements also would require an additional 500 feet of improvements to the levee. Similar to the improvements identified along C Street, the levee cross-section would be

reconstructed to meet current design standards, which require 3:1 side slopes on the landside and waterside of the levee, with a 20-foot-wide crown at the top of the levee. The levee improvements also would include a slurry cutoff wall that extends to a depth of 110 feet below the original ground elevation.

Alternative 2—C Street Connection to 3rd Street

Alternative 2 would connect to the same location at C Street, approximately 150 feet east of the 3rd Street intersection and continue north approximately 300 feet. This alternative would then make a 90-degree left turn and connect to 3rd Street approximately 300 feet north of C Street. This alternative would require right-of-way acquisition from seven individual parcels and removal of three structures. One structure is located on APN 010-101-010 and appears to be an individual residence. Another structure is located on APN 010-101-013 and appears to be an apartment building that supports up to one individual apartment. The last structure is located on APN 010-101-004 and appears to be an individual residence.

1.2.2 No Build (No Project) Alternative

Under the No Build Alternative, the existing I Street Bridge would remain in use for vehicle, bicycle, and pedestrian access between the Cities of Sacramento and West Sacramento. No changes to traffic patterns on I Street or C Street would occur. The four approach structures would remain in place and in use; and there would be no changes to existing roadways, levees or Class I bikeways.

Improvements and development of transportation infrastructure would continue following the General Plans of both cities, the Sacramento Railyards Specific Plan (approved December 2007), and the Washington Specific Plan (adopted May 1996). The Sacramento Railyards Specific Plan identifies the extension of Railyards Boulevard west to a Tee intersection at Jibboom Street. Railyards Boulevard at Bercut Drive would consist of two westbound lanes and one eastbound lane. The same number of lanes on Railyards Boulevard would extend west to the intersection with Jibboom Street; at this point, the left westbound lane on Railyards Boulevard would become a dedicated left-turn onto southbound Jibboom Street, and the right westbound lane would be a dedicated right-turn onto northbound Jibboom Street.

In West Sacramento, future changes to C Street would be based on the Washington Specific Plan, which identifies 12-foot-wide sidewalks and 7-foot-wide Class II bike lanes along the roadway. The connection to the I Street Bridge would not change.

Chapter 2 Study Methods

This chapter describes the regulatory requirements that are relevant to biological resources and the methods used to identify special-status species and their habitats, sensitive natural communities, and waters of the United States and State (including wetlands) in the biological study area (BSA). The BSA includes all areas of proposed permanent and temporary impacts, as well as the area under I-5 and adjacent to the proposed removal of roadway approach structures in the City of Sacramento and parcels adjacent to some of the proposed road improvements in the City of West Sacramento.

2.1 Regulatory Requirements

This section summarizes the federal and state regulations that protect special-status species; waters of the United States (which also are considered waters of the State), including wetlands; and sensitive habitats. This section also discusses pertinent local general plan policies and ordinances related to the protection and preservation of biological resources.

2.1.1 Federal Regulations

2.1.1.1 Federal Endangered Species Act

The federal Endangered Species Act (ESA) of 1973, and subsequent amendments, provides regulations for the conservation of endangered and threatened species and the ecosystems on which they depend. The U.S. Fish and Wildlife Service (USFWS) (with jurisdiction over plants, wildlife, and resident fish) and the National Marine Fisheries Service (NMFS) (with jurisdiction over anadromous fish and marine fish and mammals) oversee the ESA. Section 7 of the ESA mandates all federal agencies to consult with USFWS and NMFS if they determine that a proposed project may affect a listed species or destroy or adversely modify designated critical habitat. Section 7 requirements do not apply to nonfederal actions. A Clean Water Act (CWA) Section 404 permit from the U.S. Army Corps of Engineers (USACE) will be required for project construction. Consequently, consultation under Section 7 for effects to federally listed species will be required. Under Section 7, the federal lead agency must obtain incidental take authorization or a letter of concurrence stating that the proposed project is not likely to adversely affect federally listed species.

Section 9 of the ESA prohibits the take of any fish or wildlife species listed as endangered, including the destruction of habitat that prevents the species' recovery. *Take* is defined as any action or attempt to hunt, harm, harass, pursue, shoot, wound, capture, kill, trap, or collect a species. Section 9 prohibitions also apply to threatened species unless a special rule has been defined with regard to take at the time of listing. Under Section 9 of the ESA, the take

prohibition applies only to wildlife and fish species. However, Section 9 does prohibit the unlawful removal and possession, or malicious damage or destruction, of any endangered plant from federal land. Section 9 prohibits acts to remove, cut, dig up, damage, or destroy an endangered plant species in nonfederal areas in knowing violation of any state law or in the course of criminal trespass. Candidate species and species that are proposed for or under petition for listing receive no protection under Section 9.

Federally listed species identified as having the potential to occur in the BSA for the proposed project include valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), Sacramento River winter-run Chinook salmon (*Oncorhynchus tshawytscha*), Central Valley spring-run Chinook salmon (*O. tshawytscha*), Central Valley steelhead (*O. mykiss*), North American green sturgeon (*Acipenser medirostris*), and delta smelt (*Hypomesus transpacificus*). In addition, designated critical habitat for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, North American green sturgeon, and delta smelt occurs in the BSA. These species and designated critical habitat are discussed in Chapter 4.

2.1.1.2 Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Management and Conservation Act (MSA), as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267), requires federal agencies to consult with NMFS on activities that may adversely affect essential fish habitat (EFH). The purpose of the MSA is to conserve and manage the fishery resources of the United States and to promote protection of EFH. *EFH* is the aquatic habitat necessary for fish to spawn, breed, feed, or grow to maturity that will allow a level of production needed to support a long-term, sustainable commercial fishery and contribute to a healthy ecosystem (Pacific Fishery Management Council 2003). Important components of EFH include substrate, water quality, water quantity, depth, velocity, channel gradient and stability, food, cover, habitat complexity, space, access and passage, and habitat connectivity. EFH is described for Pacific salmon fisheries (specifically Chinook salmon) in Chapter 4. The MSA requires the following.

- Federal agencies undertaking, permitting, or funding an activity that may adversely affect EFH are required to consult with NMFS.
- NMFS is required to provide conservation recommendations for any federal or state activity that may adversely affect EFH.
- Within 30 days of receiving conservation recommendations from NMFS, federal agencies must provide a detailed response in writing to NMFS regarding the conservation recommendations (the response must include a description of measures proposed by the

agency for avoiding, mitigating, or offsetting the impact of the activity on EFH, or reasons for not following the recommendations).

An EFH assessment will be prepared for NMFS jointly with a Biological Assessment (BA) to address potential effects on Pacific salmon fisheries (specifically, Chinook salmon).

2.1.1.3 Executive Order 11990: Protection of Wetlands

Executive Order (EO) 11990, signed May 24, 1977, directs all federal agencies to refrain from assisting in or giving financial support to projects that encroach on publicly or privately owned wetlands. It further requires that federal agencies support a policy to minimize the destruction, loss, or degradation of wetlands. A project that encroaches on wetlands may not be undertaken unless the agency has determined that (1) there are no practicable alternatives to such construction; (2) the project includes all practicable measures to minimize harm to wetlands that would be affected by the project; and (3) the impact will be minor.

The proposed project would affect wetlands; therefore, federal agencies are required to consider this EO prior to issuing permits. Potential project effects to wetlands are discussed in Chapter 4.

2.1.1.4 Executive Order 12962: Recreational Fisheries

EO 12962, signed June 7, 1995, and amended by EO 13474 on September 26, 2008, directs all federal agencies to improve the quantity, function, sustainable productivity, and distribution of U.S. aquatic resources for increased recreational fishing opportunities—to the extent permitted by law and where practicable. This EO requires evaluation and documentation in NEPA analyses of the effects caused by federally funded, permitted, or authorized actions on aquatic systems, fishing access, and recreational fisheries.

The proposed project may reduce the abundance of fish in the BSA; therefore, federal agencies are required to consider this EO prior to issuing permits. Measures identified in Chapter 4 will avoid, minimize, or compensate for project effects to fish and fish habitat.

2.1.1.5 Executive Order 13112: Prevention and Control of Invasive Species

EO 13112, signed February 3, 1999, directs all federal agencies to prevent and control the introduction of invasive species in a cost-effective and environmentally sound manner. The EO established the National Invasive Species Council (NISC), which is composed of federal agencies and departments, and a supporting Invasive Species Advisory Committee (ISAC) composed of state, local, and private entities. In 2008, NISC released an updated national invasive species management plan (National Invasive Species Council 2008) that recommends objectives and measures to implement the EO and to prevent the introduction and spread of invasive species. The EO requires consideration of invasive species in NEPA analyses, including

their identification and distribution, their potential impacts, and measures to prevent or eradicate them.

The proposed project may introduce or spread invasive species into the BSA; therefore, federal agencies are required to consider this EO prior to issuing permits. Measures identified in Chapter 4 will avoid or minimize the introduction and spread of invasive species as a result of project activities.

2.1.1.6 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) protects migratory bird species from take. Under the MBTA, *take* is defined as to (or attempt to) pursue, hunt, shoot, capture, collect, or kill (50 Code of Federal Regulations [CFR] 10.12). The definition differentiates between intentional take (take that is the purpose of the activity in question) and unintentional take (take that results from, but is not the purpose of, the activity in question). EO 13186, signed January 10, 2001, directs each federal agency taking actions that would, or likely would, negatively affect migratory bird populations to work with USFWS to develop a memorandum of understanding (MOU) to promote the conservation of migratory bird populations. Protocols developed under the MOU must include the following agency responsibilities.

- Avoid and minimize, to the extent practicable, adverse impacts on migratory bird resources when conducting agency actions.
- Restore and enhance habitat of migratory birds, as practicable.
- Prevent or abate the pollution or detrimental alteration of the environment for the benefit of migratory birds, as practicable.

The EO is designed to assist federal agencies in their efforts to comply with the MBTA; it does not constitute any legal authorization to take migratory birds. Migratory birds could nest in the BSA. The discussion of nesting migratory birds in Chapter 4 describes potential project impacts on migratory birds and measures to avoid or minimize impacts on those species.

2.1.1.7 Clean Water Act

The CWA was passed by Congress in 1972 with a broad mandate "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." The chief purpose of the CWA is to establish the basic structure for regulating discharges of pollutants into waters of the United States. The CWA authorizes the U.S. Environmental Protection Agency (EPA) to set national water quality standards and effluent limitations, and includes programs addressing both point-source and nonpoint-source pollution. *Point-source pollution* is pollution that originates or enters surface waters at a single, discrete location, such as an outfall structure or an excavation or construction site. *Nonpoint-source pollution* originates over a broader area and includes urban contaminants in storm water runoff and sediment loading from upstream areas. The CWA

operates on the principle that all discharges into the nation's waters are unlawful unless specifically authorized by a permit; permit review is the CWA's primary regulatory tool. Aquatic resources (i.e., channelized features, wetlands) are present in the BSA and may be regulated under CWA Section 404 (described below).

Section 401: Water Quality Certification

Under CWA Section 401, applicants for a federal license or permit to conduct activities that may result in the discharge of a pollutant into waters of the United States must apply for water quality certification from the State. Therefore, all projects with a federal component that may affect state water quality (including projects that require federal agency approval, such as a Section 404 permit) must comply with CWA Section 401. Aquatic resources that appear to qualify as waters of the United States are present in the BSA.

As currently designed, roadway and bridge construction associated with the proposed project is expected to result in a discharge of pollutants into waters of the United States; therefore, a Section 401 water quality certification from the Central Valley Regional Water Control Board (RWQCB) would likely be required for the proposed project.

Section 402: Permits for Stormwater Discharge

CWA Section 402 regulates construction-related storm water discharges to surface waters through the National Pollutant Discharge Elimination System (NPDES) program, administered by EPA. In California, the State Water Resources Control Board (State Water Board) is authorized by EPA to oversee the NPDES program through the RWQCB.

NPDES permits are required for projects that disturb more than 1 acre of land. The NPDES permitting process requires the applicant to file a public notice of intent to discharge storm water and to prepare and implement a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP must include a site map, a description of proposed construction activities, and the BMPs that will be implemented to prevent soil erosion and discharge of other construction-related pollutants (e.g., petroleum products, solvents, paints, and cement) that could contaminate nearby water resources. Permittees are required to conduct annual monitoring and reporting to ensure that BMPs are correctly implemented and effective in controlling the discharge of storm water-related pollutants. Because the proposed project would disturb more than 1 acre of land, the project proponent will prepare a SWPPP and apply for an NPDES permit.

Section 404: Permits for Fill Placement in Waters of the United States (Including Wetlands)

Waters of the United States (including wetlands) are protected under Section 404 of the CWA. Any activity that involves a discharge of dredged or fill material into waters of the United States,

including wetlands, is subject to regulation by the USACE. *Waters of the United States* is defined to encompass navigable waters of the United States; interstate waters; all other waters where their use, degradation, or destruction could affect interstate or foreign commerce; tributaries of any of these waters; and wetlands that meet any of these criteria or are adjacent to any of these waters or their tributaries. *Wetlands* are defined under Section 404 as those areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Jurisdictional wetlands must meet three wetland delineation criteria.

- They support hydrophytic vegetation (i.e., plants that grow in saturated soil).
- They have hydric soil types (i.e., soils that are wet or moist enough to develop anaerobic conditions).
- They have wetland hydrology.

As currently designed, roadway and bridge construction associated with the proposed project is expected to result in a discharge of fill material into potential waters of the United States; therefore, a Section 404 CWA permit likely will be required for the proposed project. A delineation of waters of the United States has been completed for the project and is contained in Appendix A of this NES. The wetland delineation report will be submitted to the USACE to support a preliminary jurisdictional determination for the project.

Rivers and Harbors Appropriation Act of 1899

The River and Harbors Appropriation Act of 1899 (RHA) addresses activities that involve the construction of dams, bridges, dikes, and other structures across any navigable water. Placing obstructions to navigation outside established federal lines and excavating from or depositing material in such waters require permits from the USACE. The Sacramento River is a navigable water subject to the requirements of the RHA.

Section 9 and the General Bridge Act of 1946

Section 9 (33 USC 403) of the RHA and the General Bridge Act of 1946 require that the location and plans of bridges and causeways across navigable waters be submitted to and approved by the Secretary of Homeland Security prior to their construction. Under the authority of these acts, the USCG regulates the placement of bridges across navigable waters, such as the Sacramento River. Construction of the proposed bridge will require a bridge permit from the USCG District 11.

Section 10

Section 10 (33 USC 403) of the RHA prohibits the unauthorized obstruction or alteration of any navigable water of the United States. Under Section 10, a permit is required for work or

structures in, over, or under navigable waters of the United States. Construction of the proposed bridge will require a Section 10 permit from the USACE.

2.1.2 State Regulations

2.1.2.1 California Endangered Species Act

The California Endangered Species Act (CESA) (California Fish and Game Code [CFGC] Section 2050 et seq.) establishes state policy to conserve, protect, restore, and enhance threatened or endangered species and their habitats. CESA mandates that state agencies should not approve projects that jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available that would avoid jeopardy. For projects that would affect a species on the federal and state lists, compliance with ESA satisfies CESA if the California Department of Fish and Wildlife (CDFW) determines that the federal incidental take authorization is consistent with CESA under CFGC Section 2080.1 (consistency determination). Consistency determinations allow an applicant who has obtained a federal incidental take statement (Section 7 consultation) or a federal Section 10(a) incidental take permit to submit the federal incidental take statement or permit to the CDFW Director for a determination as to whether the federal document is "consistent" with CESA. However, consistency determinations can be used only for species that are listed under both the federal ESA and CESA, and cannot be applied to species that are listed by the state but are not federally listed. For projects that would result in take of a species that is only state listed, the project proponent must apply for a take permit under Section 2081(b). Five state-listed species—Swainson's hawk (*Buteo swainsoni*), Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, delta smelt, and longfin smelt (*Spirinchus thaleichthys*)—are known or have the potential to occur in the BSA and be affected by the proposed project (Swainson's hawk and longfin smelt are only state listed). Chapter 4 describes potential project-related impacts and identifies avoidance and minimization measures that will avoid direct impacts and minimize indirect impacts on these species. Because CDFW's Bay Delta Region is no longer issuing consistency determinations and two species (Swainson's hawk and longfin smelt) are only state listed, a Section 2081 Incidental Take Permit Application will be prepared to address the potential for take of Swainson's hawk, Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, delta smelt, and longfin smelt.

2.1.2.2 California Environmental Quality Act

CEQA is the regulatory framework by which California public agencies identify and mitigate significant environmental impacts. A project normally is considered to cause a significant environmental impact on biological resources if it would substantially affect a rare or endangered species or the habitat of that species; substantially interfere with the movement of resident or

migratory fish or wildlife; or substantially diminish habitat for fish, wildlife, or plants. The State CEQA Guidelines define *rare, threatened, and endangered species* as those listed under the ESA and CESA and any other species that meets the criteria of the resource agencies or local agencies (e.g., CDFW-designated species of special concern). The State CEQA Guidelines state that the lead agency preparing an Environmental Impact Report (EIR) must consult with and receive written findings from CDFW concerning project impacts on species listed as endangered or threatened. The impacts of a proposed project on these resources are important in determining whether the project would result in significant environmental impacts under CEQA. The project proponent will be preparing an EIR to comply with the State CEQA Guidelines.

2.1.2.3 California Native Plant Protection Act

The California Native Plant Protection Act (CNPPA) of 1977 prohibits importation of rare and endangered plants into California, take of rare and endangered plants, and sale of rare and endangered plants. CESA defers to the CNPPA, which ensures that state-listed plant species are protected when state agencies are involved in projects subject to CEQA. In this case, plants listed as rare under the CNPPA are not protected under CESA but rather under CEQA. Three special-status plant species known to occur in the project region (i.e., within a 10-mile radius of the BSA) are listed as rare under the CNPPA. None of these species were observed in the BSA during the field surveys. Chapters 3 and 4 discuss the potential for special-status plants to occur in the BSA.

2.1.2.4 California Fish and Game Code

Several sections of the CFGC apply to the proposed project, as described below.

Lake or Streambed Alteration (Section 1602)

CDFW regulates activities that would interfere with the natural flow of—or substantially alter the channel, bed, or bank of—a lake, river, or stream, including disturbance of riparian vegetation, under CFGC Sections 1600–1616. CDFW requires a Lake or Streambed Alteration Agreement (LSAA) permit for these activities. Requirements to protect the integrity of biological resources and water quality often are conditions of LSAAs. CDFW may establish conditions that include avoiding or minimizing vegetation removal, using standard erosion control measures, limiting the use of heavy equipment, limiting work periods to avoid impacts on fisheries and wildlife resources, and restoring degraded sites or compensating for permanent habitat losses. Waters of the State (i.e., perennial, ephemeral, and intermittent streams) that would be regulated by CDFW are present in the BSA.

The proposed project is expected to result in modification of the bed, bank, or channel of a stream and removal of riparian vegetation adjacent to a stream; therefore, a LSAA will be required.

Protection of Birds and Raptors (Sections 3503 and 3503.5)

Section 3503 of the CFGC prohibits killing of birds and destruction of bird nests. Section 3503.5 prohibits killing of raptor species and destruction of raptor nests. Typical violations include destruction of active bird and raptor nests as a result of tree removal, and failure of nesting attempts (loss of eggs or young) as a result of disturbance of nesting pairs caused by nearby human activity.

The proposed project has the potential to adversely affect birds and raptors protected under Sections 3503 and 3503.5 of the CFGC. The project proponent will avoid violation of CFGC Sections 3503 and 3503.5 by implementing measures identified for nesting birds in Chapter 4.

Fully Protected Species (Sections 3511, 3513, 4700, and 5050)

CFGC Sections 3511, 3513, 4700, and 5050 pertain to fully protected wildlife species (birds in Sections 3511 and 3513, mammals in Section 4700, and reptiles and amphibians in Section 5050) and strictly prohibit take of these species. CDFW cannot issue a take permit for fully protected species, except under narrow conditions for scientific research or the protection of livestock, or if a Natural Community Conservation Plan (NCCP) has been adopted. Specifically, Section 3513 prohibits any take or possession of birds designated by the MBTA as migratory nongame birds except as allowed by federal rules and regulations pursuant to the MBTA.

One fully protected bird species, white-tailed kite (*Elanus leucurus*), has the potential to nest in the BSA and be affected by the proposed project. The project proponent would avoid take of white-tailed kite by implementing measures identified for nesting birds in Chapter 4.

2.1.2.5 Porter-Cologne Water Quality Control Act

The California Water Code addresses the full range of water issues in the state and includes Division 7, known as the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) (California Water Code Sections 13000–16104). Section 13260 requires “any person discharging waste, or proposing to discharge waste, in any region that could affect the waters of the State to file a report of discharge (an application for waste discharge requirements [WDRs])” with the appropriate RWQCB. Under this act, each of the nine RWQCBs must prepare and periodically update Water Quality Control Basin Plans (Basin Plans). Each Basin Plan sets forth water quality standards for surface water and groundwater, as well as actions to control nonpoint and point sources of pollution. Projects that affect waters of the State must meet the WDRs of the RWQCB. Pursuant to CWA Section 401, an applicant for a Section 404 permit to conduct any activity that may result in discharge into navigable waters must provide a certification from the RWQCB that such discharge will comply with state water quality standards. As part of the wetlands permitting process under Section 404, the project proponent will be required to apply for water quality certification from the Central Valley RWQCB.

Section 13050 of the Porter-Cologne Act authorizes the State Water Board and the relevant RWQCB to regulate biological pollutants. The California Water Code generally regulates more substances contained in discharges and defines discharges to receiving waters more broadly than does the CWA.

As currently designed, roadway and bridge construction associated with the proposed project is expected to result in a discharge of fill material into waters of the State; therefore, the RWQCB is likely to issue WDRs for the proposed project.

2.1.2.6 Central Valley Flood Protection Plan: Levee Vegetation Management Strategy

Under the Central Valley Flood Protection Act of 2008, the California Department of Water Resources (DWR) developed the 2012 Central Valley Flood Protection Plan (CVFPP) as the foundation for the statewide FloodSAFE California initiative (California Department of Water Resources 2012a). Part of the CVFPP is a strategy for managing levee vegetation. Based on this strategy, existing trees on levees will be allowed to live out their normal life cycles unless they pose an unacceptable threat to levee integrity.

2.1.2.7 Urban Levee Design Criteria

The Urban Levee Design Criteria (ULDC) are intended to supply engineering guidance and criteria for levees required to provide an urban level of flood protection (200-year flood) (California Department of Water Resources 2012b). The ULDC also correspond to the CVFPP Levee Vegetation Management Strategy. With regard to levee improvements, the ULDC state the following.

> In cases of levee repair or improvement, vegetation shall be removed as required to meet objectives of the specific project. Vegetation removed as part of direct construction activities may not be replaced in the vegetation management zone. However, vegetation on other sections of the levee, not affected by the construction activity may remain in place, natural revegetation may be allowed outside of the vegetation management zone, and replanting may be allowed… Trees and other woody vegetation may be: (1) planted, and (2) allowed to naturally revegetate on a landside planting berm. Only the portion of the landside planting berm that is both 15 feet or more from the landside levee slope and 15 feet or more from the landward top of the planting berm may be planted and allowed to naturally revegetate.

2.1.3 Local Regulations

2.1.3.1 City of Sacramento General Plan

Goals and policies in the City of Sacramento General Plan (Part 2, Environmental Resources section) (City of Sacramento 2009) apply to biological resources in the proposed project area that would be affected by implementation of the project. These policies include conservation of open space areas to protect creeks and the Sacramento River; preservation of natural habitats; retention of sensitive habitats and species; preservation of riparian habitats or mitigation by

preservation and/or restoration at a 1:1 ratio; preservation of wetlands or mitigation for no-net-loss of value and/or function; preservation of wildlife corridors or replacement with habitat of equivalent value; performance of sensitive species surveys and/or habitat assessments and, if suitable habitat is present for a species, performance of either protocol-level or industry-recognized species surveys or assumption of species presence and consultation with appropriate resource agencies and mitigation in compliance with state and federal laws; and retention of heritage trees.

2.1.3.2 City of West Sacramento General Plan

Goals and policies in the City of West Sacramento General Plan (Part II, Section 6) (City of West Sacramento 2004) apply to biological resources in the BSA that would be affected by implementation of the project. These policies include preservation, enhancement, and no net loss of riparian and wetland habitats, particularly at the Sacramento River; requirements for site-specific vegetation surveys; development setbacks from wetlands; preservation of special-status species populations; minimization of recreational use effects on riparian habitat; and promotion of using native plants for landscaping near the Sacramento River.

2.1.3.3 City of Sacramento Heritage Tree Ordinance

The City Heritage Tree Ordinance (City of Sacramento Municipal Code, Title 12, Chapter 12.64) defines a heritage tree as follows.

- Any tree or any species with a truck circumference of one hundred (100) inches [diameter of 32 inches] or more, which is of good quality in terms of health, vigor of growth and conformity to generally accepted horticultural standards of shape and location for its species.
- Any native *Quercus* species, *Aesculus californica* or *Platanus racemosa*, having a circumference of thirty-six (36) inches [diameter of 11.5 inches] or greater when a single trunk, or a cumulative circumference of thirty-six (36) inches or greater when a multi-trunk.
- Any tree thirty-six (36) inches in circumference [diameter of 11.5 inches] or greater in a riparian zone. The riparian zone is measured from the center line of the watercourse to thirty (30) feet beyond the high water line.
- Any tree, grove of trees or woodland trees designated by resolution of the city council to be of special historical or environmental value or of significant community benefit.

The ordinance states that, during construction activity on any property on which a heritage tree is located, unless the express written permission of the director is first obtained, no person shall:

- Change the amount of irrigation provided to any heritage tree from that provided prior to the commencement of construction activity.
- Trench, grade, or pave into the dripline area of a heritage tree, or trim roots.

- Change, by more than 2 feet, grade elevations within thirty (30) feet of the dripline area of a heritage tree.
- Park or operate any motor vehicle within the dripline area of any heritage tree.
- Place or store any equipment or construction materials within the dripline area of any heritage tree.
- Attach any signs, ropes, cables or any other items to any heritage tree.
- Cut or trim any branch of a heritage tree for temporary construction purposes.
- Place or allow to flow into or over the dripline area of any heritage tree any oil, fuel, concrete mix, or other deleterious substance.

In addition, the ordinance states that none of the following activities shall be performed without a tree permit.

- Removal of any heritage tree.
- Pruning or spraying of any heritage tree greater than 12 inches in circumference.
- Disturbing the soil or placing any chemical on the soil within the dripline of any heritage tree.

The BSA supports heritage trees in the City of Sacramento that would be affected by implementation of the project and would be subject to the City of Sacramento Heritage Tree Ordinance.

2.1.3.4 City of West Sacramento Tree Preservation Ordinance

The City's Tree Preservation Ordinance is found in the West Sacramento Municipal Code, Title 8 (Health and Safety), Chapter 24 (Tree Preservation). The City protects heritage and landmark trees, as defined in the ordinance, and requires tree permits for activities that would affect such trees.

A *heritage* tree is defined as follows.

- Any living tree with a trunk circumference of 75 inches (diameter of 24 inches) or more, or
- Any living native oak (any species of the genus *Quercus*) with a trunk circumference of 50 inches (diameter of 16 inches) or more, both measured 4.5 feet above ground level. The circumference of multi-trunk trees is based on the sum of the circumference of each trunk.

A *landmark* tree is defined as a tree or stand of trees that is especially prominent, stately, or of historical significance as designated by the City Council. Trees that are too small in diameter to meet the size threshold of either a heritage or landmark tree but are located within the public right-of-way (typically 12.5 feet from the curb) also are protected by the ordinance.

It is unlawful in West Sacramento to perform any of the following acts with respect to a heritage or landmark tree without a tree permit issued by the City's tree administrator.

- Move, remove, cut down, poison, set fire to or permit fire to burn in proximity to, or perform or fail to perform any act that results in the unnatural death or destruction of a landmark or heritage tree.
- Perform any activity that will interfere with or retard the natural growth of any landmark or heritage tree.
- Perform any work or permit any work to be performed within the dripline area of a landmark or heritage tree.
- Trim or prune any branch of a landmark or heritage tree that is 5 inches or more in diameter.
- Change the appropriate amount of irrigation or drainage water provided to any landmark, heritage, or street tree. Trench, grade, pave, or otherwise damage or disturb any exposed roots within 1 foot outside the dripline area of any landmark, heritage, or street tree.
- Park or operate any motor vehicle within 1 foot outside the dripline area of any landmark, heritage, or street tree.
- Place or store any equipment or construction materials within 1 foot outside the dripline area of any landmark, heritage, or street tree.
- Place, apply, or attach any signs, ropes, cables, or other items to any landmark, heritage, or street tree.
- Place or allow to flow any oil, fuel, concrete mix, or other deleterious substance into or over within 1 foot outside the dripline area of any landmark, heritage, or street tree.

Tree permits require the applicant to replace a removed tree with a living tree on the property or within West Sacramento in a location approved by the tree administrator. The applicant also must replace the replacement tree if it dies any time within 3 years of the initial planting. Replacement is not required if a tree is removed because it poses a risk or hosts a plant parasite.

Replacement trees are required at a ratio of 1:1 (i.e., 1-inch diameter of replacement plant for every 1-inch diameter of tree removed). Replacement trees may be a combination of 15-gallon trees, which are the equivalent of a 1-inch-diameter tree, or 24-inch box trees, which are the equivalent of a 3-inch-diameter tree. If a property owner is unable to replace the tree on his or her property or within an area approved by the tree administrator, the tree administrator shall require the property owner to pay an in-lieu fee to the city. An in-lieu fee payment is not required if the tree needs to be removed solely because it poses a risk to persons or property, or if the tree acts as a host for a plant that is parasitic. In-lieu fees will be set by City Council resolution and be used to purchase and plant trees elsewhere in West Sacramento.

The BSA supports heritage trees in West Sacramento that would be affected by implementation of the project and would be subject to the City of West Sacramento Tree Preservation Ordinance.

2.2 Studies Required

Potential biological resource issues associated with the proposed project were identified through review of existing information and field surveys. It was determined that the following studies and surveys would be required to document natural resources in the BSA.

- General habitat evaluation to determine whether suitable habitat exists for special-status plant and animal species.
- Focused elderberry shrub survey and stem counts to document suitable habitat for the federally listed valley elderberry longhorn beetle.
- Bat survey consisting of identifying potential and occupied bat roosts and conducting acoustic surveys.
- Botanical field surveys to map land cover types, including natural communities, and survey for special-status plant species.
- Delineation of waters of the United States and waters of the State.
- General stream habitat survey to evaluate the occurrence and extent of shaded riverine aquatic (SRA) cover, including overhead vegetation, undercut banks, and instream woody material that exists for special-status fish species in the BSA.
- Standard Assessment Methodology (SAM) to assess existing habitat conditions and evaluate the impacts and compensation requirements based on the needs of listed fish species.

To prepare for the field surveys, biologists reviewed existing resource information related to the project to evaluate whether special-status species or other sensitive biological resources (e.g., waters of the United States) could occur in the BSA. As this document was prepared and revised, updated versions of the resources were obtained, reviewed, and incorporated. The sources listed below were reviewed.

- California Native Plant Society's (CNPS's) online Inventory of Rare and Endangered Plants of California records search of the Sacramento West, Clarksburg, Saxon, Rio Linda, Sacramento East, Florin, Taylor Monument, Grays Bend, and Davis U.S. Geological Survey (USGS) 7.5-minute quadrangles (California Native Plant Society 2015) (Appendix B).
- California Natural Diversity Database (CNDDB) records search of the Sacramento West, Clarksburg, Saxon, Rio Linda, Sacramento East, Florin, Taylor Monument, Grays Bend, and Davis USGS 7.5-minute quadrangles (California Department of Fish and Wildlife 2015) (Appendix B).
- A list of endangered and threatened species that may occur in or be affected by projects within the Sacramento West USGS 7.5-minute quadrangle and Yolo and Sacramento Counties (U.S. Fish and Wildlife Service 2015a) (Appendix B).

- Lists of plants identified as noxious weeds or invasive plants by the U.S. Department of Agriculture (USDA) (Natural Resources Conservation Service 2014a), the California Department of Food and Agriculture (CDFA) (Natural Resources Conservation Service 2003) and the California Invasive Plant Council (Cal-IPC) (2006, 2007).
- Soil map unit descriptions for the BSA (Natural Resources Conservation Service 2014b).

This information was used to develop lists of special-status species and other sensitive biological resources that could be present in the project region. Species from the lists were considered if they were known to occur in the project region or had potential habitat in the BSA and the BSA was within the species' range.

2.3 Personnel and Survey Dates

ICF International (ICF) biologists conducted biological surveys in the BSA in 2014 and 2015 (Table 2-1). Methods and personnel involved in documenting wetlands and other waters of the United States and conducting botanical, wildlife, and SRA cover habitat surveys are described below. Representative photographs taken during field surveys are provided in Appendix C.

Table 2-1. Biological Survey Personnel and Dates

Survey Type	Survey Date	Surveyors
Natural communities and habitat-based assessment for special-status species	April 14, 2014	John Howe, ICF Wildlife Biologist, 18 yrs. experience Lisa Webber, ICF Botanist/Wetland Ecologist, 25 yrs. experience
Botanical surveys	April 14, 2014; and April 8, May 8, and June 17, 2015	Lisa Webber
Delineation of waters of the United States and waters of the State	April 8, 2015	Lisa Webber
Wildlife habitat assessment and elderberry shrub survey	April 8, 2015	John Howe
Bat habitat mapping and acoustic surveys	May 5 and June 11, 2015	John Howe Leila Harris, ICF Wildlife Biologist, 8 yrs. experience
Shaded riverine aquatic cover habitat survey, fish passage reconnaissance assessment, and Standard Assessment Methodology	May 8 and June 17, 2015	Jeff Kozlowski, ICF Fisheries Biologist, 29 yrs. experience Rita Wilson, ICF Research Assistant, 1 yr. experience

2.3.1 Waters of the United States, Including Wetlands

ICF botanist/wetland ecologist Lisa Webber conducted delineation field work in the BSA on April 8, 2015. The delineation was conducted using the routine onsite determination method described in the *U.S. Army Corps of Engineers Wetlands Delineation Manual* (Environmental

Laboratory 1987) and the supplemental procedures and wetland indicators provided in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (U.S. Army Corps of Engineers 2008). The wetland delineation letter report is included as Appendix A.

2.3.2 Botanical Resources

ICF botanist Lisa Webber conducted botanical surveys in the BSA on April 14, 2014, and on April 8, May 8, and June 17, 2015. The spring and summer surveys coincided with the identification periods of special-status plants with potential to occur in the project region. During all but the June 17, 2015 surveys, the botanist walked the entire BSA and compiled lists of plants species observed. For the June 17, 2015 survey, close-up photographs of the banks were taken from the river via a kayak and then examined for the presence of special-status plants, in particular woolly rose-mallow. One part of the bank in West Sacramento was then walked to confirm the absence of woolly rose-mallow. A list of plant species observed in the BSA is included as Appendix D. Natural communities in the BSA also were identified and mapped during the botanical field surveys. The results of these surveys are presented in Chapters 3 and 4.

2.3.3 Wildlife Resources

ICF biologist John Howe conducted habitat-based field assessments for wildlife in the BSA on April 14, 2014, and on April 8, 2015. During the assessments, Mr. Howe took notes on the general topography of the BSA, the vegetation present, and the amount of human activity/disturbance at the site; he recorded wildlife (or wildlife signs) observed during the visit. During the April 8, 2015 site visit, Mr. Howe performed an elderberry shrub survey to document the location of elderberry shrubs (the host plant for valley elderberry longhorn beetle) present in the project limits and within 100 feet of the project limits. During the elderberry shrub survey, Mr. Howe recorded information on the number and size of stems, presence or absence of exit holes, and habitat associations. A list of wildlife species observed in the BSA is provided in Chapter 3.

In addition, on May 5 and June 11, 2015, Mr. Howe and ICF biologist Leila Harris mapped potential and occupied bat habitat, and conducted nighttime acoustic surveys within the BSA. Acoustic surveys were conducted using two Pettersson ultrasonic bat detectors, and recordings were processed using Sonobat software—a comprehensive tool for analyzing and comparing high-resolution, full-spectrum sonograms of bat echolocation calls.

The results of the wildlife surveys are presented in Chapters 3 and 4.

2.3.4 Fisheries Resources

On May 8, 2015, ICF fish biologist Jeff Kozlowski, accompanied by Rita Wilson, conducted an SRA cover habitat survey, a fish passage reconnaissance assessment, and a general reconnaissance-level field survey of the Sacramento River within the BSA. The reconnaissance-level field survey focused on evaluating existing habitat conditions within the BSA relative to the needs of special-status fish species. In addition, Jeff Kozlowski and Rita Wilson took photographs of the banks and levees from the Sacramento River on June 17, 2015, for application of the SAM analysis. No special-status fish surveys were conducted for the proposed project.

2.4 Agency Coordination and Professional Contacts

The following agency coordination has been conducted for the project.

2.4.1 Caltrans Office of Local Assistance

On June 25, 2014, Caltrans biologist Maureen Doyle with District 3 participated in a site visit within the BSA in the City of Sacramento and the City of West Sacramento to review and discuss the Preliminary Environmental Study (PES) with project representatives from the Cities of Sacramento and West Sacramento, management and engineering representatives from Mark Thomas and Company, and ICF project management and technical specialist representatives (including John Howe and Lisa Webber).

On June 3, 2015, Caltrans biologist Jennifer Osmondson, ICF biologist John Howe, and ICF botanist/wetland ecologist Lisa Webber participated in a conference call to discuss proposed mitigation for sensitive biological resources.

On June 11, 2015, Ms. Osmondson and Ms. Webber discussed by phone the format of the letter report for the delineation of waters of the United States to be submitted to the USACE.

On October 28, 2015, Ms. Osmondson sent to the NMFS, USFWS, USACE, and CDFW an email invitation for a November 17, 2015 resource agency meeting and site visit with project representatives from the Cities of Sacramento and West Sacramento, management and engineering representatives from Mark Thomas and Company, and ICF project management and technical specialist representatives. The purpose of the meeting was to discuss the design of the project and the potential biological impacts, and to get feedback from the agencies regarding likely mitigation requirements.

On November 17, 2015, Ms. Osmondsonand representatives of the Cities of Sacramento and West Sacramento, Caltrans and members of the project consulting team, including Ms. Webber,

Mr. Howe, and Mr. Kozlowski, attended the resource agency meeting. A summary of the proposed project and preliminary impact results was provided and input from the agencies regarding the impacts and likely mitigation requirements was solicited.

2.4.2 National Marine Fisheries Service

On June 9, 2015, Jeff Kozlowski, on behalf of Caltrans and the City of Sacramento, and in cooperation with the City of West Sacramento, requested a species list from Maria Rea, Assistant Regional Administrator for NMFS' California Central Valley Area Office for the project.

On November 17, 2015, Lieutenant Junior Grade Sean Luis attended the resource agency meeting and offered initial feedback regarding the project and in-water work windows.

2.4.3 U.S. Fish and Wildlife Service

On November 17, 2015, Mr. Armin Halston attended the resource agency meeting and offered initial feedback regarding the project. Mr. Halston was not able to participate for the full duration of the meeting or the site visit.

2.4.4 U.S. Army Corp of Engineers

Staff from the U.S. Army Corp of Engineers was invited to attend the November 17, 2015 resource agency meeting but no representatives attended the meeting.

2.4.5 California Department of Fish and Wildlife

On November 17, 2015, Ms. Tanya Sheya attended the resource agency meeting and offered initial feedback regarding the project and mitigation requirements.

2.4.6 State Lands Commission

There has been no consultation with the State Lands Commission (SLC) to date, but a Land Use Lease will be required for bridge construction in the Sacramento River.

2.5 Limitations That May Influence Results

The botanical surveys were conducted during the reported blooming periods for all of the special-status plants identified as having potential habitat in the BSA. The potential for occurrence of special-status plants in the BSA is generally low, due to historical and ongoing disturbance of the area for development, agriculture, and flood control. Although plant surveys were conducted during a drought period, the special-status species with potential habitat in the BSA would all grow on the Sacramento River banks. The river banks did not experience substantially drier conditions than normal due to the presence of normal river water levels; therefore, the drought conditions would not be expected to affect the growth of special-status plants along the river.

At the time of the delineation fieldwork, indicators of hydrophytic vegetation, hydric soils, wetland hydrology, and the mean high water line were evident and identifiable. Therefore, there were no limitations with regard to the survey for wetlands and other waters in the BSA.

Focused nesting bird surveys (including surveys for Swainson's hawk) were not conducted as part of the wildlife surveys. Based on the large population of nesting Swainson's hawk along the Sacramento River and their historical use of riparian habitat in the project vicinity, there is a high likelihood that Swainson's hawks could nest in or adjacent to the study area during construction. However, the presence of an active nest in one particular year is not a clear indication of where Swainson's hawks may nest in the year of construction. Therefore, for purposes of assessing impacts on Swainson's hawk, it was assumed that they are present in the BSA.

The assumed presence of, and the impact assessment on, special-status fish species depends largely on previously collected data; literature reviews; and general species distribution, habitat requirements, and life history accounts. As stated previously, no fish surveys were conducted, and this NES assumes that seven listed fish species (Sacramento winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley fall- and late fall–run Chinook salmon, Central Valley steelhead, North American green sturgeon, delta smelt, and longfin smelt), and two California species of special concern (Sacramento splittail [*Pogonichthys macrolepidotus*] and river lamprey [*Lampetra ayresi*]) are present in the BSA.

Chapter 3 Results: Environmental Setting

This chapter defines the BSA for the proposed project and describes the existing physical and biological conditions within the BSA.

3.1 Existing Biological and Physical Conditions

3.1.1 Biological Study Area

The extent of the BSA, which includes all permanent and temporary project impact areas, is shown in Figure 3-1. The BSA consists of the Sacramento River, riparian woodland and open space with bike/pedestrian trails along the Sacramento River, local roads, elevated roads (viaducts) and bridge approach structures, residential areas, and commercial development. The BSA has a relatively high level of historical and ongoing disturbance.

3.1.2 Physical Conditions

The BSA is located in the Sacramento Valley subregion of the California Floristic Province (Baldwin et al. 2012:43). The topography in the BSA varies from relatively level to moderate slopes on the Sacramento River levees, and elevations range from approximately -6 to 64 feet above mean sea level.

According to soil data from the Natural Resources Conservation Service, the BSA contains the following five soil map units and water (Natural Resources Conservation Service 2014a).

- Orthents-Urban land complex, 0 to 2 percent slopes (Sacramento County)
- Urban land (Sacramento County)
- Lang sandy loam (Yolo County)
- Lang sandy loam, deep (Yolo County)
- Sycamore silt loam (Yolo County)

The soil profile has been disturbed by development in West Sacramento and construction activity in the Sacramento Railyards area.

The BSA is within the Lower Sacramento watershed hydrologic unit (hydrologic unit code [HUC] 18020109) (U.S. Environmental Protection Agency 2015). The primary river in the delineation area is the Sacramento River, a traditional navigable water (TNW) that qualifies as another water of the United States (which also is considered a water of the State). The specific characteristics of waters of the United States (including wetlands) in

the BSA are further described below in the "Natural Communities" section and in the wetland delineation report (Appendix A).

3.1.3 Biological Conditions

3.1.3.1 Natural Communities

The natural communities in the BSA are interspersed with roadways, railroad tracks, commercial and industrial areas, and residential development. The term *land cover type* is used in this NES to refer to vegetation communities, open water, and unvegetated developed or disturbed areas. Land cover types mapped during field surveys are described below and shown in Figure 3-1. Representative photographs of land cover types within the BSA are provided in Appendix C.

The BSA supports both common vegetation communities and natural communities of special concern. Common vegetation communities are habitats with low species diversity that are widespread, reestablish naturally after disturbance, or support primarily non-native species. These communities generally are not protected by agencies unless the specific site is habitat for or supports special-status species (e.g., raptor foraging or nesting habitat, upland habitat in a wetland watershed). Common vegetation communities in the BSA are ruderal woodland and landscaped areas.

Natural communities of special concern are habitats considered sensitive because of their high species diversity, high productivity, unusual nature, limited distribution, or declining status. Local, state, and federal agencies consider these habitats important. The CNDDB contains a current list of rare natural communities throughout the state. USFWS considers certain habitats, such as wetlands and riparian communities, important to wildlife; and the USACE and EPA consider wetland habitats important for water quality and wildlife. The habitats in the BSA that meet the criteria for natural communities of special concern are cottonwood riparian forest and riparian forest/shrub wetland. Perennial stream, although not a vegetation community, is included as a natural community of special concern because it is important wildlife and fish habitat, and is regulated by resource agencies.

The distribution, representative vegetation, and typical wildlife species found in land cover types within the BSA are described below. Lists of plant species observed in the BSA are included in Appendix D and a list of wildlife species observed in the BSA is presented in Section 3.1.3.2, *Common Animal Species*.

Figure 3-1
Impacts on Landcover Types and Sensitive Biological Resources in the Biological Study Area

Cottonwood Riparian Forest

Cottonwood riparian forest in the BSA occurs along the upper banks and floodplains of the Sacramento River (Figure 3-1). The overstory of riparian forest is predominantly mature Fremont cottonwood (*Populus fremontii*) trees associated with valley oak (*Quercus lobata*) and black walnut (*Juglans californica* var. *hindsii)*. Other riparian tree species observed include Oregon ash (*Fraxinus latifolia*), boxelder (*Acer negundo* var. *californicum*), and black willow (*Salix gooddingii*). The riparian understory on the waterside of the levee is primarily rip-rap with non-native annual grasses and forbs; however, there are also patches of more typical riparian species, such as narrow-leaf willow (*Salix exigua*), Himalayan blackberry (*Rubus armeniacus*), and mugwort (*Artemisia douglasiana*). The invasive red sesbania (*Sesbania punicea*) shrub was observed in the riparian forest on the Sacramento side of the river. One blue elderberry shrub (*Sambucus nigra* ssp. *caerulea*), habitat for the federally threatened valley elderberry longhorn beetle (VELB), was found in riparian habitat on the Sacramento side of the river. One area of riparian forest exhibited positive indicators of all three federal wetland criteria and is discussed below under "Riparian Forest/Shrub Wetland." Riparian forest associated with the Sacramento River in the BSA is depicted in Photos 1 and 2 in Appendix C.

Riparian habitats are sensitive natural communities that provide important habitat for wildlife and shaded riverine habitat for fish. Local, state, and federal agencies recognize riparian habitats as sensitive natural communities.

Riparian habitats provide cover, foraging and nesting habitat, and serve as migration and dispersal corridors for several bird and mammal species in the region. Common wildlife species that may occur in these habitats include black phoebe (*Sayornis nigricans*), yellow-rumped warbler (*Dendroica coronata*), house finch (*Carpodacus mexicanus*), American goldfinch (*Carduelis tristis*), yellow-billed magpie (*Pica nuttalli*), pocket gopher (*Thomomys bottae*), fox squirrel (*Sciurus niger*), common muskrat (*Ondatra zibethicus*), and raccoon (*Procyon lotor*).

Riparian Forest/Shrub Wetland

Riparian forest/shrub wetland occurs in the BSA within riparian habitat that meets all three federal wetland criteria (i.e., hydrophytic vegetation, hydric soils, and wetland hydrology). The riparian forest/shrub wetland is located in the northern portion of the BSA, on the west side of the Sacramento River within a low area (Figure 3-1) (Photos 3 and 4 in Appendix C). The vegetative composition of the riparian forest/shrub wetland is predominantly cottonwood but also includes buttonwillow (*Cephalanthus occidentalis*

var. *californicus*), boxelder, and narrow-leaf willow. Additional information about the riparian forest/shrub wetland is provided in the wetland delineation report (Appendix A).

As noted above, riparian wetland habitats are sensitive natural communities that provide important cover, foraging, and nesting habitat, and serve as migration and dispersal corridors for several bird and mammal species in the region. Local, state, and federal agencies recognize riparian habitats as sensitive natural communities.

Ruderal Woodland

The West Sacramento section of the BSA includes several areas of naturalized vegetation on undeveloped parcels or parts of parcels that support mature trees with ruderal or non-native annual grassland in the understory. Several parcels between 2nd Street and the levee are predominantly vegetated by the invasive species tree of heaven (*Ailanthus altissima*); several riparian trees are interspersed, including black walnut and Fremont cottonwood. Another invasive tree species, black locust (*Robinia pseudoacacia*), also grows in this area. The understory vegetation in these areas of naturalized vegetation includes non-native annual grasses and forbs, such as wild oat (*Avena fatua*), ripgut brome (*Bromus diandrus*), foxtail barley (*Hordeum murinum* ssp. *leporinum*), star thistle (*Centaurea solstitialis*), vetch (*Vicia* spp.), and prickly lettuce (*Lactuca serriola*). Several blue elderberry shrubs grow in this community type (Figure 3-1). Representative photographs of ruderal woodland in the BSA are provided as Photos 5, 6, and 7 in Appendix C.

The ruderal woodland and associated ruderal grasslands provide nesting habitat for common birds, including northern mocking bird (*Mimus polyglottos*), western meadowlark (*Sturnella neglecta*), and killdeer (*Charadrius vociferous*) (in more open areas). Mallards from the adjacent river could use the denser areas of ruderal grassland for nesting. This ruderal area also provides foraging habitat for bird species. Pocket gophers are known to occur in the ruderal woodlands of the BSA.

Perennial Stream (Sacramento River)

The Sacramento River is the only perennial stream in the BSA (see Figure 3-1). All perennial stream is unvegetated open water. The river averages 672 feet wide at the ordinary high water mark (OHWM) in the BSA. The river banks are levees that are mostly steeply sloped and support riparian forest vegetation, as described above, with rip-rap near the bottom of the slope. Additional information about the perennial stream is provided in the wetland delineation report (Appendix A). Representative photographs of the Sacramento River in the BSA are provided as Photos 1 and 2 in Appendix C.

The Sacramento River is a TNW and a water of the United States subject to regulation under CWA Section 404 and Section 10 of the RHA, and is under the jurisdiction of the USACE. The river is considered a sensitive natural community. The RWQCB protects all waters of the State under the Porter-Cologne Act.

Riverine habitats like the Sacramento River provide habitat for amphibians, birds, and mammals. Common wildlife species that could be found in the river and along the shore of the river include American bullfrog (*Lithobates catesbeianus*), mallard (*Anas platyrhynchos*), great egret (*Ardea alba*), and river otter (*Lutra canadensis*). Numerous species of fish also are known to occur in the Sacramento River and are described below.

Landscaped

The vegetation in landscaped areas typically is comprised of ornamental species planted for decorative or landscaping purposes, including oleander (*Nerium oleander*), coast redwood (*Sequoia sempervirens*), California fan palm (*Washingtonia filifera*), Callery pear (*Pyrus calleryana*), Italian cypress (*Cupressus sempervirens*), pines (*Pinus* spp.), non-native oaks (*Quercus* sp.), and fruit trees (Figure 3-1). Landscaping is depicted in Photo 8 in Appendix C.

Common bird species may forage and nest in some of the landscaped areas, including mourning dove, American robin (*Turdus migratorius*), cliff swallow (*Petrochelidon pyrrhonota*) (nests on buildings and bridges), and western scrub jay (*Aphelocoma californica*).

Developed / Graded

Developed portions of the BSA consist of residential structures, commercial/industrial areas, and paved roadways and parking lots. Some small areas mapped as “Developed” on Figure 3-1 include landscaping, where the vegetated patches are small and interspersed with houses and other structures. Graded portions of the BSA include areas adjacent to roadways, the railroad, unpaved parking areas, and the area underneath and east of I-5. The vegetative composition of these areas is generally sparse and generally consists of nonnative species, particularly annual grasses and weedy forbs. Disturbed/ graded areas are depicted in Photos 9 and 10 in Appendix C.

Common wildlife species that would occur in developed areas would be the same as those described above in the landscaped areas.

3.1.3.2 Common Animal Species

Wildlife

The BSA supports common birds and mammals typical of both riverine, riparian, and urban areas. Wildlife species that were observed in the BSA are western fence lizard (*Sceloporus occidentalis*), great blue heron (*Ardea herodias*), Canada goose (*Branta canadensis*), white-throated swift (*Aeronautes saxatalis*), western scrub jay, northern mockingbird, European starling (*Sturnus vulgaris*), rock dove (*Columbia livia*), yellow-billed magpie, feral house cat (*Felis catus*), black-tailed jackrabbit (*Lepus californicus*), fox squirrel, raccoon (tracks), and skunk (odor) (likely *Mephitis mephitis*).

In addition, several occupied and potential bats roots were observed under the I Street (both sides of the Sacramento River) and Jibboom Street approach structures. During the May 5, 2015 bat surveys, 30 expansion joints were mapped on the approach ramps for a total of 1,132 linear feet of potential bat roosting habitat. Of the 30 expansions joints, 16 were observed to be occupied by bats at the time of the May 15, 2015 survey; they were visually identified as Mexican free-tailed bats (*Tadarida brasiliensis*). Acoustic surveys conducted on the nights of May 5 and June 11, 2015, recorded Mexican free-tailed bats, big brown bats (*Eptesicus fuscus*), Yuma myotis (*Myotis yumanensis*), and Western red bat (*Lasiurus blossevillii*)—a species of special concern.

Wildlife Migration Corridors

The BSA consists of predominantly disturbed and developed areas along both sides of the Sacramento River, with a narrow band of riparian habitat along the river. Despite these existing conditions, the open water portion of the river serves as a migration corridor for aquatic species; and, even though limited, the riparian habitat can be used by birds and other wildlife for dispersing along the Sacramento River corridor. Fish passage and migration within the Sacramento River are discussed below.

Fish

The Sacramento River in the BSA falls within the Sacramento-San Joaquin Province (Central Valley Subprovince), one of six aquatic zoogeographic provinces in California, as defined by Moyle (2002). The Sacramento-San Joaquin Province is drained by the Sacramento and San Joaquin Rivers. Generally, four native fish assemblages can be recognized in Central Valley streams: rainbow trout assemblage, California roach assemblage, pikeminnow-hardhead-sucker assemblage, and deep-bodied fish assemblage (Moyle 2002). Based on its geographic location, the BSA lies at the interface between the zone characterized by the deep-bodied fish assemblage and the Sacramento-San Joaquin Estuary (i.e., the Delta).

Native fish species that occur where the Sacramento River meets the Delta include Sacramento sucker (*Catostomus occidentalis*), Sacramento pikeminnow (*Ptychocheilus grandis*), Sacramento splittail (*Pogonichthys macrolepidotus*), Sacramento blackfish (*Orthodon microlepidotus*), hitch (*Lavinia exilicauda*), Chinook salmon (*Oncorhynchus tshawytscha*) (winter-, spring-, fall-, and late fall–run), steelhead (*O. mykiss*), green sturgeon (*Acipenser medirostris*), white sturgeon (*A. transmontanus*), Pacific lamprey (*Entosphenus tridentata*), river lamprey (*Lampetra ayresi*), delta smelt (*Hypomesus transpacificus*), longfin smelt (*Spirinchus thaleichthys*), tule perch (*Hysterocarpus traski*), and prickly sculpin (*Cottus asper*) (Moyle 2002). The dominant fishes, however, are all nonnative (alien) species: largemouth, smallmouth, and spotted bass (*Micropterus* spp.); white and black crappie (*Pomoxis* spp.); bluegill (*Lepomis macrochirus*); American (*Alosa sapidissima*) and threadfin shad (*Dorosoma petenense*); striped bass (*Morone saxatilis*); bigscale logperch (*Percina macrolepida*); red shiner (*Cyprinella lutrensis*); inland silverside (*Menidia beryllina*); white catfish (*Ameiurus catus*); black and brown bullhead (*Ameiurus* spp.); and common carp (*Cyprinus carpio*) (Moyle 2002).

The Sacramento River is wide and deep and provides unimpeded passage for migratory and resident fish species in the BSA. Although the existing I Street Bridge is supported on three in-water piers, the existing piers do not confine flows or create hydraulic conditions (e.g., shallow water depths or excessive water velocities) that adversely affect the upstream or downstream passage of fish or other aquatic organisms in the Sacramento River.

3.2 Regional Special-Status Species

Regional species and habitats of concern were identified using the CNDDB records search (California Department of Fish and Wildlife 2015) (Appendix B), CNPS's online Inventory of Rare and Endangered Plants of California (2015) (Appendix B), the species list obtained from the USFWS (2015a) website (Appendix B), and species distribution and habitat requirements data. Based on a review of this information, 24 special-status plant species, 26 special-status wildlife species, and 2 special-status fish species (Tables 3-1 and 3-2 [at the end of the chapter]) were identified as having the potential to occur or are known to occur in the project region (i.e., within 10 miles of the BSA).

For the purpose of this NES, special-status species are plants, wildlife, and fish that are legally protected under ESA, CESA, or other regulations, and species that are considered sufficiently rare by the scientific community to qualify for such listing. Special-status plants, animals, and fish are those species in any of the categories listed below.

- Species listed or proposed for listing as threatened or endangered under ESA (50 CFR 17.11 [listed animals], 50 CFR 17.12 [listed plants], and various notices in the Federal Register [FR] [proposed species]).
- Species that are candidates for possible future listing as threatened or endangered under ESA (79 FR 72450 December 5, 2014).
- Species listed or proposed for listing by the State of California as threatened or endangered under CESA (14 CCR 670.5).
- Species that meet the definitions of rare or endangered under CEQA (State CEQA Guidelines Section 15380).
- Plants listed as rare under the CNPPA (California Fish and Game Code 1900 et seq.).
- Plants considered by CDFW and CNPS to be "rare, threatened, or endangered in California" (Rare Plant Ranks 1B and 2; California Department of Fish and Wildlife 2015; California Native Plant Society 2015).
- Plants identified by CDFW and CNPS about which more information is needed to determine their status, and plants of limited distribution (Rare Plant Ranks 3 and 4, California Department of Fish and Wildlife 2015, California Native Plant Society 2015), which may be included as sensitive species on the basis of local significance or recent biological information.
- Animal species of special concern to CDFW.
- Animals fully protected in California (CFGC Section 3511 [birds], 4700 [mammals], 5050 [amphibians and reptiles], and 5515 [fish]).

3.2.1 Special-Status Plants

Based on the searches of the CNDDB, the CNPS rare plant inventory, and the USFWS website, 24 special-status plant species were identified as occurring in the vicinity of the BSA (Table 3-1 [at the end of the chapter]). The natural communities in the BSA contain potential habitat for 4 of these 24 species. The other 20 species have habitat or microhabitat requirements (e.g., playas, vernal pools, perennial marsh; alkaline, saline, clay, or serpentine soils) that are not present in the BSA. Additionally, the relatively high level of historical and ongoing disturbance that is present in most of the BSA detracts from the quality of potential habitat for special-status plant species. No special-status plants were observed during 2015 botanical surveys, and none have been previously reported in the BSA (California Department of Fish and Wildlife 2015; California Native Plant Society 2015).

As described in Chapter 2, the surveys coincided with the reported identification periods of all 24 special-status plant species. Although plant surveys were conducted during a drought period, the special-status species with potential habitat in the BSA would all

grow on the Sacramento River banks. The river banks did not experience substantially drier conditions than normal due to the presence of normal river water levels; therefore, the drought conditions would not be expected to affect the growth of special-status plants along the river. All four species with potential habitat in the BSA are perennial, although three are herbaceous (rose-mallow, Mason's lilaeopsis, and Suisun Marsh aster). The habitat for all three of these species would be restricted to the banks of the Sacramento River, and their seed germination and growth would not likely be affected by the drought conditions. Based on the field survey results and the lack of recorded occurrences in the BSA, this NES concludes that no special-status plant species occur in the BSA.

3.2.2 Special-Status Wildlife

Based on a review of the CNDDB search results; the USFWS list of endangered, threatened, and proposed species within the project region; and species' distribution and habitat data, 26 special-status wildlife species were determined to have the potential to occur in the project region (Table 3-2 [at the end of the chapter]). After completion of the field survey, the biologists determined that 19 of the 26 species would not occur in the BSA because the area lacks suitable habitat or is outside the species' known range. An explanation for the absence of each of these species from the BSA is provided in Table 3-2. Suitable habitat is present in the BSA for the remaining seven species listed below. These species are discussed in Chapter 4.

- Valley elderberry longhorn beetle
- Western pond turtle (*Emys marmorata*)
- Swainson's hawk
- White-tailed kite
- Purple martin (*Progne subis*)
- Pallid bat (*Antrozous pallidus*)
- Western red bat

3.2.3 Special-Status Fish

Based on a review of the CNDDB search results; the USFWS and NMFS lists of endangered, threatened, and proposed species within the project region; and species' distribution and habitat data (e.g., Moyle 2002; U.S. Fish and Wildlife Service 2015b), nine special-status fish species were identified as occurring in the project region (Table 3-2 [at the end of the chapter]). These nine species are listed below and are discussed further in Chapter 4.

- Sacramento River winter-run Chinook salmon

- Central Valley spring-run Chinook salmon
- Central Valley fall- and late fall–run Chinook salmon
- Central Valley steelhead
- Southern Distinct Population Segment (DPS) of North American green sturgeon
- Delta smelt
- Longfin smelt
- Sacramento splittail
- River lamprey

In addition, the Sacramento River in the BSA is designated as critical habitat for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, North American green sturgeon, and delta smelt. The Sacramento River in the BSA is also considered EFH for Pacific salmon (i.e., Chinook salmon).

3.2.4 Other Protected and Managed Biological Resources

3.2.4.1 Migratory Birds

Non-special-status migratory birds, including raptors, have the potential to nest in trees, in shrubs, and on the ground in the BSA. In addition to purple martins (a species of special concern), cliff swallows and white-throated swifts are known to nest on the approach structures within the BSA. Although common migratory bird species are not considered special-status wildlife species, their occupied nests and eggs are protected by CFGC Sections 3503 and 3503.5 and the MBTA.

3.2.4.2 Bats

Several bat species, including Mexican free-tailed bat, big brown bat, Yuma myotis, and Western red bat were detected in the BSA during acoustic surveys conducted on May 5 and June 11, 2015. During the May 5, 2015 bat survey, Mexican free-tailed bats were observed roosting in expansion joints in the existing I Street Bridge approach structures. Other bat species could roost within the expansion joints and in trees and buildings within the BSA, including special-status bats. Bats play important roles in California ecosystems and offer important benefits to humans, including the control of mosquitos and crop-damaging insects and the deposition of nitrogen rich guano under roosts that serves as a natural fertilizer (Western Bat Working Group 2004; Erickson et al. 2002:2). A total of 18 species of bats use bridges in one way or another in California (Erickson et al. 2002:14). Bridges provide important habitat for roosting bats in California considering the amount of riparian habitat lost and the loss of rock outcrops and caves from reservoir development (Erickson et al. 2002: 2).

3.2.4.3 Protected Trees

A list of trees, by species, with a diameter at breast height (dbh) of 6 inches or greater was recorded for the approximate project footprint areas in the BSA (Appendix E). The City of Sacramento Heritage Tree Ordinance protects all trees with a dbh of 32 inches or greater; and native oaks, California buckeye (*Aesculus californica*), western sycamore (*Platanus racemosa*), and all riparian trees with a dbh of 11.5 inches or greater. The City of West Sacramento Tree Preservation Ordinance protects all trees with a dbh of 24 inches or greater and native oaks with a dbh of 16 inches or greater.

Within the proposed project footprint alternatives, a total of 95 trees meet the tree ordinance criteria for the city in which they occur—approximately 22 trees in Sacramento and 73 trees in West Sacramento (Appendix E). The tree species included in this total are Oregon ash, California black walnut, western sycamore, Fremont's cottonwood, valley oak, black willow, arroyo willow, and tree of heaven. The tree of heaven is an invasive species, but meets the heritage tree size criterion.

3.2.4.4 Invasive Species

Invasive plant species include species designated as federal noxious weeds by the USDA, species listed by the CDFA, and invasive plants identified by Cal-IPC. Invasive plants displace native species, change ecosystem processes, alter plant community structure, and lower wildlife habitat quality (California Invasive Plant Council 2006:1). Road, highway, and related construction projects are some of the principal dispersal pathways for invasive plants and their propagules. FHWA requires that state departments of transportation use the state's noxious weed list to identify invasive plant species that could be spread by construction of transportation projects. Accordingly, Table 3-3 lists the invasive plant species identified by the CDFA and Cal-IPC that are known to occur in the BSA (Natural Resources Conservation Service 2003; California Invasive Plant Council 2006, 2007). No plant species designated as federal noxious weeds have been identified in the BSA (Natural Resources Conservation Service 2014b). Invasive plant species occur in ruderal woodland, disturbed/graded areas, and, to a lesser extent, riparian forest.

Table 3-3. Invasive Plant Species Identified in the Biological Study Area

Species	CDFA	Cal-IPC
Tree of heaven (*Ailanthus altissima*)	–	Moderate
Wild oat (*Avena fatua*)	–	Moderate
Black mustard (*Brassica nigra*)	–	Moderate
Ripgut brome (*Bromus diandrus*)	–	Moderate
Soft chess (*Bromus hordeaceus*)	–	Limited
Red brome (*Bromus madritensis* ssp. *rubens*)	–	High
Cheatgrass (*Bromus tectorum*)	–	High
Italian thistle (*Carduus pycnocephalus*)	C	Moderate
Yellow star-thistle (*Centaurea solstitialis*)	C	High
Bindweed (*Convolvulus arvensis*)	C	–
Bermuda grass (*Cynodon dactylon*)	C	Moderate
Red-stemmed filaree (*Erodium cicutarium*)	–	Limited
Rattail fescue (*Festuca myuros*)	–	Moderate
Italian ryegrass (*Festuca perennis*)	–	Moderate
Edible fig (*Ficus carica*)	–	Moderate
Fennel (*Foeniculum vulgare*)	–	High
Cutleaf geranium (*Geranium dissectum*)	–	Limited
English ivy (*Hedera helix*)	–	High
Bristly ox-tongue (*Helminthotheca echioides*)	–	Limited
Foxtail barley (*Hordeum murinum* ssp. *leporinum*)	–	Moderate
Rough cat's-ear (*Hypochaeris radicata*)	–	Moderate
Perennial peppergrass (*Lepidium latifolium*)	B	High
Tree-tobacco (*Nicotiana glauca*)	–	Moderate
Sourgrass (*Oxalis pes-caprae*)	–	Moderate
English plantain (*Plantago lanceolata*)	–	Limited
Rabbitsfoot grass (*Polypogon monspeliensis*)	–	Limited
Wild radish (*Raphanus sativus*)	–	Limited
Black locust (*Robinia pseudoacacia*)	–	Limited
Himalayan blackberry (*Rubus armeniacus*)	–	High
Curly dock (*Rumex crispus*)	–	Limited
Red sesbania (*Sesbania punicea*)	B	High
Milk thistle (*Silybum marianum*)	–	Limited
London rocket (*Sisymbrium irio*)	–	Moderate
Johnson grass (*Sorghum halepense*)	C	–
Smilo grass (*Stipa miliacea*)	–	Limited
Puncturevine (*Tribulus terrestris*)	C	–
Rose clover (*Trifolium hirtum*)	–	Moderate
Periwinkle (*Vinca major*)	–	Moderate

Note: The California Department of Agriculture (CDFA) and California Invasive Plant Council (Cal-IPC) lists assign ratings that reflect the CDFA and Cal-IPC views of the statewide importance of the pest, likelihood that eradication or control efforts would be successful, and present distribution of the pest in the state. These ratings are guidelines that indicate the most appropriate action to take against a pest under general circumstances. The Cal-IPC species list is more inclusive than the CDFA list.

The CDFA categories indicated in the table are defined as follows:

B: Eradication, containment, control or other holding action at the discretion of the county agricultural commissioner.

C: State-endorsed holding action and eradication only when found in a nursery; action to retard spread outside nurseries at the discretion of the county agricultural commissioner.

The Cal-IPC categories indicated in the table are defined as follows:

High: Species with severe ecological impacts, high rates of dispersal and establishment, and usually widely distributed.

Moderate: Species with substantial and apparent ecological impacts, moderate to high rates of dispersal, establishment dependent on disturbance, and limited to widespread distribution.

Limited: Species with minor ecological impacts, low to moderate rates of invasion, limited distribution, and locally persistent and problematic.

Table 3-1. Special-Status Plants Known or with Potential to Occur in the Project Region, or That May Be Affected by the Proposed Project

Common Name *Scientific Name*	Status[a] Federal/State/ CRPR	General Habitat Description	Blooming Period	Habitat Present/ Absent	Rationale
Ferris' milk-vetch (*Astagalus tener* var. *ferrisiae*)	–/–/1B.1	Seasonally wet areas in meadows and seeps, subalkaline flats in valley and foothill grassland; 6–246 feet	April–May	Habitat absent	Grassland habitat only in open areas of ruderal woodland. Riparian wetland is the only seasonally wet habitat and is not suitable. No subalkaline flats present. Nearest recorded occurrence is ~4 miles west of the BSA. Not observed in April or May 2015 surveys.
Alkali milk-vetch (*Astragalus tener* var. *tener*)	–/–/1B.2	Playas, on adobe clay in valley and foothill grassland, vernal pools on alkali soils; below 197 feet	March–June	Habitat absent	Grassland habitat only in open areas of ruderal woodland. No playas, vernal pools or alkali soils present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Heartscale (*Atriplex cordulata* var. *cordulata*)	–/–/1B.2	Saline or alkaline soils in chenopod scrub, meadows and seeps, sandy areas in valley and foothill grassland; below 1,230 feet	April–October	Habitat absent	Grassland habitat only in open areas of ruderal woodland. No saline or alkaline soils present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Brittlescale (*Atriplex depressa*)	–/–/1B.2	Alkaline or clay soils in chenopod scrub, meadows and seeps, playas, valley and foothill grassland, vernal pools; below 1,050 feet	April–October	Habitat absent	Grassland habitat only in open areas of ruderal woodland. No alkaline or clay soils present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
San Joaquin saltscale (*Atriplex joaquiniana*)	–/–/1B.2	Alkaline soils in chenopod scrub, meadows and seeps, playas, valley and foothill grassland; below 2,739 feet	April–October	Habitat absent	Grassland habitat only in open areas of ruderal woodland. No alkaline soils present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.

Common Name *Scientific Name*	Status[a] Federal/State/ CRPR	General Habitat Description	Blooming Period	Habitat Present/ Absent	Rationale
Bristly sedge (*Carex comosa*)	–/–/2.1	Coastal prairie, marshes and swamps at lake margins, valley and foothill grassland; below 2,050 feet	May–September	Habitat absent	Grassland habitat only in open areas of ruderal woodland. Riparian wetland is only seasonally wet and is not suitable habitat. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Palmate-bracted bird's-beak (*Chloropyron palmatum*) [*Cordylanthus palmatus*]	E/E/1B.1	Alkaline grassland, alkali meadow, chenopod scrub; 50–1,670 feet	May–October	Habitat absent	No alkaline grassland habitat or chenopod scrub present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Peruvian dodder (*Cuscuta obtusiflora* var. *glandulosa*)	–/–/2.2	Not seen since 1948; freshwater marshes and swamps; 50–920 feet	July–October	Habitat absent	No freshwater marsh habitat present. Riparian wetland is only seasonally wet and is not suitable habitat. Nearest recorded occurrence is more than 10 miles away.
Dwarf downingia (*Downingia pusilla*)	–/–/2.2	Vernal pools and mesic valley and foothill grasslands; below 1,459 feet	March–May	Habitat absent	No vernal pool habitat present. Nearest recorded occurrence is ~7.5 miles north of the BSA. Not observed in April or May 2015 surveys.
Stinkbells (*Fritillaria agrestis*)	–/–/4.2	Chaparral, cismontane woodland, pinyon-juniper woodland, valley and foothill grassland, on clay, sometimes serpentinite substrate; 33–5,101 feet	March–June	Habitat absent	Grassland habitat only in open areas of ruderal woodland. No chaparral or suitable woodland habitat present. No clay or serpentine soils. Nearest recorded occurrence is ~6 miles northeast of the BSA. Not observed in April or May 2015 surveys.
Boggs Lake hedge-hyssop (*Gratiola heterosepala*)	–/E/1B.2	Clay soils in areas of shallow water, lake margins of swamps and marshes, vernal pool margins; 33–7,791 feet	April–August	Habitat absent	No vernal pool habitat or clay soils present. Nearest recorded occurrence is ~8 miles northeast of the BSA. Not observed in April or May 2015 surveys.

Common Name *Scientific Name*	Status[a] Federal/State/ CRPR	General Habitat Description	Blooming Period	Habitat Present/ Absent	Rationale
Rose-mallow (*Hibiscus lasiocarpus* var. *occidentalis*)	–/–/2.2	Freshwater marsh along rivers and sloughs; often in rip-rap on sides of levees; below 394 feet	June–September	Habitat present	Low potential for presence in rip-rap along the Sacramento River. Riparian wetland is only seasonally wet and is not suitable habitat. Nearest recorded occurrence is ~2 miles northwest of the BSA. Not observed in June 2015.
Northern California black walnut (*Juglans hindsii*)	–/–/1B.1	Last two native stands in Napa and Contra Costa Counties; riparian scrub and riparian woodland; below 1,443 feet	April–May	Habitat present	Riparian habitat present with several black walnut trees, but no native stands present. Nearest recorded occurrence along the Sacramento River ~8 miles south of the BSA is extirpated.
Legenere (*Legenere limosa*)	–/–/1B.1	Deep, seasonally wet habitats such as vernal pools, ditches, marsh edges, and river banks; below 2,887 feet	April–June	Habitat absent	No vernal pool habitat present. Nearest recorded occurrence is ~6 miles northeast of the BSA.
Heckard's pepper-grass (*Lepidium latipes* var. *heckardii*)	–/–/1B.2	Alkaline flats in valley and foothill grassland; 32–656 feet	March–May	Habitat absent	Grassland habitat only in open areas of ruderal woodland. No alkaline soils present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Mason's lilaeopsis (*Lilaeopsis masonii*)	–/R/1B.1	Freshwater or brackish marsh, riparian scrub; in tidal zone	April–November	Habitat present	Low potential for presence in degraded habitat present on the Sacramento River bank, but not known to occur in this area; flow and boat wakes are likely too great for establishment of this species, and most levee banks have rip-rap to below the water level or trampled sand flats Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Little mousetail (*Myosurus minimus* ssp. *apus*)	–/–/3.1	Alkaline soils in valley and foothill grassland and vernal pools; 66–2,100 feet	March–June	Habitat absent	BSA is lower than species' known elevation range. No alkaline soils or vernal pool habitat present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.

Common Name *Scientific Name*	Status[a] Federal/State/ CRPR	General Habitat Description	Blooming Period	Habitat Present/ Absent	Rationale
Baker's navarretia (*Navarretia leucocephala* ssp. *bakeri*)	–/–/1B.1	Mesic areas in cismontane woodland, lower montane coniferous forest, meadows and seeps, valley and foothill grassland, vernal pools;16–5,709 feet	April–July	Habitat absent	No suitable mesic grassland or vernal pool habitat present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Colusa grass (*Neostapfia colusana*)	T/E/1B.1	Adobe soils of vernal pools; 16–656 feet	May–August	Habitat absent	No vernal pool habitat or adobe soils present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Bearded popcorn flower (*Plagiobothrys hystriculus*)	–/–/1B.1	Mesic grassland, vernal pools; 33–900 feet	April-May	Habitat absent	No mesic grassland or vernal pool habitat present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.
Sanford's arrowhead (*Sagittaria sanfordii*)	–/–/1B.2	Freshwater marshes, sloughs, canals, and other slow-moving water habitats; below 2,132 feet	May–October	Habitat absent	No freshwater marsh or slow-moving water habitat present. Riparian wetland is only seasonally wet and is not suitable habitat. Nearest recorded occurrence is ~2 miles east of the BSA. Not observed in April or May 2015 surveys.
Suisun Marsh aster (*Symphotrichum lentum*)	–/–/1B.2	Brackish and freshwater marshes and swamps; below 10 feet	May–November	Habitat present	Low potential for presence in rip-rap along the Sacramento River. Riparian wetland is only seasonally wet and is not suitable habitat. Nearest recorded occurrence is ~5 miles southwest of the BSA. Not observed in April or May 2015 surveys.
Saline clover (*Trifolium hydrophilum*)	–/–/1B.2	Salt marsh, mesic alkaline areas in valley and foothill grasslands, vernal pools, marshes and swamps; below 980 feet	April–June	Habitat absent	No salt marsh, mesic grassland, vernal pool, or marsh habitat present. Riparian wetland is only seasonally wet and is not suitable habitat. No alkaline soils present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.

Common Name *Scientific Name*	Status[a] Federal/State/ CRPR	General Habitat Description	Blooming Period	Habitat Present/ Absent	Rationale
Crampton's tuctoria (*Tuctoria mucronata*)	E/E/1B.1	Mesic areas in valley and foothill grassland, vernal pools; 16–33 feet	April–August	Habitat absent	No mesic grassland or vernal pool habitat present. Nearest recorded occurrence is more than 10 miles away. Not observed in April or May 2015 surveys.

BSA = biological study area

Sources: California Native Plant Society 2015; California Department of Fish and Wildlife 2015.

[a] Status explanations:

Federal

E = Listed as endangered under the federal ESA.
T = Listed as threatened under the federal ESA.
— = No listing status.

State

E = Listed as endangered under CESA.
R = Listed as rare under the CESA. This category is no longer used for newly listed plants, but some plants previously listed as rare retain this designation.
— = No listing status.

CRPR

1B = List 1B species: rare, threatened, or endangered in California and elsewhere.
2 = List 2 species: rare, threatened, or endangered in California but more common elsewhere.
3 = List 3 species: more information is needed about this plant.
4 = List 4 species: limited distribution; species on a watch list
.1 = Seriously endangered in California (over 80% of occurrences threatened—high degree and immediacy of threat).
.2 = Fairly endangered in California (20-80% occurrences threatened).

Note: In March, 2010, California Department of Fish and Game (now CDFW) changed the name of "CNPS List" or "CNPS Ranks" to "California Rare Plant Ranks (CRPR)." This was done to reduce confusion over the fact that CNPS and CDFW jointly manage the Rare Plant Status Review groups (300+ botanical experts from government, academia, non-governmental organizations, and the private sector) and that the rank assignments are the product of a collaborative effort and not solely a CNPS assignment.

Table 3-2. Special-Status Wildlife and Fish Known or with Potential to Occur in the Project Region, or That May Be Affected by the Proposed Project

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
Invertebrates				
Conservancy fairy shrimp *Branchinecta conservatio*	E/-	Typically found in large, turbid vernal pools but known to occur in other types of pools; occurs in scattered locations from Butte and Tehama Counties to Ventura County.	Habitat absent	No suitable vernal pool habitat is present in the BSA.
Vernal pool fairy shrimp *Branchinecta lynchi*	T/–	Found in Central Valley, central and south Coast Ranges from Tehama to Santa Barbara County; isolated populations also in Riverside County; common in vernal pools; also found in sandstone rock outcrop pools.	Habitat absent	No suitable vernal pool habitat is present in the BSA.
Vernal pool tadpole shrimp *Lepidurus packardi*	E/–	Found from Shasta County south to Merced County; occurs in vernal pools and ephemeral stock ponds.	Habitat absent	No suitable vernal pool habitat is present in the BSA.
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	T/–	Streamside habitats below 3,000 feet throughout the Central Valley; occurs in riparian and oak savanna habitats with elderberry shrubs; elderberries are the host plant.	Habitat present	Seven elderberry shrubs are present in the BSA. Only one shrub occurs within riparian habitat.
Amphibians				
California tiger salamander *Ambystoma californiense*	T/T	Breeds during the wet season in vernal pools and ponds, with a minimum 10-week inundation period; adults spend most of the year in grassland oak woodland habitat, primarily in small mammal burrows; occurs from Yolo to Kern County in the Central Valley and in the Sierra Nevada foothills from Amador to Tulare County, and from Sonoma to Santa Barbara County on the coast.	Habitat absent	No suitable habitat for the species is present in the BSA, and the BSA is outside the known distribution of the species.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
California red-legged frog *Rana draytonii*	T/SSC	Found along the coast and coastal mountain ranges of California from Mendocino to San Diego County and in the Sierra Nevada from Butte to Tuolumne County; occurs in permanent and semipermanent aquatic habitats, such as creeks and ponds, with emergent and submergent vegetation; uses upland areas for cover (burrows, logs, rocks, and crevices) and dispersal.	Habitat absent	No suitable habitat for the species is present in the BSA, and the BSA is outside the known distribution of the species.
Reptiles				
Western pond turtle *Emys marmorata*	–/SSC	Occurs throughout California west of the Sierra-Cascade crest; found from sea level to 6,000 feet; does not occur in desert regions except along the Mojave River and its tributaries; occupies ponds, marshes, rivers, streams, and irrigation canals with muddy or rocky bottoms.	Habitat present	In the BSA, suitable aquatic habitat is present in the Sacramento River, and potential upland habitat is present in riparian woodland habitat adjacent to the river.
Giant garter snake *Thamnophis gigas*	T/T	Sloughs, canals, low-gradient streams, and freshwater marsh habitats with a prey base of small fish and amphibians; also found in irrigation ditches and rice fields; requires grassy banks and emergent vegetation for basking and areas of high ground protected from flooding during winter.	Habitat absent	The Sacramento River is not considered suitable aquatic habitat for the species. No other suitable habitat is present in the BSA.
Birds				
Swainson's hawk *Buteo swainsoni*	–/T	Lower Sacramento and San Joaquin Valleys, the Klamath Basin, and Butte Valley; highest nesting densities occur near Davis and Woodland, Yolo County; nests in oaks or cottonwoods in or near riparian habitats; forages in grasslands, irrigated pastures, and grain fields.	Habitat present	Suitable nest trees occur within and adjacent to the BSA. Species has been documented nesting north and south of the BSA along the Sacramento River.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
White-tailed kite Elanus leucurus	–/FP	Lowland areas west of Sierra Nevada from the head of the Sacramento Valley south, including coastal valleys and foothills to western San Diego County at the Mexico border; low foothills or valley areas with valley or live oaks, riparian areas, and marshes near open grasslands for foraging.	Habitat present	Suitable nest trees occur within and adjacent to the BSA.
Western snowy plover *Charadrius alexandrines nivosus*	T/SSC	Barren to sparsely vegetated ground at alkaline or saline lakes, reservoirs, ponds, and riverine sand bars; also along sewage, salt-evaporation, and agricultural wastewater ponds.	Habitat absent	The BSA lacks suitable habitat for the species.
Mountain plover *Charadrius montanus*	-/SSC	Occupies open plains or rolling hills with short grasses or very sparse vegetation; nearby bodies of water are not needed; may use newly plowed or sprouting grainfields.	Habitat absent	The BSA lacks suitable habitat for the species.
Western yellow-billed cuckoo *Coccyzus americanus occidentalis*	T/E	In the west, breeding populations are limited primarily to the Sacramento Valley; nests in large blocks of riparian habitat with dense understory foliage.	Habitat absent	The riparian habitat in the BSA is not typical nesting habitat used by the species because it consists of mostly thin rows of trees along the river with very little understory.
Burrowing owl *Athene cunicularia*	–/SSC	Lowlands throughout California, including the Central Valley, northeastern plateau, southeastern deserts, and coastal areas; rare along south coast; level, open, dry, heavily grazed or low stature grassland or desert vegetation with available burrows.	Habitat absent	The BSA lacks ground squirrel burrows or other structures that could be used by burrowing owl for nesting.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
Least Bell's vireo *Vireo bellii pusillus*	E/E	Historically nested in riparian habitat throughout the Central Valley, but the majority of the population now occurs in southern California; recently documented nesting on the San Joaquin River west of Modesto; requires dense riparian vegetation for nesting and a dense, stratified canopy for foraging	Habitat absent	The BSA lacks dense riparian vegetation with a stratified canopy.
Purple martin *Progne subis*	-/SSC	Nests in abandoned woodpecker holes in oaks, cottonwoods, and other deciduous trees in a variety of wooded and riparian habitats. Also nests in vertical drainage holes under elevated freeways and highway bridges.	Habitat present	The species is known to nest in ventilation holes underneath the Sacrament side of the I Street Bridge ramp.
Bank swallow *Riparia riparia*	-/T	Nests in bluffs or banks, usually adjacent to water, where the soil consists of sand or sandy loam.	Habitat absent	The Sacramento River within the BSA lacks suitable bank habitat with sandy open soil for nesting. The banks are all covered with rip-rap.
Grasshopper sparrow *Ammodramus svannarum*	-/SSC	Occurs in dry, dense grasslands, especially those with a variety of grasses and tall forbs and scattered shrubs for singing perches. Nests in slight depressions in dense grasslands.	Habitat absent	The BSA lacks dense grasslands.
Song sparrow ("Modesto populations") *Melospiza melodia*	-/SSC	Endemic to the north-central portion of the Central Valley and the Bay-Delta; breeds in emergent marsh and riparian scrub, and in valley oak riparian forests with dense blackberry understory, vegetated irrigation canals, and levees.	Habitat absent	The BSA lacks riparian habitat with a dense understory and lacks emergent marsh.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
Tricolored blackbird *Agelaius tricolor*	–/E	Permanent resident in the Central Valley from Butte to Kern County; breeds at scattered coastal locations from Marin County south to San Diego County; and at scattered locations in Lake, Sonoma, and Solano Counties; rare nester in Siskiyou, Modoc, and Lassen Counties; nests in dense colonies in emergent marsh vegetation, such as tules and cattails, or upland sites with blackberries, nettles, thistles, and grainfields; habitat must be large enough to support 50 pairs; probably requires water at or near the nesting colony.	Habitat absent	The BSA lacks suitable nesting and foraging habitat for the species.
Yellow-headed blackbird *Xanthocephalus xanthocephalus*	-/SSC	Nests in freshwater emergent wetlands with dense vegetation and deep water, often along borders of lakes or ponds; forages along moist shorelines and in grasslands and agricultural areas; breeding range includes primarily the Central Valley, northeastern California, and portions of southern California; most individuals migrate south of California in winter.	Habitat absent	The BSA lacks suitable nesting and foraging habitat for the species.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
Mammals				
Pallid bat *Antrozous pallidus*	–/SSC	Occurs throughout California, primarily at lower and mid-level elevations in a variety of habitats from desert to coniferous forest; most closely associated with oak, yellow pine, redwood, and giant sequoia habitats in northern California and oak woodland, grassland, and desert scrub in southern California. Daytime roosts include rock outcrops, mines, caves, hollow trees, buildings, and bridges.	Habitat present	The I Street and Jibboom Street approach structures in the BSA are known to be used by bats. Trees on both sides of the river within the BSA also provide potential habitat for bats. Buildings within and adjacent to the BSA also provide potential roosting habitat for pallid bats.
Townsend's big-eared bat *Corynorhinus townsendii townsendii*	–/T	Roosts in caves, tunnels, mines, and dark attics of abandoned buildings; very sensitive to disturbances and may abandon a roost after one onsite visit. Also reported to use bridges and hollow trees as roost sites. In bridges, typically uses cavernous spaces under bridges. In California, occurs in inland deserts, moist cool redwood forests, oak woodlands of the inner Coast Ranges and Sierra Nevada foothills, and lower to mid-elevation mixed coniferous forests.	Habitat absent	The species is not currently known to occur on the floor of the Sacramento Valley.
Western red bat *Lasiurus blossevillii*	–/SSC	Found throughout much of California at lower elevations; found primarily in riparian and wooded habitats; occurs at least seasonally in urban areas; day roosts in trees within the foliage; found in fruit orchards and sycamore riparian habitats in the Central Valley.	Habitat present	Trees within the BSA represent potential roosting habitat for the species.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
Western mastiff bat *Eumops perotis californicus*	-/SSC	Typically roosts in crevices in cliffs and rocky outcrops, in colonies of fewer than 100 individuals; may also roost in caves and buildings that allow sufficient height and clearance for dropping into flight; forages in a variety of grassland, shrub, and wooded habitats, including riparian and urban areas, although most commonly in open, arid lands; year-round range spans most of California, with records absent from the northwest and northeast portions of the state and is not known to occur on the floor of the Sacramento Valley.	Habitat absent	Although areas that could be used for roosting are present in the BSA (buildings), the species is not known to roost on the floor of the Sacramento Valley.
American badger *Taxidea taxus*	-/SSC	Drier open shrub, forest, and herbaceous habitats with friable soils; typically does not occupy cultivated lands; a single individual's home range can range between 300 and 1,500 acres; year-round range spans all of California except the Humboldt and Del Norte County coasts.	Habitat absent	No suitable habitat in the BSA for this species.
Fish				
Sacramento River winter-run Chinook salmon *Oncorhynchus tshawytscha*	E/E	Mainstem Sacramento River below Keswick Dam (Moyle 2002); occurs in well-oxygenated, cool, riverine habitat with water temperatures from 8.0 to 12.5 °C; habitat types are riffles, runs, and pools (Moyle 2002); adults and juveniles migrate in the lower Sacramento River and through the Delta.	Habitat present	Sacramento River within the BSA provides migration and seasonal rearing habitat, is designated as critical habitat for the species, and is considered essential fish habitat (EFH) for Chinook salmon.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
Central Valley spring-run Chinook salmon *Oncorhynchus tshawytscha*	T/T	Upper Sacramento River, Feather River, and Yuba River and several perennial tributaries of the Sacramento River (Battle, Butte, Clear, Deer, and Mill Creeks); has the same general habitat requirements as winter-run Chinook salmon; coldwater pools are needed for holding adults (Moyle 2002); adults and juveniles migrate in the lower Sacramento River and through the Delta.	Habitat present	Sacramento River within the BSA provides migration and seasonal rearing habitat, is designated as critical habitat for the species, and is considered EFH for Chinook salmon.
Central Valley fall-/late fall–run Chinook salmon *Oncorhynchus tshawytscha*	SC/SSC	Sacramento and San Joaquin Rivers and tributary Central Valley streams and rivers below impassable barriers; occurs in well-oxygenated, cool, riverine habitat with water temperatures from 8.0 to 12.5 °C; habitat types are riffles, runs, and pools; adults spawn at head of riffles/tails of pools; young rear for several months and emigrate to the ocean before summer (Moyle 2002).	Habitat present	Sacramento River within the BSA provides migration and seasonal rearing habitat, and is considered EFH for Chinook salmon.
Central Valley steelhead *Oncorhynchus mykiss*	T/–	Sacramento and San Joaquin Rivers and tributary Central Valley streams and rivers below impassable barriers; occurs in well-oxygenated, cool, riverine habitat with water temperatures from 7.8 to 18 °C; habitat types are riffles, runs, and pools; adults spawn at head of riffles/tails of pools; young rear year-round for 1–4 years before emigrating to the ocean (Moyle 2002).	Habitat present	Sacramento River within the BSA provides migration and seasonal rearing habitat, and is designated as critical habitat for the species.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
Green sturgeon (southern DPS) *Acipenser medirostris*	T/SSC	Sacramento, Klamath, and Trinity Rivers (Moyle 2002). Spawns in large river systems with well-oxygenated water, with temperatures from 8.0 to 14 °C.	Habitat present	Sacramento River within the BSA provides migration and rearing habitat, and is designated as critical habitat for the species.
Delta smelt *Hypomesus transpacificus*	T/E	Found primarily in the Sacramento–San Joaquin Estuary but has been found as far upstream as the mouth of the American River on the Sacramento River and Mossdale on the San Joaquin River; range extends downstream to San Pablo Bay; occurs in estuary habitat in the Delta where fresh and brackish water mix in the salinity range of 2–7 parts per thousand (Moyle 2002).	Habitat present	Sacramento River within the BSA provides migration, spawning, and seasonal rearing habitat and is designated as critical habitat for the species.
Longfin smelt *Spirinchus thaleichthys*	-/T	San Francisco estuary, Humboldt Bay, Eel River estuary, and Klamath River estuary. Occurs in open waters of estuaries and seasonally migrates to spawn in freshwater habitats of upper estuary; spawns over sand, rocks, and aquatic plants.	Habitat present	Sacramento River within the BSA provides migration, spawning, and seasonal rearing habitat.
Sacramento splittail *Pogonichthys macrolepidotus*	–/SSC	Occurs throughout the year in low-salinity waters and freshwater areas of the Sacramento–San Joaquin Delta, Yolo Bypass, Suisun Marsh, Napa River, and Petaluma River (Moyle 2002). Spawning takes place among submerged and flooded vegetation in sloughs and the lower reaches of rivers.	Habitat present	Sacramento River within the BSA provides migration, spawning, and seasonal rearing habitat.

Common Name *Scientific Name*	Legal Status (Federal/State/Other)	General Habitat Description	Habitat Present/Absent	Rationale
River lamprey *Lampetra ayresi*	–/SSC	Sacramento, San Joaquin, and Napa Rivers; tributaries of San Francisco Bay (Moyle 2002; Moyle et al. 1995). Adults live in the ocean and migrate into fresh water to spawn.	Habitat present	Sacramento River within the BSA provides migration and rearing habitat.

[a] Status explanations:

Federal

E = Listed as endangered under the federal Endangered Species Act.
T = Listed as threatened under the federal Endangered Species Act.
D = Delisted from the federal Endangered Species Act.
– = No listing.

State

E = Listed as endangered under the California Endangered Species Act.
T = Listed as threatened under the California Endangered Species Act.
P = Proposed for listing as threatened or endangered under the California Endangered Species Act.
FP = Fully protected under the California Fish and Game Code.
SSC = Species of special concern in California.
– = No listing.

Notes: Habitat absent – no habitat present and no further work needed. Habitat present –habitat is, or may be, present. The species may be present.

Chapter 4 Results: Biological Resources, Discussion of Impacts and Mitigation

The impact analysis for biological resources was conducted by evaluating the potential changes to existing biological communities based on the anticipated project construction activities and permanent project elements that could cause impacts of varying degrees on sensitive biological resources present in the BSA.

There are two roadway design alternatives for the Railyards Boulevard/Jibboom Street/Bercut Drive intersection in the City of Sacramento, but both alternatives would have the same impact area on biological resources. Therefore, the impacts of these alternatives are not discussed separately in this chapter. In some instances, impacts of the two City of West Sacramento residential access alternatives on biological resources would differ from each other. These differences are described in the analyses below. Figure 3-1 shows the locations of each land cover type and proposed project impacts. Table 4-1 lists the acreages of each land cover type within the portions of the BSA that would be permanently or temporarily affected by the proposed project.

Table 4-1. Permanent and Temporary Impacts on Land Cover Types in the Biological Study Area[a]

	Proposed Project with West Sacramento Residential Access Alternative 1[a]		Proposed Project with West Sacramento Residential Access Alternative 2[a]	
Land Cover Type	**Permanent Impact Area (acres)**	**Temporary Impact Area (acres)**	**Permanent Impact Area (acres)**	**Temporary Impact Area (acres)**
Cottonwood riparian forest[b]	2.54	1.79	1.44	1.52
Riparian forest/shrub wetland[b]	0.07	0.11	0	0
Perennial drainage[b]	1.85	0.10	1.85	0.10
Ruderal woodland	2.00	1.70	2.00	1.70
Landscaped	0.60	0.70	0.54	0.63
Developed/graded	7.91	5.87	7.74	5.69
Total	**15.23**	**10.27**	**13.55**	**9.64**

[a] There are no differences in acreage impacts as a result of the City of Sacramento roadway design alternatives.
[b] These are natural communities of special concern.

4.1 Natural Communities of Special Concern

The BSA supports three natural communities of special concern: cottonwood riparian forest, riparian forest/shrub wetland, and perennial stream.

4.1.1 Cottonwood Riparian Forest

4.1.1.1 Survey Results

Riparian forest in the BSA occurs along the upper banks and floodplains of the Sacramento River. The overstory of riparian forest is predominantly mature Fremont cottonwood trees associated with valley oak and black walnut. Other riparian tree species observed include Oregon ash, boxelder, and black willow. The riparian understory on the waterside of the levee is primarily rip-rap with non-native annual grasses and forbs; however, there are also patches of more typical riparian species, such as narrow-leaf willow, Himalayan blackberry, and mugwort. Local, state, and federal agencies recognize riparian habitats as sensitive natural communities.

4.1.1.2 Project Impacts

Implementation of the proposed project would result in a loss of cottonwood riparian habitat. Clearing of the existing cottonwood riparian forest vegetation within the proposed project footprint would result from construction activities related to the abutments for the two fixed-span bridge approach structures on both the City of Sacramento and City of West Sacramento sides, residential access in West Sacramento, temporary access roads, and roadway approaches (Figure 3-1). Impacts on cottonwood riparian forest differ between the two proposed residential access alternatives in the City of West Sacramento (Table 4-1).

Construction of the proposed project with City of West Sacramento Residential Access Alternative 1 would result in permanent loss of up to 2.54 acres of cottonwood riparian forest within the area designated as the limits of disturbance. Clearing of the existing cottonwood riparian forest vegetation within the proposed project footprint would result from activities related to construction of two fixed-span bridge approach structures, the bikeway along Jibboom Street in the City of Sacramento, the new residential access road connecting B Street and C Street, and recontouring the slope on the north side of the road in the City of West Sacramento (Figure 3-1). The riparian area between the permanent footprint of the bridge abutments and the bikeway on the City of Sacramento side or the road on the City of West Sacramento side would be considered permanently removed. In this area, vegetation would be removed during construction of the adjacent structures and overhead bridge and would be unlikely to revegetate after construction due to low clearance under the bridge and shading from the bridge. Up to 1.79 acres of riparian forest would temporarily be disturbed during construction of the proposed project with City of West Sacramento Residential Access Alternative 1. Temporary impacts would occur from trimming riparian vegetation and removing additional trees and understory vegetation to provide equipment access.

Construction of the proposed project with City of West Sacramento Residential Access Alternative 2 would result in permanent loss of up to 1.44 acres of cottonwood riparian forest

within the area designated as the limits of disturbance. Clearing of the existing cottonwood riparian forest vegetation within the proposed project footprint would result from construction activities related to construction of two fixed-span bridge approach structures, the bikeway along Jibboom Street in the City of Sacramento, and the new residential access road connecting B Street and 3rd Street in the City of West Sacramento (Figure 3-1). As described for Alternative 1, the riparian area between the permanent footprint of the bridge abutments and the bikeway on the City of Sacramento side or the road on the City of West Sacramento side also would be considered permanently removed. Temporary disturbance of up to 1.52 acres of riparian forest would occur during construction of the proposed project with City of West Sacramento Residential Access Alternative 2. Temporary impacts would occur from trimming riparian vegetation and removing additional trees and understory vegetation to provide equipment access.

The proposed project could result in indirect impacts on riparian habitat from shading of habitat by the new bridge approach structures on both river banks. The extent of potential shading effects on areas north and south of the bridge depends on the width and height of the new approach structures above the existing vegetation and the orientation of the structures relative to the sun's path. During part of the year, the north side of the new structures would be more shaded than the south side. However, the height of the proposed structures would allow adequate light to penetrate most of the adjacent vegetation during much of the year and would be unlikely to cause a loss of, or a shift in, the species composition of riparian vegetation adjacent to the new structures. Further discussion of potential shading impacts and loss of shaded riverine aquatic (SRA) cover habitat is provided in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

State and federal agencies would require avoidance, minimization, and compensatory mitigation for the loss of riparian habitat. CDFW will require an LSAA for construction within the riparian habitat.

4.1.1.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3 would ensure that the proposed project minimizes effects on cottonwood riparian forest adjacent to the project construction area.

Measure 1: Install Orange Construction Fencing between the Construction Area and Adjacent Sensitive Biological Resources

The project proponent and/or their contractor will install orange construction fencing between the construction area and adjacent sensitive biological resource areas. Sensitive biological resources that occur adjacent to the construction area that could be directly affected by the project include natural communities of special concern; special-status

wildlife habitats for valley elderberry longhorn beetle; nest sites of Swainson's hawk, purple martin, or other migratory birds; roosting bats; and protected trees to be avoided.

Barrier fencing around sensitive areas will be installed as one of the first orders of work and prior to equipment staging. Before construction begins, the construction contractor will work with the project engineer and a resource specialist to identify the locations for the orange construction fencing, and will place stakes around the sensitive resource sites to indicate these locations. The protected areas will be designated as environmentally sensitive areas and clearly identified on the construction plans and described in the specifications. To minimize the potential for snakes and other ground-dwelling animals from being caught in the orange construction fencing, the fencing will be placed with at least a 1-foot gap between the ground and the bottom of the orange construction fencing. The exception to this condition is where construction barrier fencing overlaps with erosion control fencing and must be secured to prevent sediment runoff. Barrier fencing will be installed before construction activities are initiated, maintained throughout the construction period, and removed after completion of construction.

Measure 2: Conduct Environmental Awareness Training for Construction Employees

The project proponent will retain a qualified biologist to conduct environmental awareness training for construction crews before project implementation. The awareness training will be provided to all construction personnel and will brief them on the need to avoid effects on sensitive biological resources (e.g., native trees, natural communities of special concern, and special-status species habitats in and adjacent to the construction area). The education program will include a brief review of the special-status species with the potential to occur in the BSA (including their life history, habitat requirements, and photographs of the species). The training will identify the portions of the BSA in which the species may occur, as well as their legal status and protection. The program also will cover the restrictions and guidelines that must be followed by all construction personnel to reduce or avoid effects on these species during project implementation. This will include the steps to be taken if a sensitive species is found within the construction area (i.e., notifying the crew foreman, who will call a designated biologist). In addition, construction employees will be educated about the importance of controlling and preventing the spread of invasive plant infestations. An environmental awareness handout that describes and illustrates sensitive resources to be avoided during project construction and identifies all relevant permit conditions will be provided to each crew member. The crew foreman will be responsible for ensuring that crew members adhere to the guidelines and restrictions. Education programs will be conducted for appropriate new personnel as they are brought on the job during the construction period.

Measure 3: Conduct Periodic Biological Monitoring

The project proponent will retain a qualified biological monitor for the project who will visit the site a minimum of once per week to ensure that fencing around environmentally sensitive areas is intact and that activities are being conducted in accordance with the

agreed upon project schedule and agency conditions of approval. The monitor will provide the project proponent with a monitoring log for each site visit.

Certain activities will require a biological monitor to be present for the duration of the activity or during the initial disturbance of an area to ensure that impacts on special-status species are avoided. The activities that require specific monitoring are identified below in Measures 10, 13, 25, and 26.

4.1.1.4 Compensatory Mitigation

Implementation of Measure 4 would compensate for temporary effects to and permanent loss of riparian forest habitat.

Measure 4: Compensate for Temporary Effects to and Permanent Loss of Cottonwood Riparian Forest (including SRA Cover)

The project proponent will compensate for the permanent loss of up to 2.54 acres of riparian forest under City of West Sacramento Residential Access Alternative 1 or up to 1.44 acres of riparian forest under City of West Sacramento Residential Access Alternative 2. In addition, any unavoidable temporary loss of riparian forest will be mitigated. The project proponent will implement onsite and, if necessary, offsite compensation measures and/or purchase mitigation bank credits to compensate for losses of cottonwood riparian forest on the waterside slope of the existing levees, including riparian forest supporting SRA cover habitat (as described in section 4.4.1.4, "Survey Results", portions of the cottonwood riparian forest in the BSA also provide SRA cover habitat for fish). Onsite compensation will be used to the maximum extent practicable. Compliance with the USACE levee vegetation policy (U.S. Army Corps of Engineers 2014), the ULDC (California Department of Water Resources 2012b), or other engineering constraints may limit the ability to achieve full onsite compensation. Therefore, offsite compensation and/or purchase of mitigation bank credits may be needed to achieve no net loss of existing in-kind riparian and SRA cover habitat values. Each of these options is discussed below.

1. **Onsite and/or Offsite Restoration and/or Enhancement along the Sacramento River.** Riparian habitat restoration and/or enhancement onsite or offsite should occur in the same year construction is completed. For onsite or offsite replacement plantings, the project proponent will prepare a mitigation planting plan, including a species list and number of each species, planting locations, and maintenance requirements. Plantings will consist of cuttings taken from local plants or plants grown from local material. Planted species for the mitigation plantings will be similar to those removed from the project area and will include native species, such as Fremont cottonwood, valley oak, black walnut, Oregon ash, boxelder, and black willow. The final planting plan will be developed based on results of the arborist survey for species to be removed (see additional discussion below). All plantings will be fitted with exclusion cages or other suitable protection from herbivory. Plantings will be irrigated for up to 3 years or until established. Plantings will be monitored annually for 3 years or as required in the project permits. If 75% of the plants survive

at the end of the monitoring period, the re-vegetation will be considered successful. If the survival criterion is not met at the end of the monitoring period, planting and monitoring will be repeated after mortality causes have been identified and corrected.

2. **Mitigation Bank Credit Purchase.** If this option is chosen, the project proponent will provide written evidence to the resource agencies that compensation has been established through the purchase of mitigation credits. The amount to be paid will be the fee that is in effect at the time the fee is paid. The mitigation will be approved by CDFW and may be modified during the permitting process. Mitigation can be in the form of creation and/or preservation credits. If mitigation is in the form of restoration/creation credits, the mitigation will be at a minimum ratio of 1:1 (1 acre of restored or created riparian habitat for each acre of riparian habitat removed). If mitigation is in the form of preservation credits, the mitigation will be at a minimum ratio of 2:1 (2 acres of preserved riparian habitat for each acre of riparian habitat removed). The final compensation ratio will be approved by CDFW in order to result in no net loss of riparian habitat. The project proponent will purchase riparian habitat credits from an approved mitigation bank near the project, such as the Cosumnes Floodplain Mitigation Bank, Fremont Landing Conservation Bank, or Elsie Gridley Mitigation Bank. Replacement riparian forest habitat will include trees species that would support nesting Swainson's hawk (i.e., oak, cottonwood) and will occur within the range of nesting Swainson's hawk within the Sacramento Valley.

To provide a more accurate estimate of tree loss, an arborist survey will be conducted upon completion of 90% design plans for the project. In addition to a description of the tree, the arborist survey report will include the precise location of the trunk and size of the dripline for all trees whose trunk or canopy overlap with the project footprint. Riparian forest compensation will be consistent with the requirements of the City of West Sacramento and City of Sacramento tree ordinances to ensure compensation for losses of individual protected trees.

In addition to mitigating for the loss of riparian forest habitat, specific measures will be included to satisfy NMFS requirements and compensate for the loss of SRA cover (area and linear feet). However, the acreage will not be duplicated, such that the acreage of riparian forest habitat restored for SRA cover mitigation will apply towards riparian forest habitat mitigation requirements. SRA cover mitigation will include the following riparian replacement requirements:

- Replace the 890 linear feet and 0.44 acres of affected SRA cover vegetation (see section 4.4.1.5, "Loss of Shaded Riverine Aquatic Cover") at a 3:1 replacement ratio (i.e., 3 linear feet replaced for every 1 foot affected and 3 acres replaced for every acre affected) by planting native riparian trees in temporary impact areas and along existing onsite or offsite unshaded banks along the Sacramento River.
- Plant native riparian trees onsite to the maximum extent practicable, followed by planting on adjacent reaches of the Sacramento River to minimize the need for purchasing offsite mitigation bank credits.
- Plant riparian trees that are intended to provide SRA cover along the water's edge at summer low flows up to the OHWM and at sufficient densities to provide shade along

at least 85% of the bank's length when the trees reach maturity. This will ensure that riparian plantings intended for SRA cover mitigation will contribute to instream SRA cover when they are inundated during winter/spring flows and overhead cover (shade) during summer flows when they approach maturity.

- Monitor and evaluate the re-vegetation success of riparian plantings intended for SRA cover mitigation as described above.

If mitigation for SRA cover is in the form of offsite mitigation bank credits, credits will need to be purchased from an approved mitigation bank within the approved service area for the project that provides riparian forest floodplain conservation credits as off-site compensation for impacts on state- and federally-listed fish species, designated critical habitat, and EFH for Pacific salmon.

4.1.1.5 Cumulative Impacts

Cumulative impacts on riparian forest would result from construction of other general development and levee projects in Sacramento and Yolo Counties. Although implementation of the avoidance and minimization efforts and compensatory mitigation would replace the lost habitat, the compensation would occur offsite and not on the Sacramento River, in compliance with the Urban Levee Design Criteria regarding woody vegetation on flood protection levees (California Department of Water Resources 2012b). The loss of riparian forest on the Sacramento River, therefore, would be permanent and would contribute to the ongoing loss of riparian habitat along the river. Therefore, construction of the proposed project would make a considerable contribution to the cumulative loss of riparian forest.

4.1.2 Riparian Forest/Shrub Wetland

4.1.2.1 Survey Results

Riparian forest/shrub wetland in the BSA occurs in one wetland within riparian habitat that meets all three federal wetland criteria (i.e., hydrophytic vegetation, hydric soils, and wetland hydrology). The riparian forest/shrub wetland is located in the northern portion of the BSA, on the west side of the Sacramento River within a basin. The vegetative composition of riparian forest/shrub wetlands is predominantly cottonwood but also includes buttonwillow, boxelder, and narrow-leaf willow. Local, state, and federal agencies recognize riparian and wetland habitats as sensitive natural communities.

4.1.2.2 Project Impacts

Construction of the proposed project with City of West Sacramento Residential Access Alternative 1 would result in the loss of riparian forest/shrub wetland. Clearing of the existing riparian forest/shrub wetland vegetation within the proposed project footprint would result from construction activities related to the proposed connecting road between B Street and C Street and

recontouring the slope on the north side of the road (Figure 3-1). These construction activities would result in a permanent loss of approximately 0.07 acre of riparian wetland, pending verification of the wetland extent by USACE (Table 4-1). No impact on riparian forest/shrub wetland would result from constructing the proposed project with City of West Sacramento Residential Access Alternative 2.

Temporary disturbance of up to 0.11 acre of riparian wetland would occur during construction and likely would include trimming riparian vegetation and removing additional trees and understory vegetation to provide equipment access.

State and federal agencies would require avoidance, minimization, and compensatory mitigation for the loss of riparian wetland habitat. The loss or disturbance of riparian wetland vegetation is considered adverse because it provides a variety of important ecological functions and values.

4.1.2.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3 and 5 would ensure that the proposed project minimizes effects to riparian forest/shrub wetland habitat adjacent to the project construction area.

Measure 5: Protect Water Quality and Prevent Erosion and Sedimentation in Drainages and Wetlands

The project proponent and/or their construction contractor will comply with all construction site BMPs specified in the Water Quality Assessment Report prepared for the project (ICF 2015) and the final SWPPP that will be developed for the project, as well as any other permit conditions to minimize introduction of construction-related contaminants and mobilization of sediment in the Sacramento River and the riparian forest/shrub wetland. Broadly, these BMPs will address soil stabilization, sediment control, wind erosion control, vehicle tracking control, non-storm water management, and waste management practices. The BMPs will be based on the best conventional and best available technology.

The proposed project is subject to storm water quality regulations established under the NPDES, described in Section 402 of the federal CWA. In California, the NPDES program requires that any construction activity disturbing 1 or more acres comply with the statewide General Permit, as authorized by the State Water Board. The General Permit requires elimination or minimization of non-storm water discharges from construction sites and development and implementation of a SWPPP for the site. The primary elements of the SWPPP include the following.

- Description of site characteristics—including runoff and streamflow characteristics and soil erosion hazard—and construction procedures
- Guidelines for proper application of erosion and sediment control BMPs
- Description of measures to prevent and control toxic materials spills

- Description of construction site housekeeping practices

In addition to these primary elements, the SWPPP specifies that the extent of soil and vegetative disturbance would be minimized by control fencing or other means and that the extent of soil disturbed at any given time would be minimized. The SWPPP must be retained at the construction site.

The BMPs will be selected to achieve maximum sediment removal and represent the best available technology that is economically achievable; they are subject to review and approval by the project proponent. The project proponent will perform routine inspections of the construction area to verify that the BMPs are properly implemented and maintained. The project proponent will notify contractors immediately of a noncompliance issue and will require compliance.

The BMPs will include, but are not limited to, the following.

- All earthwork or foundation activities involving wetlands or the intermittent vegetated stream will occur in the dry season (between May 1 and October 31). All in-water work within the Sacramento River will be conducted between May 1 and November 30 to minimize or avoid potential impacts on sensitive life stages (migration, spawning, egg and embryo incubation, and rearing) of special-status fish species.
- Equipment used in and around drainages and wetlands will be in good working order and free of dripping or leaking engine fluids. All vehicle maintenance will be performed at least 300 feet from all streams. Any necessary equipment washing will be carried out where the water cannot flow into drainages or wetlands.
- Develop a hazardous material spill prevention control and countermeasure plan before construction begins. The plan will include strict onsite handling rules to keep construction and maintenance materials from entering the river, including procedures related to refueling, operating, storing, and staging construction equipment and to preventing and responding to spills. The plan also will identify the parties responsible for monitoring a spill response. During construction, any spills will be cleaned up immediately according to the spill prevention control and countermeasure plan. The project proponent will review and approve the contractors' spill prevention control and countermeasure plan before allowing construction to begin.
- Prohibit the following types of materials from being rinsed or washed into the streets, shoulder areas, or gutters: concrete, solvents and adhesives, thinners, paints, fuels, sawdust, dirt, gasoline, asphalt and concrete saw slurry, and heavily chlorinated water.
- Take any surplus concrete rubble, asphalt, or other rubble from construction to a local landfill.
- Prepare and implement an erosion and sediment control plan for the proposed project that will include the following provisions and protocols. The SWPPP for the project will detail the applications and type of measures and the allowable exposure of unprotected soils.

- Discharge from dewatering operations, if needed, and runoff from disturbed areas will be made to conform to the water quality requirements of the waste discharge permit issued by the RWQCB.
- Apply temporary erosion control measures, such as sandbagged silt fences, throughout construction of the proposed project and remove them after the working area is stabilized or as directed by the engineer. Soil exposure will be minimized through use of temporary BMPs, groundcover, and stabilization measures. Exposed dust-producing surfaces will be sprinkled daily, if necessary, until wet; this measure will be controlled to avoid producing runoff. Paved roads will be swept daily following construction activities.
- The contractor will conduct periodic maintenance of erosion and sediment control measures.
- Plant an appropriate seed mix of native species on disturbed areas upon completion of construction.
- Cover or apply nontoxic soil stabilizers to inactive construction areas (previously graded areas inactive for 10 days or more) that could contribute sediment to waterways.
- Enclose and cover exposed stockpiles of dirt or other loose, granular construction materials that could contribute sediment to waterways. Material stockpiles will be located in non-traffic areas only. Side slopes will not be steeper than 2:1. All stockpile areas will be surrounded by a filter fabric fence and interceptor dike.
- Contain soil and filter runoff from disturbed areas by berms, vegetated filters, silt fencing, straw wattle, plastic sheeting, catch basins, or other means necessary to prevent the escape of sediment from the disturbed area.
- Use other temporary erosion control measures (such as silt fences, staked straw bales/wattles, silt/sediment basins and traps, check dams, geofabric, sandbag dikes, and temporary revegetation or other ground cover) to control erosion from disturbed areas as necessary.
- Avoid earth or organic material from being deposited or placed where it may be directly carried into the channel.

The project proponent also will obtain a 401 Water Quality Certification from the Central Valley RWQCB, which may contain additional BMPs and water quality measures to ensure the protection of water quality.

4.1.2.4 Compensatory Mitigation

Implementation of Measure 6 would compensate for temporary and permanent loss of riparian forest/shrub wetland habitat.

Measure 6: Compensate for Permanent Loss of Riparian Forest/Shrub Wetland

The project proponent will comply with any regulatory requirements determined as part of the CWA Section 404 permit for the work that would occur within the riparian

forest/shrub wetland, including wetland mitigation. The project proponent will compensate for the permanent loss of up to 0.07 acre of riparian forest/shrub wetland under City of West Sacramento Residential Access Alternative 1. The actual affected acreage is pending verification by USACE.

The project proponent will compensate for the loss of up to 0.07 acre of riparian forest/shrub wetland by purchasing mitigation bank credits, which can be in the form of preservation and/or creation credits:

- The mitigation ratio will be a minimum of 2:1 (2 acres of mitigation for each acre of riparian wetland filled), for a total of up to 0.14 acre, if credits are for preservation of riparian wetland habitat, or
- a minimum of 1:1 (1 acre of mitigation for each acre of riparian wetland removed), for a total of up to 0.07 acre, if credits are for creation of riparian wetland habitat.

Final ratios will be as required under the Section 404 permit in order to result in no net loss of wetland habitat. The project proponent will purchase riparian wetland credits from an approved mitigation bank near the project, such as the Cosumnes Floodplain Mitigation Bank or Elsie Gridley Mitigation Bank. If no suitable mitigation bank options are available at the time of construction, the project proponent will pay into the National Fish and Wildlife Foundation Sacramento District In-Lieu Fee (ILF) program.

4.1.2.5 Cumulative Impacts

Cumulative impacts on riparian forest/shrub wetland would result from construction of other general development projects in Sacramento and Yolo Counties. With implementation of the avoidance and minimization efforts and compensatory mitigation, construction of the proposed project would not add to the cumulative loss of riparian forest/shrub wetland and would not result in a cumulatively adverse effect on riparian forest/shrub wetland.

4.1.3 Perennial Stream

4.1.3.1 Survey Results

The Sacramento River is the only perennial stream in the BSA (see Figure 3-1). All perennial stream is unvegetated open water. The river averages 672 feet wide at the OHWM in the BSA. The river banks are levees that are mostly steeply sloped and support riparian forest vegetation, as described above, with rip-rap near the bottom of the slope. The Sacramento River is a TNW and a water of the United States subject to regulation under CWA Section 404 and Section 10 of the RHA, and under the jurisdiction of USACE. The river is considered a sensitive natural community. The RWQCB protects all waters of the State under the Porter-Cologne Act.

4.1.3.2 Project Impacts

Implementation of the proposed project would result in temporary and permanent impacts (placement of fill) on the Sacramento River in the BSA, including construction of bridge

approach structures and installation of RSP around bridge abutments and piers, RSP along the shoreline adjacent to the bridge, a bridge fender system, and temporary cofferdams (Figures 1-3 and 3-1). In addition to direct fill impacts, project activities could indirectly affect water quality within the stream by causing increased erosion and sedimentation downstream of the work area. The extent of impacts on perennial stream would be the same under all project alternatives.

The abutments for each of the two fixed-span approach structures would be constructed on a foundation above the OHWM. A total of up to 1.85 acre of permanent impacts on perennial stream in the Sacramento River would result from the following bridge components and RSP to be placed below the OHWM (see Table 4-9 below).

- The two fixed-span approach structures for the new bridge would be constructed on center piers (Piers 2 and 5) with foundations each consisting of 50 driven or CIDH piles. The piles would be covered by pile caps and RSP. The footprint for Piers 2 and 5 on the river bottom would total 8,500 square feet (0.20 acre).
- The movable span section of the bridge would be constructed on a foundation of four 9-foot diameter cast-in-steel-shell (CISS) piles in the river bed. The CISS piles, consisting of hollow steel shells, would be driven into the channel bottom using drivers and cranes on the temporary trestle or mounted on barges to temporarily place the steel shells at the desired location for each pile. Once the steel shells are in place, the soil inside the shell would be drilled out, and concrete would be poured into the dewatered hollow shells. The piles would be covered by pile caps and RSP. The footprint for r Piers 3 and 4 on the river bottom would total 1,864 square feet (0.04 acre).
- A bridge fender system would be constructed around the movable span piers that would include approximately 30 driven piles around each pier. The footprint of the bridge fender system on the river bottom would total 85 square feet (0.002 acre).
- RSP (1/4-ton, Method B) would be installed along 1,600 linear feet of shoreline (900 linear feet on City of Sacramento shoreline and 700 linear feet on City of West Sacramento shoreline) below the OHWM. The footprint for the RSP would total up to 70,000 square feet (1.61 acre).

Temporary impacts of up to 0.10 acre would occur due to installation of two cofferdams (approximately 0.09 acre) and approximately 141 temporary trestle piles (0.005 acre) during construction (see Table 4-9 below). A total of 160 trestle piles would be installed, but some of them would be above the OHWM. The area inside the cofferdams would be dewatered by pumping to the river, with implementation of sediment control measures if necessary.

State and federal agencies would require avoidance, minimization, and compensatory mitigation for the loss of perennial stream. The loss of perennial stream is considered adverse because it provides a variety of important ecological functions and values.

4.1.3.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3 and 5 would ensure that the proposed project minimizes effects on perennial stream adjacent to the project construction area.

4.1.3.4 Compensatory Mitigation

Implementation of Measure 7 would compensate for the permanent loss of perennial stream.

Measure 7: Compensate for Loss of Perennial Stream

The project proponent will comply with any regulatory requirements determined as part of the state (Section 401 Water Quality Certification or WDRs, LSAA) and federal (Section 404 and Section 10 permits) processes for the work that would occur in the Sacramento River. The project proponent will compensate for the permanent fill of up to 1.85 acre of other waters of the United States in the Sacramento River by purchasing mitigation bank credits, which can be in the form of preservation and/or creation credits using the following minimum ratios.

- A minimum of 2:1 (2 acres of mitigation for each acre filled), for a total of up to 3.7 acres, if credits are for preservation of habitat; or,
- A minimum of 1:1 (1 acre of mitigation for each acre filled), for a total of up to 1.85 acre, if credits are for creation of habitat.

The actual compensation ratios will be determined through coordination with the Central Valley RWQCB and USACE as part of the permitting process. The project proponent will compensate for permanent loss of perennial stream by implementing one or a combination of the following options.

- Purchase credits for created riparian stream channel at a USACE- approved mitigation bank with a service area that encompasses the project area, such as the Cosumnes Floodplain Mitigation Bank, Fremont Landing Conservation Bank, or Elsie Gridley Mitigation Bank. The project proponent will provide written evidence to the resource agencies that compensation has been established through the purchase of mitigation credits.
- Compensate out-of-kind for loss of perennial stream by implementing compensatory mitigation for cottonwood riparian forest impacts described in Measure 4. The acreage restored or created to compensate for loss of perennial stream will be added to the acreage restored or created for loss of riparian habitat.

4.1.3.5 Cumulative Impacts

Cumulative impacts on perennial stream would result from construction of other general development projects in Sacramento and Yolo Counties. With implementation of the avoidance

and minimization efforts and compensatory mitigation, construction of the proposed project would not add to the cumulative loss of perennial stream and would not result in a cumulatively adverse effect on perennial stream.

4.2 Special-Status Plant Species

4.2.1.1 Survey Results

Based on the searches of the CNDDB, the CNPS rare plant inventory, and the USFWS website, 24 special-status plant species were identified as occurring in the vicinity of the BSA (Table 3-3). The natural communities in the BSA contain potential habitat for 4 of these 24 species, but the relatively high level of historical and ongoing disturbance that is present in most of the BSA detracts from the quality of potential habitat for special-status plant species. No special-status plants were observed during 2015 botanical surveys, and none have been previously reported in the BSA (California Department of Fish and Wildlife 2015; California Native Plant Society 2015).

As mentioned in Chapter 2, the surveys coincided with the reported identification periods of all 24 special-status plant species, although 2015 was a severe drought rain year, which could affect the potential for observation of annual and herbaceous perennial species. All four species with potential habitat in the BSA are perennial, although three are herbaceous and potentially more sensitive to drought conditions (rose-mallow, Mason's lilaeopsis, and Suisun Marsh aster). However, the habitat for all three of these species would be restricted to the banks of the Sacramento River, and their seed germination and growth would not likely be affected by the drought conditions. Based on the field survey results and the lack of recorded occurrences in the BSA, this NES concludes that no special-status plant species occur in the BSA.

4.2.1.2 Project Impacts

No special-status plants were found during botanical surveys of the BSA; therefore, construction of the project with either residential access alternative is not expected to cause any direct or indirect impacts on special-status plants.

4.2.1.3 Avoidance and Minimization Efforts

No avoidance or minimization efforts for impacts on special-status plants are required.

4.2.1.4 Compensatory Mitigation

No compensatory mitigation for impacts on special-status plants is required.

4.2.1.5 Cumulative Impacts

No direct impacts on special-status plants would result from construction of the project; therefore, the project would not contribute to cumulative impacts on special-status plants.

4.3 Special-Status Wildlife Species

Seven special-status wildlife species were identified with the potential to occur in the BSA based on the known range of these species and the suitability of the habitat in the BSA. None of these species, or signs of their presence, were observed in the BSA during surveys.

4.3.1 Valley Elderberry Longhorn Beetle

The VELB is federally listed as threatened. The current known range of the VELB extends throughout California's Central Valley and associated foothills from about the 3,000-foot contour on the east and the watershed of the Central Valley on the west (U.S. Fish and Wildlife Service 1999:1). The VELB is dependent on its host plant, elderberry, which is a common component of riparian corridors and adjacent upland areas in the Central Valley (Barr 1991:5).

The VELB has four stages of life: egg, larva, pupa, and adult. Females deposit eggs on or adjacent to the host elderberry. Egg production varies, and females have been observed to lay between 16 and 180 eggs. Eggs hatch within a few days of being deposited and larvae emerge. The larvae bore into the wood of the host plant and create a long feeding gallery in the pith of the elderberry stem. The larvae feed on the pith of the plant for 1–2 years. When a larva is ready to pupate, it chews an exit hole to the outside of the stem and then plugs it with wood shavings. The larva then retreats into the feeding gallery to an enlarged pupal chamber. The larvae metamorphose into pupae between December and April; the pupal stage is thought to last about a month. The adult remains in the chamber for several weeks after the pupal phase and then emerges from the chamber through the exit hole, which is typically 4–10 millimeters (mm) in diameter and circular to oval in shape. Adults emerge between mid-March and mid-June, the flowering season of the plant. Adults feed on elderberry leaves and mate within the elderberry canopy (Talley et al. 2006a:7–9).

4.3.1.1 Survey Results

ICF wildlife biologist John Howe surveyed for and mapped elderberry shrubs in the BSA during the April 8, 2015 field survey. Seven elderberry shrubs were identified within the BSA. Five shrubs are located on the West Sacramento side, and two are on the Sacramento side of the BSA (Figure 3-1). The results of the survey are summarized in Table 4-2. Shrub 1 was observed to be a re-sprout from an elderberry stump, which appeared to have been cut down. The stump was measured to be approximately 12 inches in diameter at ground level; multiple new stems were growing out of it and from the surrounding soil. Shrub 5 also was cut down at some point; it had

two stumps greater than 5 inches in diameter with new stems growing out of them. Table 4-2 reports only those stems that currently provide habitat for VELB (i.e., the cut stumps themselves are not included). VELB has been documented approximately 0.5 mile north of the BSA along the west bank of the Sacramento (California Department of Fish and Wildlife 2015).

Table 4-2. Elderberry Shrub Survey Results

Shrub Number	Stem Diameter Class at Ground Level in Inches			Shrub Height in Feet	Exit Holes Present?	Shrub in Riparian Habitat?
	≥1–≤3	>3–<5	≥ 5			
1	4	0	0	6	No	No
2	0	1	1	22	No	No
3	0	0	1	12	No	No
4	4	3	0	15	No	No
5	18	0	0	10	No	No
6	6	0	3	26	No	No
7	0	0	1	20	No	Yes
Total	**32**	**4**	**6**			

4.3.1.2 Project Impacts

Five of the seven shrubs (shrubs 1, 2, 3, 5, and 7) would be directly affected (removed or trimmed) by project construction, regardless of roadway design or residential access alternative, and the other two (shrubs 4 and 6) could be indirectly affected by project construction (i.e., impacts between 20 and 100 feet from the shrub dripline). Shrubs 1, 2, 3, and 7 all fall within areas identified as temporarily impacted by project construction. Although these shrubs ultimately may be able to be avoided, construction activities would likely be within 20 feet of the shrub driplines. Shrub 5 would be permanently impacted with the connection of B and C Streets under both Alternatives 1 and 2 within the City of West Sacramento.

Shrub 4 is approximately 80 feet west of areas identified for temporary disturbance associated with the removal of the West Sacramento approach structure; Shrub 6 occurs immediately adjacent to the area identified as temporarily affected and less than 20 feet from areas of permanent impact. The USFWS typically considers project activities that result in a change in hydrology, fragmentation of habitat, drift of fertilizers or pesticides, increased pedestrian traffic, artificial lighting, and dust as potential indirect effects on the species. The project will not result in any of these effects on shrubs 4 and 6. Both shrubs occur in and adjacent to developed areas that are already subject to pedestrian traffic, artificial lighting, and the potential use of herbicides and pesticides from adjacent developed areas. The project construction that would occur within 100 feet of Shrub 4 is limited to the removal of the approach structure on the West Sacramento side of the river, which would not result in an alternation of the hydrology in this area. Although work would occur within 20 feet of shrub 6, it is located on the embankment of I-5, which is

above the current grade. Thus, construction activities at Bercut Drive and Railyards Boulevard are not likely to substantially alter the hydrology in the area around the shrub such that it would be adversely affected. Talley et al. (2006b:647) found that, in fact, elderberry shrubs adjacent to paved surfaces were less stressed that those near dirt surfaces, possibly because increased runoff from paved surfaces benefitted the shrubs. Talley et al. also found that dust from low-traffic dirt roads trails and paved roads did not affect VELB presence in shrubs either directly or indirectly through changed elderberry condition (Talley et al. 2006b:647). Therefore, project dust is not expected to affect the VELB or its habitat associated with shrubs 4 and 6. Though shrubs 4 and 6 occur within 100 feet of project construction, construction activities and the operation of the project are not expected to result in a change in condition that could result in take of VELB.

Project construction, regardless of roadway design or residential access alternative, is likely to adversely affect the federally threatened VELB through the loss of suitable habitat in accordance with the definition of take under the ESA.

4.3.1.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 8, and 9 would ensure that construction activities avoid and minimize impacts on VELB within and adjacent to the BSA.

Measure 8: Avoid and Minimize Impacts on Valley Elderberry Longhorn Beetle

The following measures will be implemented prior to and during construction to ensure that the proposed project does not adversely affect elderberry shrubs adjacent to the project footprint.

- Consistent with Measure 2, contractors will be briefed on the need to avoid damaging the elderberry shrubs and the possible penalties for not complying with these requirements. Crews also will be educated on the status of the VELB and the need to protect its habitat.
- All elderberry shrubs that are outside of the permanent project footprint or that can be avoided will be identified on construction drawings, with notes indicating that they are sensitive resources to be avoided.
- Consistent with Measure 1, orange construction barrier fencing will be placed at a minimum of 20 feet from each shrub's dripline [fencing around shrub 6 (construction will be within 20 feet) will be placed as far out from the dripline as possible]. No construction activities will be permitted within the buffer zone other than those activities necessary to erect the fencing. As specified in the Conservation Guidelines for the Valley Elderberry Longhorn Beetle (Guidelines) (U.S. Fish and Wildlife Service 1999), signs will be posted every 50 feet (at a minimum) along the perimeter of the buffer area fencing. The signs will contain the following information: *This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the Endangered Species Act of 1973, as amended. Violators are subject to prosecution, fines, and imprisonment*. The signs

should be clearly readable from a distance of 20 feet and must be maintained for the duration of construction.

- Consistent with Measure 3, buffer area fences around the shrubs will be inspected weekly by a biological monitor during ground-disturbing activities and monthly after ground-disturbing activities until project construction is complete or until the fences are removed, as approved by the biological monitor. The biological monitor will be responsible for ensuring that the contractor maintains the buffer area fences around elderberry shrubs throughout construction. Biological inspection reports will be provided to USFWS and the project proponent.

Measure 9: Transplant Elderberry Shrubs That Cannot Be Avoided

Elderberry shrubs that cannot be avoided will be transplanted to a USFWS-approved conservation area in accordance with the Guidelines (U.S. Fish and Wildlife Service 1999). Transplanting will occur during the plant's dormant phase (approximately November through the first 2 weeks of February, after they have lost their leaves). A qualified specialist familiar with elderberry shrub transplantation procedures will supervise the transplanting. The location of the conservation area transplantation site will be approved by USFWS before removal of the shrubs.

4.3.1.4 Compensatory Mitigation

Implementation of Measure 10 would compensate for direct impacts on VELB habitat.

Measure 10: Compensate for Impacts on Valley Elderberry Longhorn Beetle Habitat

Before construction begins, the project proponent will compensate for direct impacts (including transplanting) on all elderberry stems measuring 1 inch or more at ground level (i.e., habitat for VELB) that are located within 20 feet of proposed construction activities. Compensation will include planting replacement elderberry seedlings or cuttings and associated native plantings in a USFWS-approved conservation area, at a ratio between 1:1 and 8:1 (ratio = new plantings to affected stems), depending on the diameter of the stem at ground level, the presence or absence of exit holes, and whether the shrub is located in riparian habitat (U.S. Fish and Wildlife Service 1999).

Mitigation credits for VELB will be purchased at a USFWS-approved mitigation bank. The exact amount and location of compensatory mitigation will be based on consultation with USFWS.

Table 4-3 summarizes the compensation required for direct effects on up to five elderberry shrubs (shrubs 1, 2, 3, 5, and 7) that provide VELB habitat. Based on stem counts listed in Table 4-2 for these five shrubs and in accordance with the Guidelines, 34 elderberry seedlings and 34 associated native plants will be planted in a USFWS-approved conservation area. This compensation may be reduced if some of the shrubs occurring within temporary impact areas (shrubs 1, 2, 3, and 7) can be avoided once more detailed plans are available.

Table 4-3. Required Compensation for Directly Affected Elderberry Shrubs

Habitat	Stem Diameter	Number of Stems	Exit Holes?	Seedling Ratio	Native Plant Ratio	Total Seedling	Total Native Plants
Riparian	Stems >1" to <3"	0	No	2:1	1:1	0	0
	Stems >1" to <3"	0	Yes	4:1	2:1	0	0
	Stems >3" to <5"	0	No	3:1	1:1	0	0
	Stems >3" to <5"	0	Yes	6:1	2:1	0	0
	Stems >5"	1	No	4:1	1:1	4	4
	Stems >5"	0	Yes	8:1	2:1	0	0
Nonriparian	Stems >1" to <3"	22	No	1:1	1:1	22	22
	Stems >1" to <3"	0	Yes	2:1	2:1	0	0
	Stems >3" to <5"	1	No	2:1	1:1	2	2
	Stems >3" to <5"	0	Yes	4:1	2:1	0	0
	Stems >5"	2	No	3:1	1:1	6	6
	Stems >5"	0	Yes	6:1	2:1	0	0
Total		**26**				**34**	**34**

4.3.1.5 Cumulative Impacts

With implementation of the avoidance and minimization efforts and compensatory mitigation, construction of the proposed project would not add to cumulative effects on VELB in the region.

4.3.2 Western Pond Turtle

Western pond turtle is a California species of special concern. Western pond turtle occurs throughout much of California, except east of the Sierra-Cascade crest and desert regions (with the exception of the Mojave River and its tributaries) (Zeiner et al. 1988:100). Aquatic habitats used by pond turtles include ponds, lakes, marshes, rivers, streams, and irrigation ditches with a muddy or rocky bottom in grassland, woodland, and open forest areas (Stebbins 2003:250). Pond turtles spend a considerable amount of time basking on rocks, logs, emergent vegetation, mud or sand banks, or human-generated debris (Jennings et al. 1992:11). Pond turtles move to upland areas adjacent to watercourses to deposit eggs and overwinter (Jennings and Hayes 1994:98). Turtles have been observed overwintering several hundred meters from aquatic habitat. In the southern portion of their range and along the central coast, pond turtles are active year-round. In the remainder of their range, these turtles typically become active in March and return to overwintering sites by October or November. (Jennings et al.1992:11.)

4.3.2.1 Survey Results

No pond turtles were observed in the BSA during the reconnaissance-level surveys. The Sacramento River provides suitable aquatic habitat for the species, and the banks on the Sacramento River and adjacent uplands may be used for basking and nesting. Although there is a high amount of disturbance within uplands in the BSA, including domestic dogs and cats that may prey on pond turtles or pond turtle eggs, pond turtles may still attempt to nest in these areas

if they are present in the adjacent aquatic habitat. The species has been recorded within 10 miles of the BSA (California Department of Fish and Wildlife 2015).

4.3.2.2 Project Impacts

The proposed project would affect potential western pond turtle nesting habitat on both sides of the Sacramento River. Construction of the proposed project with City of West Sacramento Residential Access Alternative 1 would result in a total of 4.5 acres of permanent impacts and 3.7 acres of temporary impacts on areas that could support western pond turtle nesting (cottonwood riparian forest, riparian forest/shrub wetland, and ruderal woodland). Construction of the proposed project with City of West Sacramento Residential Access Alternative 2 would result in a total of 3.3 acres of permanent impacts and 3.4 acres of temporary impacts on areas that could serve as nesting habitat.

The proposed project would require two seasons of temporary in-channel work that could result in injury and mortality to pond turtles. Injury or mortality could result from placement of equipment and materials into the river channel and on the river banks. In addition, underwater vibrations from pile driving could result in injury to pond turtles if they are in the vicinity. Construction activities, including noise and visual disturbance, also could temporarily discourage pond turtles from foraging and basking near the project site.

4.3.2.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 11 would ensure that construction activities avoid or minimize impacts on western pond turtle within and adjacent to the limits of disturbance associated with construction.

> **Measure 11: Conduct Preconstruction Surveys for Western Pond Turtle and Allow Turtles to Leave Work Area Unharmed**
>
> To avoid potential injury to or mortality of western pond turtles, the project proponent will retain a qualified biologist to conduct a preconstruction survey for western pond turtles immediately prior to construction activities (including vegetation removal) along the banks of the Sacramento River. The biologist will survey the aquatic habitat, river banks, and adjacent riparian and ruderal habitat within the construction area immediately prior to disturbance.
>
> If a western pond turtle is found within the immediate work area during the preconstruction survey or during project activities, work shall cease in the area until the turtle is able to move out of the work area on its own. Information about the location of turtles seen during the preconstruction survey will be included in the environmental awareness training (Measure 2) and provided directly to the construction crew working in that area to ensure that areas where turtles were observed are inspected each day prior to the start of work to ensure that no turtles are present.

If a western pond turtle nest is discovered during the preconstruction survey or during project construction, the project proponent will coordinate with CDFW to determine whether additional avoidance measures (e.g., no-disturbance buffer or monitoring) is prudent.

4.3.2.4 Compensatory Mitigation

No compensatory mitigation is required.

4.3.2.5 Cumulative Impacts

Because measures will be implemented to avoid and minimize potential impacts on western pond turtle, the project would not contribute to cumulative effects on this species.

4.3.3 Swainson's Hawk

Swainson's hawk is state listed as threatened. Swainson's hawks forage in grasslands, grazed pastures, alfalfa and other hay crops, and certain grain and row croplands. Vineyards, orchards, rice, and cotton crops are generally unsuitable for foraging because of the density of the vegetation (California Department of Fish and Game 1992:41). The majority of Swainson's hawks winter in South America, although some winter in the United States. Swainson's hawk arrives in California in early March to establish nesting territories and breed (California Department of Fish and Game 1994:5). They usually nest in large, mature trees. Most nest sites (87%) in the Central Valley are found in riparian habitats (Estep 1989:35), primarily because trees are more available there. Swainson's hawks also nest in mature roadside trees and in isolated trees in agricultural fields or pastures. The breeding season is from March through August (Estep 1989:12, 35).

4.3.3.1 Survey Results

No Swainson's hawks were observed during the April 2014 and May 2015 surveys. The CNDDB contains several records for Swainson's hawk both upstream and downstream of the BSA, with the nearest record approximately 0.2 mile north of the BSA on the west side of the river in 2007 (California Department of Fish and Wildlife 2015).

Trees within the cottonwood riparian forest, riparian forest/shrub wetland, ruderal woodland, and landscaped area represent potential nesting habitat for Swainson's hawk.

4.3.3.2 Project Impacts

The proposed project would affect potential Swainson's hawk nesting habitat on both sides of the Sacramento River. Construction of the proposed project with City of West Sacramento Residential Access Alternative 1 would result in a total of 5.0 acres of permanent impacts and 4.4 acres of temporary disturbance in areas that support suitable nest trees (cottonwood riparian forest, riparian forest/shrub wetland, landscaped, and ruderal woodland). Construction of the

proposed project with City of West Sacramento Residential Access Alternative 2 would result in a total of 3.8 acres of permanent impacts and 4.0 acres of temporary disturbance in areas that could support suitable nest trees.

Noise and visual disturbances associated with project construction during the nesting season may disrupt Swainson's hawk nesting behavior to the point of nest abandonment or forced fledging that results in young mortality. Nest that are located within or adjacent to the BSA could be affected by typical construction noise and visual disturbances. Because the BSA has high levels of pedestrian, bike, vehicle, and boat traffic and associated noise, most construction activities may not substantially increase noise and visual disturbance above baseline conditions. However, pile driving and the use of cranes in proximity to an active nest are expected to exceed existing levels of noise disturbance. Bridge construction will require impact pile driving to be spread out over two summer construction seasons. These loud noises could startle Swainson's hawk beyond the BSA and disrupt normal behaviors, including nesting. CDFW typically considers intensive new disturbances in developed areas to have potential impacts on active Swainson's hawk nests located in urban areas that are within 0.25 mile of the activity (California Department of Fish and Game 1994:10).

4.3.3.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3 and 12–14 would ensure that construction activities avoid or minimize potential impacts on Swainson's hawk within and adjacent to the limits of disturbance associated with project construction.

Measure 12: Conduct Focused Surveys for Nesting Swainson's Hawk prior to Construction

The project proponent will retain a wildlife biologist experienced in surveying for Swainson's hawk to conduct surveys for the species in the spring/summer prior to construction. The surveys will be conducted within the limits of disturbance and in a buffer area up to 0.25 mile from the limits of disturbance. The size of the buffer area surveyed will be based on the type of habitat present and the line-of-sight from the construction area to surrounding suitable breeding habitat. Surveys will follow the methods in Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley (Swainson's Hawk Technical Advisory Committee 2000). A minimum of six surveys will be conducted according to these methods. If a variance of the survey distance or number of surveys is necessary, the project proponent will coordinate with CDFW regarding appropriate survey methods based on proposed construction activities. Surveys generally will be conducted from February to July. Survey methods and results will be reported to the project proponent and CDFW.

Measure 13: Conduct Tree Removal during Non-Sensitive Periods for Wildlife

The project proponent will remove or trim trees during the non-breeding season for tree-nesting migratory birds and raptors, and prior to periods when bats would be hibernating (generally between September 15 and October 31). If tree removal cannot be confined to this period, the project proponent will retain a qualified wildlife biologist with knowledge of the wildlife species that could occur in the project area to conduct the appropriate preconstruction surveys and establish no-disturbance buffers for sensitive wildlife species as described under Measure 14 (Swainson's hawk), Measure 15 (nesting birds), and Measure 20 (roosting bats).

Measure 14: Monitor Active Swainson's Hawk Nests during Pile Driving and other Construction Activities

Active Swainson's hawk and white-tailed kite nests within 600 feet of the BSA will be monitored during pile driving and other construction activities. Monitoring will be conducted by a wildlife biologist with experience in monitoring Swainson's hawk and white-tailed kite nests. The monitor will document the location of active nests, coordinate with the project proponent and CDFW, and record all observations in a daily monitoring log. The monitor will have the authority to temporarily stop work if activities are disrupting nesting behavior to the point of resulting in potential take (i.e., eggs and young chicks still in nests and adults appear agitated and could potentially abandon the nest). The monitor will work closely with the contractor, the project proponent, and CDFW to develop plans for minimizing disturbance, such as modifying or delaying certain construction activities.

A minimum non-disturbance buffer of 600 feet (radius) will be established around all active Swainson's hawk and white-tailed kite nests. No entry of any kind related to construction will be allowed within this buffer while the nest is active, unless approved by CDFW through issuance of an Incidental Take Permit or through consultation during project construction. The buffer size may be modified based on site-specific conditions, including line-of-sight, topography, type of disturbance, existing ambient noise and disturbance levels, and other relevant factors. Entry into the buffer for construction activities will be granted when the biological monitor determines that the young have fledged and are capable of independent survival or that the nest has failed and the nest site is no longer active. All buffer adjustments will be approved by CDFW.

4.3.3.4 Compensatory Mitigation

The mitigation for riparian impacts (Measure 4) and replacement of protected trees (Measure 32) would offset the loss of potential Swainson's hawk nesting habitat within the BSA. Replacement habitat will occur within the Sacramento Valley population of Swainson's hawk and will include tree species suitable for Swainson's hawk nesting.

4.3.3.5 Cumulative Impacts

Because measures will be implemented to avoid and minimize potential impacts on Swainson's hawk and because the loss of riparian habitat and protected trees will be mitigated, the project would not likely contribute to cumulative impacts on this species.

4.3.4 White-Tailed Kite

White-tailed kite is fully protected by the CFGC. White-tailed kite occurs in coastal and valley lowlands in California (Zeiner et al. 1990:120). White-tailed kites generally inhabit low-elevation grassland, savannah, oak woodland, wetland, agricultural, and riparian habitats. Some large shrubs or trees are required for nesting and for communal roosting sites. Nest trees range from small, isolated shrubs and trees to trees in relatively large stands (Dunk 1995:6, 8). White-tailed kites make nests of loosely piled sticks and twigs lined with grass and straw, near the top of dense oaks, willows, and other tree stands. The breeding season lasts from February through October and peaks from May to August. They forage in undisturbed, open grassland, meadows, farmland, and emergent wetlands. (Zeiner et al. 1990:120.)

4.3.4.1 Survey Results

Focused surveys for white-tailed kite were not conducted, and no kites were observed during the April 2014 and May 2015 field surveys. There are numerous records of white-tailed kite nesting within 10 miles of the BSA; the nearest is approximately 1.75 miles east of the BSA (California Department of Fish and Wildlife 2015). There is an eBird (2015) record for a sighting of white-tailed kite on July 21, 2014, just south of the I Street Bridge on the West Sacramento side of the river.

Trees within the cottonwood riparian forest, riparian forest/shrub wetland, ruderal woodland, and landscaped area represent potential nesting habitat for white-tailed kite.

4.3.4.2 Project Impacts

The proposed project would affect potential white-tailed kite nesting habitat on both sides of the Sacramento River. Construction of the proposed project with City of West Sacramento Residential Access Alternative 1 would result in a total of 5.0 acres of permanent impacts and 4.4 acres of temporary impacts on areas that support suitable nest trees for the kite (cottonwood riparian forest, riparian forest/shrub wetland, landscaped, and ruderal woodland). Construction of the proposed project with City of West Sacramento Residential Access Alternative 2 would result in a total of 3.8 acres of permanent impacts and 4.0 acres of temporary impacts on areas that could support suitable nest trees.

Noise and visual disturbances associated with project construction during the nesting season may disrupt white-tailed kite nesting behavior to the point of nest abandonment or forced fledging

that results in mortality of young. Nest that are located within or adjacent to the BSA could be affected by typical construction noise and visual disturbances. Because the BSA has high levels of pedestrian, bike, vehicle, and boat traffic and associated noise, most construction activities may not substantially increase noise and visual disturbance above baseline conditions. However, pile driving and the use of cranes near an active nest is expected to exceed existing levels of noise disturbance. Bridge construction will require impact pile driving spread over two summers. These loud noises could startle white-tailed kites beyond the BSA and disrupt normal behaviors, including nesting. Because white-tailed kite is a fully protected species, removal of trees with active nests and activities that may result in loss of white-tailed kites are prohibited.

4.3.4.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3 and 13–15 would ensure that construction activities avoid or minimize potential impacts on white-tailed kite within and adjacent to the limits of disturbance associated with project construction.

Measure 15: Conduct Preconstruction Surveys for Nesting Migratory Birds, Including Special-Status Birds, and Establish Protective Buffers

The project proponent will retain a qualified wildlife biologist to conduct nesting surveys before the start of construction. These nesting surveys will be conducted in conjunction with the Swainson's' hawk nesting surveys under Measure 12 and will include a minimum of three separate surveys to look for active nests of migratory birds, including raptors. Surveys will include a search of all trees and shrubs, ruderal areas, and grassland vegetation that provide suitable nesting habitat within 50 feet of disturbance. In addition, a 0.25-mile area from the river will be surveyed for nesting raptors in order to identify raptors that might be affected by pile driving. Surveys should occur during the height of the breeding season (March 1 to June 1), with one survey occurring in each of the 2 consecutive months within this peak period and the final survey occurring within 1 week of the start of construction. If no active nests are detected during these surveys, no additional measures are required.

If an active nest is found in the survey area, a no-disturbance buffer will be established to avoid disturbance or destruction of the nest site until the end of the breeding season (September 15) or until after a qualified wildlife biologist determines that the young have fledged and moved out of the construction area (this date varies by species). The extent of these buffers will be determined by the biologist in coordination with CDFW and will depend on the level of noise or construction disturbance taking place, line-of-sight between the nest and the disturbance, ambient levels of noise and other non-project disturbances, and other topographical or artificial barriers. Suitable buffer distances may vary between species.

4.3.4.4 Compensatory Mitigation

The mitigation for riparian impacts (Measure 4) and replacement of protected trees (Measure 32) would offset the loss of potential white-tailed kite nesting habitat within the BSA.

4.3.4.5 Cumulative Impacts

Because measures will be implemented to avoid and minimize potential impacts on white-tailed kite, and because white-tailed kite also would benefit from compensatory mitigation for other biological resources, the proposed project would not contribute to cumulative effects on this species.

4.3.5 Purple Martin

Purple martin is designated as a California species of special concern. The species is broadly distributed across eastern North America and occurs locally in the western states (Shuford and Gardali 2008:294). In California, the species occurs as a summer resident and migrant, primarily from mid-March to late September, and breeds from May to mid-August (Shuford and Gardali 2008:294). Purple martins are widely but locally distributed in forest and woodland areas at low to intermediate elevations throughout much of the state (Shuford and Gardali 2008:294). Populations are densest in central and northern coastal coniferous forests and smaller and more localized in the Sierra Nevada, interior foothills, and southern California (Shuford and Gardali 2008:294). The species' range has contracted substantially on the central and southern coastal slope and in the Central Valley (Shuford and Gardali 2008:294). Historically widespread, only one extant population of purple martins persists within the Central Valley. This population nests solely in elevated freeways and overpasses ('bridges") in the Sacramento region (i.e., the City of Sacramento, Sacramento County, and one nest site in western Placer County) (Airola et al. 2009:8). The population of purple martins in the Sacramento region has been steadily declining since 2002, going from 135 breeding pairs down to 30 breeding pairs in 2014 (Airola et al. 2014:14).

4.3.5.1 Survey Results

The population of purple martin in the Sacramento area in 2014 was reported at 30 pairs, with 7 of those pairs occurring within the BSA. The 7 pairs were reported to be nesting in the vent holes that are on the underside of the approach structure heading east from the I Street Bridge to J Street (Airola et al. 2014:14). The number of nesting pairs on the I Street Bridge approach structure has significantly declined over the last 10 years, with a marked drop from 32 pairs in 2005 to 17 pairs in 2006 to a low of 4 pairs in 2010 (Airola et al. 2014:14).

Possible threats to these urban populations likely include changes in habitat conditions (i.e., increases in train and car traffic, loss of flight access to nesting areas, loss of perch sites, and loss of nest material collection areas), use of neonicotinoid insecticides, increased predation by kestrels and feral cats, and competition for nests sites with white-throated swifts (Airola et al. 2014).

4.3.5.2 Project Impacts

The proposed project would result in the removal of the approach structures and thus the removal of the purple martin nesting habitat within the BSA. Based on the most recent population estimates, the loss of nesting habitat within the BSA would displace approximately 25% of the Sacramento population of purple martins, which is the only extant population in the Central Valley.

Removal of the approach structures, if not timed properly, could remove active nests or directly disrupt breeding behavior and potentially result in mortality and injury of adults, young, and eggs.

An existing perching wire located just north of the I Street Bridge approach structure, at the edge of the State Parks parking lot, was installed as mitigation for a nearby project. This perching wire will not be removed as part of the approach structure demolition and would continue to be used by purple martins if replacement habitat (see Measure 18) is created near the perch. On both the east and west sides of the Sacramento River, several utility lines that are in proximity to the future bridge would be available to purple martins for perching.

As part of the proposed project, landscaping would be incorporated along the road improvements on the West Sacramento side of the BSA, which would provide purple martins a source for gathering nesting materials, if replacement habitat is situated nearby. In addition, the levee on the West Sacramento side will remain vegetated in herbs and grasses, which would provide another area for purple martins to gather nesting material if they nest on the West Sacramento side of the bridge and if additional replacement habitat is located in this area (see Measure 18 below).

4.3.5.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 16, and 17 would avoid and minimize impacts on purple martins, as well as other nesting birds and bats that use the approach structures.

> **Measure 16: Avoid and Minimize Impacts on Purple Martins during Construction Activities**
>
> No construction activity that results in ground disturbance, modification of the I Street Bridge approach structure, loud noises, and/or vibrations will be conducted within 100 feet of the edge of the purple martin colony during the purple martin nesting season (March 15 to August 15). In addition, no construction-related vehicles or machinery shall be operated or stored beneath the colony during this period or until a qualified biologist determines that the purple martins have completed nesting and are no longer occupying the structure.

Measure 17: Avoid and Minimize Impacts on Nesting Birds and Roosting Bats from Demolition of Approach Structures

Because all four of the approach structures that are associated with the I Street Bridge are used by nesting birds (including purple martin) and roosting bats, the removal of these structures will take place outside of the breeding season for migratory birds and bats, and will be conducted in the following manner to avoid and minimize direct harm and temporary disturbance to nesting birds and roosting bats.

Timing of Approach Structure Demolition

To avoid and minimize potential impacts on purple martins and bats, the approach structures will not be removed or be altered until after the new I Street Bridge and associated replacement habitat on the bridge and/or elsewhere is in place and available for use by birds and bats for at least one overlapping nesting/maternal season, which generally would be from March 15 to September 15. Exclusion activities will be initiated between September 15 and October 31 to avoid affecting nesting purple martins and other birds, and to avoid affecting maternal and hibernating bat roosts. The exact date of beginning exclusion will be determined based on the results of preconstruction surveys that will be conducted in mid- to late August to document the status of bird nests and bat roosts. Active nests will be periodically monitored until it is verified that they are no longer being used. The non-volant (non-flying) period for most young bats is between April and the beginning of September (Johnston et al. 2004:26).

To avoid and minimize potential noise impacts on migratory birds nesting adjacent to project demolition activities, all demolition activities resulting in loud noise will be conducted outside of the nesting season, which is generally September 15 to February 1, to the extent feasible.

Approach Structure Exclusion Measures

The following exclusion measures will be implemented before demolition of the approach structures and will be approved by the project proponent and CDFW prior to implementation.

The vent holes and expansions joints on the approach structures will be altered to exclude birds and bats from using them prior to initiating demolition activities. After it has been confirmed that purple martins or other birds are no longer nesting in the vent holes, one-way doors will be installed on the vent holes to allow any wildlife (e.g., birds and bats) that may be occupying the hollow box-girders on the existing approach structure to exit and not re-enter. After the one-way doors have been in place for 48 hours, they will be removed and the vent holes will be sealed off to prevent any wildlife from re-entering prior to demolition.

One-way door devices also will be installed along the expansion joints to allow bats to exit but not re-enter. These one-way door devices will be designed such that they do not contain netting or wire mesh that bats could become entangled in. The one-way doors

will remain in place for 48 hours, after which they will be inspected for remaining bats. Once each expansion joint is confirmed to be unoccupied, they will be sealed close with an expanding foam sealant to prevent bats from reoccupying the approach structures.

4.3.5.4 Compensatory Mitigation

Implementation of Measures 18 and 19 would partially compensate for the loss of purple martin habitat and the long-term effects on the Sacramento area population.

Measure 18: Create Purple Martin Replacement Habitat

Purple martin nesting habitat that will be lost due to demolition of the I Street Bridge approach structure will be mitigated in part with replacement habitat. The amount of replacement habitat will be based on the maximum number of pairs observed nesting in the existing approach structure that is proposed for removal, which was 37 pairs in 2002 (Airola et al. 2014: 14). Because of the uncertainty of replacement habitat being used and due to the magnitude of the impact (effects to approximately 25% of the Sacramento population), replacement habitat will be provided at a ratio of 2:1 (replacement habitat to habitat removed). Therefore, the following replacement habitat will be of sufficient size to accommodate at least 74 nesting pairs of purple martins.

Replacement Habitat on New Bridge Structure

The new bridge will include a hollow box-girder design with at least 74 vent holes on the underside to allow for purple martins to use the new structure for nesting. Vent holes intended for use by martins will be at least 20 feet above the ordinary high water mark (OHWM) of the Sacramento River. Each vent hole will be associated with an individual chamber (i.e., a four sided chamber) that is intended for use by a breeding pair and will be at least 10 feet square. Nest guards consisting of ½ inch wire mesh will be installed along the interior edge of the vent hole to prevent nestlings from falling out. The wire mesh will extend at least 1 inch above the floor of the chamber.

Landscaping will be designed to not disrupt the flight access within 120 feet of replacement nesting habitat (i.e., will not physically or visually obstruct the space around the nesting habitat). Small to medium non-fruit-bearing trees shall be incorporate into the landscaping plans. Where possible, pine trees (*Pinus* spp.) also will be incorporated into landscaping plans to provide a permanent source of nesting material for purple martins. If feasible, some mowed or cut vegetation along the West Sacramento levee in the BSA will be left in place between March 15 and May 15 to allow purple martins to use this material for nesting.

Measure 19: Implement a Monitoring and Management Plan for Purple Martins

Because of the current status of the population in the region and the impact of the project on this population, the project proponent will develop and implement a purple martin monitoring and management plan. This plan at a minimum will include the following.

- The monitoring and management plan will be implemented by a wildlife biologist with knowledge of the life history, behavior, and habitat requirements of purple martin and with demonstrated prior experience in monitoring purple martin colonies.
- Monitor use of replacement habitat by purple martins over a 10-year period for a minimum of 5 monitoring years (e.g., years 2, 3, 5, 7, and 10) following the completion of the new bridge and the demolition of the existing approach structure that provides nesting habitat for purple martins. The monitoring period may be extended if it is found that (1) purple martins are not using the replacement habitat; or (2) the replacement habitat is not functioning as intended and repairs are made, or additional replacement habitat is created. At a minimum, the following information will be recorded.
  - Number of nesting pairs.
  - Documentation of which vent holes (or other replacement structures) are used.
  - Documentation of use of perching structures.
  - Effectiveness of landscaped areas and semi-natural areas (vegetated levee) in providing nesting materials.
  - Observations of predation or presence of known predators.
  - Changes in habitat in and around the colony.
- To provide context for how the I Street Bridge colony is doing relative to the remaining population, at least 3 reference colonies in the Sacramento population also will be monitored over the same 10-year period for a minimum of 5 monitoring years following the completion of the project. The reference population monitoring will be conducted concurrently with the replacement monitoring. Information collected during the reference colony monitoring will include at a minimum the following.
  - The number of nesting pairs in at least 3 historical colonies.
  - Other relevant observations on the status of the colonies (e.g., sources of predation, changes in habitat).
- The monitoring and management plan will include adaptive management measures to correct problems with replacement habitat, make other habitat improvements, and/or implement management recommendations within or adjacent to the BSA, or elsewhere within the Sacramento population, in an attempt to boost nesting success. These measures may include but would not be limited to the following.
  - A commitment to replacing poor-functioning or damaged free-standing purple martin nesting and/or perching habitat such that there is no net loss in the amount of created habitat.
  - A process for making and implementing recommendations on the management of vegetation around Sacramento area colonies.

4.3.5.5 Cumulative Impacts

The project's contribution to cumulative impacts on purple martins within the Sacramento region would be considerable. The colony that would be lost represents approximately 25% of the Central Valley population, which has been in decline for several decades due in part to an increase in the European starling population (Shuford and Gardali 2008:295).

4.3.6 Pallid Bat

Pallid bat is designated as a California species of special concern. Pallid bat occurs at low elevations throughout California (Zeiner et al. 1990:70). They occur in a variety of habitat, including grasslands, shrublands, and woodlands, and are most common in open, dry habitats with rocky areas for roosting (Zeiner et al. 1990:70). Pallid bats roost alone, in small groups, or gregariously in crevices in rocky outcrops and cliffs, caves, mines, trees hollows, exfoliating tree bark, and various human structures such as bridges and buildings (Western Bat Working Group 2005).

4.3.6.1 Survey Results

The existing I Street and Jibboom Street approach structures, buildings, and several large trees with cavities within the cottonwood riparian forest, landscaped, and ruderal woodland on both sides of the river provide potential roosting habitat for pallid bats in the BSA. A total of 30 expansion joints, representing 1,132 linear feet of potential roosting habitat, were mapped on the approach structures.

No pallid bats were detected during visual inspections of expansion joints or during acoustic surveys; however, Mexican free-tail bats have been observed in several expansion joints on the Sacramento side of the river, and bats have been reported using the approach structure on the West Sacramento side (Wyatt pers. comm.). No sign of bat occupation (guano) was detected in the tree cavities inspected; however, not all portions of these trees were accessible (e.g., higher portions of trees). Pallid bats may roost in the expansion joints, in trees with cavities, and in buildings within the BSA. The nearest known record of this species is approximately 10 miles west of the BSA near the City of Davis (California Department of Fish and Wildlife 2015).

4.3.6.2 Project Impacts

The proposed project would result in removal of the existing I Street and Jibboom Street approach structures. Potential roosting habitat, consisting of 30 expansion joints, for pallid bats will be removed during project demolition activities. Several large trees with cavities would be removed within the cottonwood riparian forest, landscaped, and ruderal woodland as part of both alternatives. Both City of West Sacramento residential access alternatives also would affect buildings on the West Sacramento side of the BSA that could be used by pallid bats for roosting.

Project construction could result in injury and/or mortality to the species if occupied roost sites are removed at times when bats are not awake and active (e.g., early in the day, periods of cold weather).

4.3.6.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 13, 17, and 20 would ensure that construction activities avoid and minimize potential impacts on pallid bat within and adjacent to the limits of disturbance associated with construction.

Measure 20: Conduct Preconstruction Surveys for Roosting Bats and Implement Protective Measures

To avoid and minimize potential impacts on pallid bat, western red bat, and non-special-status bat species from the removal of trees and buildings, the project proponent will implement the following actions.

Preconstruction Surveys

Within 2 weeks prior to tree trimming or removal and any building demolition (e.g., homes, sheds, other outbuildings), a qualified biologist will examine trees to be removed or trimmed and buildings planned for demolition for suitable bat roosting habitat. High-quality habitat features (e.g., large tree cavities, basal hollows, loose or peeling bark, larger snags, abandoned buildings, attics) will be identified, and the area around these features searched for bats and bat sign (e.g., guano, culled insect parts, staining). Riparian woodland and stands of mature broadleaf trees will be considered potential habitat for solitary foliage-roosting bat species.

If suitable roosting habitat and/or bat sign is detected, biologists will conduct an evening visual emergence survey of the source habitat feature, from a half hour before sunset to 1–2 hours after sunset for a minimum of 2 nights. Full-spectrum acoustic detectors will be used during emergence surveys to assist in species identification. If site security allows, detectors should be set to record bat calls for the duration of each night. All emergence and monitoring surveys will be conducted during favorable weather conditions (calm nights with temperatures conducive to bat activity and no precipitation predicted). The biologist will analyze the bat call data using appropriate software and prepare a report that will be submitted to the project proponent and CDFW.

Timing of Tree Removal and Building Demolition

Trees and buildings planned for removal and demolition will have exclusion devices installed between September 15 and October 31 to avoid affecting maternal and hibernating bat roosts. The exact timing of removal and demolition will be determined based on preconstruction surveys of trees and buildings.

Protective Measures

Protective measures may be necessary if it is determined that bats are using buildings or trees in the BSA as roost sites, or if sensitive bats species are detected during acoustic monitoring. The following measures will be implemented when roosts are found within trees or buildings planned for removal according to the timing discussed above. Specific measures will be approved by the project proponent and CDFW prior to excluding bats from occupied roosts.

- Exclusion from buildings or bridge structures will not take place until temporary or permanent replacement roosting habitat is available.
- Exclusion from roosts will take place late in the day or in the evening to reduce the likelihood of evicted bats falling prey to diurnal predators, and will take place during weather and temperature conditions conducive to bat activity.
- Biologists experienced with bats and bat evictions will carry out or oversee the exclusion tasks and will monitor tree trimming and removal, and buildings if they are determined to be occupied.
- Trees that provide suitable roost habitat will be removed in pieces, rather than felling the entire tree and should be done late in the day or in the evening to reduce the likelihood of evicted bats falling prey to diurnal predators, and will take place during warm weather conditions conducive to bat activity.
- Structural changes may be made to a known roost proposed for removal, to create conditions in the roost that are undesirable to roosting bats and encourage the bats to leave on their own (e.g., open additional portals so that temperature, wind, light and precipitation regime in the roost change). Structural changes to the roost will be authorized by CDFW and will be performed during the appropriate exclusion timing (listed above) to avoid harming bats.
- Non-injurious harassment at the roost site, such as ultrasound deterrents or other sensory irritants, may be used to encourage bats to leave on their own.
- One-way door devices will be used where appropriate to allow bats to leave the roost but not to return.
- Prior to building demolition and/or tree removal/trimming and after other eviction efforts have been attempted, any confirmed roost site will be gently shaken or repeatedly struck with a heavy implement such as a sledge hammer or an axe. Several minutes should pass before beginning demolition work, felling trees, or trimming limbs to allow bats time to arouse and leave the roost. A biological monitor will search downed vegetation for dead and injured bats. The presence of dead or injured bats will be reported to CDFW. Injured bats will be transported to the nearest CDFW-permitted wildlife rehabilitation facility.

4.3.6.4 Compensatory Mitigation

Implementation of Measures 21 and 22 would compensate for the loss of bat roosting habitat on the approach structure and ensure that the habitat is functioning. The loss of any tree roosting

habitat will be in part mitigated by Measures 4 and 33, which would restore and protect riparian habitat and compensate for the loss of protected trees.

Measure 21: Replace Bat Roosting Habitat Lost from Demolition of Approach Structures

Bat roosting habitat will be incorporated into the new bridge and, if necessary, additional free-standing roosting habitat (e.g., bat houses) will be created and installed within or adjacent to the BSA. At a minimum ratio of 1:1, 1,132 linear feet of roosting habitat will be created to compensate for the loss of bat roosting habitat associated with the approach structures. Bat replacement habitat will consist of crevice habitat built into the new bridge. Bat replacement habitat will be designed generally following the guidelines in California Bat Mitigation Techniques, Solutions, and Effectiveness (Johnston et al. 2004), which provides a review of mitigation options for bats in relation to Caltrans projects. Final plans for bat habitat replacement will be approved by the project proponent and CDFW.

Measure 22: Monitor Bat Replacement Habitat

The project proponent will be responsible for monitoring replacement bat habitat over a 5-year period for a minimum of 3 years (e.g., years 2, 3, and 5) to determine whether bats are using the habitat, determine whether the habitat is functioning as intended, and identify any corrective actions that need to be made to the habitat to improve its use by bats. Bat use will be documented through a combination of visual observation (bats and bat sign), which could be conducted during the day where roosting bats are visible or at night during an emergence survey. Acoustic recordings will be used in combination with emergence surveys to attempt to identify the species of bat(s) using the replacement habitat. The locations and amount of occupied habitat will be recorded. Recommendations for corrective actions will be presented to the project proponent and CDFW for approval. Annual monitoring reports will be sent to the project proponent and CDFW.

4.3.6.5 Cumulative Impacts

Because measures will be implemented to avoid and minimize potential impacts on pallid bat, and because permanently affected bat roosting habitat would be compensated for by implementation of Measures 21 and 22, the project would not contribute to cumulative effects on this species.

4.3.7 Western Red Bat

Western red bat is designated as a California species of special concern. Western red bat occurs along the California coast from Mendocino County south to San Diego and into the Sierra Nevada, but the most significant distribution in the state is within the Central Valley (Pierson et al. 2006:12). Western red bat roost is typically solitary, roosting primarily in the foliage of trees or shrubs (Western Bat Working Group 2005). Day roosts are commonly in edge habitats

adjacent to streams or open fields (Western Bat Working Group 2005). In the Central Valley, they are more common in areas with wide strips of mature cottonwoods and sycamores (*Platanus racemosa*) (Pierson et al. 2006:12). They are also known to roost in orchard trees, in particular, walnut orchards (Pierson et al. 2006:13)

4.3.7.1 Survey Results

The cottonwood riparian forest, riparian forest/shrub wetland, landscaped, and ruderal woodland on both sides of the river provide potential roosting habitat in the BSA for western red bats.

Western red bats were detected within the BSA on the night of June 11, 2015, during acoustic surveys on the West Sacramento side of the river. The species has not been previously reported within 10 miles of the BSA (California Department of Fish and Wildlife 2015).

4.3.7.2 Project Impacts

The proposed project would affect potential western red bat roosting habitat on both sides of the Sacramento River. Construction of the proposed project with City of West Sacramento Residential Access Alternative 1 would result in a total of 5.0 acres of permanent impacts and 4.4 acres of temporary impacts on areas that could support the species (cottonwood riparian forest, riparian forest/shrub wetland, landscaped, and ruderal woodland). Construction of the proposed project with City of West Sacramento Residential Access Alternative 2 would result in a total of 3.8 acres of permanent impacts and 4.0 acres of temporary impacts on areas that could support the species.

Project construction could result in injury and/or mortality to the species if habitat they are roosting in is removed at times when they are not active (e.g., early in the day, periods of cold weather).

4.3.7.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 13, and 20 would ensure that construction activities avoid and minimize potential impacts on western red bat within and adjacent to the limits of disturbance associated with construction.

4.3.7.4 Compensatory Mitigation

No specific compensatory mitigation for western red bat is recommended. Western red bat would generally benefit from the replacement of riparian habitat under Measure 4 and the replacement of protected trees under Measure 32.

4.3.7.5 Cumulative Impacts

Because measures will be implemented to avoid and minimize potential impacts on western red bat, and because permanently affected riparian habitat would be compensated for by

implementation of Measure 4, the project would not contribute to cumulative effects on this species.

4.4 Special-Status Fish Species

As described in Chapter 3, Environmental Setting, special-status fish species known to occur in the BSA were identified after a review of the CNDDB search results; the USFWS and NMFS lists of endangered, threatened, and proposed species within the project region; and species' distribution and habitat data (e.g., Moyle 2002; U.S. Fish and Wildlife Service 2015b). Table 3-4 lists all special-status fish species that were identified as occurring in the project region. Table 4-4 summarizes the life stage timing and distribution of special-status species potentially affected by the proposed project. The special-status species and their designated critical habitats, where a

4.4.1 Sacramento River Winter-Run Chinook Salmon

4.4.1.1 Status and Distribution

The Sacramento River winter-run Chinook salmon Evolutionarily Significant Unit (ESU) (*Oncorhynchus tshawytscha*) was listed as threatened under ESA on August 4, 1989, under an emergency rule. NMFS subsequently reclassified the ESU as endangered on January 4, 1994, and reaffirmed this listing on June 28, 2005. NMFS designated critical habitat for Sacramento River winter-run Chinook salmon on June 16, 1993 (58 Federal Register [FR] 33212–33219). The ESU includes all naturally spawned populations of winter-run Chinook in the Sacramento River and its tributaries, as well as populations from two artificial propagation programs—one at the Livingston Stone National Fish Hatchery (LSNFH) and the other at Bodega Marine Laboratory (discontinued in 2004) (National Marine Fisheries Service 2005a). The Sacramento River winter-run Chinook salmon ESU was listed as endangered under CESA in September 1989.

Prior to construction of Shasta Dam, winter-run Chinook salmon spawned in the upper reaches of the Sacramento River, the McCloud River, and the lower Pit River. Spawning is now restricted to approximately 44 miles of the mainstem Sacramento River, immediately downstream of Keswick Dam (Yoshiyama et al. 1998). The abundance of winter-run Chinook salmon in the Sacramento River before Shasta Dam was constructed is unknown. Some biologists believe that the run was relatively small, possibly consisting of a few thousand fish (Slater 1963). Others, relying on anecdotal accounts, believe that the run could have numbered more than 200,000 fish (National Marine Fisheries Service 1993). During the mid-1960s, more than 20 years after the construction of Shasta Dam, the population exceeded 80,000 fish (U.S. Department of the Interior, Bureau of Reclamation 1986). The population declined substantially during the 1970s and 1980s.

Historically, four independent populations of winter-run Chinook were delineated in the Sacramento River ESU. The areas used for spawning by three of these populations are now inaccessible because they are above the impassable Keswick and Shasta Dams, while conditions for a fourth population (Battle Creek) are at present unsuitable due to high summer water temperatures. Lindley et al. (2007) concluded that the mainstem Sacramento River population was at a low risk of extinction based on data up to 2004. However, the ESU as a whole is not considered viable because there is only one naturally spawning population that is found outside its historical range. Furthermore, there is some concern over the introgression of naturally-produced fish with hatchery-produced fish from LSNFH, although the risk is still thought to be low when considering extinction risk.

In 1989, winter-run Chinook salmon escapement was estimated at less than 550 adults. Escapement continued to decline, diminishing to an estimated 450 fish in 1990 and 191 fish in 1991. The rapid decline in escapement during the late 1980s and early 1990s prompted listing of the winter-run Chinook salmon as endangered under CESA and ESA. Escapement in 1992 was estimated to be 1,180 fish, indicating good survival of the 1989 class. NMFS's data indicate that the population has increased during the late 1990s through 2001. In 1996, returning spawners numbered about 1,000 fish; and in 2001, returning adults were estimated to be 5,500 (Pacific Fishery Management Council 2002). Despite increased efforts to maintain and enhance the population of winter-run Chinook salmon by various entities, in their final listing determination of June 28, 2005, NMFS again found "that the Sacramento River winter-run Chinook salmon ESU in-total is in danger of extinction throughout all or a significant portion of its range" and concludes that the ESU continues to warrant listing as an endangered species under ESA (National Marine Fisheries Service 2005a).

Like other Chinook populations in the Central Valley, winter-run have declined in abundance since 2005, and the 10-year trend is negative. Recent escapement trends were marked by a general downward trend from an average of approximately 10,700 adults in 2001–2006 to an average of 2,400 adults in 2007–2011 and a low of 827 in 2011 (CalFish 2012). Average run size is associated with a low risk of extinction, but the most recent returns are associated with a moderate risk. In general, the proportion of hatchery fish from LSNFH has ranged from 5 to 10%, with an outlier of 20% in 2005. In 2010, the estimated hatchery escapement was about 12% (CalFish 2010). This is generally consistent with the USFWS goal to keep hatchery escapement to less than 20%. In perspective, the winter-run ESU has shown marked improvement over the critically low abundance and productivity in the 1980s–1990s. The rate of population growth or the cohort replacement rate has been negative through 2010, indicating that it is not self-sustaining. Winter-run Chinook in the Central Valley continue to be at high risk of extinction, and there is nothing to indicate that the risk has diminished (Williams et al. 2011). Longer term

reduction in risk will depend on whether the introduction of winter-run into Battle Creek is successful in establishing another population within the winter-run's historical range.

4.4.1.2 Life History

Winter-run Chinook salmon spend 1–3 years in the ocean. Adult winter-run Chinook salmon leave the ocean and migrate through the Sacramento–San Joaquin River Delta (Delta) into the Sacramento River from December through July, with peak migration in March (Moyle 2002). Adults spawn from mid-April through mid-August, with peak activity in May and June (Vogel and Marine 1991). Fry emerge from the gravel beginning in late June and continuing through October (Fisher 1994). The primary spawning habitat in the Sacramento River is above Red Bluff Diversion Dam (RBDD) at River Mile (RM) 243, although spawning has been observed downstream as far as RM 218 (National Marine Fisheries Service 2001). Spawning success below RBDD may be limited primarily by warm water temperatures (Hallock and Fisher 1985; Yoshiyama et al. 1998). Spawning and egg incubation do not occur in the study area (Moyle 2002).

Downstream movement of juvenile winter-run Chinook salmon begins in August, soon after fry emerge. The peak abundance of juveniles moving downstream at Red Bluff occurs in September and October (Vogel and Marine 1991). Juvenile Chinook salmon move downstream from spawning areas in response to many factors, which may include inherited behavior, habitat availability, flow, competition for space and food, and water temperature. The numbers of juveniles that move and the timing of movement are highly variable. Storm events and their resulting high flows and turbidity appear to trigger downstream movement of substantial numbers of juvenile Chinook salmon.

Winter-run Chinook salmon smolts (i.e., juveniles that are physiologically ready to enter seawater) may migrate through the Delta and San Francisco Bay to the ocean from November through May (Yoshiyama et al. 1998). The Sacramento River channel is the main migration route through the Delta. However, the Yolo Bypass also provides significant outmigration passage during higher flow events.

During winter in the Sacramento–San Joaquin system, juveniles rear on seasonally inundated floodplains. Sommer et al. (2001) found higher growth and survival rates of juvenile Chinook salmon reared on the Yolo Bypass floodplain than those that reared in the mainstem Sacramento River.

4.4.1.3 Factors Affecting Abundance

One of the main factors in the decline of winter-run Chinook salmon is habitat loss and degradation. On the Sacramento River, Shasta Dam blocked access to historical spawning and

rearing habitat. Other factors affecting abundance include the effects of reservoir operations on water temperature, drought effects, passage impediments, harvesting and fishing pressure, entrainment in diversions, contaminants, predation by non-native species, and interaction with hatchery stock (U.S. Army Corps of Engineers 2000).

In the Sacramento River, operation of the Central Valley Project (CVP) and State Water Project (SWP) influences river flow. Low flows can reduce habitat area and adversely affect water quality. The resulting warm water temperatures and low dissolved oxygen levels can stress incubating eggs and rearing juvenile winter-run Chinook salmon. Low flow may affect migration of juveniles and adults through increased water temperature or reduced velocity that slows downstream movement of juveniles. Low flow, in combination with diversions, may result in higher entrainment losses at the state and federal pumping plants in the south Delta (U.S. Army Corps of Engineers 2000).

In the Delta, flow drawn through the Delta Cross Channel (DCC) and Georgiana Slough transports some percentage of downstream migrating salmon into the central Delta. The number of juveniles entering the DCC and Georgiana Slough is assumed to be proportional to the flow volume diverted from the Sacramento River (California Department of Fish and Game 1987). Survival of juvenile Chinook salmon that are drawn into the central Delta is lower than survival of juvenile Chinook salmon that remain in the Sacramento River channel.

Factors such as levee construction and bank armoring have altered the critical habitat of winter-run Chinook salmon. These factors reduce floodplain habitat, change river bank substrate size, and decrease the amount of SRA cover and riparian habitat, which in turn, reduce habitat availability and quality (National Marine Fisheries Service 2006a)

4.4.1.4 Survey Results

Focused surveys for Sacramento River winter-run Chinook salmon were not conducted. However, it is well documented that winter-run Chinook salmon use the BSA as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, juvenile winter-run Chinook salmon seasonally use the lower reaches of the Sacramento River for rearing while emigrating to the ocean. Spawning and egg incubation do not occur in the BSA (Moyle 2002).

The temporal occurrence and relative abundance of juvenile winter-run Chinook salmon in the BSA can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the Delta Juvenile Fish Monitoring Program (DJFMP) (U.S. Fish and Wildlife Service 2015b). Sherwood Harbor is located approximately 4.5 miles downstream of the BSA, and the trawls conducted by USFWS provide a consistent and reliable method for

observing the timing of occurrence and relative abundance of juvenile winter-run Chinook salmon in the BSA. USFWS uses a Kodiak trawl at Sherwood Harbor from December through March and switches to a mid-water trawl beginning in April.

From January 2005 through March 2015, winter-run size juvenile Chinook salmon were detected in the trawls from October through April, although most were detected in the trawls from November through March (Table 4-5).

[2] 2015 data are excluded from total because data are incomplete.

Quantification of SRA cover habitat in the BSA was based on a combination of field observations (June 17, 2015) and interpretation of recent aerial photographs, by ICF biologists. USFWS defines *SRA cover* as "the unique, near-shore aquatic cover that occurs at the interface between a stream or river and adjacent woody riparian habitat" and is an essential component of salmonid habitat. Key features of SRA cover include the following.

- An adjacent bank composed of natural, often eroding substrate that supports overhanging riparian vegetation and vegetation that may protrude into the water.
- A stream channel with variable amounts of woody material and detritus, and variable water velocity and depth.

SRA cover is composed of two components: overhead cover and instream cover. Overhead cover consists of overhanging riparian vegetation that provides important stream shading and contributes leaf litter and insects to the stream. Instream cover consists of submerged woody material (exposed roots, branches, and trunks), aquatic plants, substrate (gravel, cobble, and

boulders), and undercut banks. These attributes provide high-value feeding areas, burrowing substrates, escape cover, and reproductive cover for numerous regionally important fish and wildlife species. (U.S. Fish and Wildlife Service 1992)

Table 4-6 shows the amount of SRA cover present along both banks of the Sacramento River in the BSA relative to the total bank length.

4.4.1.5 Project Impacts

The following assessment addresses potential direct and indirect effects of the proposed project on special-status fish species, including listed species, and designated critical habitat (where applicable). Potential project effects on listed species and critical habitat include both short-term and long-term effects. Short-term effects include temporary construction-related impacts on fish and aquatic habitat that may last from a few hours to days (e.g., suspended sediment and turbidity, construction noise, artificial lighting). Long-term effects (addition of overwater structure, loss of aquatic habitat [substrate and water column], loss of SRA cover habitat) typically would last months or years, or would be permanent. These effects are generally due to physical alteration of important habitat attributes of the channel, shoreline, and adjacent bank. Short-term effects on listed fish species were evaluated qualitatively based on general knowledge of the impact mechanisms and species responses to construction actions. Long-term effects were measured in terms of the area and/or linear feet of artificial shade, aquatic habitat, and SRA cover habitat affected by the proposed project.

It should be noted that impacts on special-status fish species and designated critical habitat from project construction discussed below would be the same for all project roadway design alternatives and residential access alternatives, as the design and construction methods for the new bridge would be the same under all alternatives.

Pile Driving Noise

Impact pile driving is of particular concern because of the intensity of sounds and known occurrences of fish kills associated with impact pile driving (Popper and Hastings 2009). The

effects of pile driving noise on fish may include behavioral responses, physiological stress, temporary and permanent hearing loss, tissue damage (auditory and non-auditory), and direct mortality (Popper and Hastings 2009). In general, factors that may influence the magnitude of effects include species, life stage, and size of fish; type and size of pile and hammer; frequency and duration of pile driving; site characteristics (e.g., water depth); and distance of fish from the source of the underwater sound.

The primary source of underwater noise associated with the project would be driving the 200 16-inch piles with an impact hammer for the two in-water piers (i.e., piers 2 and 5) and two in-levee abutments (i.e., abutments 1 and 6) for the new bridge, the 160 16-inch piles for the temporary trestle and work platforms, the 60 16-inch piles for the bridge fender system, and the eight 16-inch spud piles for the barges (Figure 1-3). Additional sources of underwater noise associated with the project would occur during installation of the eight 108-inch steel casings for the two in-water piers (i.e., piers 3 and 4) for the lift span with a vibratory hammer and/or hydraulic-driven oscillator/rotator system, and installation and removal of temporary sheet piles with a vibratory hammer for the temporary cofferdams used to isolate the in-water construction areas for bridge piers 2 and 5. Only driving of piles with an impact hammer is expected to produce sound levels that could result in injury to fish.

Table 4-7 presents a summary of the pile driving assumptions used in the analysis, including assumptions related to pile location (e.g., structure location, land, in-water, in de-watered cofferdam), pile size and type (e.g., steel pipe, steel H pile, concrete), the number of piles to be installed (e.g., total and number per day), type of driver to be used (e.g., impact, vibratory, hydraulic driven oscillator/rotator system), estimated total pile strikes (e.g., per pile and day), sound attenuation (e.g., bubble curtain, dewatered cofferdam, none), and underwater sound level assumptions. Because a specific pile type has not been determined, Table 4-7 presents pile driving assumptions for all possible pile driving scenarios, including with and without sound attenuation (i.e., bubble curtain).

The assessment of underwater noise impacts on fish is based on the overlap of construction activities (timing, location, duration) with the spatial and temporal distribution of sensitive species and life stages (Tables 4-4, 4-5, and 4-9 through 4-14), as well as the expected fish behavior if encountering underwater noise. An important measure for reducing the potential exposure of fish populations to pile driving noise is the restriction of in-water impact pile driving activities to May 1 through November 30, a period when the abundance of special-status fish in the construction area is reduced (Measure 23).

Piers 3 and 4	108-in steel casings	Vibratory hammer and/or hydraulic driven oscillator/rotator system	8	Water	2 weeks /pile	NA	NA	NA	Vibratory pile driving is not known to cause injury to fish and is therefore not evaluated here.										
									Hydraulic oscillator/rotator systems slowly rotate pile into place and do not generate high underwater noise levels.										

Note 1. Cofferdam sheet piles will be driven with a vibratory driver. Vibratory pile driving is not known to cause injury to fish and is therefore not evaluated.
Note 2. There is limited data available for concrete piles driven on land. Data taken from measurements at the Port of Oakland is used. In this case piles driven on land resulted in higher underwater sound levels than piles driven in water.
Note 3. Pile driving energy does not accumulate once the single strike SEL drops to 150 dB (i.e. "effective quiet"). The distance to the onset of physical injury therefore cannot extend beyond the distance to "effective quiet." Once the daily number of strikes exceeds 5,000 strikes per day the distance to the onset of injury does not increase.
For this reason the distances to the 183 dB and 187 dB thresholds are the same.

To further minimize direct effects on fish, the project proponent proposes to use sound attenuation measures—including cofferdam dewatering and, if feasible, bubble curtains—and hydroacoustic monitoring to minimize the exposure of special-status fish species to potentially harmful pile driving sounds (Measures 24 and 25). During in-water pile driving activities, the use of an impact driver will be limited to driving only the 16-inch piles that are needed for the piers and abutments of the new bridge, the temporary trestles, and the barges. All of the 108-inch steel casings will be installed with a vibratory hammer and/or hydraulic-driven oscillator/rotator system, and all of the temporary sheet piles for the cofferdams will be installed and extracted using a vibratory driver. Use of a vibratory driver and/or hydraulic-driven oscillator/rotator system to install the 108-inch steel casings and the vibratory driver to install and remove the temporary sheet piles for coffer dams is not expected to produce sound levels that result in injury to fish. Vibratory pile driving is a preferred method for minimizing the exposure of fish to potentially harmful pile driving sounds (National Marine Fisheries Service 2009b). Therefore, the following assessment focuses on the potential for injury to fish based on predicted noise levels associated with impact pile driving.

Injury Thresholds for Pile Driving Noise

The ability to predict impacts of pile driving noise on listed fish species is currently limited by a lack of information on the key variables and mechanisms linking pile driving sounds with the biological responses of the species of concern (Popper and Hastings 2009). Beginning in 2004, Caltrans—in coordination with the FHWA, Oregon Department of Transportation, and Washington Department of Transportation—established a Fisheries Hydroacoustic Working Group (FHWG) to coordinate and improve information related to the assessment of underwater noise impacts on fish from pile driving. Other member agencies include NMFS (West Coast Region [formerly Northwest and Southwest Regions]), USFWS, and CDFW.

The following assessment is based on application of interim noise criteria established by the FHWG in 2008 (Table 4-8). These criteria, based on recommendations developed by Popper at al. (2006) and revised by Carlson et al. (2007), are considered preliminary thresholds for assessing the potential for injury to listed fish species. The peak sound pressure level (SPL) is considered the maximum SPL a fish can receive from a single strike without injury. The cumulative sound exposure level (SEL) is considered the total amount of acoustic energy that a fish can receive from a single or multiple strikes without injury. Insufficient data are currently available to support the establishment of a noise threshold for behavioral effects (Popper et al. 2006); however, NMFS generally assumes that a noise level of 150 decibels root mean square (dB RMS) is an appropriate threshold for behavioral effects. Technical guidance on the application of these criteria to pile driving projects is presented by ICF Jones & Stokes and Illingworth and Rodkin (2009).

Table 4-8. Interim Criteria for Injury to Fish from Pile Driving Activities

Interim Criteria	Agreement in Principle
Peak sound pressure level (SPL)	206 dB re 1µPa (for all sizes of fish)
Cumulative sound exposure level (SEL)	187 dB re 1µPa^2-sec—for fish size ≥ 2 grams 183 dB re 1µPa^2-sec—for fish size < 2 grams
Behavioral (RMS)	150 dB re 1µPa (for all sizes of fish)

dB = decibel(s)
dB re 1µPa = dB referenced to a pressure of 1 microPascal
dB re 1µPa2-sec = dB referenced to a pressure of 1 microPascal squared per second
RMS = root mean square

The potential for physical injury to fish from exposure to pile driving sounds was evaluated using the "NMFS Pile Driving Calculator," a spreadsheet model developed by NMFS to calculate the distances from the pile that sound attenuates to the peak or cumulative criteria. These distances define the area in which the criteria are expected to be exceeded as a result of impact pile driving (potential impact area). The NMFS spreadsheet calculates these distances based on estimates of the single-strike sound levels for each pile type (measured at 10 meters [32.8 feet] from the pile) and the rate at which sound attenuates with distance. To account for the exposure of fish to multiple pile driving strikes, the model computes a cumulative SEL for multiple strikes based on the single-strike SEL and the number of strikes per day or pile driving event. Estimated single-strike sound levels were based on measured sound levels produced by similar piles (California Department of Transportation 2009). The standard sound attenuation rate of 4.5 dB per doubling of distance was used in the absence of other data. The estimated number of pile strikes per day was provided by the project engineers. Because juveniles of some species in the project area could be smaller than 2 grams, the cumulative SEL threshold of 183 dB (i.e., the more protective threshold) is used in this analysis. It should be noted, however, that because the estimated daily number of strikes per day exceeds 5,000 strikes, the distance to the onset of physical injury does not increase because pile driving energy does not accumulate once the single strike SEL drops to 150 dB (i.e., "effective quiet"); therefore, the distance to the 183 dB and 187 dB thresholds are the same (see "Note 3" at bottom of Table 4-7).

16-Inch Piles for Temporary Trestles

A total of 160 16-inch piles would be installed to support trestles for the work platforms during construction. The trestles would be installed over a 3 week period in May in the first year of construction and would remain in place throughout the duration of bridge construction (Figure 1-4). It was assumed that up to 20 piles (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-7). The piles for the temporary trestles would be removed during October of the second construction season once bridge construction is completed. Two pile types are being considered: 16-inch-diameter steel and 16-inch H piles. Both pile types have been evaluated separately for noise impacts.

Because bubble curtain feasibility and effectiveness have not been evaluated for installing the temporary trestle piles, the following results are for driving of piles without sound attenuation and represent a worst-case scenario for underwater sound levels. However, results for driving both pile types (i.e., 16-inch-diameter steel and 16-inch H piles) with sound attenuation (i.e., bubble curtain) are also shown in Table 4-7 for comparison, but are not discussed further.

16-Inch-Diameter Steel Piles for Temporary Trestles

Impact driving of 16-inch-diameter steel piles is expected to produce a single-strike peak SPL of 208 dB and a single-strike SEL of 176 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-7); the single-strike peak SPL exceeds the interim criteria (Table 4-8). Peak SPLs above the interim threshold (206 dB) would extend 14 meters (46 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile, with two pile drivers operating), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 541 meters (1,775 feet) away from the source pile.

16-Inch H Piles for Temporary Trestles

Impact driving of 16-inch H piles is expected to produce a single-strike peak SPL of 195 dB and a single-strike SEL of 170 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-7). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-8). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile, with two pile drivers operating), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 215 meters (705 feet) away from the source pile.

16-Inch Piles for Piers 2 and 5

A total of 100 (50 per pier) 16-inch piles would be installed to construct piers 2 and 5 for the two fixed-span approach structures that would tie into the Sacramento and West Sacramento banks of the river (Figure 1-3). The 16-inch piles for piers 2 and 5 would be installed inside dewatered cofferdams that would be constructed to isolate the construction site from the Sacramento River. The piles would be driven over a 1 week period in May in the first construction season (Figure 1-4). It was assumed that up to 20 piles (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-7). Two pile types are being considered: 16-inch-diameter steel and 16-inch-square precast concrete piles. Both pile types have been evaluated separately for noise impacts.

16-Inch-Diameter Steel Piles for Piers 2 and 5

Impact driving of 16-inch H piles for piers 2 and 5 in the dewatered cofferdams is expected to produce a single-strike peak SPL of 203 dB and a single-strike SEL of 171 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-7).The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-8). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 251 meters (824 feet) away from the source pile.

16-Inch-Square Precast Concrete Piles for Piers 2 and 5

Impact driving of 16-inch-square concrete piles for piers 2 and 5 in the dewatered cofferdams is expected to produce a single-strike peak SPL of 183 dB and a single-strike SEL of 161 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-7).The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-8). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 54 meters (177 feet) away from the source pile.

16-Inch Piles for Abutments 1 and 6

A total of 100 (50 per abutment) 16-inch piles would be installed to construct abutments 1 and 6 on the West Sacramento and Sacramento banks of the river, respectively (Figure 1-3). The piles would be installed over a 1 week period in May of the second construction season (Figure 1-4). It was assumed that up to 20 piles (4–10 per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-7). Two pile types are being considered: 16-inch-diameter steel and 16-inch-square precast concrete. Both pile types have been evaluated separately for noise impacts because of their proximity to the river.

16-Inch-Diameter Steel Piles for Abutments 1 and 6

Impact driving of 16-inch-diameter piles for abutments 1 and 6 is expected to produce a single-strike peak SPL of 198 dB and a single-strike SEL of 171 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-7). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-8). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 251 meters (824 feet) away

from the source pile. Because the piles would be driven on land, there are no opportunities to attenuate noise levels.

16-Inch-Square Precast Concrete Piles for Abutments 1 and 6

Impact driving of 16-inch-square precast concrete piles for abutments 1 and 6 is expected to produce a single-strike peak SPL of 192 dB and a single-strike SEL of 174 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-7). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-8). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 398 meters (1,306 feet) away from the source pile. Because the piles would be driven on land, there are no opportunities to attenuate noise levels.

16-Inch-Diameter Concrete Piles for Bridge Fender System

A total of 60 (30 per pier) 16-inch-diameter concrete piles would be installed at piers 3 and 4 to construct the bridge fender system for the two movable span piers (Figure 3-1). The fender system would protect the piers from errant watercraft navigating the river. The piles would be installed over a 2 week period in October of the second construction season (Figure 1-4). It was assumed that up to 20 piles per day (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 20,000 strikes with an impact hammer to drive and test each pile (Table 4-7).

Because bubble curtain feasibility and effectiveness have not been evaluated for installing the concrete piles for the bridge fender system, the following results are for driving of piles without sound attenuation and represent a worst-case scenario for underwater sound levels. However, results for driving the 16-inch-diameter concrete piles with sound attenuation (i.e., bubble curtain) are also shown in Table 4-7 for comparison, but are not discussed further.

Impact driving of 16-inch-diameter concrete piles for the bridge fender system is expected to produce a single-strike peak SPL of 188 dB and a single-strike SEL of 166 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-7). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-8). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 20,00 strikes per day (20 piles per day at 1,000 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 117 meters (384 feet) away from the source pile.

16-Inch-Diameter Steel Piles for Barge Installation

A total of 8 16-inch-diameter steel piles (spud piles) would be installed to anchor each barge to provide a floating work platform during bridge construction. One to two barges would be used during construction and would be installed over a 1 week period in May of the first and second construction season. The barges would be in use for approximately 24 months and would be moved approximately 4–6 times during anytime of the year. It was assumed that up to 8 piles per day would be driven on the days a barge would be moved, requiring up to 6,400 strikes with an impact hammer to drive each pile (Table 4-7).

Because bubble curtain feasibility and effectiveness have not been evaluated for installing the spud piles for the barges, the following results are for driving of piles without sound attenuation and represent a worst-case scenario for underwater sound levels. However, results for driving the spud piles with sound attenuation (i.e., bubble curtain) are also shown in Table 4-7 for comparison, but are not discussed further.

Impact driving of 16-inch-diameter steel (spud) piles for the barges is expected to produce a single-strike peak SPL of 208 dB and a single-strike SEL of 176 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-7); the single-strike peak SPL exceeds the interim criteria (Table 4-8). Peak SPLs above the interim threshold (206 dB) would extend 14 meters (46 feet) from the source pile. Based on an assumed maximum rate of 6,400 strikes per day (8 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 541 meters (1,775 feet) away from the source pile.

108-Inch Steel Casings for Piers 3 and 4

A total of 8 (4 per pier) 108-inch steel casings would be installed to construct piers 3 and 4 for the tower foundations (Figure 1-3). The 108-inch steel casings for piers 3 and 4 would be installed with a vibratory pile driver and/or hydraulic-driven oscillator/rotator system; therefore, this method of installation would not generate high underwater noise levels (Table 4-7). It was assumed that it will take approximately 7 weeks to install both 108-inch steel casings. The 108-inch steel casings would be installed from late May through early July in the first construction season (Figure 1-4).

Sheet Piles for Temporary Cofferdams

Two cofferdams would be installed to construct piers 2 and 5 (Figure 1-3). The sheet piles for the cofferdams would be installed and removed with a vibratory pile driver; therefore, this method of installation and removal would not generate high underwater noise levels (Table 4-7). The sheet piles for the two cofferdams would be installed at the same time over a 2 week period in May of the first construction season (Figure 1-4).

Effects of Pile Driving Noise on Fish

The proposed timing of pile driving activities and, where feasible, use of sound attenuation measures are expected to minimize the exposure of listed fish species to potentially harmful pile driving sounds. Generally, the potential for injury or mortality of special-status fish species would be greatest for the 16-inch-diameter steel piles for the temporary trestles and the 16-inch-diameter steel piles for anchoring the barges driven in water (no attenuation) and would be the lowest for the 16-inch-square precast concrete piles for piers 2 and 5 driven in dewatered cofferdams. For the 16-inch-diameter steel piles for the temporary trestles and the 16-inch-diameter steel piles for anchoring the barges driven in water (unattenuated), the potential for injury and mortality would exist within areas of up to 14 meters (46 feet) for single-strike exposures and within areas of up to 541 meters (1,775 feet) of the source piles for multiple-strike exposures to impact pile driving sounds. By comparison, for 16-inch-square precast concrete piles for piers 2 and 5 driven in dewatered cofferdams, the potential for injury and mortality would still exist within areas of less than 10 meters (32.8 feet) of the source piles for single-strike exposures and within areas of up to 54 meters (177 feet) of the source piles for multiple-strike exposures to impact pile driving sounds.

Several factors that could influence the potential exposure and susceptibility of fish to injury from pile driving sounds include the size, mobility, and likely responses of the species and the life stages of concern. Large, actively migrating adults and juveniles are capable of readily avoiding or migrating through the areas where potential injury may occur. In addition, because of their large size (>600 mm [24 inches]), adult salmonids and green sturgeon would be expected to tolerate higher sound pressures than the levels associated with the onset of injury in smaller fish (Table 4-8), such as juvenile salmonids and species whose individuals are relatively small (e.g., delta and longfin smelt). At a minimum, any adults or juveniles encountering pile driving noise may exhibit some form of behavioral response, including an avoidance response that could disrupt or delay their movement or feeding. Evidence suggests that some fish species avoid or disperse from areas subject to pile driving or other human-generated noises (Popper and Hastings 2009).

Installation of the temporary trestle piles and piles for piers 2 and 5 in May of the first year of construction presents the greatest concern for the potential of injury and mortality of fish from pile driving noise because of the relatively large number of piles (i.e., approximately 160 total piles) that would be installed and the relatively large channel area that would be subject to cumulative sound levels exceeding the injury thresholds (Table 4-7). In addition, relocation of the construction barges is of concern if impact driving is required to install the spud piles to anchor the barges during primary periods of species and life stage occurrence. However, unlike pile driving associated with the temporary trestles and bridge piers, pile driving associated with

relocation of the barges would be infrequent (4–6 times over the course of construction) and would require that only 8 piles be driven over the course of one day, per event.

Winter-run, spring-run, fall-run, and late fall–run Chinook salmon, steelhead, green sturgeon, and river lamprey eggs and fry would not be exposed to underwater noise from pile driving activities because these activities are located well downstream of spawning areas or because these life stages would not be present during the proposed in-water construction period. Some overlap with green sturgeon and winter-run and spring-run Chinook salmon adults may occur at the end of the migration season in May and June, with late fall–run Chinook salmon and steelhead adults at the beginning of the migration season in November, and with steelhead and river lamprey adults in November. Adult fall-run Chinook salmon may be exposed to underwater noise from pile driving activities in early July and November, and some fall-run and spring-run Chinook salmon and steelhead smolts may be exposed to underwater noise from pile driving in May and June.

Unlike anadromous salmonids, green sturgeon, and lamprey that spawn well upstream of the BSA, delta and longfin smelt, and splittail may spawn within or in the vicinity of the BSA; therefore, their eggs and larvae may be exposed to underwater noise from pile driving activities. In addition, pile driving activities would overlap with delta smelt, longfin smelt, and Sacramento splittail adults at the end of the migration and spawning season in May and June, and with larvae and juveniles of these species in May through early July. Pile driving associated with relocating the construction barges outside of May 1 to November 30 could potentially overlap peak migration and spawning periods for special-status fish species; however, because it is not known when barges would have to be moved it is not possible to identify which species and life stages potentially would be affected. However, these pile driving activities would be infrequent and last for less than one day per event.

Based on the predicted levels of underwater noise, pile driving activities could lead to injury and/or direct and indirect mortality if individuals are within the range of noise levels that could cause physical harm or behavioral effects that lead to mortality (e.g., from predation). However, it is likely that only a small proportion of each fish population is at risk, based on the relatively limited overlap of pile driving activities with migration timing.

Although pile driving would occur over many days per season, pile driving will not be continuous and will be limited to daylight hours only, resulting in extended overnight periods each day for migrating fish to pass the construction site undisturbed. In addition, the project proponent proposes to drive piles for in-water piers 2 and 5 in dewatered cofferdams and to install the 108-inch-diameter steel casings for in-water piers 3 and 4 using a vibratory hammer and/or hydraulic driven oscillator/rotator system, which would not generate the same underwater

noise levels had these piles been driven in water with an impact hammer. Finally, the project proponent will require the contractor to employ sound attenuation devices (e.g., bubble curtains) during in-water pile driving, if feasible.

Insufficient data are currently available to support the establishment of a noise threshold for behavioral effects (Popper et al. 2006). NMFS generally assumes that a noise level of 150 dB RMS is an appropriate threshold for behavioral effects. During in-water (no attenuation) impact driving of the 16-inch piles for the trestles and barges, the spreadsheet calculations indicate that underwater sounds exceeding 150 dB RMS would extend 2,929 meters (1.8 miles) from the source piles (Table 4-7). However, these calculations assume an unimpeded open water propagation path over this distance, which is not the case for the Sacramento River. The Sacramento River has major river channel bends within about 1,280 meters (4,200 feet) upstream and 1,830 meters (6,000 feet) downstream from the proposed bridge crossing that will result in diffraction and attenuation of sound waves. Thus, the distance within which 150 dB RMS is exceeded likely would be less than indicated in Table 4-7.

Based on the area of disturbance and timing of pile driving operations, some disturbance to the movement and feeding of special-status fish is anticipated. In addition, pile driving activities would not be continuous but would start and stop during the course of each day of pile driving (including cessation of pile driving activities at night), providing opportunities for fish to continue with their movements and feeding without substantial delays. In addition, general construction noise may act to disperse fish away from the construction area before impact driving is initiated.

Increased Exposure to Contaminants

Disturbance and resuspension of river bottom sediments during in-water construction pose a risk to juvenile and adult winter-run Chinook salmon because of potential increases in the exposure to contaminated sediments.

Sand, silt, and gravel characterize bottom substrate in the BSA. Non-soluble contaminants with a tendency to adsorb[1] to sediments (as opposed to soluble contaminants which have the tendency to be readily diluted in water) can accumulate in the substrate over time. Non-soluble contaminants that are known to be present in the Sacramento River include polychlorinated biphenyls (PCBs), mercury, pesticides and insecticides (i.e., dieldrin, chlorodane, DDT), and other unknown toxicities (State Water Resources Control Board 2011). Resuspension of sediments with adsorbed metals during in-water construction potentially could lead to degradation of water quality and food resources in the BSA. In addition, resuspended particulate

[1] *Adsorption* is the adhesion of atoms, ions, or molecules from a gas, liquid, or dissolved solid to a surface—in this case, a sediment particle.

material could be transported to other locations in the Sacramento River as a result of transport by river currents, thus leading to potential degradation of water quality and food resources beyond the BSA. Although special-status fish species may be present in the BSA during any month, restricting in-water construction to the May 1–November 30 window will minimize or avoid exposure of most juvenile and adult winter-run Chinook salmon to contaminants because they occur less frequently in the Sacramento River during this time of year (Tables 4-4 and 4-5). Green sturgeon may be more susceptible than other fish species to contaminated sediments because they are more benthic oriented than other species and therefore may come into direct contact with contaminated sediments through ingestion of sediments along with benthic food organisms. In addition, their long life span allows them to accumulate high body burdens of contaminants, which potentially can reach concentrations with deleterious physiological effects.

In-water construction would be limited to pile driving and installation and removal of sheet piles for cofferdams. In addition, in-water construction would be limited to daylight hours each day. Thus, disturbance of channel substrate and the potential for increased contaminants would be temporary and localized. Assuming that mobilization of sediment is also an indication of contaminant mobilization, the proposed in-water construction methods should minimize the increase in contaminants.

Given the relatively short exposure time and the restricted area of in-water construction relative to the distribution and temporal occurrence of adult and juvenile winter-run Chinook salmon between May 1 and November 30, the effect of contaminants mobilized by in-water construction is not expected to result in significant effects to the survival and growth of winter-run Chinook salmon.

Contaminant Spills

Construction activities that occur in or near the Sacramento River channel can result in the discharge of contaminants that are potentially lethal to fish. The operation of heavy equipment, cranes, pile drivers, drilling rigs, tug boats, and other construction equipment during bridge construction can result in spills and leakage of fuel, lubricants, hydraulic fluids, and coolants. Other sources of potential contamination include asphalt, wet concrete, and other materials that may come into direct contact with surface water during construction activities. For example, concrete that is being poured for the bridge decking could be discharged accidentally to the river, thereby contaminating the river with uncured concrete (which can raise pH) and related compounds.

The potential magnitude of biological effects resulting from contaminants depends on a number of factors, including the proximity of spills to the river; the type, volume, concentration, and solubility of the contaminant; and the timing and duration of the spill or release of the

contaminant into the water column. Contaminants can affect survival, growth, and reproductive success of fish and other aquatic organisms. The level of effect depends on the species, life stage sensitivity, duration of exposure, condition or health of exposed individuals, and the physical and chemical properties of the water (e.g., temperature, pH, dissolved oxygen, and other factors).

Implementation of Measure 5 would eliminate or minimize the risk of contaminant spills and the potential effects of any spills on fish and other aquatic organisms.

Erosion and Mobilization of Sediment

Site clearing, earthwork, driving of permanent piles, driving and removal of piles for the temporary trestles, vibrating and removal of sheet piles for cofferdams, and installation of RSP will result in disturbance of soil and riverbed sediments, resulting in temporary increases in turbidity and suspended sediments in the Sacramento River. In addition, dewatering and soil removal from the inside of the cofferdams could result in temporary increases in turbidity and suspended sediments in the river, if water (and associated spoils) from within the cofferdams is not properly disposed of or contained and treated before being discharged back to the river.

The potential for disturbance of riverbed sediments and associated increases in sedimentation and turbidity in the Sacramento River are anticipated to be greatest during activities to extract the piles used for the temporary trestles and cofferdams. These activities would result in greater disturbance to riverbed sediments than would occur during pile driving for piers and the bridge fender system; these piles would be driven only and not extracted.

In addition to increasing exposure to contaminants as discussed previously, elevated levels of suspended sediments have the potential to result in physiological, behavioral, and habitat effects related to increased sediment concentrations in the water column. The severity of these effects depends on the sediment concentration, duration of exposure, and sensitivity of the affected life stage. Short-term increases in turbidity and suspended sediment may disrupt normal behavior patterns of fish, potentially affecting foraging, rearing, and migration. The level of disturbance may also cause juveniles to abandon protective habitat or reduce their ability to detect predators, potentially increasing their vulnerability to predators (e.g., striped bass and largemouth bass). Previous studies have documented these effects. For example, juvenile salmonids have been observed to avoid streams that are chronically turbid (Lloyd et al. 1987) or move laterally or downstream to avoid turbidity plumes (Sigler et al. 1984). Bisson and Bilby (1982) reported that juvenile coho salmon avoid turbidities exceeding 70 nephelometric turbidity units (NTUs). Chronic exposure to high turbidity and suspended sediment may affect growth and survival by impairing respiratory function, reducing tolerance to disease and contaminants, and causing physiological stress (Waters 1995). Sigler et al. (1984) found that prolonged exposure to turbidities between 25 and 50 NTUs resulted in reduced growth and increased emigration rates of

juvenile coho salmon and steelhead compared to controls. Increased sediment delivery can also smother aquatic invertebrates (a fish food item), degrade forage habitat, and reduce cover for juvenile fish.

Green sturgeon may be at higher risk of exposure to construction-related impacts than other listed species because their benthic nature may make them more likely to encounter sediment plumes that may be more concentrated near the river bottom.

Implementation of Measure 5 would eliminate or minimize the potential for mobilization of sediment and increased sedimentation and turbidity in the Sacramento River. Some harassment of adult and juvenile fish may occur due to temporary, localized plumes of sediment during pile driving and installation and removal of temporary piles and sheet piles. Turbidity would be monitored throughout in-water construction (Measure 26).

Increases in Impervious Surface Area and Storm Water Runoff

The proposed project would result in added impervious surface which would have the potential to increase runoff volume in the Sacramento River. Increased traffic loads on the new bridge resulting from improved access could result in increased deposition of particulates onto the bridge deck that could then be transported to the Sacramento River with road runoff.

Heavy metals, oil, grease, and polycyclic aromatic hydrocarbons (PAHs) are common pollutants in road runoff;. Some of these pollutants can accumulate in stream sediments with lethal and sublethal consequences for fish and other aquatic species, particularly during “first flush” rain events. PAHs are organic compounds—containing only carbon and hydrogen—that occur in motor vehicle exhaust, petroleum products, materials associated with asphalt, and various other municipal and industrial sources. PAHs are widely distributed in the environment and are important environmental pollutants because of their carcinogenicity and tendency to bioaccumulate. PAHs are readily absorbed by fish and other aquatic organisms and, depending on concentration, can lead to lethal and deleterious sublethal effects in these organisms (Tuvikene 1995). PAHs tend to adsorb to any particulate matter, including fine sediment; therefore, relative concentrations of PAHs in aquatic ecosystems are generally highest in sediments, followed by aquatic biota and the water column (Tuvikene 1995). There is evidence that urban runoff containing roadway sediment may be an important PAH input to aquatic habitats and that a significant contribution to the PAH content of roadway sediment comes from materials associated with asphalt (Wakeham et al. 1980).

Although the new bridge would represent added impervious surface area, the proposed project would not represent a substantial increase in impervious surface area in the BSA relative to existing conditions. The new bridge would replace the vehicle portion of the existing I Street

Bridge, and existing traffic would be re-routed to the new bridge. In addition, storm water runoff from the new bridge would be directed to the existing storm water collection systems. Therefore, it is not anticipated that the proposed project would contribute to a cumulative water quality impact during operations.

Temporary and Permanent Loss of Aquatic Habitat

The proposed project would result in the temporary and permanent loss of aquatic habitat area and volume, including foraging and rearing habitat for juvenile winter-run Chinook salmon. Table 4-9 shows the temporary and permanent loss of aquatic habitat that would occur as a result of constructing the proposed project.

Table 4-9. Amount of Temporarily and Permanently Affected Aquatic Habitat in the Sacramento River Resulting from the Proposed Project

Feature/Habitat	Temporary Impact	Permanent Impact
Temporary Cofferdams		
Substrate Area (square feet [acre])	4,000 [0.09]	NA
Water Column Volume (cubic feet)	73,640	NA
Temporary Trestle Piles		
Substrate Area (square feet [acre])	197 [0.005]	NA
Water Column Volume (cubic feet)	3,573	NA
Piers 2 and 5		
Substrate Area (square feet [acre])	NA	8,500 [0.20][1]
Water Column Volume (cubic feet)	NA	12,250
Piers 3 and 4		
Substrate Area (square feet [acre])	NA	1,864 [0.04][2]
Water Column Volume (cubic feet)	NA	17,800
Piles for Bridge Fender System		
Substrate Area (square feet [acre])	NA	85 [0.002]
Water Column Volume (cubic feet)	NA	2,600
Shoreline Rock Revetment (RSP)		
Substrate Area (square feet [acre])	**NA**	**70,000 [1.61]**
Water Column Volume (cubic feet)	**NA**	**NA**
TOTALS		
Substrate Area (square feet [acre])	4,197 [0.095]	80,449 [1.85]
Water Column Volume (cubic feet)	77,213	32,650

NA = Not applicable
[1] 2,500 sf (pile caps) + 6,000 sf (RSP)
[2] 64 sf (piles) + 1,800 sf (RSP)

Installation of sheet pile cofferdams to isolate the in-water construction areas for piers 2 and 5 from the water column during pier construction would result in the temporary loss of aquatic habitat (substrate and water column) equal to the enclosed area and volume of the in-water cofferdams. The proposed dimensions of each cofferdam are 25 feet by 80 feet, or 2,000 square feet. Together, the two cofferdams would result in a temporary loss of 4,000 square feet (0.09 acre) of substrate habitat and up to 73,640 cubic feet of water column habitat below the OHWM (based on a water surface elevation of +20 feet). Similarly, installation of piles for the

temporary trestles would also result in the temporary loss of substrate and water column habitat equal to the total area and volume of the in-water piles used to support the temporary trestles. The temporary trestle piles would remain in place throughout the duration of construction. A total of approximately 141 16-inch-diameter pipe or H piles would be installed below the OHWM to support the temporary trestles, and would result in a temporary loss of 197 square feet (0.005 acre) of substrate habitat and up to 3,573 cubic feet of water column habitat below the OHWM. (Approximately 19 of the 160 piles for the temporary trestles would be installed above the OHWM).

Installation of the new bridge piers (piers 2–5) and piles for the new bridge fender system would result in the permanent loss of aquatic habitat (substrate and water column) equal to the cumulative area (substrate) and volume (water column) of the in-water piers and bridge fender piles. Similarly, placement of rock revetment (rip-rap) around the new bridge piers and on the waterside slope of the existing levees below the OHWM also would result in the permanent loss of natural substrate habitat equal to the net increase in area of rock revetment. Up to 1,600 linear feet of shoreline (900 linear feet on City of Sacramento shoreline and 700 linear feet on City of West Sacramento shoreline), covering up to 70,000 square feet (1.61 acre) of the bank below the OHWM, would be lined with RSP (1/4-ton, Method B). A total of 2,000 cubic yards of RSP would be placed below the OHWM, and a total of 2,000 cubic yards would be placed above the OHWM.

Installation of these features may result in direct and indirect effects by inhibiting establishment of riparian vegetation; inhibiting recruitment and retention of sediment and woody debris; and eliminating shallow, low-velocity river margins preferred by juvenile fish.

Compensation for impacts on critical habitat, as described below, would offset the effects of permanent impacts on the substrate and water column resulting from construction of the new bridge piers.

Loss of Shaded Riverine Aquatic Cover

Clearing of the existing cottonwood riparian forest vegetation within the proposed project footprint would result in the permanent loss of up to 1.44 acres and temporary loss of up to 1.52 acres of cottonwood riparian forest within the BSA, of which approximately 0.44 acres is below the OHWM and contributes to overhead (shade) and instream SRA cover (see additional discussion below regarding SRA cover). The permanent loss of existing cottonwood forest would result from activities related to construction of the two fixed-span bridge approach structures, the bikeway along Jibboom Street in the City of Sacramento, and the new residential access road connecting B Street and 3rd Street in the City of West Sacramento (Figure 3-1). The temporary loss of cottonwood riparian forest would occur from trimming riparian vegetation and

removing additional trees and understory vegetation to provide equipment access. Portions of this affected riparian forest also provide SRA cover habitat that is an important component of anadromous fish habitat (see additional discussion below). Clearing of the existing cottonwood riparian forest that contributes to SRA cover would result in the temporary and permanent loss of up to 890 linear feet (i.e., up to 513 linear feet on the City of Sacramento side of the Sacramento River and up to 377 linear feet on the City of West Sacramento side of the Sacramento River) of overhead SRA cover (shade) along the summer (low-flow) shoreline of the Sacramento River.

Riparian vegetation is important in controlling stream bank erosion, contributing to instream structural diversity, and maintaining undercut banks. In addition, canopy cover (overhanging vegetation [a form of SRA cover]) maintains shade that is necessary to reduce thermal input and provides an energy input to the aquatic habitats in the form of fallen leaves and insects (a food source for fish). SRA cover also provides fish with protection from predators in the form of undercut banks, branches, roots, and instream woody material (e.g., logs).

Without appropriate mitigation, removal of streamside vegetation is likely to adversely affect winter-run Chinook salmon and other fish species because riparian and SRA cover habitat are essential components of salmonid rearing habitat that may limit production and abundance of salmonids in the Sacramento River. Salmonid populations are highly influenced by the amount of available cover (Raleigh et al. 1984). The amount of existing riparian and SRA cover habitat in the BSA and in the region is of variable quality because of past and ongoing impacts, including levee construction and bank protection activities (i.e., placement of rock revetment).

USFWS mitigation policy identifies California's riparian habitats, including SRA cover habitat, in Resource Category 2. The designation criteria for habitat in Resource Category 2 is "habitat to be impacted is of high quality for evaluation species and is relatively scarce or becoming scarce on a national basis or in the ecoregion section" (U.S. Fish and Wildlife Service 2015c), for which "no net loss of in-kind habitat value" is recommended (46 FR 7644, January 23, 1981). In addition, NMFS recommends re-vegetating onsite at a 3:1 ratio (3 units replaced for every 1 unit of affected habitat) with native riparian species to facilitate the development of SRA cover habitat (Rea pers. comm.).

Temporary and permanent impacts on riparian and SRA cover habitat will be compensated for by implementing Measure 4, discussed above.

Increase in Overwater Structure (Artificial Shade)

Overwater structures can alter underwater light conditions and provide potential holding conditions for juvenile and adult fish, including species that prey on juvenile fishes. Temporary shading attributable to the presence of the temporary trestles, work platforms, and barges during

bridge construction and permanent shading from the new bridge potentially could reduce primary productivity of affected habitats. Temporary shading also could increase the number of predatory fishes (e.g., striped bass, largemouth bass) holding in the study area and/or their ability to prey on juvenile fishes. Because the temporary trestles, work platforms, and barges would be present only during construction, effects of trestle, work platform, and barge shading would be temporary and localized.

Barge shading would occur year-round during construction of the new bridge. One to two barges, each approximately 60 feet wide and 190 feet long (11,400 square feet [0.26 acre]), would be present during construction and would provide a total of 11,400–22,800 square feet (0.26–0.52 acre) of temporary over-water structure (Table 4-10). Because the barges would be present only during construction and moved periodically as construction of the bridge progresses, effects of barge shading would be temporary and localized.

Table 4-10. Amount of Artificial Overwater Structure (Shade) on the Sacramento River under Existing and With-Project Conditions

Overwater Structure	Square Feet of Shaded Area		
	Existing Conditions	With-Project Conditions (Barge/Trestle/Bridge)	Change
Barge (Temporary)	0	11,400–22,800[a]	+11,400–22,800[a]
Trestle (Temporary)	0	30,000	+30,000
Bridge (Permanent)	0	55,000	+55,000
Net Change (Temporary)			+41,400–52,800a
Net Change (Permanent)			+55,000

NA = Not Applicable.
[a] 1 barge–2 barges.

Shading by the temporary trestles and work platforms would occur year-round during construction of the new bridge. Two trestles, approximately 30 feet wide and varying in length and configuration (Figure 1-3), would be present during construction and would provide a total of approximately 30,000 square feet (0.69 acre) of temporary over-water structure (Table 4-10). Because the trestles and work platforms would be present only during construction, effects of trestle shading would be temporary and localized. Together, the barges and temporary trestles would create up to 52,800 square feet (1.21 acres) of temporary overwater structure (i.e., shade) (Table 4-10).

The new bridge would create approximately 55,000 square feet (1.26 acre) of permanent over-water structure where no over-water structure currently exists. The increased shading created by the new bridge could potentially affect the migration of adult and juvenile winter-run Chinook salmon, and other species. Within the Sammamish River, in Washington State, migrating adult salmon hold in shaded areas beneath bridges (Carrasquero 2001). Juvenile salmonids also prefer shaded areas created by bridges. Because of the height of the new bridge over the water, ambient

light levels generally would be expected to penetrate into the water, thereby minimizing the effect of bridge shading on aquatic habitats in the Sacramento River. Compensation for impacts on critical habitat, as described below, would offset the effects of bridge shading on aquatic habitats in the Sacramento River.

Fish Entrapment in Cofferdams

Cofferdams will be required in order to construct piers 2 and 5 for the new bridge. Cofferdams will be constructed of sheet piles; when installed, each cofferdam will be approximately 25 feet wide and 80 feet long. The potential exists for entrapment and mortality of fish following closure and dewatering of the cofferdam. The proposed timing of cofferdam installation (May) would avoid the primary period of occurrence of juvenile winter-run Chinook salmon; however, the potential would remain for some special-status fish species to become entrapped in the cofferdams. Implementation of Measures 27 and 28 would further minimize or avoid the risk of mortality for fish potentially stranded during cofferdam installation, closure, and dewatering.

Introduction of Aquatic Invasive Species

During construction, the operation of barges and other in-water equipment originating from regions or areas outside the project area could result in the introduction and spread of aquatic invasive species (AIS), including the Asian overbite clam (*Corbula amurensis*), quagga mussel (*Dreissena bugensis*), zebra mussel (*Dreissena polymorpha*), hydrilla (*Hydrilla verticillata*), and Brazilian elodea (*Egeria densa*) (California Department of Fish and Game 2008). These species can adversely affect native fishes and other ecologically and economically important species through a number of mechanisms, including competition for resources, predation, parasitism, interbreeding, disease transmission, or changes in the physical or chemical attributes of aquatic habitat. The project proponent will address this impact by implementing Measure 29.

Increase in Direct Lighting on Sacramento River

Temporary lighting of work areas to facilitate nighttime construction, especially at construction sites adjacent to or over the Sacramento River, and permanent lighting associated with the new bridge may result in increased nighttime light intensity on the water surface of the Sacramento River. Increases in direct lighting of the Sacramento River at night may affect the migratory behavior of juvenile fish; alter behavior of animals that prey on fish (e.g., piscivorous birds, mammals, and fish) in adjacent and affected habitats; or make juvenile fish more visible to predators, thereby leading to increased mortality of fish through increased predation (Tabor et al. 2001). Implementation of Measure 30 would minimize the potential for effects of lighting on fish by requiring shielding and focusing of temporary lights on work areas and permanent bridge lighting to avoid and minimize the amount of nighttime lighting that directly radiates on streams, to the extent practicable.

The proposed project is *likely to adversely affect* winter-run Chinook salmon based on temporary effects on water quality (increased turbidity and suspended sediment), rearing and movement habitat (noise and shade), and channel substrates (cofferdams and temporary trestles); temporary and permanent effects on riparian and SRA cover habitat (vegetation removal, bridge and bike path construction) and permanent effects on aquatic habitat (construction of bridge piers, shade, and placement of RSP) in the Sacramento River.

Impacts on Sacramento River Winter-Run Chinook Salmon Critical Habitat

The Sacramento River within the BSA is included in the designated critical habitat for Sacramento River winter-run Chinook salmon (58 FR 33212–33219, June 16, 1993). The primary constituent elements of critical habitat in the BSA include freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of winter-run Chinook salmon. Critical habitat for winter-run Chinook salmon in the BSA includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

The project is *likely to adversely affect* Sacramento River winter-run Chinook salmon designated critical habitat. Impacts on winter-run Chinook salmon critical habitat include temporary effects on the water column (underwater noise and sound pressure, and water quality impacts) and channel substrate (cofferdams and trestles), and permanent loss of aquatic habitat (water column and substrate) and riparian and SRA cover habitat in the Sacramento River. These impacts would be the same as those discussed above for winter-run Chinook salmon.

With implementation of Measures 1–3, 5, 23–26, 29, and 30, impacts on winter-run Chinook salmon critical habitat would be avoided or minimized. In addition, impacts on riparian habitat would be compensated for by implementing Measure 4, while impacts on perennial stream would be compensated for by implementing Measure 7.

NMFS recommends the purchase of channel enhancement credits at a 3:1 ratio at a NMFS-approved anadromous fish conservation bank for the acres of impacted critical habitat within the river channel resulting from the proposed project (Rea pers. comm.). Measure 31 would be implemented to compensate for effects to critical habitat (see “Compensatory Mitigation” below).

4.4.1.6 Avoidance and Minimization Efforts

Implementation of the following measures would avoid and/or minimize direct and indirect impacts on Sacramento River winter-run Chinook salmon and their designated critical habitat.

Measure 1: Install Orange Construction Fencing between the Construction Area and Adjacent Sensitive Biological Resources

Please refer to the discussion of Measure 1 in Section 4.1.1.3.

Measure 2: Conduct Environmental Awareness Training for Construction Employees

Please refer to the discussion of Measure 2 in Section 4.1.1.3.

Measure 3: Conduct Periodic Biological Monitoring

Please refer to the discussion of Measure 3 in Section 4.1.1.3.

Measure 5: Protect Water Quality and Prevent Erosion and Sedimentation in Drainages and Wetlands

Please refer to the discussion of Measure 5 in Section 4.1.2.3.

Measure 23: Conduct All In-Water Construction Activities between May 1 and November 30 and during Daylight Hours Only

The project proponent will conduct all in-water construction work and pile driving (in-water and shore-based within 250 feet of the Sacramento River), installation of cofferdams, removal of temporary sheet piles, and placement of rock revetment between May 1 and November 30 to avoid or minimize causing disturbance and injury to, or mortality of, special-status fish species in the affected reaches of the Sacramento River. In addition, in-water work will be conducted during daylight hours only to provide fish in the affected reaches of the Sacramento River with an extended quiet period during nighttime hours for feeding and unobstructed passage.

Limiting in-water construction to the May 1–November 30 period would achieve several goals.

- In-water construction activities with the potential to generate harmful levels of underwater noise (e.g., driving piles with an impact hammer) would avoid the primary migration periods of adults and juveniles of special-status fish species.
- The length of the in-water construction period would be maximized, thereby limiting the number of construction seasons that in-water construction would be needed and the number of year classes of fish species that potentially would be exposed to in-water construction effects.

Measure 24: Implement Measures to Minimize Exceedance of Interim Threshold Sound Levels during Pile Driving

The project proponent will require the contractor to implement the following measures, developed in coordination with project design engineers, to minimize the exposure of listed fish species to potentially harmful underwater sounds.

- If feasible, the contractor will vibrate all piles to the maximum depth possible before using an impact hammer.
- No more than 20 piles will be driven per day, and pile driving with an impact hammer will occur on no more than 75 individual days total during construction.
- During impact driving, the contractor will limit the number of strikes per day to the minimum necessary to complete the work and will limit the total number of hammer strikes to 16,000 strikes per day (i.e., 800 hammer strikes per pile, per day) for piles for the bridge piers and temporary trestles, and 20,000 strikes per day (i.e., 1,000 hammer strikes per pile, per day) for the piles for the bridge fender system.
- The smallest pile driver and minimum force necessary will be used to complete the work.
- During impact driving, the project proponent will require the contractor to use a bubble curtain or similar device, if feasible, to minimize the extent to which the interim peak and cumulative SEL thresholds are exceeded (see Section 4.4.1.3, “Project Impacts”).
- No pile driving activity will occur at night, thereby providing fish with an extended quiet period during nighttime hours on days pile driving is being conducted for feeding and unobstructed passage.

Measure 25: Develop and Implement a Hydroacoustic Monitoring Plan

The project proponent and/or its construction contractor will develop and implement a hydroacoustic monitoring plan. The monitoring plan will be submitted to the resource agencies (CDFW, NMFS, and USFWS) for approval at least 60 days before the start of project activities. The plan will include the following requirements.

- The project proponent and/or its construction contractor will monitor underwater noise levels during all impact pile driving activities on land and in water to ensure that that peak and cumulative SELs do not exceed estimated values (Table 4-7).
- The monitoring plan will describe the methods and equipment that will be used to document the extent of underwater sounds produced by pile driving, including the number, location, distances, and depths of the hydrophones and associated monitoring equipment.
- The monitoring plan will include a reporting schedule for daily summaries of the hydroacoustic monitoring results and for more comprehensive reports to be provided to the resource agencies on a monthly basis during the pile driving season.

- The daily reports will include the number of piles installed per day; the number of strikes per pile; the interval between strikes; the peak SPL, SEL, and RMS per strike; and the accumulated SEL per day at each monitoring station.
- The project proponent or its contractors will ensure that a qualified fish biologist is on site during impact pile driving to document any occurrences of stressed, injured, or dead fish. If stressed, injured, or dead fish are observed during pile driving, the project proponent and/or its construction contractor will reduce the number of strikes per day to ensure that fish are no longer showing signs of stress, injury, or mortality.

Measure 26: Monitor Turbidity in the Sacramento River

The project proponent will require the construction contractor to monitor turbidity levels in the Sacramento River during in-water construction activities (e.g., pile driving, extraction of temporary sheet piles used for cofferdams, placement of RSP). Turbidity will be measured using standard techniques upstream and downstream of the construction area to determine whether changes in ambient turbidity levels exceed 20%, the threshold derived from the Sacramento and San Joaquin Rivers Basins Plan (Central Valley Regional Water Quality Control Board 2011). If it is determined that turbidity levels exceed the 20% threshold, then the project proponent and/or its contractors will adjust work to ensure that turbidity levels do not exceed the 20% threshold.

Measure 27: Implement Cofferdam Restrictions

The following restrictions will be implemented during installation of the cofferdams and cofferdam dewatering.

- The extent of cofferdam footprints will be limited to the minimum necessary to support construction activities.
- Sheet piles used for cofferdams will be installed and removed using a vibratory pile driver.
- Cofferdams will be installed and removed only during the proposed in-water work window (between May 1 and November 30).
- Cofferdams will not be left in place over winter where they could be overtopped by winter/spring flows and when juveniles of listed species are most likely to be present in the construction area.
- All pumps used during dewatering of cofferdams will be screened according to CDFW and NMFS guidelines for screens.
- Cofferdam dewatering and fish rescue/relocation from within cofferdams will commence immediately following cofferdam closure.

Measure 28: Prepare and Implement a Fish Rescue and Relocation Plan

The project proponent and/or its construction contractor will develop and implement a fish rescue and relocation plan to recover any fish trapped in cofferdams. The fish rescue

and relocation plan will be submitted to the resource agencies (CDFW, NMFS, and USFWS) for approval at least 60 days before initiating activities to install cofferdams. At a minimum, the plan will include the following.

- A requirement that fish rescue and relocation activities will commence immediately after cofferdam closure and that dewatering has sufficiently lowered water levels inside cofferdams to make it feasible to rescue fish.
- A description of the methods and equipment proposed to collect, transfer, and release all fish trapped within cofferdams. Capture methods may include seining, dip netting, and/or electrofishing as approved by CDFW, NMFS, and USFWS. The precise methods and equipment to be used will be developed cooperatively by CDFW, NMFS, USFWS, and the project proponent and/or contractor.
- A requirement that only CDFW-, NMFS-, and USFWS-approved fish biologists will conduct the fish rescue and relocation.
- A requirement that fish biologists will contact CDFW, NMFS, and USFWS immediately if any listed species are found dead or injured.
- A requirement that a fish rescue and relocation report be prepared and submitted to CDFW, NMFS, and USFWS within 5 business days following completion of the fish relocation. Data will be provided in tabular form and at a minimum will include the species and number rescued and relocated, approximate size of each fish (or alternatively, approximate size range if large number of individuals are encountered), date and time of their capture, and general condition of all live fish (e.g., good–active with no injuries; fair–reduced activity with some superficial injuries; poor–difficulty swimming/orienting with major injuries). For dead fish, additional data will include fork length and description of injuries and/or possible cause of mortality if it can be determined.

Measure 29: Prevent the Spread or Introduction of Aquatic Invasive Species

The project proponent or its contractors will implement the following actions to prevent the potential spread or introduction of AIS associated with the operation of barges and other in-water construction activities. Species of concern related to the operation of barges and other equipment in the lower Sacramento River include invasive mussels (e.g., quagga mussels [*Dreissena bugensis*] and zebra mussels [*Dreissena polymorpha*]) and aquatic plants (e.g., Brazilian waterweed [*Egeria densa*] and hydrilla [*Hydrilla verticillata*]) (California Department of Fish and Game 2008).

- The project proponent or its contractors will coordinate with the CDFW's Invasive Species Program to ensure that the appropriate BMPs are implemented to prevent the spread or introduction of AIS.
- Educate construction supervisors and managers about the importance of controlling and preventing the spread of AIS.
- Train vessel and equipment operators and maintenance personnel in the recognition and proper prevention, treatment, and disposal of AIS.

- If feasible, prior to departure of vessels from their place of origin and before in-water construction equipment is allowed to operate within the waters of the Sacramento River, thoroughly inspect and remove and dispose of all dirt, mud, plant matter, and animals from all surfaces that are submerged or may become submerged, or places where water can be held and transferred to the surrounding water.

Measure 30: Minimize or Avoid Temporary Construction Lighting and Permanent Bridge Lighting from Directly Radiating on Water Surfaces of the Sacramento River

The project proponent will minimize or avoid the effects of nighttime lighting on special-status fish species by implementing the following actions.

Temporary Construction Lighting

- Avoiding construction activities at night, to the maximum extent practicable.
- Using the minimal amount of lighting necessary to safely and effectively illuminate the work areas.
- Shielding and focusing lights on work areas and away from the water surface of the Sacramento River, to the maximum extent practicable.

Permanent Bridge Lighting

- Minimizing nighttime lighting of the bridge structure for aesthetic purposes.
- Using the minimal amount of lighting necessary to safely and effectively illuminate vehicular, bicycle, and pedestrian areas on the bridge.
- Shielding and focusing lights on vehicular, bicycle, and pedestrian areas and away from the water surface of the Sacramento River, to the maximum extent practicable.

4.4.1.7 Compensatory Mitigation

Implementation of the Measures 31 and 32 would compensate for permanent impacts on critical habitat and loss of riparian vegetation and SRA cover.

Measure 31: Purchase Channel Enhancement Credits for Impacts on Critical Habitat

Permanent impacts on critical habitat (bank and substrate below the OHWM and water column habitat), totaling 3.11 acres (up to 80,449 square feet [1.85 acre] from the new bridge piers and RSP and up to 55,000 square feet [1.26 acre] from bridge shading of aquatic habitat) will be mitigated at a 3:1 ratio. The project proponent proposes to mitigate the permanent loss of critical habitat through purchase of 9.33 acres of mitigation credits at a NMFS-approved anadromous fish conservation bank.

4.4.1.8 Cumulative Impacts

Current, future, and reasonably foreseeable actions in the project region that could also affect special-status fish species, SRA cover habitat, and critical habitat potentially affected by the proposed project include the following.

- Flood management projects affecting the Sacramento River.
- Restoration and other water-related projects in and near the Sacramento River that could affect fish or vegetation on the waterside of levees.
- Development in the West Sacramento area that could result in effects similar to those of the proposed project.

Without compensation, construction of the proposed project would contribute a small amount to the cumulative loss of suitable aquatic habitat (substrate, water column) for winter-run Chinook salmon in the project region. However, with implementation of the proposed avoidance and minimization efforts and compensatory mitigation, construction of the proposed project would not add to the cumulative effects on Sacramento River winter-run Chinook salmon.

Under the ESA, cumulative effects are "those effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area of the federal action subject to consultation" (50 CFR 402.2). Future federal actions that are unrelated to the proposed action are not considered in this assessment because they require separate consultation pursuant to Section 7 of the ESA.

Caltrans is not aware of any future state or private activities that are reasonably certain to affect winter-run Chinook salmon or designated critical habitat within the area potentially affected by the proposed project.

4.4.2 Central Valley Spring-Run Chinook Salmon

4.4.2.1 Status and Distribution

The NMFS listed the Central Valley ESU of spring-run Chinook salmon as threatened on September 16, 1999 and reaffirmed this listing on June 28, 2005. The ESU includes naturally spawned populations in the Sacramento River and its tributaries, including the Feather River, and the artificial propagation program at Feather River Fish Hatchery (FRFH). NMFS proposed critical habitat for Central Valley spring-run Chinook salmon on December 10, 2004, and published a final rule designating critical habitat for this ESU on September 2, 2005. The Central Valley spring-run Chinook salmon ESU was listed as threatened under CESA in February 1999.

Spring-run Chinook salmon may have once been the most abundant of Central Valley Chinook salmon (Mills and Fisher 1994), historically occupying the upstream reaches of all major river systems in the Central Valley where there were no natural barriers. The San Joaquin populations

were essentially extirpated by the 1940s; and populations in the upper Sacramento, Feather, and Yuba Rivers were eliminated with the construction of major dams during the mid-1900s (Yoshiyama et al. 1998). Naturally spawning populations of spring-run Chinook salmon currently are restricted to accessible reaches of the upper Sacramento River, Antelope Creek, Battle Creek, Beegum Creek, Big Chico Creek, Butte Creek, Clear Creek, Deer Creek, Mill Creek, Feather River, and Yuba River (California Department of Fish and Game 1998).

The abundance of Central Valley spring-run Chinook salmon, as measured by the number of adults returning to spawn, has averaged 7,800 natural spawning adults and 3,900 adults returning to hatcheries from 1993 to 2010 (CalFish 2011). Temporal and spatial overlap between spawning spring-run Chinook salmon and fall-run Chinook salmon in the Sacramento and Feather Rivers brings into question their genetic integrity. Genetically uncontaminated populations may exist in Deer Creek, Mill Creek, Butte Creek, and other eastside tributaries of the Sacramento River, including a growing population in Battle Creek.

The FRFH was constructed by DWR in the mid-1960s to mitigate for the loss of Chinook salmon and steelhead spawning habitat above Oroville Dam. The FRFH is the only hatchery in the Central Valley producing spring-run Chinook salmon. The current annual production target for spring-run Chinook salmon at the FRFH is 2 million smolts. From 2000 to 2009, annual releases of spring-run smolts ranged from approximately 0.75 to 1.3 million smolts (Cavallo et al. 2009).

4.4.2.2 Life History

Adult spring-run Chinook salmon enter the mainstem Sacramento River from February through September, with the peak upstream migration occurring from May through June (Yoshiyama et al. 1998). Adults generally enter tributaries from the Sacramento River between mid-April and mid-June (National Marine Fisheries Service 2006a). Spring-run Chinook salmon are sexually immature during upstream migration, and adults hold in deep, cold pools near spawning habitat until spawning commences in late summer and fall. Spring-run Chinook salmon spawn in the upper reaches of the mainstem Sacramento River and tributary streams (U.S. Fish and Wildlife Service 1995), with the largest tributary runs occurring in Butte, Deer, and Mill Creeks (Yoshiyama et al. 1998). Spawning typically begins in late August and may continue through October. Juveniles emerge in November and December in most locations but may emerge later when water temperature is cooler. Newly emerged fry remain in shallow, low-velocity edgewater (California Department of Fish and Game 1998).

Juvenile spring-run Chinook salmon typically spend up to 1 year rearing in fresh water before migrating to sea as yearlings, but some may migrate downstream as young-of-year juveniles. Rearing takes place in their natal streams, the mainstem of the Sacramento River, inundated floodplains (including the Sutter and Yolo Bypasses), and the Delta. Based on observations in

Butte Creek and the Sacramento River, young-of-year juveniles typically migrate from November through May. Yearling spring-run Chinook salmon migrate from October to March, with peak migration in November (Cramer and Demko 1997; Hill and Webber 1999). Downstream migration of yearlings typically coincides with the onset of the winter storm season, and migration may continue through March (California Department of Fish and Game 1998).

4.4.2.3 Factors Affecting Abundance

Reasons for the decline and current status of Central Valley spring-run Chinook salmon fall into three general categories: (1) loss of historical spawning habitat; (2) degradation of remaining habitat; and (3) threats to the genetic integrity of the wild spawning populations. The construction of debris, hydropower, flood control, and water supply dams eliminated virtually all historical spawning habitat of spring-run Chinook salmon. Current spawning is restricted to limited areas in mainstem reaches below the lowermost impassable dams and in a few tributaries where the habitat has been degraded by a number of historical and ongoing activities. Major factors that contributed to declines—and that currently limit salmon and steelhead populations—include altered flows and water temperatures from dam operations and water diversions; losses of suitable spawning substrate; channel alterations (e.g., channelization, levees) associated with navigation and flood risk reduction; and associated losses of riparian, floodplain, and wetland habitat.

Land use activities such as agricultural conversion and industrial and urban development have resulted in substantial losses and degradation of salmonid habitat. For example, historical and ongoing land uses in the Feather River downstream of Oroville Dam, including hydraulic mining, gravel mining, levee construction, agricultural encroachment, and urbanization, have resulted in severe constriction and fragmentation of the active floodplain and associated riparian, floodplain, and wetland habitats that once bordered the river (California Department of Water Resources 2004). In addition, levee construction and bank protection have adversely affected salmonid habitat by disrupting the natural erosional processes that create and maintain riparian habitat, SRA cover, and floodplain connectivity. Bank stabilization (e.g., rock revetment) has further simplified the structural and hydraulic characteristics of natural shorelines, eliminating the shallow, low-velocity river margins used by juvenile fish to escape from fast currents, deep water, and predators (U.S. Fish and Wildlife Service 2004).

Habitat blockage by dams poses an additional threat to spring-run Chinook salmon by preventing the spatial and temporal separation between spring-run and fall-run spawners that minimized competition for spawning habitat and maintained the genetic integrity of these runs prior to dams and intensive hatchery programs. For example, overlap in spawning between spring-run and fall-run Chinook salmon in the low-flow channel below Oroville Dam limits spawning success and

has likely resulted in significant hybridization of spring-run and fall-run in the Feather River. The continued practice of releasing large numbers of hatchery fall-run and spring-run Chinook salmon in San Pablo Bay results in substantial straying, further contributing the risk of genetic introgression of hatchery and wild stocks of spring-run and fall-run Chinook salmon (National Marine Fisheries Service 2009a).

4.4.2.4 Survey Results

Focused surveys for Central Valley spring-run Chinook salmon were not conducted. However, it is well documented that spring-run Chinook salmon use the BSA as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, juvenile spring-run Chinook salmon use the lower reaches of the Sacramento River for rearing while emigrating to the ocean. Spawning and egg incubation do not occur in the BSA (Moyle 2002).

The temporal occurrence and relative abundance of juvenile spring-run Chinook salmon in the BSA can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015b). From January 2005 through March 2015, spring-run size juvenile Chinook salmon were detected in the trawls from December through May (Table 4-11).

4.4.2.5 Project Impacts

Project impacts on Central Valley spring-run Chinook salmon would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

The proposed project is *likely to adversely* affect Central Valley spring-run Chinook salmon from exposure to underwater noise during pile driving activities and based on temporary effects to water quality (increased turbidity and suspended sediment), rearing and movement habitat (noise and shade), and channel substrates (cofferdams and temporary trestles); temporary and permanent effects on riparian and SRA cover habitat (vegetation removal, bridge and bike path construction); and permanent effects on aquatic habitat (construction of bridge piers, shade, and placement of RSP) in the Sacramento River.

Impacts on Central Valley Spring-Run Chinook Salmon Critical Habitat

The Sacramento River within the BSA is included in the designated critical habitat for Central Valley spring-run Chinook salmon (70 FR 52488, September 2, 2005). The primary constituent elements of critical habitat in the BSA include freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of spring-run Chinook salmon. Critical habitat for spring-run Chinook salmon in the BSA includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

The project is *likely to adversely affect* Central Valley spring-run Chinook salmon designated critical habitat. Impacts on winter-run Chinook salmon critical habitat include temporary effects to the water column (underwater noise and sound pressure, and water quality impacts) and channel substrate (cofferdams and trestles), and permanent loss of aquatic habitat (water column and substrate) and riparian and SRA cover habitat in the Sacramento River. These impacts would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.2.6 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 23 through 30 would further avoid or minimize the potential for construction-related effects on adult and juvenile spring-run Chinook salmon and designated critical habitat in the BSA.

4.4.2.7 Compensatory Mitigation

Compensation for impacts on critical habitat for winter-run Chinook salmon (Measure 31) and loss of riparian and SRA cover habitat (Measure 4), as described above, also would benefit Central Valley spring-run Chinook salmon. No further compensatory mitigation would be required.

4.4.2.8 Cumulative Impacts

Cumulative impacts on Central Valley spring-run Chinook salmon would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.3 Central Valley Fall-Run and Late Fall–Run Chinook Salmon

4.4.3.1 Status and Distribution

The Central Valley fall-run and late fall–run Chinook salmon ESU includes all naturally spawning populations of fall-run and late fall–run Chinook salmon in the Sacramento and San Joaquin River basins and their tributaries east of the Carquinez Strait in California (64 FR 50394). On September 16, 1999, after reviewing the best available scientific and commercial information, NMFS determined that listing Central Valley fall- and late fall–run Chinook salmon was not warranted. On April 15, 2004, the Central Valley fall- and late fall–run Chinook salmon ESU was identified by NMFS as a species of concern (69 FR 19975).

The Central Valley fall- and late fall–run Chinook salmon ESU is not listed under CESA. However, Central Valley late fall–run Chinook salmon was classified as a Class 2 species of special concern by CDFG (now CDFW) in 1995 (Moyle et al. 1995). Class 2 species of special concern are species with low, scattered, or highly localized populations and require active management to prevent them from becoming Class 1 Species (i.e., species that conform to the state definitions of threatened or endangered species) (Moyle et al. 1995.)

Central Valley fall-run Chinook salmon historically spawned in all major tributaries, as well as the mainstems of the Sacramento and San Joaquin Rivers. The historical distribution of Central Valley late fall–run Chinook salmon is not well understood but is thought to be less extensive than that of fall-run. Late fall–run adults most likely spawned in the upper Sacramento and McCloud Rivers in reaches now blocked by Shasta Dam, as well as in major tributaries with adequate cold water in summer. There is also some evidence that they once spawned in the San Joaquin River in the Friant region and in other large San Joaquin tributaries (Yoshiyama et al. 1998).

The abundance of Central Valley fall- and late fall–run Chinook salmon escapement before 1952 is poorly documented. Reynolds et al. (1993) estimated that production of fall- and late fall–run Chinook salmon on the San Joaquin River historically approached 300,000 adults and probably averaged approximately 150,000 adults. Calkins et al. (1940) estimated fall- and late fall–run Chinook salmon abundance at 55,595 adults in the Sacramento River basin from 1931 to 1939. In the early 1960s, adult fall- and late fall–run Chinook salmon escapement was estimated to be 327,000 in the Sacramento River basin (California Department of Fish and Game 1965). In the mid-1960s, fall- and late fall–run Chinook salmon escapement to the San Joaquin River basin was estimated to be about 2,400 fish (Reynolds et al. 1993).

Long-term trends in adult fall-run Chinook salmon escapement since 1953 indicate that abundance in the Sacramento River has been consistently higher than abundance in the San

Joaquin River. Annual escapement on the Sacramento River has been characterized by relatively high variability, ranging from approximately 100,000 to over 800,000 fish. Sacramento River escapement showed a marked increase in abundance between 1990 and 2003, followed by a decline in abundance from 2004 to the present. In 2009, adult fall-run Chinook salmon returns to Central Valley rivers showed a substantial decline in both the Sacramento and San Joaquin River systems (CalFish 2010). Similar declines in adult escapement also were observed for coho salmon and Chinook salmon returning to other river systems in California (MacFarlane et al. 2008). Trends in adult fall-run Chinook salmon escapement in the San Joaquin River tributaries have been relatively low since the 1950s, ranging from several hundred adults to approximately 100,000 adults (Reynolds et al. 1993).

Adult escapement estimates for late fall–run Chinook salmon returning to the Sacramento River from 1971 through 2009 have ranged from several hundred adults to over 40,000 adults. Adult escapement showed a general trend of declining abundance between 1971 and 1997. During the late 1990s and continuing through 2006, escapement increased substantially but was characterized by high interannual variability. The 2008 and 2009 escapement estimates were lower than the previous 4 years but were not characterized by the severe decline observed for fall-run Chinook salmon (CalFish 2010).

4.4.3.2 Life History

Adult fall-run Chinook salmon migrate through the Delta and into Central Valley rivers from June through December and spawn from September through December. Peak spawning activity usually occurs in October and November. The life history characteristics of late fall–run Chinook salmon are not well understood. Adult late fall–run Chinook salmon migrate through the Delta and into the Sacramento River from October through April and may wait for 1 to 3 months before spawning from December through April. Peak spawning activity occurs in February and March. Chinook salmon typically mature between 2 and 6 years of age (Myers et al. 1998). The majority of Central Valley fall-run Chinook salmon spawn at age 3 (Moyle 2002).

Chinook salmon spawn in clean, loose gravel in swift, relatively shallow riffles, or along the margins of deeper river reaches where water temperatures, depths, and velocities are suitable for redd construction and egg incubation. Egg incubation for Central Valley fall-run Chinook salmon begins with spawning in September and can extend into March (Vogel and Marine 1991). Egg incubation for late fall–run Chinook salmon occurs from December through June (Vogel and Marine 1991; Earley et al. 2010).

Central Valley fall-run Chinook salmon fry (i.e., juveniles shorter than 2 inches long) generally emerge from December through March, with peak emergence occurring by the end of January. In general, fall-run Chinook salmon fry abundance in the Delta increases following high winter

flows. Most fall-run Chinook salmon fry rear in fresh water from December through June, with smolt emigration occurring primarily from April through June. Smolts that arrive in the estuary after rearing upstream migrate quickly through the Delta and Suisun and San Pablo Bays. A very small number (generally less than 5%) of fall-run juveniles spend over a year in fresh water and emigrate as yearling smolts the following November through April. Central Valley late fall–run Chinook salmon fry generally emerge from April through June. Late fall fry rear in fresh water from April through the following April and emigrate as smolts from October through February (Snider and Titus 2000).

Upon emergence from the gravel, fry swim or are displaced downstream (Healey 1991). Fry seek nearshore habitats providing shallow water; vegetation; and substrates that provide aquatic and terrestrial invertebrates, cover and shelter from predators, and slower water velocities for resting (National Marine Fisheries Service 1996). These shallow-water habitats are considered to be more productive rearing habitat than the deeper main river channels. Higher juvenile salmon growth rates associated with greater prey consumption rates and favorable water temperatures have been observed on floodplains with extensive shallow-water habitats (Sommer et al. 2001).

4.4.3.3 Factors Affecting Abundance

Factors that contributed to the decline of Central Valley fall-/late fall–run Chinook salmon are similar to those described earlier for Sacramento River winter-run Chinook salmon and Central Valley spring-run Chinook salmon. Access to much or all of their historical spawning habitat was eliminated by dams, although fall-run Chinook salmon were less affected by these barriers because much of their historical spawning habitat included the lower gradient reaches downstream of these dams (Reynolds et al. 1993; McEwan 2001). However, changes in the seasonal hydrologic patterns resulting from water diversions and operation of upstream reservoirs for water supply, flood control, and hydroelectric power generation have altered flows, water temperatures, and other habitat conditions for fall-run Chinook salmon and other species in these reaches (Williams 2006).

Properly functioning migration corridors for juvenile Central Valley fall- and late fall–run Chinook salmon consist of a wide range of habitat types, including primary and secondary channels, streambanks, floodplains, and marshes. Much of the Sacramento and San Joaquin River corridor and Delta have been leveed, channelized, and modified with rip-rap for flood risk reduction, thereby reducing and degrading the value and availability of natural habitat for rearing and emigrating juvenile Chinook salmon (Brandes and McLain 2001). Modification of natural flow regimes from upstream reservoir operations has resulted in dampening of the hydrograph, reducing the extent and duration of seasonal floodplain inundation and other flow-dependent habitat used by migrating juvenile Chinook salmon (70 FR 52488; Sommer et al. 2001;

California Department of Water Resources 2005). Tidal and floodplain habitat areas provide important rearing habitat for foraging juvenile salmonids, including Central Valley fall-run Chinook salmon. Studies have shown that these salmonids may spend from 2 to 3 months rearing in these habitat areas, and losses resulting from land reclamation and levee construction are considered to be major stressors on juvenile salmonids (Williams 2009). Similarly, channel margins provide valuable rearing and connectivity habitat along migration corridors, particularly for smaller juvenile fry, such as fall-run Chinook salmon.

Predation on juvenile salmon by non-native fish has been identified as an important threat to fall- and late fall–run Chinook salmon in areas with high densities of non-native fish that prey on out-migrating juvenile salmon (e.g., smallmouth and largemouth bass, striped bass, and catfish) (Lindley and Mohr 2003). The low spatial complexity and reduced habitat diversity (e.g., lack of cover) of channelized waterways in the rivers and Delta reduce refuge space for salmon from predators (Raleigh et al. 1984; Missildine et al. 2001; 70 FR 52488).

Other factors that have contributed to the current status of Central Valley fall-run and late fall–run Chinook salmon and currently affect their abundance include harvest, artificial propagation programs (ecological and genetic effects), entrainment, and contaminants (Moyle 2002).

4.4.3.4 Survey Results

Focused surveys for Central Valley fall and late fall–run Chinook salmon were not conducted. However, it is well documented that fall and late fall–run Chinook salmon use the BSA as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, Central Valley fall and late fall–run Chinook salmon seasonally use the lower reaches of the Sacramento River for rearing while emigrating to the ocean. Spawning and egg incubation do not occur in the BSA (Moyle 2002).

The temporal occurrence and relative abundance of juvenile fall and late fall–run Chinook salmon in the BSA can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015b). From January 2005 through March 2015, fall-run size juvenile Chinook salmon were detected in the trawls from December through August, although most were detected in the trawls from January through May (Table 4-12).

4.4.3.5 Project Impacts

Project impacts on Central Valley fall and late fall–run Chinook salmon would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section. Because Central Valley fall and late fall–run Chinook salmon are not listed under ESA, no take would be associated with implementation of the project.

Impacts on Central Valley Fall-Run and Late Fall–Run Chinook Salmon Critical Habitat

Critical habitat has not been designated for the Central Valley fall-run and late fall-run Chinook salmon ESU because the ESU is not listed under ESA. Consequently, no impacts on Central Valley fall-run and late fall-run Chinook salmon critical habitat would result from implementation of the project. However, Central Valley fall- and late fall-run Chinook salmon habitats are protected under the MSA as EFH. Those waters and substrate that support Central Valley fall-run and late fall–run Chinook salmon growth to maturity are included as EFH. Effects on Pacific salmon EFH are described under "Essential Fish Habitat" later in this chapter.

4.4.3.6 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 23 through 30 would avoid or minimize the potential for project-related effects on adult and juvenile fall and late fall–run Chinook salmon.

4.4.3.7 Compensatory Mitigation

Compensation for impacts on critical habitat for winter-run Chinook salmon (Measure 31) and riparian and SRA cover habitat losses (Measure 4), as described above, also would benefit Central Valley fall and late fall–run Chinook salmon. No further compensatory mitigation would be required.

4.4.3.8 Cumulative Impacts

Cumulative effects to Central Valley fall and late fall–run Chinook salmon would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.4 Central Valley Steelhead

4.4.4.1 Status and Distribution

The California Central Valley (CCV) steelhead (*Oncorhynchus mykiss*) DPS was federally listed as threatened on March 19, 1998 (National Marine Fisheries Service 1998) (63 FR 13347). The threatened status of CCV steelhead was reaffirmed in NMFS's final listing determination on January 5, 2006 (71 FR 834) (National Marine Fisheries Service 2006a); at the same time, NMFS adopted the term *DPS*, in place of *ESU*, to describe Central Valley steelhead and other population segments of this species. NMFS originally designated critical habitat for CCV steelhead on February 16, 2000 (National Marine Fisheries Service 2000). However, following a lawsuit (*National Association of Home Builders et al. v. Donald L. Evans, Secretary of*

Commerce, et al.), NMFS decided to rescind the listing and re-evaluate how to classify critical habitat for several ESUs (now DPSs) of steelhead. Critical habitat for CCV steelhead was redesignated by NMFS on September 2, 2005 (70 FR 52488) (National Marine Fisheries Service 2005b). The DPS includes all naturally spawned populations of steelhead in the Sacramento and San Joaquin Rivers and their tributaries, excluding steelhead from San Francisco and San Pablo Bays and their tributaries. Artificially propagated fish from Coleman National Fish Hatchery and FRFH are included in the DPS (National Marine Fisheries Service 2006a). CCV steelhead are not listed under CESA.

Steelhead ranged throughout the tributaries of the Sacramento and San Joaquin Rivers prior to dam construction, water development, and watershed perturbation dating from the 19th and 20th centuries. Wild stocks are now mostly confined to the upper Sacramento River downstream of Keswick Dam; upper Sacramento River tributaries such as Deer, Mill, and Antelope Creeks; and the Yuba River downstream of Englebright Dam. Populations may also exist in Big Chico and Butte Creeks, and a few wild steelhead are produced in the American and Feather Rivers (McEwan and Jackson 1996). The abundance of naturally reproducing CCV steelhead, as measured by the number of adults returning to spawn, is largely unknown. Natural escapement in 1995 was estimated to be about 1,000 adults each for Mill and Deer Creeks and the Yuba River (S. P. Cramer and Associates 1995). Hatchery returns have averaged around 10,000 adults (Mills and Fisher 1994). The most recent annual estimate of adults spawning upstream of RBDD is less than 2,000 fish (National Marine Fisheries Service 2006a).

4.4.4.2 Life History

Oncorhynchus mykiss have one of the most complex life histories of any salmonid species, exhibiting both anadromous and freshwater resident life histories. Freshwater residents typically are referred to as rainbow trout, and those exhibiting an anadromous life history are called steelhead (National Marine Fisheries Service 1999). Steelhead exhibit highly variable life history patterns throughout their range but are broadly categorized into winter and summer reproductive ecotypes. Winter steelhead, the most widespread reproductive ecotype and the only type currently present in Central Valley streams (McEwan and Jackson 1996), become sexually mature in the ocean; enter spawning streams in summer, fall, or winter; and spawn a few months later in winter or late spring (Meehan and Bjornn 1991; Behnke 1992).

In the Sacramento River, adult winter steelhead migrate upstream during most months of the year, beginning in July, peaking in September, and continuing through February or March (Hallock 1987). Spawning occurs primarily from January through March but may begin as early as late December and may extend through April (Hallock 1987). Individual steelhead may spawn more than once, returning to the ocean between each spawning migration.

Juvenile steelhead rear a minimum of 1 year, and typically 2 or more years, in fresh water before migrating to the ocean as smolts. Juvenile migration to the ocean generally occurs from December through August. The peak months of juvenile migration are January to May (McEwan 2001). The importance of main channel and floodplain habitats to steelhead in the lower Sacramento River and upper Delta is not well understood. Steelhead smolts have been found in the Yolo Bypass during winter and spring inundation (Sommer pers. comm.), but the importance of this and other floodplain areas in the lower Sacramento River and upper Delta is not yet clear.

4.4.4.3 Factors Affecting Abundance

The decline in steelhead populations is attributable to changes in habitat quality and quantity. The availability of steelhead habitat in the Central Valley has been reduced by as much as 95% or more due to barriers created by dams (National Marine Fisheries Service 1996). Populations have been most severely affected by dams blocking access to the headwaters of all major tributaries; consequently, most runs are maintained through artificial production. The decline of naturally produced Central Valley steelhead has been more precipitous than that of hatchery stocks. Populations in the range's southern portion have experienced the most severe declines. Other factors contributing to the decline of steelhead in the Central Valley are mining, agriculture, urbanization, logging, harvest, hatchery influences, flow management (including reservoir operations), hydropower generation, and water diversion and extraction (National Marine Fisheries Service 1996).

Factors such as levee construction and bank armoring have altered the critical habitat of steelhead. These factors reduce floodplain habitat, change river bank substrate size, and decrease the amount of riparian and SRA habitat, which in turn, reduce habitat availability and quality (National Marine Fisheries Service 2006a).

4.4.4.4 Survey Results

Focused surveys for Central Valley steelhead were not conducted. However, it is well documented that steelhead use the BSA as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, juvenile steelhead seasonally use the lower reaches of the Sacramento River for rearing while emigrating to the ocean. Spawning and egg incubation do not occur in the BSA (Moyle 2002).

The temporal occurrence and relative abundance of juvenile steelhead in the BSA can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015b). From January 2005 through March 2015, adipose fin-clipped juvenile steelhead (indicating hatchery origin) and unclipped (wild) steelhead were detected in the trawls from January through June (Table 4-14).

Table 4-14. Total Number of Wild (Unclipped) and Hatchery (Adipose Fin-Clipped) Juvenile Steelhead Captured by Trawl at Sherwood Harbor (Rivermile 55) by Month (January 2005 through March 2015)[a]

4.4.4.5 Project Impacts

Project impacts on Central Valley steelhead would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

The proposed project is *likely to adversely affect* Central Valley steelhead based on the potential for exposure to underwater noise during pile driving activities and temporary effects to water quality (increased turbidity and suspended sediment), rearing and movement habitat (noise and shade), and channel substrates (cofferdams and temporary trestles); temporary and permanent effects on riparian and SRA cover habitat (vegetation removal, bridge and bike path construction); and permanent effects on aquatic habitat (construction of bridge piers, shade, and placement of RSP) in the Sacramento River.

Impacts on Central Valley Steelhead Critical Habitat

The Sacramento River within the BSA is included in the designated critical habitat for Central Valley steelhead (70 FR 52488, September 2, 2005). The primary constituent elements of critical habitat in the BSA include freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of steelhead. Critical habitat for Central Valley steelhead in the BSA includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

The project is *likely to adversely affect* Central Valley steelhead designated critical habitat. Impacts on steelhead critical habitat include temporary effects to the water column (underwater noise and sound pressure, and water quality impacts) and channel substrate (cofferdams and trestles), and permanent loss of aquatic habitat (water column and substrate) and riparian and SRA cover habitat in the Sacramento River. These impacts would be the same as those discussed earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.4.6 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 23 through 30 would further avoid or minimize the potential for construction-related effects on adult and juvenile Central Valley steelhead and designated critical habitat in the BSA.

4.4.4.7 Compensatory Mitigation

Compensation for impacts on critical habitat for winter-run Chinook salmon (Measure 31) and riparian and SRA cover habitat losses (Measure 4), as described above, also would benefit Central Valley steelhead. No further compensatory mitigation would be required.

4.4.4.8 Cumulative Impacts

Cumulative effects on Central Valley steelhead would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.5 Southern Distinct Population Segment of North American Green Sturgeon

4.4.5.1 Status and Distribution

NMFS listed the southern DPS of North American green sturgeon as threatened under ESA on April 7, 2006 (National Marine Fisheries Service 2006b). The southern DPS includes the spawning population in the Sacramento River and Feather River (Moyle 2002; Van Eenennaam 2005). Critical habitat was designated by NMFS on October 9, 2009 (74 FR 52300).

On January 23, 2003, NMFS determined that green sturgeon (*Acipenser medirostris*) are comprised of two populations, a northern and a southern DPS (National Marine Fisheries Service 2003). The northern DPS includes populations extending from the Eel River northward, and the southern DPS includes populations south of the Eel River to the Sacramento River. The Sacramento River supports the southernmost spawning population of green sturgeon (Moyle 2002). On April 6, 2005, NMFS determined that the northern DPS does not warrant listing under ESA, but it remains on the Species of Concern List (National Marine Fisheries Service 2005c). On April 7, 2006, NMFS determined that the southern DPS of green sturgeon was threatened under ESA (National Marine Fisheries Service 2006b). On October 9, 2009, NMFS (74 FR

52300) designated critical habitat for the green sturgeon southern DPS throughout most of its occupied range.

Green sturgeon were classified as a Class 1 species of special concern by CDFW in 1995 (Moyle et al. 1995). Class 1 species of special concern are those that conform to the State definitions of threatened or endangered and could qualify for addition to the official list. On March 20, 2006, emergency green sturgeon regulations were put into effect by CDFW, requiring a year-round zero bag limit of green sturgeon in all areas of the state (California Department of Fish and Game 2006).

4.4.5.2 Life History

The green sturgeon is anadromous, but it is the most marine-oriented of the sturgeon species and has been found in nearshore marine waters from Mexico to the Bering Sea (Colway and Stevenson 2007; Moyle 2002; National Marine Fisheries Service 2005c). The northern DPS has included spawning populations in the Rogue, Klamath, and Eel Rivers. The southern DPS has two spawning populations, in the Sacramento River and Feather River (Van Eenennaam 2005; National Marine Fisheries Service 2005d, 2010). Adults typically migrate upstream into rivers between late February and late July. Spawning occurs from March to July, with peak spawning from mid-April to mid-June. Green sturgeon are believed to spawn every 3–5 years, although recent evidence indicates that spawning may be as frequent as every 2 years (National Marine Fisheries Service 2005c, 2010).

Preferred spawning habitats are thought to contain large cobble in deep and cool pools with turbulent water (California Department of Fish and Game 2002; Moyle 2002; Adams et al. 2002). Little is known about the specific spawning habitat preferences of green sturgeon. Adult green sturgeon are believed to broadcast their eggs in deep, fast water over large cobble substrate, where the eggs settle into the interstitial spaces (Moyle 2002). Spawning is generally associated with water temperatures from 46 to 57 degrees Fahrenheit (°F). In the Central Valley, spawning occurs in the Sacramento River upstream of Hamilton City, perhaps as far upstream as Keswick Dam (Adams et al. 2002), and possibly in the lower Feather River (Van Eenennaam 2005; Moyle 2002). Water temperatures in spawning and egg incubation areas are critical; temperatures greater than 19 degrees Celsius (°C) (66.2°F) are lethal to green sturgeon embryos (Cech et al. 2000; Mayfield and Cech 2004; Van Eenennaam et al. 2005; Allen et al. 2006). Green sturgeon eggs hatch in approximately 8 days at 55°F (Moyle 2002). After 6 days, the larvae exhibit nocturnal swim-up activity (Deng et al. 2002). After about 10 days, they begin nocturnal downstream migrational movements (Kynard et al. 2005). Juvenile green sturgeon continue to exhibit nocturnal behavior beyond the metamorphosis from larval to juvenile stages. Larvae begin feeding 10 days after hatching. Young green sturgeon appear to rear for the first

1 to 2 months in the upper Sacramento River between Keswick Dam and Hamilton City (California Department of Fish and Game 2002). Metamorphosis to the juvenile stage is complete within 45 days of hatching. Juveniles spend 1 to 4 years in fresh and estuarine waters and migrate to salt water (Nakamoto et al. 1995) at lengths of 300–750 mm (National Marine Fisheries Service 2005c).

Little is known about movements, habitat use, and feeding habits of green sturgeon. Green sturgeon have been salvaged at the state and federal fish collection facilities in every month, indicating that they are present in the Delta year-round. Juveniles and adults are reported to feed on benthic invertebrates, including shrimp and amphipods, and small fish (National Marine Fisheries Service 2005c).

4.4.5.3 Factors Affecting Abundance

The historical decline of the southern DPS of green sturgeon has been largely attributed to the reduction of spawning habitat area. Keswick and Shasta Dams on the Sacramento River and Oroville Dam on the Feather River are impassable barriers that prevent green sturgeon from accessing what were likely historical spawning grounds upstream of these dams. Other potential migration barriers or impediments include RBDD, the Sacramento Deep Water Ship Channel locks, Fremont Weir, Sutter Bypass, the Delta Cross Channel in the Sacramento River, and Shanghai Bench and Sunset Pumps on the Feather River. Other factors that have been identified as potential threats to green sturgeon are reductions in freshwater outflow in the Delta during larval dispersal and rearing, high water temperatures during spawning and incubation, entrainment by water diversions, contaminants, predation and other impacts by introduced species, and poaching (National Marine Fisheries Service 2005c).

Channelization of the lower Sacramento River has resulted in the removal of riparian and IWM, which simplify ecosystem functions. Simplification results in reduced food input and pollutant and nutrient processing (Sweeney et al. 2004 as cited in National Marine Fisheries Service 2006a). These factors have degraded habitat quality for larvae and post-larvae and, to a lesser extent, rearing and migrating juvenile and/or adult green sturgeon (National Marine Fisheries Service 2006a).

4.4.5.4 Survey Results

Focused surveys for North American green sturgeon were not conducted. However, it is well documented that green sturgeon use the BSA as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, juvenile green sturgeon use the lower reaches of the Sacramento River for seasonal rearing. Spawning and egg incubation do not occur in the BSA (Moyle 2002).

Green sturgeon, which are benthic-oriented, generally are not susceptible to the USFWS trawls that sample the water column; therefore, little is known about their seasonal use of habitats and relative abundance in the BSA. However, general information on their distribution and habitat use indicates that green sturgeon have the potential to occur in the BSA year-round.

4.4.5.5 Project Impacts

Project impacts on North American green sturgeon would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

The proposed project is *likely to adversely affect* North American green sturgeon based on the potential for exposure to underwater noise during pile driving activities and temporary effects to water quality (increased turbidity and suspended sediment), rearing and movement habitat (noise and shade), and channel substrates (cofferdams and temporary trestles); temporary and permanent effects on riparian and SRA cover habitat (vegetation removal, bridge and bike path construction); and permanent effects on aquatic habitat (construction of bridge piers, shade, and placement of RSP) in the Sacramento River.

Impacts on North American Green Sturgeon Critical Habitat

The Sacramento River within the BSA is included in the designated critical habitat for the southern DPS of North American green sturgeon (74 FR 52300, October 9, 2009). The primary constituent elements of critical habitat in the BSA include freshwater areas with water flow, water quality, depth, forage, sediment quality, and passage conditions supporting migration and rearing of green sturgeon. Critical habitat for North American green sturgeon in the BSA includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

The project *is likely to adversely affect* North American green sturgeon designated critical habitat. Impacts on North American green sturgeon critical habitat include temporary effects on the water column (underwater noise and sound pressure, and water quality impacts) and channel substrate (cofferdams and trestles), and permanent loss of aquatic habitat (water column and substrate) and riparian and SRA cover habitat in the Sacramento River. These impacts would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.5.6 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 23 through 30 would further avoid or minimize the potential for construction-related effects on adult and juvenile North American green sturgeon and designated critical habitat in the BSA.

4.4.5.7 Compensatory Mitigation

Compensation for impacts on critical habitat for winter-run Chinook salmon (Measure 31) and riparian and SRA cover habitat losses (Measure 4), as described above, would also benefit North American green sturgeon. No further compensatory mitigation would be required.

4.4.5.8 Cumulative Impacts

Cumulative effects on North American green sturgeon would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.6 Delta Smelt

4.4.6.1 Status and Distribution

Delta smelt was federally listed as threatened on March 5, 1993 (58 FR 12854–12863), and critical habitat was designated on December 19, 1994 (59 FR 65256–65278). In response to several lawsuits, USFWS conducted a 5-year status review for delta smelt. USFWS concluded on March 31, 2004, that delta smelt abundance remained relatively low compared to historical levels and that many of the threats to the species identified at the time of listing were still in existence, precluding de-listing of the species (U.S. Fish and Wildlife Service 2004). Subsequent indices of delta smelt abundance based on results of CDFW fishery sampling have shown that the abundance of delta smelt continued to decline to record low numbers.

In March 2006, several environmental groups filed an emergency petition with USFWS, requesting that the status of delta smelt be elevated from threatened to endangered under ESA (Center for Biological Diversity et al. 2006). The emergency petition was not approved by USFWS; however, on July 10, 2008, USFWS announced in a 90-day finding that consideration for reclassification of delta smelt was warranted and that a status review would be initiated (73 FR 39639). On April 7, 2010, USFWS ruled that the change in the status of delta smelt from threatened to endangered was warranted but was precluded by other higher priority listing actions (75 FR 17667).

Delta smelt was listed as a threatened species under CESA on December 9, 1993. In February 2007, an emergency petition was filed with the California Fish and Game Commission to elevate the status of delta smelt from threatened to endangered under CESA (The Bay Institute et al. 2007). On March 4, 2009, the California Fish and Game Commission elevated the status of delta smelt to endangered under CESA.

Historically, delta smelt populations have fluctuated greatly in response to their 1-year life cycle and ever-changing environmental conditions. In the last 30 years, delta smelt populations have shown a long-term decline in the upper estuary (the Delta and Suisun Bay), beginning with an

abrupt decline in 1982 (Kimmerer 2002) and extremely low abundance in recent years as part of the pelagic organism decline (POD) (Sommer et al. 2007; Baxter et al. 2010). The low abundance of delta smelt since the early 1980s is attributed to a number of interacting factors. The principal factors contributing to the decline in delta smelt abundance include reductions in outflows and entrainment losses to water diversions, especially by the SWP and CVP pumping facilities located in the south Delta; extremely high river outflows that flush delta smelt and zooplankton out of the system; changes in prey abundance and composition caused by introduced species; predation by non-native species; toxic substances, including agricultural pesticides, heavy metals, and other compounds; disease; and loss of genetic integrity through interbreeding with the introduced Wagasaki smelt (Moyle 2002; Bennett 2005).

The geographic distribution of delta smelt occurs primarily downstream of Isleton on the Sacramento River, in the Cache Slough subregion (Cache Slough–Liberty Island and the Deep Water Ship Channel [DWSC]), downstream of Mossdale on the San Joaquin River, and Suisun Bay and Suisun Marsh (Moyle 2002;). Delta smelt also have been collected in the Petaluma and Napa Rivers (Bennett 2005); the Sacramento River above Rio Vista; and Cache, Lindsey, Georgiana, Prospect, Beaver, Hog, Sycamore, and Barker Sloughs (U.S. Fish and Wildlife Service 1996). Delta smelt have been observed in the Sacramento River as far upstream as the mouth of the Feather River and in the DWSC as far upstream as West Sacramento (Merz et al. 2011). Over the last 2 decades, the center of adult delta smelt abundance in fall (September through December) has been the West Delta and Suisun Bay subregions (Sommer et al. 2011). There is evidence that a life-history contingent of delta smelt may remain in the Cache Slough subregion throughout their lives (Nobriga et al. 2008; Sommer et al. 2011).

4.4.6.2 Life History

Delta smelt are endemic to the Sacramento–San Joaquin estuary and are found seasonally in Suisun Bay and Suisun Marsh (Moyle 2002). They typically are found in shallow water (<10 feet) where salinity ranges from 2 to 7 parts per thousand (ppt), although they have been observed at salinities between 0 and 18.4 ppt (Moyle 2002). Delta smelt have relatively low fecundity and most live for 1 year (Moyle 2002). They feed on planktonic copepods, cladocerans, amphipods, and insect larva (Moyle 2002).

Delta smelt are semi-anadromous. During their spawning migration, adults move into the freshwater channels and sloughs of the Delta between December and January (Moyle 2002). Spawning occurs between January and July, with peak spawning from April through mid-May (Moyle 2002). Spawning locations in the Delta have not been identified and are inferred from larval catches (Bennett 2005). Larval fish have been observed in Montezuma Slough (Wang 1986); Suisun Slough in Suisun Marsh (Moyle 2002); the Napa River estuary (Stillwater

Sciences 2006); the Sacramento River above Rio Vista; and Cache, Lindsey, Georgiana, Prospect, Beaver, Hog, Sycamore, and Barker Sloughs (U.S. Fish and Wildlife Service 1996). Spawning also was detected in the Sacramento River up to Garcia Bend (RM 51) during drought conditions as a result of increased saltwater intrusion that moved delta smelt spawning and rearing farther inland (Wang and Brown 1993). Laboratory experiments have found eggs to be adhesive, demersal, and usually attached to substrate composed of gravel, sand, or other submerged material (Moyle 2002; Wang 1991). Hatching takes approximately 9 to 13 days, and larvae begin feeding 4 to 5 days later (Moyle 2002). Newly hatched larvae contain a large oil globule that makes them semi-buoyant and allows them to stay near the bottom (Moyle 2002). As their fins and swim bladder develop, they move higher into the water column and are transported downstream to the open waters of the estuary (Moyle 2002).

4.4.6.3 Factors Affecting Abundance

Diversions and Delta inflow and outflow may affect survival of delta smelt. Estimates of delta smelt entrainment at the CVP and SWP South Delta export facilities suggest a population decline in the early 1980s, mirroring the decline indicated by mid-water trawl, summer tow-net, Kodiak trawl, and beach seine data (Bennett 2005). Diversions and upstream storage, including operation of the CVP and SWP, control Delta inflow and outflow during most months. Reduced Delta flow may inhibit or slow movement of larvae and juveniles to estuarine rearing habitat, increasing their residence in the deeper and narrower channels of the Delta and exposure to lower prey availability and increased predation (Moyle 2002). Reduced Delta flow also may increase entrainment in diversions, including entrainment at the CVP and SWP export pumps (Moyle 2002). Additional factors affecting delta smelt abundance include extremely high river outflow that increases entrainment at export facilities, changes in prey abundance and composition, predation by non-native species, toxic substances, disease, and loss of genetic integrity through interbreeding with the introduced Wagasaki smelt (Moyle 2002; Bennett 2005).

4.4.6.4 Survey Results

Focused surveys for delta smelt were not conducted. However, it is well documented that delta smelt occur in the Sacramento River in the vicinity of the BSA. Spawning locations in the Delta have not been identified and are inferred from the location of gravid females and larval catches (Bennett 2005).

The temporal occurrence and relative abundance of adult delta smelt in the vicinity of the BSA can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015b). In addition to collecting data on the relative number and timing of occurrence of delta smelt, USFWS collects information on the maturation status of adult smelt (i.e., individuals are physically examined at

the time of capture to determine their readiness to spawn based on whether eggs or milt can be manually expressed from the individual). Maturation status provides information on the potential timing of spawning and, therefore, the potential occurrence of the species' eggs and larvae in the river. The occurrence of mature adults in the trawl samples suggests that delta smelt may spawn in this part of the Sacramento River, including the BSA.

From January 2005 through March 2015, adult delta smelt (some in spawning condition) were detected in the trawls from February through May, although most were detected in the trawls in March (Table 4-15). Because of the proximity of the BSA to Sherwood Harbor, it was assumed that the occurrence of delta smelt in the BSA is similar to that observed at Sherwood Harbor.

Table 4-15. Number of Delta Smelt Captured by Trawl at Sherwood Harbor (RM 55) by Month (January 2005 through March 2015)

NA = Not applicable

4.4.6.5 Project Impacts

Project impacts on delta smelt would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section. However, because delta smelt spawn in the Delta and lower Sacramento River, the proposed project also has the potential to affect spawning habitat.

The proposed project is *likely to adversely affect* delta smelt based on the potential for exposure to underwater noise during pile driving activities and temporary effects on water quality (increased turbidity and suspended sediment), rearing and movement habitat (noise and shade), and channel substrates (cofferdams and temporary trestles); temporary and permanent effects on riparian and SRA cover habitat (vegetation removal, bridge and bike path construction); and

permanent effects on aquatic habitat (construction of bridge piers, shade, and placement of RSP) in the Sacramento River.

Impacts on Delta Smelt Critical Habitat

The Sacramento River within the BSA is not included in the designated critical habitat for delta smelt, as it includes the contiguous waters of the legal Delta up to the existing I Street Bridge on the Sacramento River (59 FR 65256, December 19, 1994). Primary constituent elements of critical habitat determined to be essential to the conservation of the species are physical habitat, water, river flow, and salinity concentrations required to maintain delta smelt habitat for spawning, larval and juvenile transport, rearing, and adult migration (U.S. Fish and Wildlife Service 2006). Where it is designated, critical habitat for delta smelt consists of all water and submerged lands below ordinary high water and the entire water column, which is used by adults for migration and spawning and juveniles for rearing.

The project *is likely to adversely affect* delta smelt designated critical habitat. Although the BSA is not designated as critical habitat for delta smelt (designated critical habitat includes the Sacramento River as far upstream as the current I Street Bridge), project effects may extend far enough downstream to affect delta smelt critical habitat. Project effects with potential to affect designated critical habitat for delta smelt include temporary effects on the water column (underwater noise and sound pressure, and water quality impacts). These impacts would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.6.6 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 23 through 30 would further avoid or minimize the potential for construction-related effects on delta smelt and designated critical habitat in the BSA.

4.4.6.7 Compensatory Mitigation

Compensation for impacts on critical habitat for winter-run Chinook salmon (Measure 31) and riparian and SRA cover habitat losses (Measure 4), as described above, also would benefit delta smelt. No further compensatory mitigation would be required.

4.4.6.8 Cumulative Impacts

Cumulative effects to delta smelt would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.7 Longfin Smelt

4.4.7.1 Status and Distribution

The San Francisco Bay-Delta DPS of longfin smelt is a candidate species under ESA. On April 2, 2012, USFWS announced a 12-month finding on a petition to list the Bay-Delta DPS of longfin smelt as threatened or endangered and to designate critical habitat under ESA. In its finding, USFWS announced that listing of the Bay-Delta DPS of longfin smelt is warranted but was precluded by higher priority actions to amend the Lists of Endangered and Threatened Wildlife and Plants (77 FR 19756). Upon publication of the 12-month finding, USFWS added the Bay-Delta DPS of longfin smelt to their candidate species list. In addition, USFWS intends to develop a proposed rule to the list the Bay-Delta DPS longfin smelt as priorities allow and will make any determinations on critical habitat for longfin smelt during development of the proposed rule. In the interim, USFWS will address the status of longfin smelt in its annual Candidate Notice of Review. Only the Bay-Delta DPS of longfin smelt was advanced to candidate status.

Longfin smelt was listed as a threatened species under CESA on June 26, 2009. Longfin smelt is included in the *Sacramento-San Joaquin Delta Native Fishes Recovery Plan*, which was completed in 1996 (U.S. Fish and Wildlife Service 1996).

Longfin smelt are a small, euryhaline (tolerant of a range of salinities) fish found in open waters of bays and estuaries (Moyle 2002). Longfin smelt have been collected in west coast estuaries ranging from the San Francisco estuary in California to Prince William Sound in Alaska (77 FR 19758). In California, longfin smelt also have been found in Humboldt Bay and in the estuaries of the Eel, Klamath, and Russian Rivers (77 FR 19759). In the San Francisco estuary, longfin smelt are rarely found upstream of Rio Vista on the Sacramento River and Medford Island on the San Joaquin River (Moyle 2002), although adults have been observed in the Sacramento River as far upstream as Colusa and in the San Joaquin River as far upstream as Lathrop (Merz et al. 2013). Although adults occur seasonally as far downstream as South San Francisco Bay, they are concentrated primarily in North San Francisco, San Pablo, and Suisun Bays (Moyle 2002). Longfin smelt are also common in nearshore coastal marine waters west of the Golden Gate Bridge in late summer and fall (Baxter 1999).

4.4.7.2 Life History

Bay-Delta longfin smelt are anadromous, leaving coastal marine areas and the brackish bays in fall and moving upstream to spawn in the freshwater reaches of the lower Sacramento and San Joaquin Rivers in winter and spring. Although spawning of Bay-Delta longfin smelt has not been observed, the location of spawning sites can be inferred from CDFW surveys that collect adult female and larval smelt. Based on these surveys, spawning habitat is presumed to exist in the

Cache Slough subregion (Sacramento River Deep Water Ship Channel, Cache-Liberty Island Complex), the West Delta subregion (lower Sacramento River), the eastern Suisun Bay subregion including upper Grizzly Bay, and Montezuma Slough in the Suisun Marsh subregion. Adult longfin smelt also have been observed as far upstream as Hog Slough off the South Fork Mokelumne River and in Old River south of Indian Slough during their winter and spring spawning period (77 FR 19757). Spawning rarely occurs in the San Joaquin River in the West Delta/South Delta subregions but, when it occurs, it is usually downstream of Twitchell Island (Moyle 2002). The exact location of spawning likely varies from year to year, in response to changing environmental conditions.

Adult longfin smelt may spawn as early as November and as late as June, although spawning is believed to typically occur from January through April based on the occurrence of larvae during this period and the decline in abundance of adult smelt after this period (77 FR 19757; Moyle 2002). Spawning occurs primarily over sandy or gravel substrates, rocks, and aquatic plants and when water temperatures are between 7.2 and14.4°C (45–58°F) (Moyle 2002). Most Bay-Delta longfin smelt live for 2 years, spawn, and then die, although some individuals may spawn as 1- or 3-year-olds. Some longfin smelt, mostly females, survive after spawning and live another year; it is not known whether these fish spawn more than once (Moyle 2002).

Embryos hatch in 40 days at 7.2°C (45°F); the number of days to hatching is inversely related to water temperature. Newly hatched larvae are 5–8 mm long and buoyant. The buoyant larvae move into the upper part of the water column and are carried into the estuary by river currents. During years with high Delta outflows, larvae are mostly transported to Suisun and San Pablo Bays, where survival is often better than it is during low outflow years, when larvae are mostly transported into the western Delta and Suisun Bay. Rearing habitat conditions are more favorable in Suisun and San Pablo Bays than in the Delta, where juveniles may become entrained and exposed to more adverse conditions (Moyle 2002).

4.4.7.3 Factors Affecting Abundance

Longfin smelt abundance in the Bay-Delta has declined significantly since the 1980s; over the last decade, abundance has been the lowest in the 40-year history of CDFW's monitoring surveys (77 FR 19763). Longfin smelt abundance is positively correlated with Delta outflow (Moyle 2002). Factors affecting the abundance of longfin smelt in the Bay-Delta are multiple and synergistic (Moyle 2002), and are likely to be similar to the factors affecting delta smelt.

4.4.7.4 Survey Results

Focused surveys for longfin smelt were not conducted. Longfin smelt are rarely captured in the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015b). From January 2005 through March 2015, one

adult longfin smelt was captured in the trawl in December 2012, suggesting that their abundance and frequency of use of habitat in the BSA is probably very low. Longfin smelt may spawn in the BSA along shallow river margins.

4.4.7.5 Project Impacts

Project impacts on longfin smelt would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section. However, because longfin smelt spawn in the Delta and lower Sacramento River, the proposed project also has the potential to affect spawning habitat. Because longfin smelt are not listed under ESA, no take would be associated with implementation of the project.

Impacts on Longfin Smelt Critical Habitat

Critical habitat has not been designated for longfin smelt because the species is not listed under ESA. Consequently, no impacts on longfin smelt critical habitat would result from implementation of the project.

4.4.7.6 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 23 through 30 would further avoid or minimize the potential for construction-related effects to longfin smelt in the BSA.

4.4.7.7 Compensatory Mitigation

Compensation for impacts on critical habitat for winter-run Chinook salmon (Measure 31) and riparian and SRA cover habitat losses (Measure 4), as described above, also would benefit longfin smelt. No further compensatory mitigation would be required.

4.4.7.8 Cumulative Impacts

Cumulative effects to longfin smelt would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.8 Sacramento Splittail

4.4.8.1 Status and Distribution

Sacramento splittail was listed as threatened under ESA on February 8, 1999 (64 FR 5963). This listing was challenged by two lawsuits (*San Luis & Delta-Mendota Water Authority v. Anne Badgley et al.* and *State Water Contractors et al. v. Michael Spear et al.*). On June 23, 2000, the Federal Eastern District Court of California found the listing to be unlawful and, on September 22 of the same year, remanded the determination back to the USFWS for re-evaluation of their original listing decision. Upon further evaluation, USFWS removed Sacramento splittail from the threatened species list on September 22, 2003 (68 FR 55139). On August 13, 2009, the Center for Biological Diversity (2009) challenged the 2003 decision to remove splittail from the

threatened species list. However, on October 7, 2010, the USFWS found that listing of Sacramento splittail was not warranted (75 FR 62070).

Sacramento splittail is not listed under CESA. However, Sacramento splittail is designated by CDFW as a California species of special concern.

Sacramento splittail were endemic to the sloughs, lakes, and rivers of California's Central Valley but are now confined to the downstream reaches of the Sacramento and San Joaquin Rivers, and the Delta. In the Sacramento River, splittail range from the Delta up to the RBDD; in the San Joaquin River, they range from the Delta up to RM 135. Selected observations in the lower portions of the Sacramento River and tributaries include the American River to RM 12, the Feather River to RM 58 and to just below the Thermalito Afterbay outlet (Oppenheim pers. comm.; Seesholtz pers. comm.), and in Butte Creek/Sutter Bypass in the vicinity of Colusa State Park.

In the San Joaquin River basin, splittail have been observed in the Cosumnes, Merced, Mokelumne, and Tuolumne Rivers. Although there have been no confirmed sightings in the Stanislaus River, based on observations from other tributaries, it is assumed that splittail probably inhabit low-gradient portions of lower segments of the river.

Adult splittail are adapted for living in estuarine waters with widely fluctuating environmental conditions. They are found mostly in the Delta, Suisun Bay, Suisun Marsh, lower Napa and Petaluma Rivers, and other parts of the San Francisco estuary (Moyle 2002). In the Delta, they are most abundant in the north and west portions when the population is low; however, they are more evenly distributed in the Delta following years with more successful spawning. Like delta smelt, splittail are tolerant of salinities (commonly found at salinities between 10 and 18 ppt), although they seem to prefer lower salinities.

4.4.8.2 Life History

Adult splittail exhibit a gradual movement upstream during winter and spring, presumably to forage and spawn in flooded areas. They have been observed to leave Suisun Bay and the Delta during December through March, and it appears that the Yolo and Sutter Bypasses provide important spawning habitat in years when the bypasses are flooded (Sommer et al. 1997). Both male and female splittail become sexually mature by their second winter at about 3.9 inches (10 centimeters [cm]) in length. Female splittail are capable of producing more than 100,000 eggs per year (Daniels and Moyle 1983; Moyle et al. 1989). The adhesive eggs are deposited over flooded terrestrial or aquatic vegetation when water temperature is between 48 and 68°F (8.9 and 20°C) (Moyle 2002; Wang 1986). Splittail spawn in late April and May in Suisun Marsh and between early March and May in the upper Delta and lower reaches and flood

bypasses of the Sacramento and San Joaquin Rivers, and on the Cosumnes River Preserve (Moyle et al. 1989, 2004). Spawning has been observed to occur as early as January and may continue through early July (Wang 1986; Moyle 2002).

The diet of adults and juveniles includes decayed organic material; earthworms, clams, insect larvae, and other invertebrates; and fish. The mysid *Neomysis mercedis* is a primary prey species, although decayed organic material constitutes a larger percentage of the stomach contents (Daniels and Moyle 1983).

Larval splittail are commonly found in shallow, vegetated areas near spawning habitat. Larvae eventually move into deeper and more open-water habitat as they grow and become juveniles. Young-of-year juvenile splittail (i.e., larvae and juveniles) frequently occur in the flood bypasses when these areas are inundated during late winter and spring (Jones & Stokes Associates 1993; Sommer et al. 1997).

No population-level estimates currently exist for Sacramento splittail, but splittail are thought to be only 35–60% as numerous as they were in 1940 (Moyle 2002). The abundance of juvenile splittail (young-of-the-year) is highly variable from one year to the next; abundance is positively correlated with hydrologic conditions within the rivers and Delta during the late-winter and spring spawning period, and the magnitude and duration of floodplain inundation (Sommer et al. 1997). Because splittail are a long-lived species (5 to 7 years) (Moyle 2002; Grimaldo pers. comm.), the abundance of juveniles in a given year may not be a good predictor of adult splittail abundance. Results of CDFW fall midwater trawl surveys indicate a marked decline in overall splittail abundance and consistently low population levels since 2002. San Francisco Bay study indices also have been extremely low.

4.4.8.3 Factors Affecting Abundance

A variety of interacting factors are believed to be responsible for the long-term decline in splittail abundance. These factors include reduction in valley floor habitats; modification of spawning habitat; changes in estuarine hydraulics, especially reduced outflows; climatic variation; toxic substances; introduced aquatic species; and harvest (Moyle 2002).

4.4.8.4 Survey Results

Focused surveys for Sacramento splittail were not conducted. However, it is well documented that Sacramento splittail use the BSA as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, Sacramento splittail may spawn in the BSA.

The temporal occurrence and relative abundance of Sacramento splittail in the BSA can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor

(RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015b). From January 2005 through March 2015, Sacramento splittail have been detected in the trawls in every month of the year, although most were detected in the trawls from January through May (Table 4-16).

Table 4-16. Number of Sacramento Splittail Captured by Trawl at Sherwood Harbor (RM 55) by Month (January 2005 through March 2015)

Month/ Year	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	Monthly Total[a]

NA = Not applicable.

4.4.8.5 Project Impacts

Project impacts on Sacramento splittail would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section. However, because Sacramento splittail spawn along the shallow margins of the lower Sacramento River, the proposed project also has the potential to affect spawning habitat. Sacramento splittail are not listed under the ESA; therefore, no take would be associated with implementation of the project.

Impacts on Sacramento Splittail Critical Habitat

Critical habitat has not been designated for Sacramento splittail because the species is not listed under ESA. Consequently, no impacts on Sacramento splittail critical habitat would result from implementation of the project.

4.4.8.6 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 23 through 30 would further avoid or minimize the potential for construction-related effects on Sacramento splittail in the BSA.

4.4.8.7 Compensatory Mitigation

Compensation for impacts on critical habitat for winter-run Chinook salmon (Measure 31) and riparian and SRA cover habitat losses (Measure 4), as described above, also would benefit Sacramento splittail. No further compensatory mitigation would be required.

4.4.8.8 Cumulative Impacts

Cumulative effects to Sacramento splittail would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.9 River Lamprey

4.4.9.1 Status and Distribution

River lamprey are a California species of special concern but have no other state or federal listing status (Moyle et al. 1995; 69 FR 77158). Although river lamprey is widely believed to be in decline, the species' exact status is uncertain, partly because it is often overlooked and seldom studied. Both historical and current abundance and distribution data are lacking.

River lamprey are found from San Francisco Bay in California to near Juneau, Alaska; however, detailed information on its distribution is lacking. Generally, river lamprey are associated with specific, lower portions of large river systems, including the Fraser (Canada), Columbia, Klamath, Eel, and Sacramento Rivers (69 FR 77158). In California, river lamprey occur in the lower Sacramento River, lower San Joaquin River and its tributaries (Stanislaus and Tuolumne Rivers), Salmon Creek and tributaries to the lower Russian River in Sonoma County, and the Trinity and Klamath Rivers (69 FR 77158). Historically, river lamprey have been reported in Alameda Creek, Cache Creek, Napa River, and Sonoma Creek, although the population in Cache Creek is believed to be extirpated (Moyle et al. 1995; Moyle 2002; 69 FR 77158). Precise knowledge of the distribution of river lamprey in California is limited because of a lack of data and only a basic understanding of its life history (Moyle 2002).

4.4.9.2 Life History

Limited information is available regarding the life history of this species in California, and current accounts are based largely on information from Canadian populations (Moyle 2002). River lamprey are semelparous (i.e., they die after spawning) anadromous fish with long freshwater rearing periods. Adults return to fresh water to spawn in fall and winter, but spawning usually occurs in February through May in gravely riffles (Moyle 2002). Juvenile river lamprey (ammocoetes) remain in silty backwater habitats where they filter feed on various microorganisms for approximately 3–5 years before migrating to the ocean during late spring periods after completing the transformation from ammocoete to adult (the process of metamorphosis takes 9–10 months) (Moyle et al. 1995; Moyle 2002). Adult lamprey feed on

other fish (herring and salmon) and may reach a total length of around 31 cm (12 inches) (Moyle 2002).

4.4.9.3 Factors Affecting Abundance

Trends in river lamprey populations in the Central Valley are unknown, largely because river lamprey are easily overlooked. However, it is assumed that the species has declined relative to historical levels, along with the decline in historical spawning and rearing habitat in the lower reaches of the larger rivers. (Moyle 2002.)

It is also likely that many of the same factors responsible for the long-term decline in abundance of other fish species in the Central Valley (modification of spawning and rearing habitat; changes in the timing and magnitude of river flow; climatic variation; toxic substances; and introduced aquatic species) have also negatively affected river lamprey.

4.4.9.4 Survey Results

Focused surveys for river lamprey were not conducted. Because it is difficult to identify juvenile lamprey to species, specific information on the temporal occurrence and relative abundance of river lamprey are not readily available. Based on their life history, river lamprey are likely to be present in the BSA year-round as ammocoetes (larvae) living in the soft-bottomed substrates, and seasonally as juveniles migrating to the Delta and Pacific Ocean and as adults making their way upstream toward spawning grounds.

4.4.9.5 Project Impacts

Project impacts on river lamprey would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section. River lamprey are not listed under ESA; therefore, no take would be associated with implementation of the project.

Impacts on River Lamprey Critical Habitat

Critical habitat has not been designated for river lamprey because the species is not listed under ESA. Consequently, no impacts on river lamprey critical habitat would result from implementation of the project.

4.4.9.6 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 5, and 23 through 30 would further avoid or minimize the potential for construction-related effects on river lamprey in the BSA.

4.4.9.7 Compensatory Mitigation

Compensation for impacts on critical habitat for winter-run Chinook salmon (Measure 31) and riparian and SRA cover habitat losses (Measure 4), as described above, also would benefit river lamprey. No further compensatory mitigation would be required.

4.4.9.8 Cumulative Impacts

Cumulative effects on Sacramento splittail would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.10 Essential Fish Habitat

The MSA, as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267) and the Magnuson-Stevens Fishery Conservation and Management Reauthorization Act of 2006 (Public Law 109-479), requires federal agencies to consult NMFS on activities that may adversely affect EFH. Important components of EFH are substrate; water quality; water quantity, depth, and velocity; channel gradient and stability; food; cover and habitat complexity; space; access and passage; and habitat connectivity.

EFH for Chinook salmon could be affected by the project. The MSA-managed species occurring in the Sacramento River and in the BSA and potentially affected by the project include Sacramento winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and fall-run and late fall–run Chinook salmon.

Effects on EFH for Pacific salmon would be similar to the impacts on species and critical habitat effects described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

The following environmental conditions potentially affect Pacific salmon EFH.

- Sedimentation and turbidity.
- Hazardous materials and contaminants.
- Disturbance and direct injury.
- Temporary and permanent loss of aquatic habitat.
- Temporary and permanent loss of SRA cover habitat.

Effects to Pacific salmon EFH associated with sedimentation and turbidity, hazardous materials and contaminants, disturbance and direct injury, and habitat loss would be temporary. Potential adverse effects to EFH of increased fine sediment and turbidity will be avoided or minimized through implementation of all applicable BMPs. The potential environmental effects of the project would be limited to short-term, localized, and minor increases in turbidity and suspended sediment. Implementation of the SWPPP along with applicable BMPs would substantially reduce or eliminate the potential for an accidental spill and unintentional discharge of contaminants with potential associated effects to EFH. Potential injury and mortality to fish associated with pile driving will be avoided or minimized by the following.

- Limiting the number and size of piles to the minimum necessary to meet the engineering and design requirements of the project.
- Using vibratory hammers whenever feasible.
- Using the smallest pile driver and minimum force necessary to complete the work.
- Using a bubble ring or similar device to minimize the magnitude and extent of potentially harmful underwater noise levels.
- Conducting pile driving only during daylight hours only.
- Limiting in-water construction to the proposed in-water construction window (May 1–November 30).

Long-term and permanent effects on EFH would be limited to the net loss of aquatic habitat (substrate, water column) associated with the new bridge piers and SRA cover habitat associated with the footprints for the bridge and bike trail footprints. However, the displacement of EFH would be insignificant compared to the total extent of EFH available to these species in the Sacramento River.

The proposed project would adversely affect EFH; however, the temporary and permanent effects would be small relative to the total EFH available in the Sacramento River. Compensation for the permanent loss of critical habitat for winter-run Chinook salmon, as described above, also would benefit EFH for Chinook salmon.

4.5 Other Protected and Managed Biological Resources

4.5.1 Migratory Birds

Several non-special-status migratory birds, including red-tailed hawk, killdeer (*Charadrius vociferous*), Anna's hummingbird (*Calypte anna*), and northern mockingbird (*Mimus polyglottos*) could nest on the ground or in shrubs or trees in and adjacent to the limits of disturbance for proposed project construction. These generally common species are locally and regionally abundant. The breeding season for most birds is generally from February 1 to August 31. Cliff swallows and white-throated swifts are known to utilize the approach structures for nesting. Cliff swallows nest from April to August and migrate south in September and October (Zeiner et al. 1990:444). White-throated swifts breed from early May to mid-August (Zeiner et al. 1990:356). The occupied nests and eggs of migratory birds are protected by federal and state laws, including the MBTA and CFCG Sections 3503 and 3503.5. USFWS is responsible for overseeing compliance with the MBTA, and CDFW is responsible for overseeing compliance with the CFGC and making recommendations on nesting bird and raptor protection.

4.5.1.1 Survey Results

Suitable nesting habitat for migratory birds is present within the cottonwood riparian forest, riparian forest/shrub wetland, ruderal woodland, and landscaped areas, and on the approach structures and buildings within the BSA.

No active nests were observed during the April 2014 and May 2015 surveys. Migratory birds observed during these surveys included great blue heron, Canada goose, white-throated swift, western scrub jay, northern mockingbird, and yellow-billed magpie.

4.5.1.2 Project Impacts

The project has the potential to affect nesting migratory birds either through direct injury or mortality during ground-disturbing activities or by disrupting normal behaviors, including nesting.

4.5.1.3 Avoidance and Minimization Efforts

Implementation of Measures 1—3, 13, 14, and 15 would avoid or reduce potential impacts on migratory birds.

4.5.1.4 Compensatory Mitigation

No compensatory mitigation is required.

4.5.1.5 Cumulative Impacts

Impacts on migratory birds would be avoided and minimized and therefore would not considerably contribute to cumulative impacts on migratory birds.

4.5.2 Bats

Bats are known to, and have the potential to, nest in built structures and trees within the BSA. California Fish and Game Code Section 4150 states that nongame mammals or parts thereof may not be taken or possessed as provided in the code or in accordance with regulations adopted by the California Fish and Game Commission, which would include common bat species.

4.5.2.1 Survey Results

The approach structures, buildings, and trees within the BSA represent potential roosting habitat for bats. Mexican free-tailed bats were observed roosting in the Jibboom Street and western I Street approach structures. A total 1,132 linear feet of roosting habitat was mapped, which consisted of 30 potential roosts on the four approach structures, 16 of which were found to be occupied by Mexican-free tailed bats. During nighttime acoustic surveys conducted in May and June 2015, Mexican free-tailed bats, big brown bats, Yuma myotis, and western red bats were detected. Big brown bats were observed night roosting in an abandoned building that is immediately west of the Jibboom Street approach structure, as confirmed by acoustic recording.

Several trees on both sides of the river had suitable habitat for foliage-roosting bats and cavity-roosting bats. No bat sign was detected in or near any of these trees.

4.5.2.2 Project Impacts

The proposed project would result in removal of the I Street and Jibboom Street approach structures. Thirty expansion joints that represent potential roosting habitat for pallid bats would be removed. Several large trees with cavities would be removed within the cottonwood riparian forest, landscaped, and ruderal woodland as part of both alternatives. Both City of West Sacramento residential access alternatives also would affect buildings on the West Sacramento side of the BSA that could be used by bats for roosting.

4.5.2.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3, 13, 17, and 20 would ensure that construction activities avoid and minimize potential impacts on bats associated with construction.

4.5.2.4 Compensatory Mitigation

Implementation of Measures 20 and 21 would compensate for the loss of bat roosting habitat on the approach structures. The loss of any tree roosting habitat would be in part mitigated by Measure 4, which would restore and protect riparian habitat, and Measure 32, which would replace protected trees (described under “Protected Trees” below).

4.5.2.5 Cumulative Impacts

Because measures would be implemented to avoid and minimize potential impacts on bats, and because permanently affected bat roosting habitat would be compensated by implementation of Measure 21, the project would not contribute to cumulative effects on bats.

4.5.3 Protected Trees

A list of trees, by species, with a diameter at breast height (dbh) of 6 inches or greater was recorded for the approximate project footprint areas in the BSA (Appendix E). The City of Sacramento Heritage Tree Ordinance protects all trees with a dbh of 32 inches or greater, native oaks, California buckeye (*Aesculus californica*), western sycamore (*Platanus racemosa*), and all riparian trees with a dbh of 11.5 inches or greater. The City of West Sacramento Tree Preservation Ordinance protects all trees with a dbh of 24 inches or greater and native oaks with a dbh of 16 inches or greater.

4.5.3.1 Survey Results

Within the proposed project footprint alternatives, 93 trees meet the heritage tree ordinance criteria for the city in which they occur—approximately 22 trees in Sacramento and 71 trees in West Sacramento (Appendix E). The tree species included in this total are Oregon ash, California

black walnut, western sycamore, Fremont's cottonwood, valley oak, black willow, arroyo willow, boxelder, coast redwood, southern magnolia, tree of heaven, and black locust. Tree of heaven and black locust are invasive species, but the trees included meet the heritage tree size criterion.

4.5.3.2 Project Impacts

Construction of the proposed project with City of West Sacramento Residential Access Alternative 1 would result in removal of up to 22 heritage trees in the City of Sacramento and 71 heritage trees in the City of West Sacramento. Trees would be removed for the construction of abutments for the two fixed-span bridge approach structures on both the City of Sacramento and City of West Sacramento sides, the bikeway along Jibboom Street in Sacramento, and the C Street connection to B Street in West Sacramento.

Construction of the proposed project with City of West Sacramento Residential Access Alternative 2 would result in the removal of up to 22 heritage trees in the City of Sacramento and 45 heritage trees in the City of West Sacramento. Trees would be removed for the construction of abutments for the two fixed-span bridge approach structures on both the City of Sacramento and City of West Sacramento sides, the bikeway along Jibboom Street in Sacramento, and the C Street connection to 3rd Street in West Sacramento.

Additional temporary impacts on heritage trees could occur during construction due to trimming of trees for construction access. However, the protection measures in each city's heritage tree ordinance would be implemented to avoid impacts on protected trees outside of the permanent impact area.

The tree ordinances of the City of Sacramento and City of West Sacramento would require avoidance, minimization, and compensatory mitigation for the loss of heritage and preservation trees.

All of the protected trees within the City of Sacramento are located in the cottonwood riparian forest habitat, and mitigation for the loss of these trees would be accomplished through implementation of Measure 4 for the loss of riparian habitat. Similarly, the loss of protected trees in the City of West Sacramento that are within cottonwood riparian forest habitat would be mitigated based on the loss of riparian habitat and implementation of Measure 4. The loss of protected trees in the City of West Sacramento that are in ruderal woodland or landscaped habitat would be mitigated based on the City of West Sacramento Tree Preservation Ordinance requirements as described below in Measure 32.

4.5.3.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3 would ensure that the proposed project minimizes effects on protected trees adjacent to the project construction area.

4.5.3.4 Compensatory Mitigation

Implementation of Measure 32 would compensate for the loss of protected trees in the City of West Sacramento. As noted above, all of the protected trees within the City of Sacramento are located in the cottonwood riparian forest habitat; mitigation for the loss of these trees would be accomplished through implementation of Measure 4 for the loss of riparian habitat.

Measure 32: Compensate for Loss of Protected Trees not in Riparian Habitat

Within 1 year prior to construction, the project proponent will conduct a preconstruction inventory of all heritage trees to be removed within the areas defined as ruderal woodland and landscaped land cover types. The inventory will include the location, species, diameter of all trunks, approximate height and canopy diameter, and approximate age, in support of a tree permit for removal of the heritage trees. All conditions of the tree permit will be implemented.

The project proponent will mitigate for the loss of protected trees using one or a combination of the two following options:

- Because it is unlikely that adequate space will be available in the project area for tree planting after construction, pay an in-lieu fee to the City of West Sacramento, which would be used to purchase and plant trees elsewhere in West Sacramento. Replacement trees will be required at a ratio of 1:1 (i.e., 1-inch diameter of replacement tree planted for every 1-inch diameter of tree removed). Replacement trees will be of the same species, except for the replacement of tree of heaven and black locust, which are invasive species and will be replaced with native tree species. Mitigation will be subject to approval by the City's tree administrator and will take into account species affected, replacement species, location, health and vigor, habitat value, and other factors to determine fair compensation for tree loss. Replacement trees will be monitored annually for 3 years to document vigor and survival. If any of the replacement trees die within 3 years of the initial planting, the project proponent will plant additional replacement trees and monitor them until all trees survive for a minimum of 3 years after planting.
- If feasible, plant replacement trees at or near the location of the tree removal, following the same replacement ratio, species, monitoring, and tree survival requirements described for the option above.

4.5.3.5 Cumulative Impacts

Cumulative impacts on protected trees would result from construction of other general development projects in the City of Sacramento and the City of West Sacramento. With implementation of the avoidance and minimization efforts and compensatory mitigation,

construction of the proposed project would not add to the cumulative loss of protected trees and would not result in a cumulatively adverse effect on protected trees.

4.5.4 Invasive Plants

Invasive plant species include species designated as federal noxious weeds by the USDA, species listed by the CDFA, and invasive plants identified by Cal-IPC. Invasive plants displace native species, change ecosystem processes, alter plant community structure, and lower wildlife habitat quality (California Invasive Plant Council 2006:1). Road, highway, and related construction projects are some of the principal dispersal pathways for invasive plants and their propagules. FHWA requires that state departments of transportation use the respective state's noxious weed list to identify invasive plant species that could be spread by construction of transportation projects. Accordingly, Table 3-5 lists the invasive plant species identified by CDFA and Cal-IPC that are known to occur in the BSA (Natural Resources Conservation Service 2003; California Invasive Plant Council 2006, 2007). No plant species designated as federal noxious weeds have been identified in the BSA (Natural Resources Conservation Service 2014a).

4.5.4.1 Survey Results

Table 3-5 in Chapter 3 identifies the invasive plant species located in the BSA. Invasive plant species occur in ruderal woodland; along roadways; in disturbed/graded areas; and, to a lesser extent, in riparian forest. The infestation of the BSA by these species is generally limited; they occur primarily as scattered individuals, with the exception of tree of heaven, which occurs as the main overstory in several parcels within ruderal woodland habitat between 2nd Street and the levee.

4.5.4.2 Project Impacts

The proposed project has the potential to create additional disturbed areas for a temporary period and to introduce and spread invasive plant species to uninfected areas within and adjacent to the BSA. This would be of particular concern for natural communities of special concern, where non-native invasive plants could outcompete and replace native vegetation. Implementation of Measures 1–3 and Measure 33 (described below) would help to prevent the introduction and spread of invasive plants.

4.5.4.3 Avoidance and Minimization Efforts

Implementation of Measures 1–3 and Measure 33 would ensure that the proposed project minimizes effects due to introduction and spread of invasive plants.

Measure 33: Avoid the Introduction and Spread of Invasive Plants

The project proponent or their contractor will be responsible for avoiding the introduction of new invasive plants and the spread of invasive plants previously documented in the

study area. Accordingly, the following measures will be implemented during construction.

- Educate construction supervisors and managers on weed identification and the importance of controlling and preventing the spread of invasive weeds.
- Dispose of invasive species material removed during project construction offsite at an appropriate disposal facility to avoid the spread of invasive plants into natural areas.
- Minimize surface disturbance to the greatest extent feasible to complete the work.
- Use weed-free imported erosion-control materials (or rice straw in upland areas).
- Use locally grown native plant stock and native or naturalized (noninvasive) grass seed during revegetation.
- If feasible, remove trees of heaven located in and adjacent to the temporary impact area on the east side of 2nd Street in the City of West Sacramento.

4.5.4.4 Compensatory Mitigation

Implementation of avoidance and minimization efforts would minimize or prevent the spread of invasive plants; therefore, no compensatory mitigation for invasive plant species is required.

4.5.4.5 Cumulative Impacts

Cumulative impacts caused by the spread of invasive weed species would result from other projects in Sacramento and Yolo Counties. With implementation of avoidance and minimization efforts, the proposed project is not expected to add to the cumulative spread of invasive weeds and would not result in cumulatively adverse effects related to the spread of invasive weed species.

Chapter 5 Conclusions and Regulatory Determinations

Applicable federal, state, and local permits and approvals that could be required prior to construction of the proposed project are listed in Table 5-1.

Table 5-1. Permits and Approvals Potentially Required for the Proposed Project

Permit/Approval	Approving Agency
Endangered Species Act Section 7: inter-agency consultation	U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS)
California Endangered Species Act and Section 2081(b) (Incidental Take Permit)	CDFW
Magnuson-Stevens Fishery Conservation and Management Act	NMFS
Clean Water Act (CWA) Section 404: placement of fill	U.S. Army Corps of Engineers (USACE), Sacramento District
CWA Section 401: Water Quality Certification	Central Valley Regional Water Quality Control Board
Rivers and Harbors Act of 1899 (RHA) Section 9 and General Bridge Act of 1946: Bridge Permit	U.S. Coast Guard, District 11
RHA Section 10: Permit for Work in Navigable Waters	USACE, Sacramento District
Executive Order (EO) 11990: Protection of Wetlands	Federal Highway Administration (FHWA)
EO 12962: Recreational Fisheries	FHWA
EO 13112: Prevention and Control of Invasive Species	FHWA
EO 13186: Migratory Bird Treaty Act	FHWA
Senate Bill 857: Fish Passage Assessment	CDFW
California Fish and Game Code (CFGC) Section 1602	California Department of Fish and Wildlife (CDFW)
CFGC Sections 3503 and 3503.5: protection of birds and raptors	CDFW
CFGC Sections 3511, 3513, 4700, and 5050: fully protected species	CDFW
California Code of Regulations Title 2 § 2002: Land Use Lease	State Lands Commission
Encroachment Permit	Central Valley Flood Protection Board
Approval of changes to levee	Sacramento Area Flood Control Agency
Approval of changes to levee	West Sacramento Area Flood Control Agency
Formal notification prior to construction	Sacramento Metropolitan Air Quality Management District
Formal notification prior to construction	Yolo-Solano Air Quality Management District
Heritage tree permit	City of West Sacramento

A summary of consultation and coordination efforts related to the listed permits and approvals is provided below.

5.1 Federal Endangered Species Act Consultation Summary

Inter-agency consultation with NMFS and USFWS under Section 7 of the ESA is required for potential effects of the proposed project to Central Valley steelhead (including designated critical habitat) (NMFS), Sacramento River winter-run Chinook salmon (including designated critical habitat) (NMFS), Central Valley spring-run Chinook salmon (including designated critical habitat) (NMFS), Green sturgeon (including designated critical habitat) (NMFS), Delta smelt (including designated critical habitat) (USFWS), and VELB (USFWS). To date, there has been no ESA consultation with USFWS or NMFS for the proposed project. A BA will be prepared and submitted to USFWS for VELB and Delta smelt. A Biological Opinion from the USFWS will be required. A separate BA will be prepared and submitted to NMFS for the remaining federally listed anadromous fish species listed above.

5.2 Essential Fish Habitat Consultation Summary

Consultation (informal or formal) with NMFS is required for potential effects of the project to EFH. An EFH assessment addressing Pacific salmon will be prepared jointly with the BA that is being prepared for submittal to NMFS.

5.3 California Endangered Species Act Consultation Summary

Five state-listed species, Swainson's hawk, Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Delta smelt, and longfin smelt, have the potential to occur in the BSA. To date, there has been no CESA consultation with CDFW for the proposed project. A Section 2081 Incidental Take Permit may be required for Swainson's hawk, Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Delta smelt, and longfin smelt because of the potential for take of these species to occur. Based on timing restrictions for pile driving (must occur during the no-migration period for listed fish species), this activity may overlap with the nesting season of Swainson's hawks. Because the BSA is in an area that historically has been occupied by nesting Swainson's hawk, there is a high likelihood that an active nest would be present within 0.25 mile of pile driving. Therefore, a Section 2081 Incidental Take Permit may be required by CDFW in order to conduct pile driving during the nesting season.

5.4 Wetlands and Other Waters Coordination Summary

To date, there has been no CWA, Porter-Cologne Act, or CFGC Section 1600 coordination for the project with the USACE, RWQCB, State Water Board, or CDFW. A delineation of waters of the United States has been conducted for the proposed project, and a delineation report (Appendix A) is pending submittal to the USACE for a preliminary jurisdictional determination. The proposed placement of temporary and permanent fill materials in a wetland and/or the Sacramento River will require a CWA Section 404 Permit, CWA Section 401 Water Quality Certification, RHA Section 9 bridge permit and Section 10 permit, CFGC Section 1602 LSAA, and Land Use Lease. With implementation of the avoidance and minimization measures described in Chapter 4, the proposed project will be in compliance with EO 11990 and will not result in a loss of wetland functions and values.

5.5 Invasive Species

Within the BSA, 32 invasive plant species (listed in Table 3-5 of Chapter 3) were identified in ruderal woodland, disturbed/graded areas, and, to a lesser extent, riparian forest habitats. None of these species are designated as federal noxious weeds by the Natural Resources Conservation Service. With implementation of the avoidance and minimization measures described in Chapter 4, the proposed project will be in compliance with EO 13112 and will not result in new, severe infestations of invasive plant species.

5.6 Other

5.6.1 Federal Migratory Bird Treaty Act

The BSA provides ground and tree nesting habitat for migratory birds. The project proponent will avoid violation of the MBTA by implementing measures identified in Chapter 4 for migratory birds, including preconstruction surveys and establishment of no-disturbance buffers around active nests.

5.6.2 Fish Passage Assessment (Senate Bill 857)

By order of Senate Bill 857, Caltrans is required to conduct a fish passage assessment for projects receiving state or federal transportation funds that affect stream crossings where anadromous salmonids are, or historically were, present. A fish passage reconnaissance assessment for the BSA was conducted on May 8, 2015, by an ICF fish biologist. The results of the fish passage reconnaissance assessment are presented in Chapter 3.

5.6.3 California Fish and Game Code

Sections 1602, 3503, 3503.5, 3511, 3513, 4700, and 5050 of the CFGC apply to the proposed project and are described below.

5.6.3.1 Section 1602: Lake or Streambed Alteration Agreements

The project proponent will enter into an LSAA with CDFW for effects within the bed and bank of the Sacramento River.

5.6.3.2 Sections 3503 and 3503.5: Protection of Birds and Raptors

The project proponent will avoid violation of CFGC Sections 3503 and 3503.5 by implementing measures identified in Chapter 4 for birds and raptors, including preconstruction surveys and establishment of no-disturbance buffers around active nests.

5.6.3.3 Sections 3511, 3513, 4700, and 5050: Fully Protected Species

The project proponent will avoid violation of CFGC Section 3511 (fully protected birds) by implementing measures identified in Chapter 4 for white-tailed kite, including preconstruction surveys and establishment of no-disturbance buffers around active nests.

5.6.4 City of Sacramento Heritage Tree Ordinance

Heritage trees in the City of Sacramento that will be preserved during project construction will be protected prior to ground-disturbing activities by installing and maintaining barrier fencing around the dripline of the tree. Removed protected trees will be mitigated at a mitigation bank with riparian habitats. With implementation of the avoidance and minimization measures described in Chapter 4, the proposed project will be in compliance with the City of Sacramento Heritage Tree Ordinance.

5.6.5 City of West Sacramento Tree Preservation Ordinance

The City of West Sacramento will comply with their Tree Preservation Ordinance by obtaining a tree permit prior to the removal or disturbance of any protected tree that would be affected within the City of West Sacramento's jurisdiction. The City of West Sacramento will implement all applicable permit conditions and comply with the required tree mitigation. Trees that will be preserved during project construction will be protected prior to ground-disturbing activities by installing and maintaining barrier fencing around the dripline of the tree. Removed protected trees in riparian habitat will be mitigated at a mitigation bank with riparian habitats, and removed protected trees in other habitats will be mitigated per the ordinance by planting replacement trees within the City of West Sacramento. With implementation of the avoidance and minimization measures described in Chapter 4, the proposed project will be in compliance with the City of West Sacramento Tree Preservation Ordinance.

Appendix A Wetland Delineation Report

July 16, 2015

Mr. Marc Fugler
U.S. Army Corps of Engineers
Sacramento District, Regulatory Division
1325 J Street, Room 1350
Sacramento, California 95814-2922

Subject: Request for preliminary jurisdictional determination of the delineation of the proposed I Street Bridge Project, Sacramento County and Yolo County, California

Dear Mr. Fugler:

On behalf of the City of Sacramento and the City of West Sacramento (Cities), ICF International is submitting a Request for Preliminary Jurisdictional Determination (PJD) for the Sacramento River at I Street Bridge project. The City of Sacramento, in cooperation with the City of West Sacramento and the California Department of Transportation, proposes to construct a new bridge over the Sacramento River to replace the existing vehicle crossing that is currently accommodated by the existing I Street Bridge in order to remove a series of functionally obsolete or structurally deficient bridges (i.e., approach structures). The new connection would also reduce future traffic congestion, improve operations and safety, serve multiple modes of transportation, and comply with current American Association of State Highway and Transportation Officials, Caltrans, and local agency design standards.

The Cities plan to submit a permit application for any work below OHWM or in the potential wetland. At this time, the Cities are requesting a PJD of the OHWM of the Sacramento River and the boundary of the potential wetland based on the discussion provided below and the attached delineation map (Exhibit A), photographs, and data forms.

Delineation Area

The delineation area comprises approximately 42 acres surrounding the proposed bridge and approaches (Exhibit A). The proposed bridge site is located over the Sacramento River between the Cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge (Figure 1). The delineation area consists of the Sacramento River, riparian woodland, and open space with bike/pedestrian trails along the Sacramento River, local roads, elevated road (viaduct) and bridge approach structures, residential areas, and commercial

development. The delineation area has a relatively high level of historical and ongoing disturbance. Elevations in the delineation area range from -6 to 64 feet above mean sea level.

According to soil data from the Natural Resources Conservation Service, the delineation area contains the following five soil map units and water:

- Orthents-Urban land complex, 0 to 2 percent slopes (Sacramento County)
- Urban land (Sacramento County)
- Lang sandy loam (Yolo County)
- Lang sandy loam, deep (Yolo County)
- Sycamore silt loam (Yolo County)

Of these, Sycamore soils are hydric and inclusions within the map units of Orthents-Urban land and Lang sandy loam are hydric. The soil profile has been disturbed by development in West Sacramento and construction activity in the Sacramento Railyards Specific Plan area.

Methods

ICF wetland ecologist/botanist Lisa Webber conducted the field study on April 8, 2015 on behalf of the Cities in support of the proposed I Street Bridge project. The field study included investigations to identify areas that could be subject to jurisdiction by the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA) and the California Department of Fish and Wildlife (DFW) and to evaluate possible environmental constraints. The investigation consisted of walking through the delineation area, mapping the observed OHWM where accessible with a sub-meter accuracy global positioning system (GPS) unit, sampling potential wetland areas using the routine on-site determination method described in the 1987 *Corps of Engineers Wetlands Delineation Manual*, and implementing the supplemental procedures and wetland indicators described in the 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual for the Arid West Region*. The wetland ecologist/botanist identified the OHWM of the Sacramento River in the field using the guidance provided in Regulatory Guidance Letter 05-05. This boundary was confirmed using site-specific topographic mapping to identify the location of the 19-foot elevation, which has been identified as the OHWM for the Sacramento River at the existing I Street bridge. Aerial and ground-view photographs of the study area were reviewed prior to the field study.

A total of four data points were examined in the delineation area—two data points to establish the riparian wetland boundary (DP-1w and DP-2u) and two data points to record upland conditions (DP-3u and DP-4u). The data forms are attached.

Results

The delineation area in the City of Sacramento east of the levee is developed, graded, or landscaped. The delineation area in the City of West Sacramento west of the levee includes residences and other buildings with landscaping, as well as ruderal woodland, which supports few native trees and predominantly tree of heaven (*Ailanthus altissima*) [FACU]. One other waters (the Sacramento River) and one potential wetland were identified in the delineation area. These features are further described below.

Other Waters—Sacramento River

The location of the OHWM in the Sacramento River was based on the elevation of 19 feet NGVD that was previously determined by the USACE at the I Street Bridge. Observations in the field further confirmed this location based on the presence of shelving, silt deposition, and wracking. The average width of the Sacramento River at the OHWM is approximately 672 feet, and the delineation area encompasses 4.877 acres of the river (Photo 1). The channel bottom is a natural substrate, presumably sand and sediment, but water turbidity prevented visual confirmation of the composition. The river banks are mostly steeply sloped and support riparian forest vegetation, with riprap near the bottom of the slope.

The cottonwood riparian community on the Sacramento River banks is predominantly mature Fremont cottonwood (*Populus fremontii*) [FAC] trees associated with valley oak (*Quercus lobata*) [FACU] and black walnut (*Juglans californica* var. *hindsii*) [FAC]. Other riparian tree species observed include Oregon ash (*Fraxinus latifolia*) [FACW], boxelder (*Acer negundo* var. *californicum*) [FACW], and black willow (*Salix gooddingii*) [FACW]. The riparian understory on the waterside of the levee is primarily rip-rap with nonnative annual grasses and forbs, however, there are also patches of more typical riparian species, such as narrow-leaf willow (*Salix exigua*) [FACW], Himalayan blackberry (*Rubus armeniacus*) [FACU], and mugwort (*Artemisia douglasiana*) [FAC].

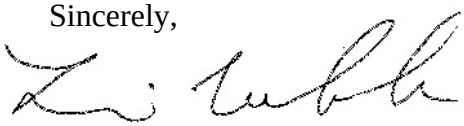
Riparian Wetland

A riparian forest/shrub wetland occurs in the delineation area within riparian habitat that meets all three federal wetland criteria (DP-1w). The riparian wetland is located in the northern portion of the delineation area on the east side of the Sacramento River within a basin (Photo 2). This basin appears to capture overflow from the Sacramento River during high flows. The vegetative composition of riparian forest/shrub wetlands is predominantly cottonwood, but also includes buttonwillow (*Cephalanthus occidentalis* var. *californicus*) [OBL], boxelder, and narrow-leaf willow. Hydric soils in the wetland met the redox depressions (F8) indicator. Wetland hydrology was indicated by observations of water marks (B1), sediment deposits (B2), and oxidized rhizospheres along living roots (C3).

The Cities request verification of the OHWM of the Sacramento River and the extent of the riparian wetland within the delineation area and a preliminary jurisdictional determination according to RGL 08-02. If you require additional information or have any questions regarding this request, please contact me at lisa.webber@icfi.com or Claire Bromund at claire.bromund@icfi.com or either of us by phone at (916) 737-3000.

Thank you for your assistance with this project.

Sincerely,



Lisa Webber
Wetland Ecologist

Exhibit A
Delineation of Potential Waters of the United States, Including Wetlands

Photo 1. View of proposed I Street Bridge site, looking from West Sacramento toward Sacramento.

Photo 2. Riparian wetland, looking down from the top of the levee slope.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: I Street Bridge City/County: Sacramento/Sac. West Sacramento/Yolo Sampling Date: 4-8-15

Applicant/Owner: City of Sacramento + City of West Sacramento State: CA Sampling Point: DP-1W

Investigator(s): Webber, Howe Section, Township, Range: T9N, R4E, unnamed section

Landform (hillslope, terrace, etc.): floodplain Local relief (concave, convex, none): concave Slope (%): <1%

Subregion (LRR): CLPR Lat: _____ Long: _____ Datum: _____

Soil Map Unit Name: La (Laang Sandy loam) NWI classification: _____

Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No X (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes X No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes X No _____	**Is the Sampled Area within a Wetland?** Yes X No _____
Hydric Soil Present?	Yes X No _____	
Wetland Hydrology Present?	Yes X No _____	

Remarks: Extreme drought year, but ~1.0" of rainfall in the previous 24 hours.

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: 20')	Absolute % Cover	Dominant Species?	Indicator Status

Surface Water Present? Yes X No ____ Depth (inches): 2"

Water Table Present? Yes X No ____ Depth (inches): to surface

Saturation Present? (includes capillary fringe) Yes X No ____ Depth (inches): to surface

Wetland Hydrology Present? Yes X No ____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Hydrology is temporary, due to construction activity and grading. Current surface water is due to recent rain.

Consultation Code: 08ESMF00-2015-SLI-0340 April 17, 2015
Event Code: 08ESMF00-2015-E-01724
Project Name: I Street Bridge Replacement

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2)

of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

The table below outlines lead FWS field offices by county and land ownership/project type. Please refer to this table when you are ready to coordinate (including requests for section 7 consultation) with the field office corresponding to your project, and send any documentation regarding your project to that corresponding office. Therefore, the lead FWS field office may not be the office listed above in the letterhead. Please visit our office's website (http://www.fws.gov/sacramento) to view a map of office jurisdictions.

Consultation Code: 08ESMF00-2015-SLI-0340
Event Code: 08ESMF00-2015-E-01724

Project Type: Bridge Construction / Maintenance

Project Name: I Street Bridge Replacement
Project Description: Construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge and south of Richards Boulevard.

Please Note: The FWS office may have modified the Project Name and/or Project Description, so it may be different from what was submitted in your previous request. If the Consultation Code matches, the FWS considers this to be the same project. Contact the office in the 'Provided by' section of your previous Official Species list if you have any questions or concerns.

Endangered Species Act Species List

There are a total of 8 threatened or endangered species on your species list. Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Critical habitats listed under the **Has Critical Habitat** column may or may not lie within your project area. See the **Critical habitats within your project area** section further below for critical habitat that lies within your project. Please contact the designated FWS office if you have questions.

Amphibians	**Status**	**Has Critical Habitat**	**Condition(s)**
California Tiger Salamander *(Ambystoma californiense)* Population: U.S.A. (CA - Sonoma County)	Endangered	Final designated	
California red-legged frog *(Rana draytonii)* Population: Entire	Threatened	Final designated	
Crustaceans			
Vernal Pool fairy shrimp *(Branchinecta lynchi)* Population: Entire	Threatened	Final designated	
Vernal Pool tadpole shrimp *(Lepidurus packardi)* Population: Entire	Endangered	Final designated	
Fishes			
Delta smelt *(Hypomesus transpacificus)* Population: Entire	Threatened	Final designated	
steelhead *(Oncorhynchus (=salmo)*	Threatened	Final designated	

mykiss) Population: Northern California DPS			
Insects			
Valley Elderberry Longhorn beetle *(Desmocerus californicus dimorphus)* Population: Entire	Threatened	Final designated	
Reptiles			
Giant Garter snake *(Thamnophis gigas)* Population: Entire	Threatened		

Critical habitats that lie within your project area

There are no critical habitats within your project area.

Chief, Environmental Management, M-1 Branch
Department of Transportation, District 3
703 B Street
Marysville, CA 95901

Re: Endangered Species Act (ESA) Section 7(a)(2) Species List for I Street Bridge Replacement Project

Dear Ms. Bauer:

This is in response to your July 22, 2015, letter requesting technical assistance from NOAA's National Marine Fisheries Service (NMFS) regarding the California Department of Transportation's (Caltrans) proposed project to replace the I Street Bridge over the Sacramento River between the cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge, in Sacramento County, California. Waterways within the project area include the mainstem of the Sacramento River upstream of the Sacramento-San Joaquin Delta (Delta) and downstream of its confluence with the American River. Caltrans has requested NMFS to provide the species listed on the Federal List of Endangered and Threatened Wildlife (50 C.F.R. 70.11), or critical habitat designated that may occur within the project area.

Available information indicates that the following listed species and designated critical habitat could occur in the project area, or have the potential to be affected by the project (Table 1):

In addition, a comprehensive collection of species listing information, critical habitat designations, status reviews, distribution maps and Federal Register (FR) Notices for listed salmonids can be found on the NMFS West Coast Region website at: http://www.westcoast.fisheries.noaa.gov/protected_species/salmon_steelhead/salmon_and_steelhead_listings/salmon_and_steelhead_listings.html, and for green sturgeon at: http://www.westcoast.fisheries.noaa.gov/protected_species/green_sturgeon/green_sturgeon_pg.html.

Formal and informal consultation is initiated through a request that must include the following six pieces of information as described in CFR 402.14(c):

(1) A description of the proposed action to be covered;

(2) A description of the specific area that may be affected by the proposed action; Table 1—FR ESA listings for affected species and their critical habitat designations as applicable in or near the project area.

Species	ESU or DPS	Original Final FR Listing	Current Final Listing Status	Critical Habitat Designated
Chinook salmon (*Oncorhynchus tshawytscha*)	Central Valley (CV) spring-run ESU	9/16/1999 64 FR 50394 Threatened	6/28/2005 70 FR 37160 Threatened	9/2/2005 70 FR 52488
Chinook salmon (*O. tshawytscha*)	Sacramento River (SR) winter-run ESU	1/4/1994 59 FR 440 Endangered	6/28/2005 70 FR 37160 Endangered	6/16/1993 58 FR 33212
Steelhead (*O. mykiss*)	California Central Valley (CCV) DPS	3/19/1998 63 FR 13347 Threatened	1/5/2006 71 FR 834 Threatened	9/2/2005 70 FR 52488
North American (NA) Green sturgeon (*Acipenser medirostris*)	Southern DPS	4/7/2006 71 FR 17757 Threatened	4/7/2006 71 FR 17757 Threatened	10/9/2009 74 FR 52300

(3) A description of any listed species or critical habitat that may be affected by the proposed action;

(4) A description of the manner in which the action may affect any listed species or critical habitat, and an analysis of any direct, indirect, or cumulative effects.

a. Direct Effects: Effects to listed species of designated critical habitat that occur during implementation of the project.

b. Indirect Effects: Effects to listed species that occur later in time or offsite, but are reasonably certain to occur.

c. Cumulative Effects: For purposes of the ESA, cumulative effects are defined as the effects of future State or private activities, not involving Federal activities, that are reasonably certain to occur within an action area of the Federal action subject to consultation (50 CFR 402.02). Future Federal actions are not included here because they require separate consultation pursuant to Section 7 of the ESA;

(5) Relevant reports, including any environmental impact statements, environmental assessments, biological assessments or other analysis prepared regarding the proposal; and

(6) Any other relevant studies or other information available on the action, the affected listed species, or critical habitat.

The following is a description of critical habitat for SR winter-run Chinook salmon, CV spring-run Chinook salmon, and CCV steelhead in or near the project area:

Critical habitat includes the stream channels in the designated stream reaches and the lateral extent as defined by the ordinary high-waterline. In areas where the ordinary high-waterline has not been defined, the lateral extent will be defined by the bankfull elevation (defined as the level at which water begins to leave the channel and move into the floodplain; it is reached at a discharge that generally has a recurrence interval of 1 to 2 years on the annual flood series). Critical habitat for SR winter-run Chinook salmon, CV spring-run Chinook salmon, and CCV steelhead are defined as specific areas that contain the primary constituent elements (PCE) and physical habitat elements (PHE) essential to the conservation of the species. The following information discusses the inland habitat types used as PCEs for CV spring-run Chinook salmon and CCV steelhead and as PHEs for SR winter-run Chinook salmon that may occur along the Sacramento River mainstem near the project site.

PCEs for CV spring-run salmon and CCV steelhead and PHEs for SR winter-run Chinook salmon in the Sacramento River near the project site

Freshwater Rearing Habitat

Freshwater rearing sites are those with water quantity and floodplain connectivity to form and maintain physical habitat conditions and support juvenile growth and mobility; water quality and forage supporting juvenile development; and natural cover such as shade, submerged and overhanging large woody material, log jams and beaver dams, aquatic vegetation, large rocks and boulders, side channels, and undercut banks. Both spawning areas and migratory corridors comprise rearing habitat for juveniles, which feed and grow before and during their outmigration. Rearing habitat condition is strongly affected by habitat complexity, food supply, and the presence of predators of juvenile salmonids. The channelized, leveed, and riprapped river reaches and sloughs that are common in the Delta south of the project location have been significantly degraded by the placement of riprap. Freshwater rearing habitats are considered to have a high conservation value and recovery potential even if they are significantly degraded compared to their natural state.

Freshwater Migration Corridors

Ideal freshwater migration corridors are free of migratory obstructions, with water quantity and quality conditions that enhance migratory movements. They contain natural cover such as riparian canopy structure, submerged and overhanging large woody objects, aquatic vegetation, large rocks, and boulders, side channels, and undercut banks which augment juvenile and adult mobility, survival, and food supply. These corridors allow the upstream passage of adults, and the downstream emigration of outmigrant juveniles. The Sacramento River is a primary migration corridor for adult and juvenile salmon and steelhead. Freshwater migration corridors are considered to have a high conservation and recovery potential value even if they are significantly degraded compared to their natural state.

Estuarine Areas

Estuarine areas free of migratory obstructions with water quality, water quantity, and salinity conditions supporting juvenile and adult physiological transitions between fresh and salt water are included as a PCE. Natural cover such as submerged and overhanging large woody material, aquatic vegetation floodplains and side channels, are essential for juvenile and adult foraging. The project area is located along the Sacramento River mainstem just north of the Delta and may be a critical component of estuarine PCEs. Estuarine areas are considered to have a high conservation value as they provide factors which function to provide predator avoidance and as a transitional zone to the ocean environment. Estuarine areas are considered to have a high conservation and recovery potential value even if they are significantly degraded compared to their natural state.

The following is a description of critical habitat for the Southern DPS of NA green sturgeon in or near the project area:

Critical habitat for Southern DPS green sturgeon includes the stream channels and waterways in and near the Delta to the ordinary high waterline. There are several PCEs present that should be considered at the project location.

PCEs for the Southern DPS of NA green sturgeon in the Sacramento River near the project site

Food Resources

Abundant food items within estuarine habitats and substrates for juvenile, subadult, and adult life stages are required for the proper functioning of this PCE for green sturgeon. Prey species for juvenile, subadult, and adult green sturgeon within bays and estuaries primarily consist of benthic invertebrates and fish, including crangonid shrimp, callianassid shrimp, burrowing thalassinidean shrimp, amphipods, isopods, clams, annelid worms, crabs, sand lances, and anchovies. These prey species are critical for the rearing, foraging, growth, and development of juvenile, subadult, and adult green sturgeon within the bays and estuaries.

Water Flow

Within bays and estuaries adjacent to the Sacramento River (*i.e.*, the Delta and the Suisun, San Pablo, and San Francisco bays), sufficient flow into the bay and estuary to allow adults to successfully orient to the incoming flow and migrate upstream to spawning grounds is required. Sufficient flows are needed to attract adult green sturgeon into the Sacramento River from the bay and to initiate the upstream spawning migration into the upper river.

Water Quality

Adequate water quality, including temperature, salinity, oxygen content, and other chemical characteristics are necessary for normal behavior, growth, and viability of all life stages. Suitable water temperatures for juvenile green sturgeon should be below 24°C (75°F). At temperatures above 24°C, juvenile green sturgeon exhibit decreased swimming performance and increased cellular stress. Adequate levels of dissolved oxygen (DO) are also required to support

oxygen consumption by juveniles (ranging from 61.8 to 76.1 mg O_2 hr^{-1} kg^{-1}). Suitable water quality also includes water free of contaminants (*e.g.*, organochlorine pesticides, polyaromatic hydrocarbons (PAHs), or elevated levels of heavy metals) that may disrupt the normal development of juvenile life stages, or the growth, survival, or reproduction of subadult or adult stages.

Migratory Corridor

Safe and unobstructed migratory pathways are necessary for successful and timely passage of adult, sub-adult, and juvenile fish within the region's different estuarine habitats and between the upstream riverine habitat and the marine habitats. Within the waterways comprising the Delta, and bays downstream of the Sacramento River, safe and unobstructed passage is needed for juvenile green sturgeon during the rearing phase of their life cycle. Rearing fish need the ability to freely migrate from the river through the estuarine waterways of the Delta and bays and eventually out into the ocean. Passage within the bays and the Delta is also critical for adults and subadults for feeding and summer holding, as well as to access the Sacramento River for their upstream spawning migrations and to make their outmigration back into the ocean. Within bays and estuaries outside of the Delta and the areas comprised by Suisun, San Pablo, and San Francisco bays, safe and unobstructed passage is necessary for adult and subadult green sturgeon to access feeding areas, holding areas, and thermal refugia, and to ensure passage back out into the ocean.

Water Depth

A diversity of depths is necessary for shelter, foraging, and migration of juvenile, subadult, and adult life stages. Adults and subadults within the estuary primarily occupy waters over shallow depths of less than 10 meters, either swimming near the surface or foraging along the bottom. In a study of juvenile green sturgeon in the Delta, relatively large numbers of juveniles were captured primarily in shallow waters from 3 to 8 feet deep, indicating juveniles may require shallower depths for rearing and foraging. Thus, a diversity of depths is important to support different life stages and habitat uses for green sturgeon within estuarine areas.

Sediment Quality

Sediment quality (*i.e.*, chemical characteristics) is necessary for normal behavior, growth, and viability of all life stages. This includes sediments free of contaminants (*e.g.*, elevated levels of selenium, PAHs, and organochlorine pesticides) that can cause negative effects on all life stages of green sturgeon.

Essential Fish Habitat (EFH)

The proposed project site is within the region identified as EFH for Pacific salmon in Amendment 14 of the Pacific Salmon FMP. EFH is defined as those waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity. For the purposes of interpreting the definition of EFH, "waters" includes aquatic areas and their associated physical, chemical, and biological properties that are used by fish, and may include areas historically used

by fish where appropriate; "substrate" includes sediment, hard bottom, structures underlying the waters, and associated biological communities; "necessary" means habitat required to support a sustainable fishery and a healthy ecosystem; and, "spawning, breeding, feeding, or growth to maturity" covers all habitat types used by a species throughout its life cycle. In order to protect EFH, federal agencies are required to consult with NMFS on activities that may adversely affect EFH, and NMFS must provide EFH conservation recommendations to those agencies (section 305(b)(4)(A)).

Fall-run Chinook salmon have the potential to be present near the project location and are managed under the Pacific Coast Salmon Fisheries Management Plan (FMP). Habitat areas of particular concern (HAPCs), as designated under this FMP, include (1) complex channels and floodplain habitats, (2) thermal refugia, (3) spawning habitat, (4) estuaries, and (5) marine and estuarine submerged aquatic vegetation. Caltrans should identify and discuss HAPCs present, if any, along the Sacramento River mainstem near the project location.

ESA Section 7(a)(1) Conservation Recommendations

Section 7(a)(1) of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C 1531 *et seq.*), directs Federal agencies to utilize their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of threatened and endangered species. Conservation recommendations are discretionary agency activities intended to minimize or avoid adverse effects of a proposed project on listed species or critical habitat, to help implement recovery plans, or to develop information.

Bridge replacement projects have a high potential to further degrade habitat for anadromous fish and reduce their recovery potential. We recommend a pre-consultation meeting to discuss methods to minimize and avoid impacts of this project, including project timing. Some examples include:

(1) Re-vegetate onsite at a 3:1 ratio immediately following the completion of the proposed project for any area consisting of removed or disturbed vegetation with native riparian species in efforts to facilitate the development of shaded riverine aquatic (SRA) habitat. A detailed re-vegetation plan should be provided and should include a list of species and designs depicting the proposed location for each species and their density. The vegetation plan should also include proposed irrigation and vegetation monitoring schedules which will likely be needed for several years;

(2) Develop a monitoring plan to evaluate the success of the re-vegetation efforts which would indicate the overall performance of the planted vegetation at each site and include guidelines for replacing vegetation that fail to establish.

(3) Purchase rearing habitat credits at a 3:1 ratio for the placement of rock slope protection (RSP), if used, within the action area at a NMFS approved anadromous fish conservation bank;

(4) Implement best management practices, including Storm Water Pollution Prevention Program and Water Pollution Control Program, to minimize effects to federally listed fish and their designated critical habitat;

(5) Use a soil-rock mixture to facilitate re-vegetation of the proposed project area. A ratio of rock to soil (70:30) is recommended. We suggest a soil-rock mixture on top of the rock revetment to allow native riparian vegetation to be planted to ensure SRA habitat is replaced;

(6) Caltrans should use a vibratory hammer whenever possible to avoid acoustic impacts to ESA-listed fish when pile driving. If an impact hammer is necessary, a bubble curtain or other sound attenuation method should be used to reduce impacts;

(7) Construction should occur when vulnerable life stages of listed anadromous fish would be least likely to occur in the project area;

(8) To address potential fish migration concerns upstream and downstream of the RSP placement points, see NMFS Guidelines for Salmonid Passage at Stream Crossings at http://www.westcoast.fisheries.noaa.gov/publications/hydropower/fish_passage_at_stream_crossings_guidance.pdf.;

(9) Minimize bridge demolition impacts by removing the existing superstructure piece by piece and disposing of it in an environmentally conscious way off-site. This includes protecting the river below the bridge by routing any flow around the construction area;

(10) Stabilize and restore the affected project footprint area by applying appropriate soil stabilization and re-vegetation techniques. This may include the implementation of riparian plantings and locally native grass and/or forb seeds to reduce and offset construction impacts. Seeded areas should be covered with broadcast straw and/or seeded erosion control blankets;

(11) Caltrans should continue to work cooperatively with other State and Federal agencies, private landowners, governments, and local watershed groups to identify opportunities for cooperative analysis and funding to support salmonid and sturgeon habitat restoration projects within the Sacramento River watershed;

(12) Caltrans and other local, State, and Federal agencies should provide training for Caltrans environmental and engineering staff that will assist in avoiding or minimizing the impacts of transportation projects on ESA-listed salmonids, NA green sturgeon and their designated critical habitats; and

(13) Caltrans should purchase salmonid habitat restoration credits at a NFMS-approved anadromous fish conservation bank at a 3:1 ratio for the footprint of the project area. The purchase of credits is consistent with 7(a)(l) because it will result in the restoration and long-term preservation of valuable habitat attributes that will improve the survival and recovery of the species.

This response is provided as technical assistance with Caltrans. This response is not intended to take the place of formal comments or consultation as required under the ESA, and does not provide incidental take authorization pursuant to section 7(b)(4) and section 7(o)(2) of the ESA.

Please contact Dylan Van Dyne at (916) 930-3625, or via e-mail at Dylan.VanDyne@noaa.gov if you have any questions or require additional information.

Sincerely,

for Maria C. Rea

Appendix D Plant Species Observed in the Biological Study Area

Appendix D Plant Species Observed in the Biological Study Area

Scientific Name	Common Name
Acer negundo var. *californicum*	Box elder
Acer saccharinum	Silver maple
*Ailanthus altissima**	Tree of heaven
Alnus rhombifolia	White alder
Amaranthus blitoides	Prostrate pigweed
Ambrosia psilostachya	Western ragweed
Amsinckia intermedia	Common fiddleneck
Artemisia douglasiana	Mugwort
*Avena fatua**	Wild oat
*Brassica nigra**	Black mustard
*Bromus diandrus**	Ripgut brome
*Bromus hordeaceus**	Soft chess
Bromus madritensis ssp. *rubens**	Red brome
*Bromus tectorum**	Cheatgrass
Capsella bursa-pastoris	Shepherd's purse
*Carduus pycnocephalus**	Italian thistle
Carex barbarae	Santa Barbara sedge
Celtis australis	European hackberry
*Centaurea solstitialis**	Yellow star-thistle
Cephalanthus occidentalis var. *californicus*	Common buttonbush
Cerastium fontanum	Mouse ear chickweed
Claytonia perfoliata	Miner's lettuce
Collinsia concolor	Chinese houses
*Convolvulus arvensis**	Bindweed
Cotula australis	Australian brass buttons
Crassula connata	Pygmy weed
Cupressus sempervirens	Italian cypress
*Cynodon dactylon**	Bermuda grass
Epilobium ciliatum	Fringed willowherb
Equisetum arvense	Horsetail
Erigeron canadensis	Horseweed
Eriobotrya japonica	Loquat
Erodium botrys	Big heronbill
*Erodium cicutarium**	Red stemmed filaree

Scientific Name	Common Name
Eschscholzia californica	California poppy
Festuca myuros [*Vulpia myuros*]*	Rattail six weeks grass
Festuca perennis [*Lolium perenne*]*	Italian ryegrass
*Ficus carica**	Edible fig
*Foeniculum vulgare**	Sweet fennel
Fraxinus latifolia	Oregon ash
Galium aparine	Common bedstraw
*Geranium dissectum**	Cutleaf geranium
Gnaphalium palustre	Lowland cudweed
*Hedera helix**	English ivy
*Helminthotheca echioides**	Bristly ox-tongue
Hordeum murinum ssp. *leporinum**	Foxtail barley
*Hypochaeris radicata**	Rough cat's ear
Juglans californica var. *hindsii*	Black walnut
Juncus effusus ssp. *pacificus*	Pacific rush
Lactuca serriola	Prickly lettuce
Lasthenia glabrata ssp. *glabrata*	Yellow-ray goldfields
Leontodon taraxicoides	Dandelion
*Lepidium latifolium**	Perennial peppergrass
Lepidium nitidum	Shining pepperweed
Logfia gallica	Narrowleaf cottonrose
Lupinus bicolor	Bicolor lupine
Magnolia grandiflora	Southern magnolia
Malva parviflora	Cheeseweed
Matricaria discoidea	Pineapple weed
Medicago sativa	Alfalfa
Melilotus alba	White sweetclover
Melilotus indicus	Yellow sweetclover
Mimulus guttatus	Monkeyflower
Nerium oleander	Oleander
*Nicotiana glauca**	Tree-tobacco
*Oxalis pes-caprae**	Sourgrass
Parthenocissus quinquefolia	Virginia creeper
Phacelia parryi	Parry's phacelia
Phoradendron macrophyllum	Big-leaf mistletoe
Pinus sp.	Pine
Pittosporum toriba	Mock orange
*Plantago lanceolata**	English plantain
Platanus x *hispanica*	London plane tree

Scientific Name	Common Name
Platanus racemosa	Western sycamore
Poa annua	Annual bluegrass
Polygonum arenastrum ssp. *depressum*	Common knotweed
*Polypogon monspeliensis**	Rabbitsfoot grass
Populus fremontii ssp. *fremontii*[2]	Fremont cottonwood
Prunus sp.	Fruit tree
Pyrus calleryana	Callery pear
Quercus lobata	Valley oak
Raphanus raphanistrum	Jointed charlock
*Raphanus sativus**	Wild radish
*Robinia pseudoacacia**	Black locust
Rosa canina	Dog rose
Rubus armeniacus [*discolor*]*	Himalayan blackberry
*Rumex crispus**	Curly dock
Salix exigua	Sandbar willow
Salix gooddingii	Black willow
Sambucus nigra ssp. *caerulea* [*mexicana*]	Blue elderberry
Senecio vulgaris	Old man of spring
Sequoia sempervirens	Coast redwood
*Sesbania punicea**	Purple river-hemp
*Silybum marianum**	Milk-thistle
*Sisymbrium irio**	London rocket
Solanum americanum	Common nightshade
Sonchus oleraceus	Common sow thistle
*Sorghum halepense**	Johnsongrass
Spergularia macrotheca	Sticky sandspurry
Stipa miliacea [*Piptatherum miliaceum*]*	Smilo grass
*Tribulus terrestris**	PunctureVine
*Trifolium hirtum**	Rose clover
Triticum aestivum	Common wheat
Urtica urens	Dwarf nettle
Verbascum blatteria	Moth mullein
Verbena bonariensis	Purpletop vervain
Veronica peregrine ssp. *xalapensis*	Hairy purslane speedwell
Vicia benghalensis	Purple vetch
Vicia sativa ssp. *sativa*	Spring vetch
Vicia villosa ssp. *varia*	Winter vetch

Scientific Name	Common Name
*Vinca major**	Periwinkle
Vitis californica	California wild grape
Washingtonia filifera	California fan palm

Summary of Findings, Conclusions and Determinations

The City of Sacramento, in cooperation with the City of West Sacramento and the California Department of Transportation (Caltrans), proposes to construct a new bridge over the Sacramento River to replace the vehicle crossing that is currently accommodated by the existing I Street Bridge in order to remove a series of functionally obsolete or structurally deficient bridges (i.e., approach structures). The new connection also would reduce future traffic congestion, improve operations and safety, serve multiple modes of transportation, and comply with current American Association of State Highway and Transportation Officials, Caltrans, and local agency design standards. The new approximately 860-foot-long bridge, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides, would be located north of the existing I Street Bridge. The proposed bridge would be a five-span bridge, with an approximately 330-foot-long movable center span to meet U.S. Coast Guard (USCG) requirements. Both in-water and out-of-water construction activities would be required.

The purpose of this biological assessment (BA) is to provide technical information and to review the proposed project in sufficient detail to determine to what extent the proposed project may affect species that are federally threatened, endangered, or proposed for threatened or endangered status. This BA was prepared in accordance with legal requirements found in Section 7(a)(2) of the Endangered Species Act (ESA) (16 U.S. C 1536[c]) and based on Federal Highway Administration (FHWA) and Caltrans regulation, policy and guidance.

The biological study area (BSA) currently supports four federally-listed fish species, including Sacramento River winter-run Chinook salmon (*Oncorhynchus tshawytscha*), Central Valley spring-run Chinook salmon (*O. tshawytscha*), Central Valley steelhead (*O. mykiss*), and Southern Distinct Population Segment (DPS) of North American green sturgeon (*Acipenser medirostris*) (all listed as threatened under the ESA, except Sacramento River winter-run Chinook salmon which is listed as endangered), provides rearing and foraging habitat for Central Valley fall-/late fall–run Chinook salmon (*O. tshawytscha*) (a species of concern), and is designated critical habitat for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, and North American green sturgeon. The biological study area also supports essential fish habitat (EFH) for Pacific salmon (Chinook salmon) which are managed under federal fisheries management plans in accordance with the Magnuson-Stevens Fishery Conservation and Management Act (MSA).

The project proponent proposes to implement the following measures to avoid and minimize project construction effects on listed fish species, designated critical habitat, and EFH:

- Measure 1: Install Orange Construction Fencing between the Construction Area and Adjacent Sensitive Biological Resources
- Measure 2: Conduct Environmental Awareness Training for Construction Employees
- Measure 3: Conduct Periodic Biological Monitoring
- Measure 4: Conduct All In-Water Construction Activities between May 1 and November 30 and during Daylight Hours Only
- Measure 5: Implement Measures to Minimize Exceedance of Interim Threshold Sound Levels during Pile Driving
- Measure 6: Develop and Implement a Hydroacoustic Monitoring Plan
- Measure 7: Protect Water Quality and Prevent Erosion and Sedimentation in Drainages and Wetlands
- Measure 8: Monitor Turbidity in the Sacramento River
- Measure 9: Implement Cofferdam Restrictions
- Measure 10: Prepare and Implement a Fish Rescue and Relocation Plan
- Measure 11: Prevent the Spread or Introduction of Aquatic Invasive Species
- Measure 12: Minimize or Avoid Temporary Construction Lighting and Permanent Bridge Lighting from Directly Radiating on Water Surfaces of the Sacramento River

In addition, the project proponent would compensate for permanent impacts on critical habitat and loss of riparian vegetation and SRA cover by implementing the following measures:

- Measure 13: Compensate for Loss of Perennial Stream
- Measure 14: Purchase Channel Enhancement Credits for Impacts on Critical Habitat
- Measure 15: Compensate for Temporary Effects to and Permanent Loss of Cottonwood Riparian Forest (including SRA Cover)

The project is likely to adversely affect listed fish species, designated critical habitat, and EFH. The primary effect of the project would be the exposure of some fish to harmful noise levels during impact pile driving potentially resulting in harassment, injury or death of individuals. The probability of injury or death is difficult to predict and would be based on the timing and frequency of pile driving; the extent that vibratory drivers and attenuation devices would minimize the duration and intensity of impact pile driving; and the numbers, size, and mobility of listed species that may occur in the vicinity of the construction area while impact pile driving is occurring. Even with implementation of the proposed avoidance and minimization measures, construction activities may cause fish to delay their migration or cease foraging in response to increased turbidity, suspended sediment, and underwater noise; however, any behavioral effects

would be temporary and are not expected to measurably affect growth, survival, or reproductive success.

The proposed project would also result in a permanent loss of 1.44 acre of cottonwood riparian forest habitat, supporting 0.44 acre and 890 linear feet of SRA cover habitat; aquatic habitat (substrate and water column) for all fish species equal to the permanent loss of 10,449 square feet (0.24 acre) of substrate area; and a net permanent loss of 32,650 cubic feet of water column (aquatic) habitat from construction of the new in-water bridge piers and pilings for the new bridge fender system. In addition, construction of the new bridge will result in the creation of approximately 55,000 square feet (1.26 acre) of permanent over-water structure (shade) on the Sacramento River from the deck of the new bridge.

Long-term effects on the primary constituent elements (PCEs) or conservation value of critical habitat in the study area for all four species would include temporary effects on the water column (underwater noise and sound pressure, and water quality impacts) and channel substrate (cofferdams and trestles), and permanent loss of aquatic habitat (water column and substrate) from new bridge piers, RSP, and pilings for the new bridge fender system, and permanent loss of riparian forest and SRA cover habitat in the Sacramento River. Adverse effects on EFH would be similar to those listed above for critical habitat and would temporarily and permanently reduce the availability of EFH for Pacific salmon.

Summary of Determinations

The project *is likely to adversely affect* Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, and North American green sturgeon. The primary effect of the project would be the exposure of some fish to harmful noise levels during impact pile driving potentially resulting in harassment, injury or death of individuals. Even with implementation of the proposed avoidance and minimization measures, construction activities may cause fish to delay their migration or cease foraging in response to increased turbidity, suspended sediment, and underwater noise; however, any behavioral effects would be temporary and are not expected to measurably affect growth, survival, or reproductive success.

The project *is likely to adversely affect* critical habitat for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, and North American green sturgeon. Project effects on critical habitat include temporary effects on the water column (underwater noise and sound pressure, and water quality impacts) and channel substrate (cofferdams and trestles), and permanent loss of aquatic habitat (water column and substrate) from new bridge piers, RSP, and pilings for the new bridge fender system, and permanent loss of riparian forest and SRA cover habitat in the Sacramento River. Compensation

is proposed for the permanent loss of critical habitat and cottonwood riparian forest, including SRA cover habitat.

The project *is likely to adversely affect* EFH for Pacific salmon. Adverse effects on EFH would be similar to those listed above for critical habitat and would temporarily and permanently reduce the availability of EFH.

Chapter 1 Introduction

The purpose of this biological assessment (BA) and Essential Fish Habitat (EFH) assessment is to evaluate the effects of the proposed I Street Bridge Replacement Project on federally-listed threatened, endangered, and proposed fish species, and commercial fish species, respectively. This BA is prepared in accordance with legal requirements found in Section 7(a)(2) of the Endangered Species Act (ESA) (16 U.S.C 1536[c]) and based on Federal Highway Administration (FHWA) and California Department of Transportation (Caltrans) regulation, policy, and guidance. Section 305(b)(2)-(4) of the Magnuson-Stevens Fishery Conservation and Management Act (MSA) requires Caltrans and the U.S. Army Corps of Engineers (USACE) to consult with the National Marine Fisheries Service (NMFS) on any action authorized, funded, or undertaken that may adversely impact EFH. The EFH assessment is integrated into this BA and the EFH consultation process will be integrated into the NMFS biological opinion (BO) for the project. NMFS will provide EFH conservation recommendations for actions that would adversely affect EFH.

The project is subject to state and federal environmental review requirements because of use of federal Highway Bridge Program (HBP) funds from the FHWA. Accordingly, project documentation is being prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The City of Sacramento is the lead agency under CEQA, with the City of West Sacramento as a responsible agency, and Caltrans is the lead agency under NEPA. NEPA approval is expected to be achieved with an Environmental Assessment. CEQA approval will be achieved with an Environmental Impact Report.

The FHWA's other responsibilities for environmental review, consultation, and any other action required in accordance with applicable federal laws for this project will be carried out by Caltrans under its assumption of responsibility pursuant to 23 U.S. Code (USC) 327.

1.1 Project History and Background

The City of Sacramento, in cooperation with the City of West Sacramento and the California Caltrans, proposes to construct a new bridge over the Sacramento River (approximately river mile [RM] 59.5) between the cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge (Figure 1-1). The project limits starting within the City of Sacramento consist of Railyards Boulevard from 200 feet east of Bercut Drive on the east, continuing west over the Sacramento River into the City of West Sacramento along C Street, and terminating approximately 100 feet west of the 5th Street intersection (Figure 1-2). The project

limits also extend along Bercut Drive approximately 500 feet north of Railyards Boulevard, along Jibboom Street 550 feet north of Railyards Boulevard and 300 feet south of Railyards Boulevard, along 3rd Street 50 feet north and south of C Street, along 4th Street 50 feet north and south of C Street, along 5th Street 50 feet north and south of C Street, and includes the existing roadway approach structures leading to both sides of the existing I Street Bridge. The total length of the project is approximately 0.42 mile along C Street and Railyards Boulevard. This project is included in the Sacramento Area Council of Governments (SACOG) 2035 *Metropolitan Transportation Plan/Sustainable Communities Strategy* (MTP/SCS).

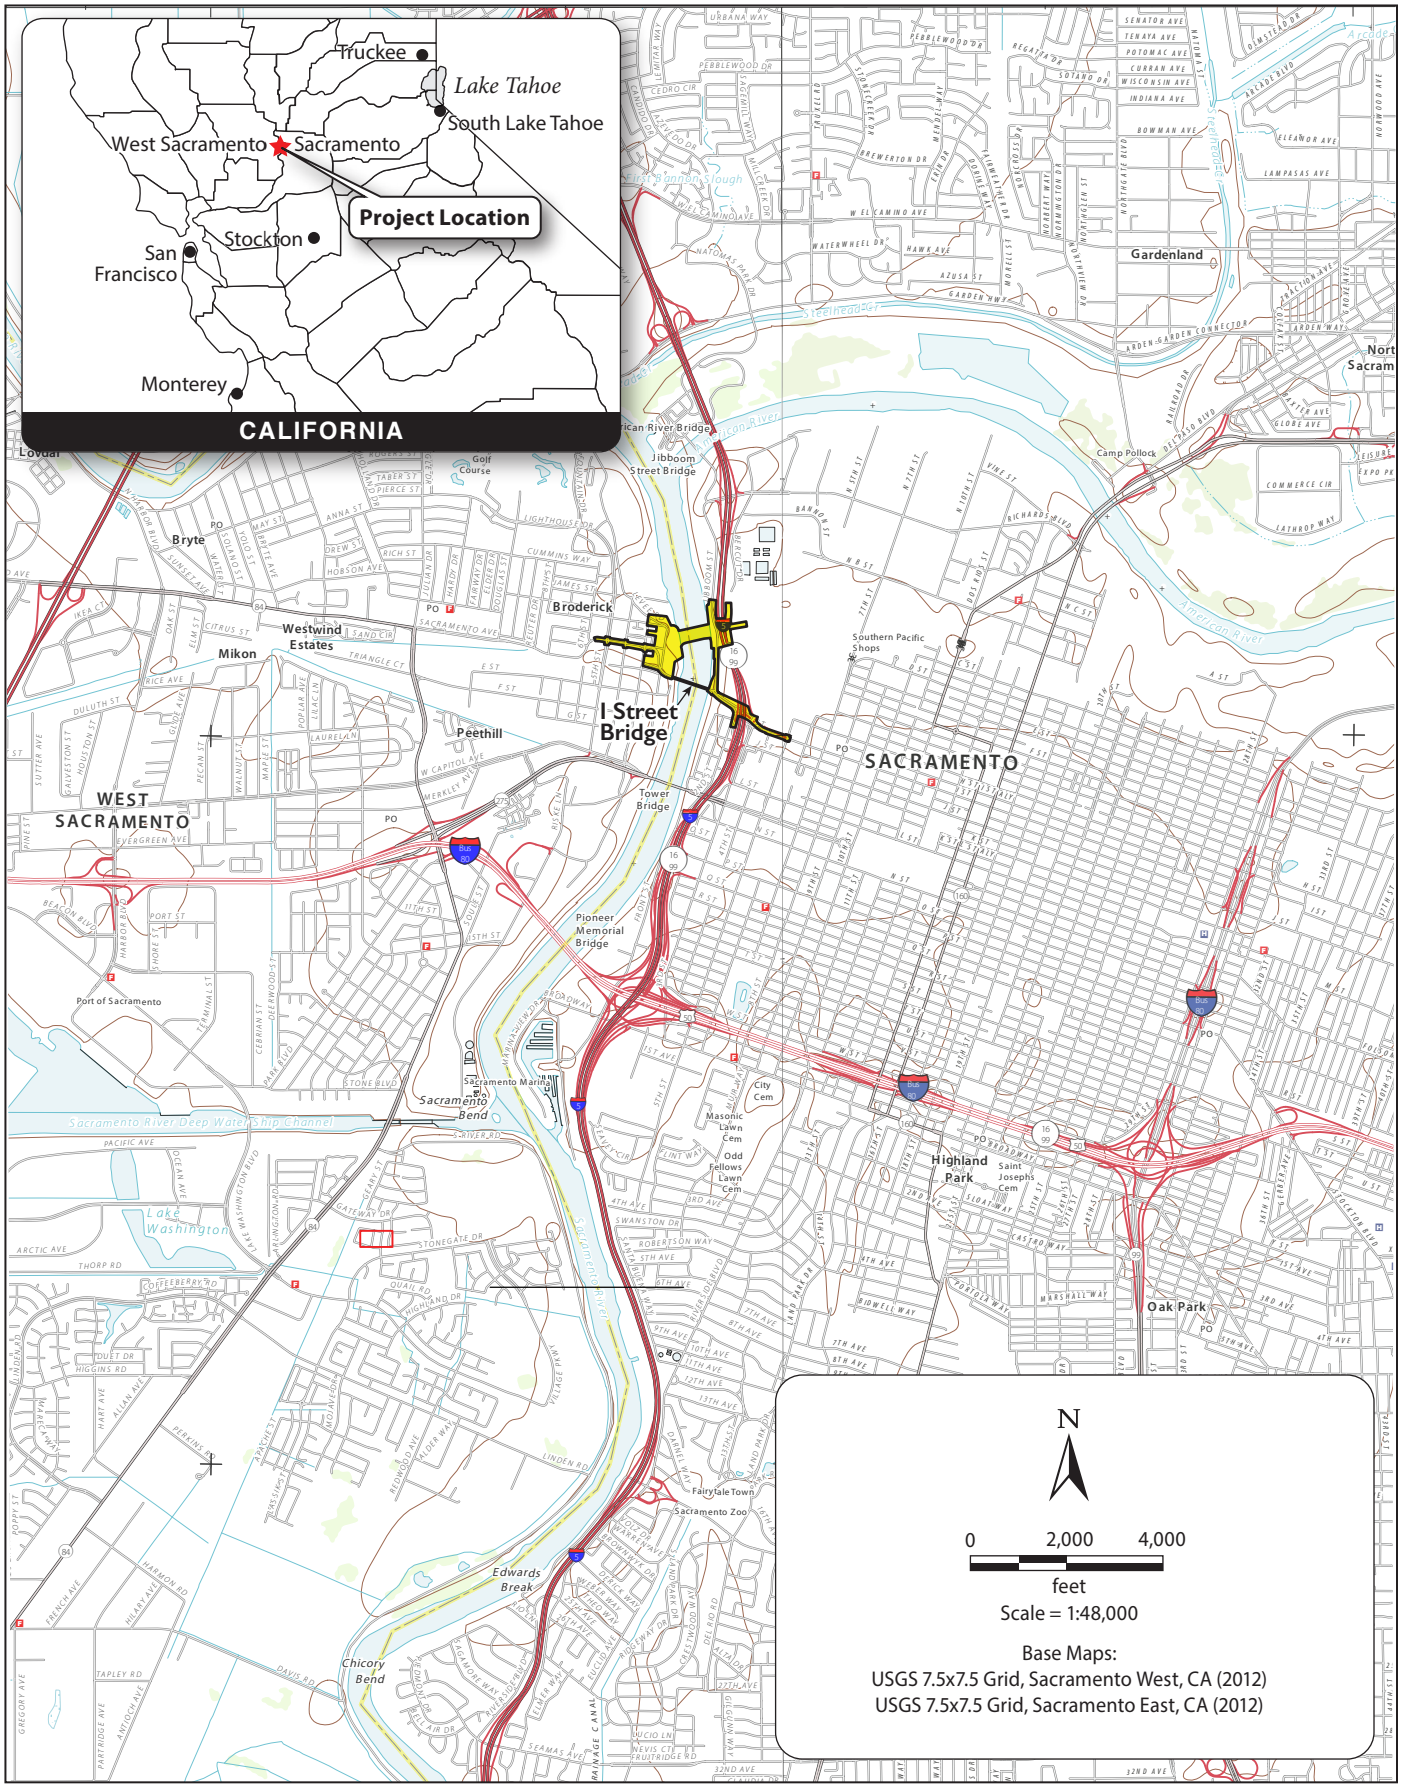
Constructed in 1911, the existing I Street Bridge is a historic double-deck, steel truss swing bridge. The lower level of the bridge provides rail access across the Sacramento River, while the upper level provides highway and pedestrian access. In 2011, the cities of Sacramento and West Sacramento completed the Sacramento River Crossings Alternatives Study which identified the purpose and need for new bridge crossings. The study concluded that a North Market Area (the area north of I Street) crossing was needed to replace the existing I Street Bridge, which has lanes that are too narrow to serve buses, lacks bicycle lanes, and has sidewalks that are too narrow to meet accessibility standards.

1.1.1 Purpose and Need

The purpose of the project is to construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento in order to remove a series of functionally obsolete or structurally deficient bridges, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.

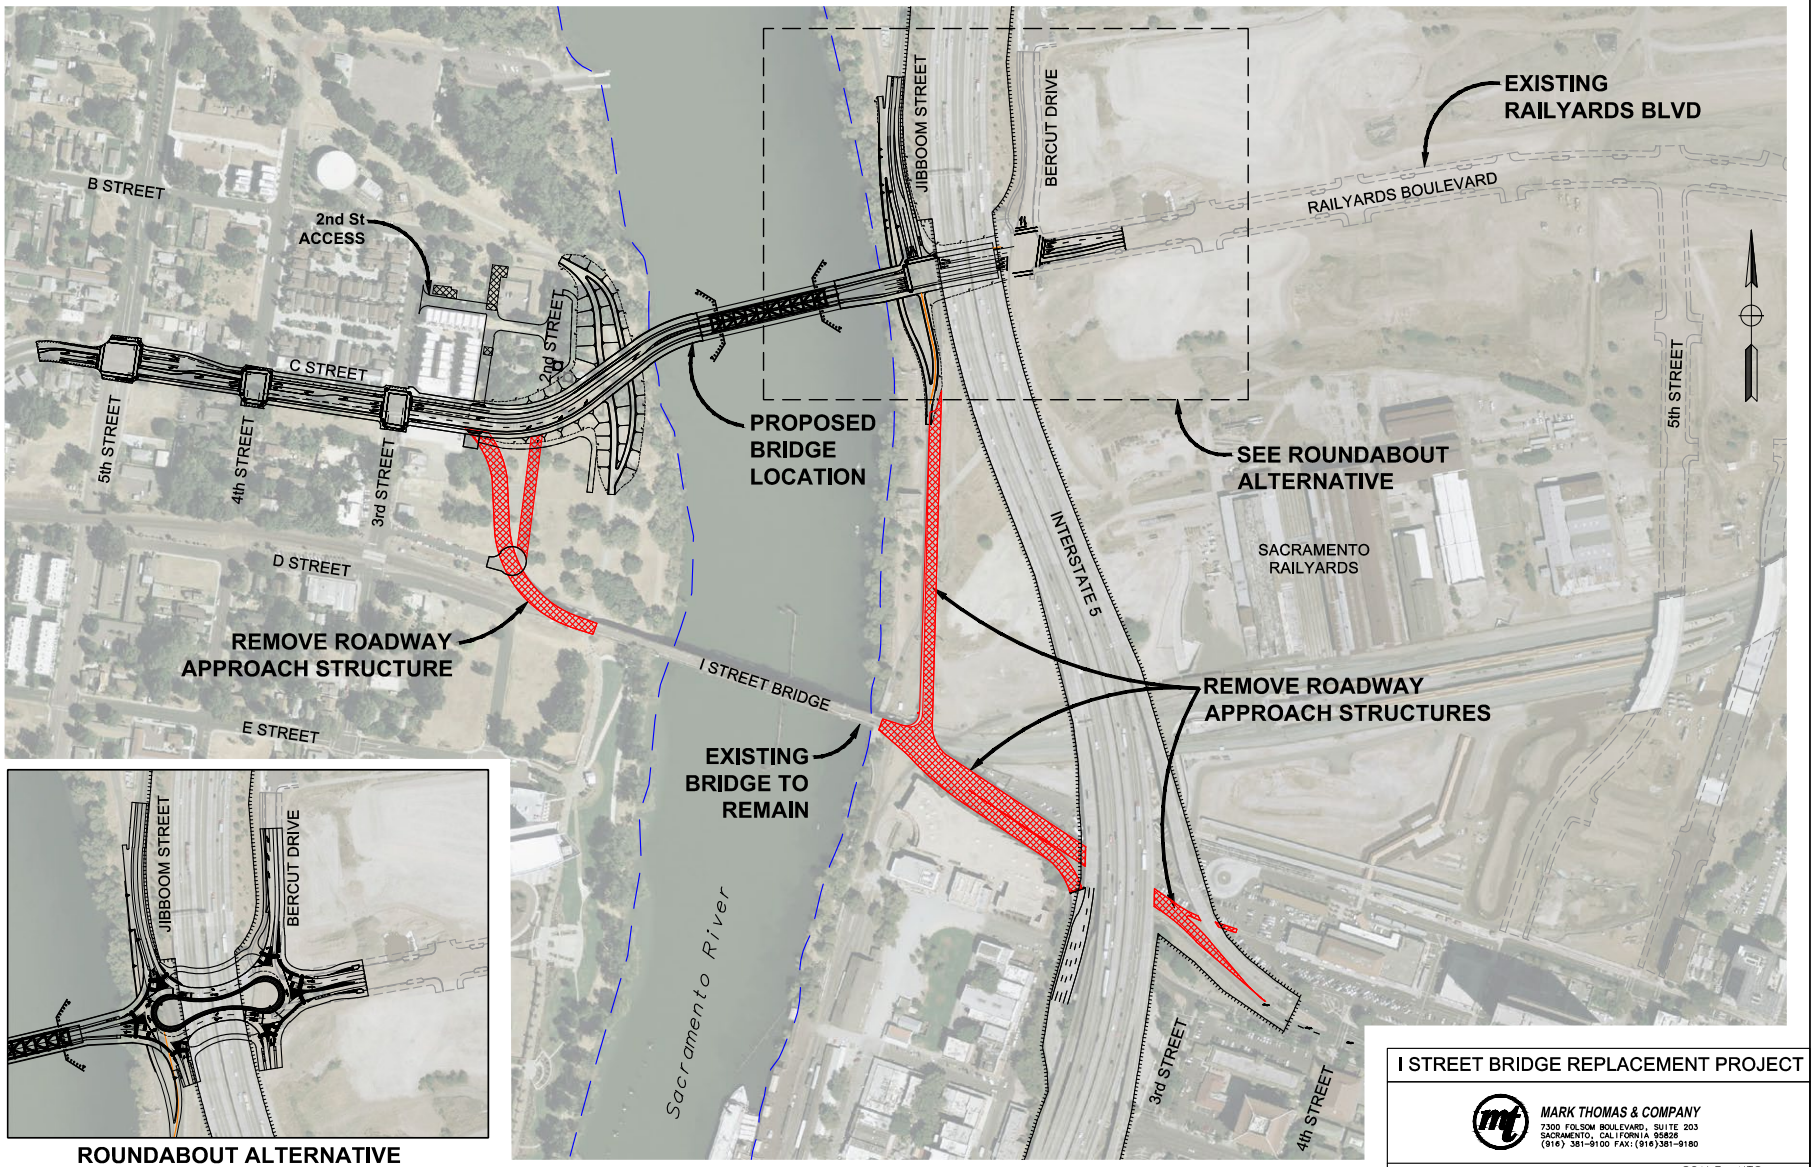
The purpose and objectives of the project are listed below.

- The project should construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.
- The new bridge should meet the requirements of the Neighborhood Friendly Bridge definition that the City of Sacramento City Council adopted by resolution on October 18, 2011, which is defined by the following elements.
  - A facility whose primary function is local connectivity rather than regional travel and primarily serves short local trips.



Graphics ... 00203.14 (6/19/15) AB

Figure 1-1
Vicinity Map



Graphics ... 00203.14 (2/17/16) AB

Figure 1-2
Proposed Project

  - A bridge which serves all users, including motorists, bicyclists, pedestrians, low energy vehicles, and public transit riders.
  - A bridge with aesthetics and dimensions which are architecturally pleasing and contextually appropriate for the adjacent neighborhoods.
  - A bridge that does not exceed or expand the already-planned capacity of the approach roadways (i.e., no widening of approaches just to accommodate bridge flows).
  - A facility which is designed with a target speed equal to or less than the approach roadways.
  - A bridge which reduces the growth in vehicle miles traveled in the adjacent communities.
  - A bridge that does not connect directly to streets which are primarily residential in character.
  - A bridge that is consistent with the Need and Purpose statement [the adopted Sacramento River Crossings Alternatives Study statement] as articulated.
- In addition to the Neighborhood Friendly Bridge definition, the project should include pedestrian and bicycle facilities in the new public crossing that meet Americans with Disabilities Act (ADA) requirements, and facilitate connections to and from the new crossing and the Sacramento River Parkway and Riverfront Park trails.
- The proposed project also would need to construct a movable bridge that satisfies the vertical clearance and river navigation requirements of the U.S. Coast Guard (USCG).
- The project design should not preclude future addition of a streetcar, a separate, stand-alone project being developed by the Cities of West Sacramento and Sacramento.
- The new bridge also is intended to improve the connectivity to, and accessibility of, businesses, recreational areas, and new or redevelopment opportunity sites located in the urban core of Sacramento and West Sacramento.

The project is needed for the following reasons.

- The existing I Street Bridge does not fully comply with current design and traffic operation standards due to the following conditions.
  - I Street Bridge limits or restricts traffic capacity and multimodal use. The current bridge width is not sufficient to provide adequate traffic operations, bicycle lanes, or the ability for transit service across the bridge.
  - The I Street Bridge and the four associated approach structures are on the federal eligible bridge list for federal funds for replacement and/or rehabilitation through the HBP. The I Street Bridge has been classified as functionally obsolete, and the existing approach structures have been classified as structurally deficient. The Cities of Sacramento and West Sacramento have decided to pursue replacement through the HBP.

- As adopted by the Sacramento City Council, new crossings of the Sacramento River between the City of Sacramento and City of West Sacramento shall be Neighborhood Friendly. In coordination with staff from the City of West Sacramento and SACOG, the definition for a Neighborhood Friendly Bridge was developed by the City of Sacramento and the Sacramento City Council adopted the definition by resolution in October 2011. The replacement bridge structure is required to be consistent with the Neighborhood Friendly Bridge definition.
- In addition to the Neighborhood Friendly Bridge requirements, lack of ADA compliance, non-standard and non-continuous sidewalks, and lack of bicycle facilities discourage walking and bicycling on the existing I Street Bridge.
- Section 9 of the Rivers and Harbors Act requires any local, state, or federal agency planning to construct a bridge over a navigable waterway to apply for a bridge permit through the USCG. The USCG requires the new bridge to meet or exceed the existing vertical clearance along the river, which is currently set by the US 50 Pioneer Bridge. In order to comply with the Neighborhood Friendly Bridge definition and meet the USCG requirements for navigation clearance, the new bridge would need to be movable.
- The SACOG MTP/SCS identifies that a proposed streetcar would cross over the new bridge from Sacramento to West Sacramento. While the streetcar would be a separate, stand-alone project, the bridge design must not preclude the future addition of a streetcar.
- Limited connectivity to the riverfront reduces the potential to achieve planned urban development and redevelopment of opportunity sites identified in the adopted plans of Sacramento and West Sacramento.

1.2 Project Description

1.2.1 Proposed Project

A new 860-foot-long bridge is proposed to be constructed to the north of the existing I Street Bridge (Figure 1-2). The proposed bridge alignment would connect Railyards Boulevard in the City of Sacramento with C Street in the City of West Sacramento. This alignment also allows the existing I Street Bridge to remain in operation during construction of the new bridge. Once construction of the new bridge is complete, the roadway approach structures leading up to the existing I Street Bridge from both directions would be demolished; however, the existing I Street Bridge would continue to be used by the railroad.

Roadway improvements on Railyards Boulevard in Sacramento and C Street in West Sacramento also are proposed. In the City of Sacramento, the intersection at Jibboom Street and Bercut Drive would be controlled by a signal or consist of a roundabout. In the City of West Sacramento, the

proposed C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. To maintain access to these parcels, a new connection to C Street would be constructed approximately 150 feet east of the C Street/3rd Street intersection, and would continue north approximately 300 feet, then make a 90-degree turn, and connect to 3rd Street approximately 300 feet north of C Street.

New Bridge Construction and Roadway Modifications

Bridge Construction

The proposed project would construct a new bridge over the Sacramento River. The total bridge length would be approximately 860 feet long, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides of the bridge. The bridge would include two fixed-span approach structures that tie into the Sacramento and West Sacramento banks of the river and are approximately 200 feet and 270 feet in length, respectively (see Figure 1-3). The center span of the bridge would be a movable span that meets the USCG requirements. The movable span is anticipated to be approximately 330 feet in length. The bridge soffit elevation would be set 3 feet above the 200-year water surface elevation to comply with the Central Valley Flood Protection Board (CVFPB) freeboard requirements.

The two fixed-span approach structures would be 72 feet wide, with a superstructure depth (or total bridge thickness) of approximately 6 feet. Each approach structure would be a two-span bridge. The abutment at one end of the structure would be constructed on the banks of the river, a center pier would be placed within the river approximately around the existing bank toe of slope, and the other end of the approach structure would be constructed on the piers for the movable span.

Based on coordination with the USCG, the movable span would provide a 278-foot clear channel opening approximately centered at the middle of the river. As such, the movable span has been identified as a vertical lift bridge, which would raise the bridge to a minimum vertical clearance of 59 feet over the maximum river elevation of 31 feet (measured to the NGVD 29 vertical datum). The truss depth of the movable span would be approximately 40 feet, with 6 feet of the structure being below the bridge deck and 34 feet above the bridge deck. The vertical towers would be approximately 130 feet tall, measured from the bridge soffit elevation. The vertical towers would be approximately 33 feet in thickness and the same width as the bridge deck. The total bridge width on the movable span would be 81 feet.

Due to the existing soil conditions, the bridge would be constructed on deep pile foundations. Table 1-1 summarizes the type and size of piles that would be used during construction of the new bridge, and the depth to which the piles would be installed. The abutments for the fixed-

span approach structures at the river bank would consist of approximately 50 piles per abutment that are driven or cast-in-drill-hole (CIDH), to a depth of approximately 70 feet below the original ground elevation. The center piers for the two fixed-span approach structures (located approximately at the bank toe of slope in the river, below the ordinary high water mark) would consist of 50 driven or CIDH piles per pier that are approximately 70 feet below the original ground elevation. If driven piles are selected for either the abutments or piers, the piles would be precast concrete or steel. The foundations for the movable span would consist of four large-diameter cast-in-steel-shell piles per pier. Each pile would be 9 feet in diameter, extending approximately 140 feet below the original ground elevation, and would be driven with a vibratory hammer and/or with a hydraulic oscillator/rotator system.

Table 1-1. Piles Proposed to Construct I Street Bridge

Pile Location	Pile Diameter/ Type	Total Number of Piles to be Installed	Depth of Installation (feet)	Temporary or Permanent Installation
Abutments 1 and 6	16-in diameter steel	100	70	Permanent
	16-in square precast concrete (alternative to 16-in diameter steel above)			
Piers 2 and 5	16-in diameter steel	100	70	Permanent
	16-in square precast concrete (alternative to 16-in diameter steel above)			
Piers 3 and 4	108-in steel casings	8	140	Permanent
Bridge Fender System	16-in diameter concrete	60	30	Permanent
Temporary trestle	16-in diameter steel	160	70	Temporary
	16-in H pile (alternative to 16-in diameter steel pile above)			
Spud piles	16-in diameter steel	8	40	Temporary
Cofferdams	Sheet piles	180	25	Temporary

Erosion control measures would be installed around the proposed bridge foundations to prevent future scour at the bridge supports. It is anticipated that rock slope protection (RSP) would be installed around the bridge abutments and piers within the water to control erosion.

A bridge fender system also is planned around the movable span piers to protect the piers from errant watercrafts that are navigating along the river. The fender system would include approximately 30 driven concrete or wooden piles around each of the movable span piers (Table 1-1). The piles would be driven to a depth of approximately 30 feet below the original ground elevation.

Figure 1-3
Proposed I Street Bridge: Plan View, Profile, and Elevation

Temporary Falsework and Cofferdams

Temporary falsework platforms (trestles) would be required to construct the proposed bridge foundations and approach structures. The platforms would be constructed during the first construction season using temporary piles within the river. Each temporary platform would include approximately 80 driven steel piles; the piles would be either 16-inch diameter or 16-inch H piles (Table 1-1). Once installed, the temporary trestle piles would remain in the river throughout the duration of construction and would be removed in the second construction season following completion of construction. In addition, temporary cofferdams would be required to construct piers 2 and 5 for the new bridge, which would be within the water. The cofferdams would consist of temporary sheet piles installed around the individual piers. The sheet piles would be installed and removed with a vibratory hammer. Dewatering inside the cofferdams would be required.

Bridge Construction Sequence

Figure 1-4 shows the sequencing of construction activities. All in-water work would be conducted between May 1 and November 30 during the two construction seasons. This schedule is intended to reduce the number of construction seasons to construct the bridge, while minimizing or avoiding construction effects on sensitive fish and wildlife species.

Roadway Modifications

City of Sacramento

In Sacramento, Railyards Boulevard would be extended west over the Sacramento River. East of Bercut Drive, Railyards Boulevard would consist of two westbound lanes and one eastbound lane. Between Jibboom Street and Bercut Drive, Railyards Boulevard would consist of two westbound lanes and three eastbound lanes with a signalized intersection at Jibboom Street and Bercut Drive, or consist of a roundabout with two lanes in each direction. West of the Jibboom Street intersection, Railyards Boulevard would consist of one lane in each direction.

Bercut Drive would be modified from Railyards Boulevard north approximately 500 feet. Bercut Drive would be designed to have two northbound lanes at the Railyards Boulevard intersection, tapering down to one northbound lane at the northern project limits, and one southbound lane. Improvements to Bercut Drive south of Railyards Boulevard are not part of, nor needed for, the proposed project and would be constructed if needed as part of a separate future project.

Proposed improvements on Jibboom Street would extend 550 feet north of Railyards Boulevard. The roadway would consist of one travel lane in each direction, on-street Class II bike lanes, sidewalk along the west side of the roadway, and retaining walls of various heights along both sides of the road. Extension of Jibboom Street south of Railyards Boulevard is not included with,

nor needed for, the proposed project and would be constructed if needed as part of a separate future project.

The proposed roadway profile for Railyards Boulevard would be approximately 6 feet higher than the original ground elevation at the Jibboom Street intersection. The profile adjustment is needed in order to satisfy the CVFPB requirements to provide 3 feet of clearance between the 200-year-flood water surface elevation and the bridge soffit (or low chord of the bridge).

City of West Sacramento

The new C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. The new alignment would connect to C Street approximately 150 feet east of the 3rd Street intersection and continue north approximately 300 feet. This new alignment would then make a 90-degree left turn and connect to 3rd Street approximately 300 feet north of C Street. This new alignment would require right-of-way acquisition from seven individual parcels and removal of three structures. One structure is located on APN 010-101-010 and appears to be an individual residence. Another structure is located on APN 010-101-013 and appears to be an apartment building that supports up to one individual apartment. The last structure is located on APN 010-101-004 and appears to be an individual residence.

Between the bridge touchdown location along C Street in West Sacramento and the 4th Street/ C Street intersection, the roadway would consist of one westbound travel lane, two eastbound travel lanes (the two eastbound travel lanes would taper down to one eastbound lane east of the 3rd Street intersection), a center left-turn lane, on-street Class II bike lanes, on-street parking along the north side of the roadway, and sidewalks along both sides of the roadway. As the roadway through this section currently consists of the proposed number of travel lanes, the widening through this area is primarily needed to support the Class II bike lanes and wider sidewalks.

Along C Street between 4th Street and 5th Street, the roadway would consist of one travel lane in each direction, left-turn lanes, on-street Class II bike lanes, and sidewalks along both sides of the road. All of the improvements through this section would be accommodated within the existing roadway limits.

Class I Bikeway and Levee Modifications and Improvements

City of Sacramento

The existing Class I Sacramento River Parkway along Jibboom Street would be reconstructed approximately 500 feet north and 300 feet south of Railyards Boulevard as part of the proposed project. In order to maintain a continuous off-street Class I path along this section, the path

Figure 1-4
Construction Schedule

would be grade-separated under the proposed bridge structure. Cyclists and pedestrians approaching Railyards Boulevard in either direction would have the option to continue along the path under the new structure, avoiding the need to cross the roadway. Cyclists and pedestrians who are traveling along the path also would have the option to connect to Railyards Boulevard and cross over the proposed bridge into West Sacramento or turn east into Sacramento. Due to the limited horizontal clearance between the river and the Interstate 5 (I-5) viaduct structure, retaining walls would be needed along the path to account for the vertical elevation difference between Jibboom Street and the path that continues under the proposed bridge structure. The maximum retaining wall height along the bike path would be 16 feet.

City of West Sacramento

The proposed project would require improvements to the existing levee along the West Sacramento side of the river, where the proposed bridge alignment would connect to C Street. The existing levee does not meet current standards required by Title 23 of the California Code of Regulations (CCR). Extending approximately 300 feet north and south of the proposed C Street alignment, the levee cross-section would be reconstructed to meet current design standards, which would require 3:1 side slopes on the landside and waterside of the levee, and a 20-foot-wide crown at the top of the levee. The levee improvements also would include a slurry cutoff wall extending to a depth of 110 feet below the original ground elevation. In addition, the proposed roadway profile would be approximately 6 feet higher than the original ground elevation as it crosses over the levee. In order to maintain access to the levee for inspection and maintenance services, access roads would be constructed from the new roadway to the top of the improved levee section. The proposed grading for the levee would require relocation of the existing water tower that is located along 2nd Street, just north of the proposed C Street alignment. The tower would be relocated to the northwest, approximately 43 feet from its existing location.

The new levee maintenance road also would serve as the future Class I River Walk Park trail extension in West Sacramento. Similar to the trail improvements proposed as part of the project in Sacramento, the trail would be grade-separated under the proposed bridge structure. Cyclists and pedestrians approaching C Street in either direction would have the option to continue along the trail under the new structure, avoiding the need to cross the roadway. Cyclists and pedestrians who are traveling along the trail also would have the option to connect to C Street to cross over the proposed bridge into Sacramento or head west on C Street.

1.2.2 Over-Water Construction-Site Access

Temporary trestles and barges would be used to provide the contractor with access to the river portion of the project area. Together, the trestles and barges would be used to stage construction

materials, provide a working platform for cranes, and for general construction support. The temporary trestles would consist of steel piles that would be driven into place with an impact hammer. Although the temporary work platforms would be removed at the end of the first construction season before the onset of winter, the temporary trestle piles would remain in place for the duration of construction. The barges would be anchored to the river bottom with spud piles that would be driven into place with an impact hammer. Up to two barges would be anchored in the river at one time. The barges would be repositioned in the channel throughout construction only as needed to complete the work. The barges would be removed after bridge construction is completed.

1.2.3 In-Water Construction Activities

In-water construction activities consists of those construction activities below the ordinary high water mark (OHWM). These activities would be limited to the period of May 1 to November 30 during the two construction seasons. This in-water construction window allows sufficient time for most in-water work to be completed within the first "in-water work season", thus limiting the potential impacts on fish and other species from these activities to primarily one construction season. This in-water work window was selected after consideration of agency in-water work restrictions, timing of presence of multiple special-status fish species, timing of breeding seasons for other special-status species in the project area, and other constraints. Other construction activities occurring above the OHWM (e.g., work on the abutments and approach superstructure, and demolition of existing approach structures) would not be limited to the in-water window of May 1 to November 30. Additional information on sequencing of construction activities is provided in Figure 1-4.

In-water construction activities would include the following.

- Installation and removal of 160 steel piles with a vibratory hammer and an impact hammer for the temporary falsework platforms (trestles). The piles would be embedded approximately 70 feet below the original ground elevation, based on preliminary engineering and site analysis.
- Installation and removal of eight steel spud piles with an impact hammer for anchoring barges. The piles would be embedded approximately 40 feet into the substrate, based on preliminary engineering and site analysis.
- Installation of steel sheet piles with a vibratory driver for temporary cofferdams;
- Installation of 100 steel piles for piers 2 and 5 with an impact hammer for the new bridge (although work would occur within dewatered cofferdams, underwater sound would

propagate beyond the dewatered cofferdams). The piles would be embedded approximately 70 feet into the substrate, based on preliminary engineering and site analysis.

- Installation of eight 108-inch-diameter steel casings for piers 3 and 4 with a vibratory hammer and/or hydraulic oscillator/rotator system for the new bridge. The piles would be embedded approximately 140 feet into the substrate, based on preliminary engineering and site analysis.
- Installation of 30 concrete piles with an impact hammer for the new bridge fender system. The piles would be embedded approximately 30 feet into the substrate, based on preliminary engineering and site analysis.
- Installation of RSP at piers 2–5 to prevent erosion.

To reduce the potential for effects on fish during pile driving, the City and/or its contractors will implement several mitigation measures (described in detail in Chapter 4), as well as the following best management practices (BMPs) to further avoid and minimize effects that may arise during the placement and driving of piles and temporary sheet piles for cofferdams, if needed. The cofferdams would be removed once pier column construction is completed.

- Bubble curtains will be installed around piles during impact driving and proofing operations to dampen underwater sound shockwaves (Figure 1-5).
- The construction contractor will conduct several dry or dead blows with the hammer initially to frighten fish away from the pile before the pile is driven or proofed with an impact pile driver. Implementation of several dry or dead blows with the hammer to initially frighten fish away is being proposed because the use of a cushioning block or similar feature would result in more strikes being needed to drive the piles, thereby resulting in a greater chance of exceeding the cumulative sound exposure levels (SELs) without significantly reducing peak SELs.

Figure 1-5. Example of an Unconfined Bubble Curtain and Supporting Frame
(Source: Caltrans 2009)

1.2.4 Above-Water Construction Activities

After the temporary cofferdams are installed around piers 2 and 5, forms would be constructed and concrete poured in the dewatered cofferdams to construct the pile caps. Work would then focus on pier 2 and 5 column construction. After the 108-inch-diameter casings for piers 3 and 4 are installed, a rebar cage would be placed into the pile and concrete would be poured into the steel shell. A cast-in-place concrete pier cap would be placed atop the columns to serve as the substructure.

Work would then focus on constructing the approach superstructure and vertical lift towers. The removable span would be constructed off-site, floated in, and erected once construction of the vertical lift towers is completed.

1.2.5 Storm Water Drainage Management

Drainage for the proposed roadway would be conveyed to the existing storm drain system installed within Railyards Boulevard and C Street. Railyards Boulevard currently drains storm water to the east along the roadway and then into a retention basin south of Railyards Boulevard.

C Street drains storm water west along the roadway and then ultimately south beyond the project limits.

As is standard with all construction projects, the contractor would be required to install temporary BMPs to control any runoff or erosion from the project site into the surrounding waterways. These temporary BMPs would be installed prior to any construction operations and would be in place for the duration of the contract. The removal of these BMPs would be the final operation, along with project site cleanup.

1.2.6 Structure Demolition and Roadway Modifications

Following completion of the new bridge connections at Railyards Boulevard and C Street, traffic would be diverted to the new bridge, and the four existing approach structures to the I Street Bridge would be removed. Bridge numbers 24C0364L, 24C0364R, 22-0033, and 22C0154 would be demolished and the foundations would be removed to a depth of 3 feet below the original ground elevation. Encroachment permits from Caltrans and Union Pacific Railroad would be needed to complete the bridge removal. The existing I Street Bridge is owned and operated by Union Pacific Railroad and would continue to remain in-place and used by trains following construction of the new bridge.

As part of the removal of the existing approach structures, the project would include modifications to I Street within the City of Sacramento from the southbound I-5 on-ramp east to the 5th Street intersection. The modification would include signing and striping revisions, demolition of existing roadway sections that are no longer required, and removal of bridge abutments and foundations.

1.2.7 Staging, Storage, and Proposed Access during Construction

Two staging areas would be used to store materials and equipment during construction, such as pipe materials, precast manholes and drop inlets, steel girders, piles, and rebar, along with the construction equipment when not in use. One area would be located south of Railyards Boulevard under I-5 in Sacramento; the other area would be located west of the landward side of the levee, south of the new bridge location in West Sacramento. The staging area located along Railyards Boulevard would be accessed via the existing intersection at Jibboom Street. The staging area in West Sacramento would be accessed via the existing 2nd Street connection at 3rd Street, south of C Street. The staging areas would be in use throughout the construction duration; the areas would be returned to their pre-project conditions at the completion of the project.

1.2.8 Utility Relocations

A number of public and private utilities would need to be relocated or adjusted to grade as part of the project, including existing water, sewer, gas, electric, and communication facilities within Jibboom Street, Bercut Drive, C Street, and 2nd Street.

1.2.9 Traffic Management and Detours during Construction

While most of the project would be constructed outside of existing roadways, some areas would require temporary detours or staged construction.

Along Jibboom Street at the proposed Railyards Boulevard intersection, the new roadway profile would be raised approximately 6 feet above the original ground elevation. To maintain access to the existing Jibboom Street viaduct south of Railyards Boulevard during the roadway construction, a temporary access road would be needed. The proposed temporary access road would connect to the existing Jibboom Street viaduct abutment approximately 350 feet south of Railyards Boulevard. The temporary road would then continue under I-5 and connect to the Railyards Boulevard/Bercut Drive intersection. The temporary road would require placement of temporary fill material and a roadway structural section that would be removed after construction of the new bridge. Traffic traveling north along Jibboom Street would continue north along Bercut Drive to access the Richards Boulevard/I-5 interchange.

In order to complete the improvements at Jibboom Street and Railyards Boulevard, Jibboom Street would be closed to traffic approximately 600 feet north of Railyards Boulevard. Traffic traveling south along Jibboom Street to continue over the existing I Street Bridge into West Sacramento would be detoured over to Bercut Drive at Richards Boulevard. Traffic would then use the temporary access road to connect to the Jibboom Street viaduct structure. The temporary access road would be in place for approximately 2 years, after which traffic would use the new roadways and new bridge.

The Sacramento River Parkway trail along Jibboom Street also would require temporary re-routing during construction. The temporary alignment for the trail would follow the temporary Jibboom Street alignment south of Railyards Boulevard. Cyclists and pedestrians would then continue following a detour north along Bercut Drive to Richards Boulevard, where they could then connect back to the Parkway on the west side of I-5. The detour would be in place for approximately 2 years.

During construction, traffic along C Street would be maintained along the existing approach structure until the new bridge is constructed.

1.2.10 Project Construction Sequence

New bridge and roadway construction would occur first, followed by demolition of the four approach structures that connect to the existing I Street Bridge. Once the new bridge and roadways are constructed, traffic would be diverted to the new bridge in order to allow demolition adjacent to the existing bridge. Construction of the project is expected to take approximately 30 months.

1.2.11 Property Acquisition

The project would require temporary and permanent property acquisitions along C Street, 3rd Street, and 2nd Street within the City of West Sacramento and along Railyards Boulevard, Jibboom Street, Bercut Drive, and I Street within the City of Sacramento.

Along C Street, temporary and permanent acquisitions would be required along the south side of the roadway to accommodate the construction of standard shoulders, bike lanes, and sidewalks—from the intersection of 4th Street to the Sacramento River.

Along 3rd Street and 2nd Street, temporary and permanent acquisitions would be needed from the Union Pacific Railroad on the south, to just north of the B Street intersections, for construction of the proposed roadway and levee improvements.

Along Railyards Boulevard, Jibboom Street, and Bercut Drive, temporary and permanent acquisition would be needed from the current state-owned right-of-way for I-5, for construction of the roadway. In addition, temporary and permanent acquisitions would be needed along Jibboom Street for the proposed temporary detour road and Class I bikeway improvements.

Temporary acquisition would be required along the existing I Street connection to facilitate removal of the existing viaduct structures. Due to the limited space available in Old Sacramento, it is anticipated that construction activities would occur from the parking lot at the intermodal station.

1.2.12 Proposed Equipment and Construction Schedule

Table 1-2 identifies the type of equipment that would be used to construct the project. Construction is expected to begin in spring 2018 and occur during three (two in-water) construction seasons. It is anticipated that the project would be completed by mid-summer 2020.

Table 1-2. Construction Phases and Equipment

Phase	Equipment	Number per Day
Grubbing/Land Clearing	Excavators	4
	Crawler Tractors	2
Excavation	Scrapers	2
	Front End Loader	2

1.3 Summary of Consultation to Date

During preparation of the BA, ICF International (ICF) (formerly Jones and Stokes) coordinated with NMFS. Coordination with the agency occurred during a meeting and a visit to the project site on November 17, 2015, and through written correspondence. Discussions focused on potential impacts on federally listed and state fully protected species, the construction schedule and timing of activities, and avoidance, minimization, and compensation measures. A detailed summary of this coordination is included in the "Agency Coordination" section in Chapter 2.

A list of federally endangered and threatened species and designated critical habitat under the jurisdiction of NMFS that have the potential to occur in the project vicinity was obtained from the Sacramento office of the NMFS (Rea pers. comm.; Appendix A).

1.4 Document Preparation History

This BA was prepared for the proposed project during 2016 by ICF. Jeff Kozlowski prepared the document and overall review was conducted by ICF project manager, Claire Bromund. Caltrans biologist Jennifer Osmondson reviewed and provided comments on the BA.

ICF prepared a wetland delineation report for the proposed project during 2015. ICF botanist/wetland ecologist Lisa Webber conducted the wetland delineation and prepared the report and overall review was conducted by Claire Bromund (ICF Project Manager). Caltrans biologist Jennifer Osmondson reviewed the wetland delineation report and submitted the report to the USACE. The wetland delineation report is provided in Appendix B.

Chapter 2 Study Methods

2.1 Listed and Proposed Species Potentially in the Biological Study Area

Table 2-1 summarizes the current listing status and critical habitat designations for Federally-listed fish species potentially occurring in the biological study area (BSA). The Sacramento River within the study area currently supports Sacramento River winter-run Chinook salmon (*Oncorhynchus tshawytscha*), Central Valley spring-run Chinook salmon (*O. tshawytscha*), Central Valley steelhead (*O. mykiss*), and Southern Distinct Population Segment (DPS) of North American green sturgeon (*Acipenser medirostris*), and provides rearing and foraging habitat for Central Valley fall-/late fall–run Chinook salmon (*O. tshawytscha*) (a federal species of concern). In addition, the Sacramento River within the study area is designated as critical habitat for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, and North American green sturgeon and is considered EFH for Pacific salmon (i.e., all four races of Chinook salmon).

Table 2-1. Current Listing Status and Critical Habitat Designation for Listed Fish Species Potentially Occurring in the Biological Study Area

Common Name	Scientific Name	Status	General Habitat Description	Habitat Present/ Absent	Rationale
Sacramento River winter-run Chinook salmon Evolutionarily Significant Unit (ESU)[a]	*Oncorhynchus tshawytscha*	Endangered—70 Federal Register (FR) 37160; June 28, 2005	Mainstem Sacramento River below Keswick Dam (Moyle 2002); occurs in well-oxygenated, cool, riverine habitat with water temperatures from 8.0 to 12.5 °C; habitat types are riffles, runs, and pools (Moyle 2002). Adults and juveniles migrate in the lower Sacramento River and through the Delta.	Present, Critical Habitat	Designated—58 FR 33212; June 16, 1993 Sacramento River also considered essential fish habitat (EFH) for Pacific salmon (Chinook salmon).
Central Valley spring-run Chinook salmon ESU[b]	*Oncorhynchus tshawytscha*	Threatened—70 FR 37160; June 28, 2005	Upper Sacramento River, Feather River, and Yuba River and several perennial tributaries of the Sacramento River (Battle, Butte, Clear, Deer, and Mill Creeks); has the same general habitat requirements as winter-run Chinook salmon; coldwater pools are needed for holding adults (Moyle 2002). Adults and juveniles migrate in the lower Sacramento River and through the Delta.	Present, Critical Habitat	Designated— 70 FR 52488; September 2, 2005 Sacramento River is considered EFH for Pacific salmon (Chinook salmon).

Common Name	Scientific Name	Status	General Habitat Description	Habitat Present/ Absent	Rationale
Central Valley Steelhead Distinct Population Segment (DPS)	*Oncorhynchus mykiss*	Threatened—71 Federal Register 834; January 5, 2006	Sacramento and San Joaquin Rivers and tributary Central Valley streams and rivers below impassable barriers; occurs in well-oxygenated, cool, riverine habitat with water temperatures from 7.8 to 18 °C; habitat types are riffles, runs, and pools; adults spawn at head of riffles/tails of pools; young rear year-round for 1–4 years before emigrating to the ocean (Moyle 2002).	Present, Critical Habitat	Designated—70 Federal Register 52488; September 2, 2005
Southern DPS of North American green sturgeon	*Acipenser medirostris*	Threatened—70 FR 17757; April 7, 2006	Sacramento, Klamath, and Trinity Rivers (Moyle 2002). Spawns in large river systems with well-oxygenated water, with temperatures from 8.0 to 14 °C.	Present, Critical Habitat	Designated—74 FR 52300; October 9, 2009
Central Valley fall-/late fall–run Chinook salmon	*Oncorhynchus tshawytscha*	Federal Species of Concern	Sacramento and San Joaquin Rivers and tributary Central Valley streams and rivers below impassable barriers; occurs in well-oxygenated, cool, riverine habitat with water temperatures from 8.0 to 12.5 °C; habitat types are riffles, runs, and pools; adults spawn at head of riffles/tails of pools; young rear for several months and emigrate to the ocean before summer (Moyle 2002).	Present, Habitat Present	Critical habitat not designated because species is not listed under ESA. Sacramento River is considered EFH for Pacific salmon (Chinook salmon).

[a] Also listed as endangered under California Endangered Species Act (CESA).
[b] Also listed as threatened under CESA.

2.2 Studies Required

Fisheries resources and aquatic resource issues and habitat conditions in the BSA were identified through a review of published and unpublished literature (e.g., Recovery Plan for Central Valley Chinook Salmon and Steelhead [National Marine Fisheries Service 2014]), status review updates, and a list of threatened and endangered species provided by the NMFS and USFWS. The USFWS and NMFS lists of threatened and endangered species are provided in Appendix A.

It was determined that the following study and survey would be required to document natural resources in the BSA and to identify and evaluate the extent and magnitude of impacts on those resources that would result from project implementation.

- Stream habitat survey to map shaded riverine aquatic (SRA) cover—including overhead vegetation, undercut banks, and instream woody material.

2.3 Personnel and Survey Dates

ICF fish biologist Jeff Kozlowski and research assistant Rita Wilson conducted a reconnaissance-level field survey of the study area on May 8, 2015. This survey focused on a shaded riverine aquatic (SRA) cover habitat survey, a fish passage reconnaissance assessment, and a general reconnaissance-level field survey of the Sacramento River within the BSA. The reconnaissance-level field survey focused on evaluating existing habitat conditions within the BSA relative to the needs of special-status fish species. No special-status fish surveys were conducted for the proposed project. In addition, Jeff Kozlowski and Rita Wilson took digital photographs of the banks, levees, and riparian vegetation (including SRA cover vegetation) from the Sacramento River on June 17, 2015.

2.4 Agency Coordination

On June 9, 2015, Jeff Kozlowski, on behalf of Caltrans and the City of Sacramento, and in cooperation with the City of West Sacramento, requested a species list from Maria Rea, Assistant Regional Administrator for NMFS' California Central Valley Area Office for the project.

On August 20, 2015, Caltrans obtained a list from NMFS of all proposed and listed endangered and threatened fish species and designated critical habitat that could occur in the vicinity of the project (Rea pers. comm.; Appendix A).

On October 28, 2015, Caltrans District 3 biologist Jennifer Osmondson sent to the NMFS, USFWS, USACE, and CDFW an email invitation for a November 17, 2015, resource agency

meeting and site visit with project representatives from the Cities of Sacramento and West Sacramento, management and engineering representatives from Mark Thomas and Company, and ICF project management and technical specialist representatives. The purpose of the meeting was to discuss the design of the project and the potential biological impacts, and to get feedback from the agencies regarding likely mitigation requirements.

On November 17, 2015, Ms. Osmondson and representatives of the Cities of Sacramento and West Sacramento, and staff from Caltrans, Mark Thomas and Company, and ICF International attended the resource agency meeting. A summary of the proposed project and preliminary impact results was provided and input from the agencies regarding the impacts and likely mitigation requirements was solicited. Resource agency members in attendance included the following:

- Lieutenant Junior Grade Sean Luis, NMFS, attended the resource agency meeting and site visit, and offered initial feedback regarding the project and in-water work windows.
- Mr. Armin Halston, USFWS, attended the resource agency meeting and offered initial feedback regarding the project. Mr. Halston was not able to participate for the full duration of the meeting or the site visit.
- Ms. Tanya Sheya, CDFW, attended the resource agency meeting and site visit, and offered initial feedback regarding the project and mitigation requirements.
- Staff from the USACE was invited to attend the resource agency meeting but no representatives were able to attend the meeting or site visit.

On January 27, 2016, ICF biologists obtained an updated species list from the USFWS website (U.S. Fish and Wildlife Service 2016; Appendix A).

2.5 Limitations that May Influence Results

No surveys for fish were conducted in the study area and the limited water clarity in Middle River precluded the ability to visually observe fish from the bank. However, the timing of species occurrence in the study area is assumed based on the scientific literature and on the timing of species in the catch by fish sampling surveys conducted in the Sacramento River at Sherwood Harbor by USFWS (U.S. Fish and Wildlife Service 2015a).

Chapter 3 Results: Environmental Setting

This chapter defines the BSA for the proposed project and describes the existing physical and biological conditions within the BSA.

3.1 Description of the Existing Biological and Physical Conditions

3.1.1 Biological Study Area

The extent of the BSA, which includes all permanent and temporary project impact areas, is shown in Figure 3-1. The BSA consists of the Sacramento River, riparian woodland and open space with bike/pedestrian trails along the Sacramento River, local roads, elevated roads (viaducts) and bridge approach structures, residential areas, and commercial development. The BSA has a relatively high level of historical and ongoing disturbance.

NMFS defines the action area as "all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action" (50 Code of Federal Regulations [CFR] 402.02). Accordingly, the action area includes the BSA defined above and portions of the Sacramento River that could be affected by elevated turbidity, sediment deposition, and underwater noise generated by in- and near-water construction activities. Because pile driving effects are anticipated to extend beyond water quality effects (with BMPs in place), the action area includes areas both upstream and downstream from pile driving activity where pile driving noise may have a physical or behavioral effect on listed species. Based on an analysis of sound expected to be generated by driving 12-inch-diameter steel piles for the temporary trestle without an attenuation device, the 183 decibel (dB) sound exposure level (SEL) accumulated interim criteria (see the pile driving assessment contained in Section 4.1.7.1 for definitions) could be exceeded a distance of up to 1,775 feet (541 meters) upstream and downstream the source. Although noise levels could exceed background levels beyond that point, a distance to any lesser threshold (e.g., 150 dB root mean square, which is sometimes used as a behavioral threshold) cannot be realistically predicted because of the physical geography of the river. The Sacramento River has river channel bends and the straight line distance of open water is 5,400 feet upstream and 5,600 feet downstream of the proposed bridge crossing, and these distances are considerably shorter than the calculated distance (9,600 feet) to which the 150 dB threshold could be exceeded. Consequently, the action area for this project is defined as the entire width of the Sacramento River channel and extending out 2,000 feet beyond the straight-line, open water distances to account for the diffraction and attenuation upstream and downstream of the proposed bridge crossing—that is, 7,400 feet upstream and 7,600 feet

downstream of the proposed bridge crossing (i.e., from approximately RM 58 to approximately RM 61).

3.1.2 Physical Conditions

The BSA is located in the Sacramento Valley subregion of the California Floristic Province (Baldwin et al. 2012:43). The topography in the BSA varies from relatively level to moderate slopes on the Sacramento River levees, and elevations range from approximately -6 to 64 feet above mean sea level.

According to soil data from the Natural Resources Conservation Service, the BSA contains the following five soil map units and water (Natural Resources Conservation Service 2014a).

- Orthents-Urban land complex, 0 to 2 percent slopes (Sacramento County)
- Urban land (Sacramento County)
- Lang sandy loam (Yolo County)
- Lang sandy loam, deep (Yolo County)
- Sycamore silt loam (Yolo County)

The soil profile has been disturbed by development in West Sacramento and construction activity in the Sacramento Railyards area.

Based on the project's Preliminary Geotechnical Report (GEI Consultants 2014), subsurface conditions in the project area are described as follows:

> *The existing borings and cone penetration tests (CPT) performed for levee evaluations on the crest and in the vicinity of the West Sacramento levee (the west end of the planned bridge), encountered approximately 15 feet of loose sand with silt (SP-SM) in the embankment. The sand with silt was underlain by an approximately 9 foot layer of clay (CL), followed by an approximately 16 feet thick layer of sandy silt (ML). The sandy silt was underlain by approximately 35 feet of sand with silt (SP-SM). The apparent densities of the sand with silt ranged from medium dense to very dense. The sand with silt was underlain by approximately 25 feet of very dense gravel (GP), followed by a layer of clay (CL). The maximum depth explored was approximately 115 feet.*
>
> *The existing borings and cone penetration tests on the east end (city of Sacramento) of the planned bridge at the crest of existing levee encountered approximately 6 feet of loose sand with silt (SP-SM). The sand with silt was underlain by approximately 10 feet of loose sand (SP), followed by approximately 7 feet of sandy silt (ML). The sandy silt layer was underlain by approximately 50 feet of sand with silt (SP-SM). The densities of the sand with silt layer varied from loose to medium dense. The sand with silt layer was underlain by an*

approximately 23 feet thick layer of medium dense to very dense gravel (GP), followed by a layer of clay (CL). The maximum depth explored was approximately 110 feet.

The substrate in the Sacramento River channel is sand with silt, overlying sand with gravel and gravel (GEI Consultants 2014).

The BSA is within the Lower Sacramento watershed hydrologic unit (hydrologic unit code [HUC] 18020109) (U.S. Environmental Protection Agency 2015). The primary river in the delineation area is the Sacramento River, a traditional navigable water (TNW) that qualifies as another water of the United States (which also is considered a water of the State). The specific characteristics of waters of the United States (including wetlands) in the BSA are further described below and in the wetland delineation report (Appendix B).

The climate is generally Mediterranean, with cool, wet winters and hot, dry summers. Precipitation occurs primarily in the winter, generally from November to April, with a distinct dry period from May to October. The average total annual precipitation is approximately 18.20 inches (Western Regional Climate Center 2005).

3.1.3 Biological Conditions in the Biological Study Area

The natural communities in the BSA are interspersed with roadways, railroad tracks, commercial and industrial areas, and residential development. The term *land cover type* is used in this BA to refer to vegetation communities, open water, and unvegetated developed or disturbed areas. Land cover types mapped during field surveys are described below and shown in Figure 3-1. Representative photographs of land cover types within the BSA are provided in Appendix C.

The BSA supports both common vegetation communities and natural communities of special concern. Common vegetation communities are habitats with low species diversity that are widespread, reestablish naturally after disturbance, or support primarily non-native species. These communities generally are not protected by agencies unless the specific site is habitat for or supports special-status species (e.g., raptor foraging or nesting habitat, upland habitat in a wetland watershed). Common vegetation communities in the BSA are ruderal woodland and landscaped areas.

The distribution, representative vegetation, and typical wildlife species found in land cover types within the BSA are described below.

Cottonwood Riparian Forest

Cottonwood riparian forest in the BSA occurs along the upper banks and floodplains of the Sacramento River (Figure 3-1). The overstory of riparian forest is predominantly mature

Fremont cottonwood (*Populus fremontii*) trees associated with valley oak (*Quercus lobata*) and black walnut (*Juglans californica* var. *hindsii)*. Other riparian tree species observed include Oregon ash (*Fraxinus latifolia*), boxelder (*Acer negundo* var. *californicum*), and black willow (*Salix gooddingii*). The riparian understory on the waterside of the levee is primarily rip-rap with non-native annual grasses and forbs; however, there are also patches of more typical riparian species, such as narrow-leaf willow (*Salix exigua*), Himalayan blackberry (*Rubus armeniacus*), and mugwort (*Artemisia douglasiana*). The invasive red sesbania (*Sesbania punicea*) shrub was observed in the riparian forest on the Sacramento side of the river. One blue elderberry shrub (*Sambucus nigra* ssp. *caerulea*) was found in riparian habitat on the Sacramento side of the river. One area of riparian forest exhibited positive indicators of all three federal wetland criteria and is discussed below under "Riparian Forest/Shrub Wetland." Riparian forest associated with the Sacramento River in the BSA is depicted in Photos 1 and 2 in Appendix C.

Riparian habitats are sensitive natural communities that provide important habitat for wildlife and SRA cover habitat for fish. Local, state, and federal agencies recognize riparian habitats as sensitive natural communities.

Riparian habitats provide cover, foraging and nesting habitat, and serve as migration and dispersal corridors for several bird and mammal species in the region. Common wildlife species that may occur in these habitats include black phoebe (*Sayornis nigricans*), yellow-rumped warbler (*Dendroica coronata*), house finch (*Carpodacus mexicanus*), American goldfinch (*Carduelis tristis*), yellow-billed magpie (*Pica nuttalli*), pocket gopher (*Thomomys bottae*), fox squirrel (*Sciurus niger*), common muskrat (*Ondatra zibethicus*), and raccoon (*Procyon lotor*).

Riparian Forest/Shrub Wetland

Riparian forest/shrub wetland occurs in the BSA within riparian habitat that meets all three federal wetland criteria (i.e., hydrophytic vegetation, hydric soils, and wetland hydrology). The riparian forest/shrub wetland is located in the northern portion of the BSA, on the west side of the Sacramento River within a low area (Figure 3-1) (Photos 3 and 4 in Appendix C). The vegetative composition of the riparian forest/shrub wetland is predominantly cottonwood but also includes buttonwillow (*Cephalanthus occidentalis* var. *californicus*), boxelder, and narrow-leaf willow. Additional information about the riparian forest/shrub wetland is provided in the wetland delineation report (Appendix B).

As noted above, riparian wetland habitats are sensitive natural communities that provide important cover, foraging, and nesting habitat, and serve as migration and dispersal corridors for several bird and mammal species in the region. Local, state, and federal agencies recognize riparian habitats as sensitive natural communities.

Ruderal Woodland

The West Sacramento section of the BSA includes several areas of naturalized vegetation on undeveloped parcels or parts of parcels that support mature trees with ruderal or non-native annual grassland in the understory. Several parcels between 2nd Street and the levee are predominantly vegetated by the invasive species tree of heaven (*Ailanthus altissima*); several riparian trees are interspersed, including black walnut and Fremont cottonwood. Another invasive tree species, black locust (*Robinia pseudoacacia*), also grows in this area. The understory vegetation in these areas of naturalized vegetation includes non-native annual grasses and forbs, such as wild oat (*Avena fatua*), ripgut brome (*Bromus diandrus*), foxtail barley (*Hordeum murinum* ssp. *leporinum*), star thistle (*Centaurea solstitialis*), vetch (*Vicia* spp.), and prickly lettuce (*Lactuca serriola*). Several blue elderberry shrubs grow in this community type (Figure 3-1). Representative photographs of ruderal woodland in the BSA are provided as Photos 5, 6, and 7 in Appendix C.

The ruderal woodland and associated ruderal grasslands provide nesting habitat for common birds, including northern mocking bird (*Mimus polyglottos*), western meadowlark (*Sturnella neglecta*), and killdeer (*Charadrius vociferous*) (in more open areas). Mallards from the adjacent river could use the denser areas of ruderal grassland for nesting. This ruderal area also provides foraging habitat for bird species. Pocket gophers are known to occur in the ruderal woodlands of the BSA.

Perennial Stream (Sacramento River)

The Sacramento River is the only perennial stream in the BSA (see Figure 3-1). All perennial stream is unvegetated open water. The river averages 672 feet wide at the mean high water level in the BSA. The river banks are levees that are mostly steeply sloped and support riparian forest vegetation, as described above, with rip-rap near the bottom of the slope. Additional information about the perennial stream is provided in the wetland delineation report (Appendix B). Representative photographs of the Sacramento River in the BSA are provided as Photos 1 and 2 in Appendix C.

The Sacramento River is a TNW and a water of the United States subject to regulation under CWA Section 404 and Section 10 of the RHA, and is under the jurisdiction of the USACE. The river is considered a sensitive natural community. The RWQCB protects all waters of the State under the Porter-Cologne Act.

Riverine habitats like the Sacramento River provide habitat for amphibians, birds, and mammals. Common wildlife species that could be found in the river and along the shore of the river include American bullfrog (*Lithobates catesbeianus*), mallard (*Anas platyrhynchos*), great egret (*Ardea*

alba), and river otter (*Lutra canadensis*). Numerous species of fish also are known to occur in the Sacramento River and are described below.

The Sacramento River in the BSA falls within the Sacramento-San Joaquin Province (Central Valley Subprovince), one of six aquatic zoogeographic provinces in California, as defined by Moyle (2002). The Sacramento-San Joaquin Province is drained by the Sacramento and San Joaquin Rivers. Generally, four native fish assemblages can be recognized in Central Valley streams: rainbow trout assemblage, California roach assemblage, pikeminnow-hardhead-sucker assemblage, and deep-bodied fish assemblage (Moyle 2002). Based on its geographic location, the BSA lies at the interface between the zone characterized by the deep-bodied fish assemblage and the Sacramento-San Joaquin Estuary (i.e., the Delta).

Native fish species that occur where the Sacramento River meets the Delta include Sacramento sucker (*Catostomus occidentalis*), Sacramento pikeminnow (*Ptychocheilus grandis*), Sacramento splittail (*Pogonichthys macrolepidotus*), Sacramento blackfish (*Orthodon microlepidotus*), hitch (*Lavinia exilicauda*), Chinook salmon (*Oncorhynchus tshawytscha*) (winter-, spring-, fall-, and late fall–run), steelhead (*O. mykiss*), green sturgeon (*Acipenser medirostris*), white sturgeon (*A. transmontanus*), Pacific lamprey (*Entosphenus tridentata*), river lamprey (*Lampetra ayresi*), delta smelt (*Hypomesus transpacificus*), longfin smelt (*Spirinchus thaleichthys*), tule perch (*Hysterocarpus traski*), and prickly sculpin (*Cottus asper*) (Moyle 2002). The dominant fishes, however, are all nonnative (alien) species: largemouth, smallmouth, and spotted bass (*Micropterus* spp.); white and black crappie (*Pomoxis* spp.); bluegill (*Lepomis macrochirus*); American (*Alosa sapidissima*) and threadfin shad (*Dorosoma petenense*); striped bass (*Morone saxatilis*); bigscale logperch (*Percina macrolepida*); red shiner (*Cyprinella lutrensis*); inland silverside (*Menidia beryllina*); white catfish (*Ameiurus catus*); black and brown bullhead (*Ameiurus* spp.); and common carp (*Cyprinus carpio*) (Moyle 2002).

The Sacramento River is wide and deep and provides unimpeded passage for migratory and resident fish species in the BSA. Although the existing I Street Bridge is supported on three in-water piers, the existing piers do not confine flows or create hydraulic conditions (e.g., shallow water depths or excessive water velocities) that adversely affect the upstream or downstream passage of fish or other aquatic organisms in the Sacramento River.

Landscaped

The vegetation in landscaped areas typically is comprised of ornamental species planted for decorative or landscaping purposes, including oleander (*Nerium oleander*), coast redwood (*Sequoia sempervirens*), California fan palm (*Washingtonia filifera*), Callery pear (*Pyrus*

calleryana), Italian cypress (*Cupressus sempervirens*), pines (*Pinus* spp.), non-native oaks (*Quercus* sp.), and fruit trees (Figure 3-1). Landscaping is depicted in Photo 8 in Appendix C.

Common bird species may forage and nest in some of the landscaped areas, including mourning dove, American robin (*Turdus migratorius*), cliff swallow (*Petrochelidon pyrrhonota*) (nests on buildings and bridges), and western scrub jay (*Aphelocoma californica*).

Developed / Graded

Developed portions of the BSA consist of residential structures, commercial/industrial areas, and paved roadways and parking lots. Some small areas mapped as "Developed" on Figure 3-1 include landscaping, where the vegetated patches are small and interspersed with houses and other structures. Graded portions of the BSA include areas adjacent to roadways, the railroad, unpaved parking areas, and the area underneath and east of I-5. The vegetative composition of these areas is generally sparse and generally consists of nonnative species, particularly annual grasses and weedy forbs. Disturbed/ graded areas are depicted in Photos 9 and 10 in Appendix C.

Common wildlife species that would occur in developed areas would be the same as those described above in the landscaped areas.

3.1.4 Invasive and Nonnative Species

Table 3-2 identifies nonnative fish species that are likely to occur in the BSA. Nonnative fish that commonly occur in the Sacramento River include striped bass, American and threadfin shad, inland silverside, Wakasagi, western mosquitofish, bigscale logperch, black bass (largemouth, smallmouth, spotted, and redeye), and sunfish (bluegill, redear, and green sunfish).

Other invasive aquatic species likely occurring in the BSA include the freshwater clam *Corbicula* (spp.) and several species of aquatic plants (e.g., Brazilian waterweed [*Egeria densa*] and water hyacinth [*Eichhornia crassipes*]).

Chapter 4 Results: Biological Resources, Discussion of Impacts and Mitigation

This chapter describes the effects of the proposed project on federally listed species under jurisdiction of NMFS. *Direct effects* are defined as the direct or immediate effects of a proposed action on a species or its habitat. Direct effects may result from the action and may include the effects of interrelated and interdependent actions. An *interrelated action* is an activity that is part of the proposed action and depends on the proposed action for its justification. An *interdependent action* is an activity that has no independent utility apart from the action under consultation (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998).

Indirect effects are caused by or result from the proposed action, are later in time, and are reasonably certain to occur. Indirect effects may occur outside the area directly affected by the action (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998).

Cumulative effects comprise the effects of future State, local, and private actions not involving a Federal action that are reasonably certain to occur within the action area under consideration (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998). Potential direct, indirect, and cumulative effects are discussed below.

4.1 Sacramento River Winter-Run Chinook Salmon

4.1.1 Status and Distribution

The Sacramento River winter-run Chinook salmon Evolutionarily Significant Unit (ESU) (*Oncorhynchus tshawytscha*) was listed as threatened under ESA on August 4, 1989, under an emergency rule. NMFS subsequently reclassified the ESU as endangered on January 4, 1994, and reaffirmed this listing on June 28, 2005. NMFS designated critical habitat for Sacramento River winter-run Chinook salmon on June 16, 1993 (58 Federal Register [FR] 33212–33219). The ESU includes all naturally spawned populations of winter-run Chinook in the Sacramento River and its tributaries, as well as populations from two artificial propagation programs—one at the Livingston Stone National Fish Hatchery (LSNFH) and the other at Bodega Marine Laboratory (discontinued in 2004) (National Marine Fisheries Service 2005a). The Sacramento River winter-run Chinook salmon ESU was listed as endangered under CESA in September 1989.

Prior to construction of Shasta Dam, winter-run Chinook salmon spawned in the upper reaches of the Sacramento River, the McCloud River, and the lower Pit River. Spawning is now restricted to approximately 44 miles of the mainstem Sacramento River, immediately downstream of Keswick Dam (Yoshiyama et al. 1998). The abundance of winter-run Chinook salmon in the Sacramento River before Shasta Dam was constructed is unknown. Some biologists believe that the run was relatively small, possibly consisting of a few thousand fish (Slater 1963). Others, relying on anecdotal accounts, believe that the run could have numbered more than 200,000 fish (National Marine Fisheries Service 1993). During the mid-1960s, more than 20 years after the construction of Shasta Dam, the population exceeded 80,000 fish (U.S. Department of the Interior, Bureau of Reclamation 1986). The population declined substantially during the 1970s and 1980s.

Historically, four independent populations of winter-run Chinook were delineated in the Sacramento River ESU. The areas used for spawning by three of these populations are now inaccessible because they are above the impassable Keswick and Shasta Dams, while conditions for a fourth population (Battle Creek) are at present unsuitable due to high summer water temperatures. Lindley et al. (2007) concluded that the mainstem Sacramento River population was at a low risk of extinction based on data up to 2004. However, the ESU as a whole is not considered viable because there is only one naturally spawning population that is found outside its historical range. Furthermore, there is some concern over the introgression of naturally-produced fish with hatchery-produced fish from LSNFH, although the risk is still thought to be low when considering extinction risk.

In 1989, winter-run Chinook salmon escapement was estimated at less than 550 adults. Escapement continued to decline, diminishing to an estimated 450 fish in 1990 and 191 fish in 1991. The rapid decline in escapement during the late 1980s and early 1990s prompted listing of the winter-run Chinook salmon as endangered under CESA and ESA. Escapement in 1992 was estimated to be 1,180 fish, indicating good survival of the 1989 class. NMFS's data indicate that the population has increased during the late 1990s through 2001. In 1996, returning spawners numbered about 1,000 fish; and in 2001, returning adults were estimated to be 5,500 (Pacific Fishery Management Council 2002). Despite increased efforts to maintain and enhance the population of winter-run Chinook salmon by various entities, in their final listing determination of June 28, 2005, NMFS again found "that the Sacramento River winter-run Chinook salmon ESU in-total is in danger of extinction throughout all or a significant portion of its range" and concludes that the ESU continues to warrant listing as an endangered species under ESA (National Marine Fisheries Service 2005a).

Like other Chinook populations in the Central Valley, winter-run have declined in abundance since 2005, and the 10-year trend is negative. Recent escapement trends were marked by a general downward trend from an average of approximately 10,700 adults in 2001–2006 to an average of 2,400 adults in 2007–2011 and a low of 827 in 2011 (CalFish 2012). Average run size is associated with a low risk of extinction, but the most recent returns are associated with a moderate risk. In general, the proportion of hatchery fish from LSNFH has ranged from 5 to 10%, with an outlier of 20% in 2005. In 2010, the estimated hatchery escapement was about 12% (CalFish 2010). This is generally consistent with the USFWS goal to keep hatchery escapement to less than 20%. In perspective, the winter-run ESU has shown marked improvement over the critically low abundance and productivity in the 1980s–1990s. The rate of population growth or the cohort replacement rate has been negative through 2010, indicating that it is not self-sustaining. Winter-run Chinook in the Central Valley continue to be at high risk of extinction, and there is nothing to indicate that the risk has diminished (Williams et al. 2011). Longer term reduction in risk will depend on whether the introduction of winter-run into Battle Creek is successful in establishing another population within the winter-run's historical range.

4.1.2 Life History

Table 4-1 summarizes the life stage timing and distribution of winter-run Chinook salmon in the Sacramento River.

Winter-run Chinook salmon spend 1–3 years in the ocean. Adult winter-run Chinook salmon leave the ocean and migrate through the Sacramento–San Joaquin River Delta (Delta) into the Sacramento River from December through July, with peak migration in March (Moyle 2002). Adults spawn from mid-April through mid-August, with peak activity in May and June (Vogel and Marine 1991). Fry emerge from the gravel beginning in late June and continuing through October (Fisher 1994). The primary spawning habitat in the Sacramento River is above Red Bluff Diversion Dam (RBDD) at River Mile (RM) 243, although spawning has been observed downstream as far as RM 218 (National Marine Fisheries Service 2001). Spawning success below RBDD may be limited primarily by warm water temperatures (Hallock and Fisher 1985; Yoshiyama et al. 1998). Spawning and egg incubation do not occur in the study area (Moyle 2002).

Table 4-1. Life Stage Timing and Distribution of Special-Status Fish Species Potentially Affected by the Proposed Project

Note: Gray shading indicates primary periods of species and life stage occurrence included in the assessment of project effects.
Sources: Wang and Brown 1993; U.S. Fish and Wildlife Service 1996; McEwan 2001; Moyle 2002; Hallock 1989; Beamesderfer et al. 2005.

Downstream movement of juvenile winter-run Chinook salmon begins in August, soon after fry emerge. The peak abundance of juveniles moving downstream at Red Bluff occurs in September and October (Vogel and Marine 1991). Juvenile Chinook salmon move downstream from spawning areas in response to many factors, which may include inherited behavior, habitat availability, flow, competition for space and food, and water temperature. The numbers of juveniles that move and the timing of movement are highly variable. Storm events and their resulting high flows and turbidity appear to trigger downstream movement of substantial numbers of juvenile Chinook salmon.

Winter-run Chinook salmon smolts (i.e., juveniles that are physiologically ready to enter seawater) may migrate through the Delta and San Francisco Bay to the ocean from November through May (Yoshiyama et al. 1998). The Sacramento River channel is the main migration route through the Delta. However, the Yolo Bypass also provides significant outmigration passage during higher flow events.

During winter in the Sacramento–San Joaquin system, juveniles rear on seasonally inundated floodplains. Sommer et al. (2001) found higher growth and survival rates of juvenile Chinook salmon reared on the Yolo Bypass floodplain than those that reared in the mainstem Sacramento River.

4.1.3 Factors Affecting Abundance

One of the main factors in the decline of winter-run Chinook salmon is habitat loss and degradation. On the Sacramento River, Shasta Dam blocked access to historical spawning and rearing habitat. Other factors affecting abundance include the effects of reservoir operations on water temperature, drought effects, passage impediments, harvesting and fishing pressure, entrainment in diversions, contaminants, predation by non-native species, and interaction with hatchery stock (U.S. Army Corps of Engineers 2000).

In the Sacramento River, operation of the Central Valley Project (CVP) and State Water Project (SWP) influences river flow. Low flows can reduce habitat area and adversely affect water quality. The resulting warm water temperatures and low dissolved oxygen levels can stress incubating eggs and rearing juvenile winter-run Chinook salmon. Low flow may affect migration of juveniles and adults through increased water temperature or reduced velocity that slows downstream movement of juveniles. Low flow, in combination with diversions, may result in higher entrainment losses at the state and federal pumping plants in the south Delta (U.S. Army Corps of Engineers 2000).

In the Delta, flow drawn through the Delta Cross Channel (DCC) and Georgiana Slough transports some percentage of downstream migrating salmon into the central Delta. The number of juveniles entering the DCC and Georgiana Slough is assumed to be proportional to the flow volume diverted from the Sacramento River (California Department of Fish and Game 1987). Survival of juvenile Chinook salmon that are drawn into the central Delta is lower than survival of juvenile Chinook salmon that remain in the Sacramento River channel.

Factors such as levee construction and bank armoring have altered the critical habitat of winter-run Chinook salmon. These factors reduce floodplain habitat, change river bank substrate size, and decrease the amount of SRA cover and riparian habitat, which in turn, reduce habitat availability and quality (National Marine Fisheries Service 2006a)

4.1.4 Survey Results

Focused surveys for Sacramento River winter-run Chinook salmon were not conducted. However, it is well documented that winter-run Chinook salmon use the action area as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, juvenile winter-run Chinook salmon seasonally use the lower reaches of the Sacramento River for rearing while emigrating to the ocean. Spawning and egg incubation do not occur in the action area (Moyle 2002).

The temporal occurrence and relative abundance of juvenile winter-run Chinook salmon in the action area can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the Delta Juvenile Fish Monitoring Program (DJFMP) (U.S. Fish and Wildlife Service 2015a). Sherwood Harbor is located approximately 4.5 miles downstream of the action area, and the trawls conducted by USFWS provide a consistent and reliable method for observing the timing of occurrence and relative abundance of juvenile winter-run Chinook salmon in the action area. USFWS uses a Kodiak trawl at Sherwood Harbor from December through March and switches to a mid-water trawl beginning in April.

From January 2005 through March 2015, winter-run size juvenile Chinook salmon were detected in the trawls from October through April, although most were detected in the trawls from November through March (Table 4-2).

Table 4-2. Number of Winter-Run Size Juvenile Chinook Salmon Captured by Trawl at Sherwood Harbor (RM 55) by Month (January 2005 through March 2015)

Month/ Year	2005	2006	2007	2008	2009	2010	2011	2012	2013[1]	2014	2015	Monthly Total[2]

NA = Not applicable.
[1] No winter-run size juvenile Chinook salmon were captured by trawl surveys.
[2] 2015 data are excluded from total because data are incomplete.

Quantification of SRA cover habitat in the BSA was based on a combination of field observations (June 17, 2015) and interpretation of recent aerial photographs, by ICF biologists. USFWS defines *SRA cover* as "the unique, near-shore aquatic cover that occurs at the interface between a stream or river and adjacent woody riparian habitat" and is an essential component of salmonid habitat. Key features of SRA cover include the following.

- An adjacent bank composed of natural, often eroding substrate that supports overhanging riparian vegetation and vegetation that may protrude into the water.
- A stream channel with variable amounts of woody material and detritus, and variable water velocity and depth.

SRA cover is composed of two components: overhead cover and instream cover. Overhead cover consists of overhanging riparian vegetation that provides important stream shading and contributes leaf litter and insects to the stream. Instream cover consists of submerged woody material (exposed roots, branches, and trunks), aquatic plants, substrate (gravel, cobble, and boulders), and undercut banks. These attributes provide high-value feeding areas, burrowing substrates, escape cover, and reproductive cover for numerous regionally important fish and wildlife species. (U.S. Fish and Wildlife Service 1992)

Table 4-3 shows the amount of SRA cover present along both banks of the Sacramento River in the BSA relative to the total bank length.

Table 4-3. Existing Shaded Riverine Aquatic Cover (Overhead Vegetation and Undercut Banks) in the Biological Study Area

River Bank	Existing Bank Length[a] (linear feet)	Existing Overhead Vegetation		Existing Undercut Bank[a] (linear feet)
		Bank Length[a] (linear feet)	Percent Bank Length[a]

City of West Sacramento	752	377	50%	0
Total	**1,652**	**975**	**59%**	**0**

[a] Within the limits of the biological study area.

4.1.5 Critical Habitat

Critical habitat includes those physical and biological features of the habitat that are essential to the conservation of the species and that may require special management consideration or protection. The Sacramento River within the action area, including the aquatic portion of the BSA, is included in the designated critical habitat for Sacramento River winter-run Chinook salmon (58 FR 33212–33219, June 16, 1993). The primary constituent elements of critical habitat in the action area include freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of winter-run Chinook salmon. Critical habitat for winter-run Chinook salmon in the action area includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

4.1.6 Avoidance and Minimization Efforts

Implementation of the following measures would avoid and/or minimize direct and indirect impacts on Sacramento River winter-run Chinook salmon and their designated critical habitat.

Measure 1: Install Orange Construction Fencing between the Construction Area and Adjacent Sensitive Biological Resources

The project proponent and/or their contractor will install orange construction fencing between the construction area and adjacent sensitive biological resource areas. Sensitive biological resources that occur adjacent to the construction area that could be directly affected by the project include natural communities of special concern; special-status wildlife habitats for valley elderberry longhorn beetle; nest sites of Swainson's hawk, purple martin, or other migratory birds; roosting bats; and protected trees to be avoided.

Barrier fencing around sensitive areas will be installed as one of the first orders of work and prior to equipment staging. Before construction begins, the construction contractor will work with the project engineer and a resource specialist to identify the locations for the orange construction fencing, and will place stakes around the sensitive resource sites

to indicate these locations. The protected areas will be designated as environmentally sensitive areas and clearly identified on the construction plans and described in the specifications. To minimize the potential for snakes and other ground-dwelling animals from being caught in the orange construction fencing, the fencing will be placed with at least a 1-foot gap between the ground and the bottom of the orange construction fencing. The exception to this condition is where construction barrier fencing overlaps with erosion control fencing and must be secured to prevent sediment runoff. Barrier fencing will be installed before construction activities are initiated, maintained throughout the construction period, and removed after completion of construction.

Measure 2: Conduct Environmental Awareness Training for Construction Employees

The project proponent will retain a qualified biologist to conduct environmental awareness training for construction crews before project implementation. The awareness training will be provided to all construction personnel and will brief them on the need to avoid effects on sensitive biological resources (e.g., native trees, natural communities of special concern, and special-status species habitats in and adjacent to the construction area). The education program will include a brief review of the special-status species with the potential to occur in the BSA (including their life history, habitat requirements, and photographs of the species). The training will identify the portions of the BSA in which the species may occur, as well as their legal status and protection. The program also will cover the restrictions and guidelines that must be followed by all construction personnel to reduce or avoid effects on these species during project implementation. This will include the steps to be taken if a sensitive species is found within the construction area (i.e., notifying the crew foreman, who will call a designated biologist). In addition, construction employees will be educated about the importance of controlling and preventing the spread of invasive plant infestations. An environmental awareness handout that describes and illustrates sensitive resources to be avoided during project construction and identifies all relevant permit conditions will be provided to each crew member. The crew foreman will be responsible for ensuring that crew members adhere to the guidelines and restrictions. Education programs will be conducted for appropriate new personnel as they are brought on the job during the construction period.

Measure 3: Conduct Periodic Biological Monitoring

The project proponent will retain a qualified biological monitor for the project who will visit the site a minimum of once per week to ensure that fencing around environmentally sensitive areas is intact and that activities are being conducted in accordance with the

agreed upon project schedule and agency conditions of approval. The monitor will provide the project proponent with a monitoring log for each site visit.

Certain activities will require a biological monitor to be present for the duration of the activity or during the initial disturbance of an area to ensure that impacts on special-status species are avoided. The activities that require specific monitoring are identified below in Measures 6, 8, and 10.

Measure 4: Conduct All In-Water Construction Activities between May 1 and November 30 and during Daylight Hours Only

The project proponent will conduct all in-water construction work and pile driving (in-water and shore-based within 250 feet of the Sacramento River), installation of cofferdams, removal of temporary sheet piles, and placement of rock revetment between May 1 and November 30 to avoid or minimize causing disturbance and injury to, or mortality of, special-status fish species in the affected reaches of the Sacramento River. In addition, in-water work will be conducted during daylight hours only to provide fish in the affected reaches of the Sacramento River with an extended quiet period during nighttime hours for feeding and unobstructed passage.

Limiting in-water construction to the May 1–November 30 period would achieve several goals.

- In-water construction activities with the potential to generate harmful levels of underwater noise (e.g., driving piles with an impact hammer) would avoid the primary migration periods of adults and juveniles of special-status fish species.
- The length of the in-water construction period would be maximized, thereby limiting the number of construction seasons that in-water construction would be needed and the number of year classes of fish species that potentially would be exposed to in-water construction effects.

Measure 5: Implement Measures to Minimize Exceedance of Interim Threshold Sound Levels during Pile Driving

The project proponent will require the contractor to implement the following measures, developed in coordination with project design engineers, to minimize the exposure of listed fish species to potentially harmful underwater sounds.

- The contractor will vibrate all piles to the maximum depth possible before using an impact hammer.

- No more than 20 piles will be driven per day, and pile driving with an impact hammer will occur on no more than 75 individual days total during construction.
- During impact driving, the contractor will limit the number of strikes per day to the minimum necessary to complete the work and will limit the total number of hammer strikes to 16,000 strikes per day (i.e., 800 hammer strikes per pile, per day) for piles for the bridge piers and temporary trestles, and 20,000 strikes per day (i.e., 1,000 hammer strikes per pile, per day) for the piles for the bridge fender system.
- The smallest pile driver and minimum force necessary will be used to complete the work.
- During impact driving, the project proponent will require the contractor to use a bubble curtain or similar device to minimize the extent to which the interim peak and cumulative SEL thresholds are exceeded (see Section 4.1.7.1, "Pile Driving Noise").
- No pile driving activity will occur at night, thereby providing fish with an extended quiet period during nighttime hours on days pile driving is being conducted for feeding and unobstructed passage.

Measure 6: Develop and Implement a Hydroacoustic Monitoring Plan

The project proponent and/or its construction contractor will develop and implement a hydroacoustic monitoring plan. The monitoring plan will be submitted to the resource agencies (CDFW, NMFS, and USFWS) for approval at least 60 days before the start of project activities. The plan will include the following requirements.

- The project proponent and/or its construction contractor will monitor underwater noise levels during all impact pile driving activities on land and in water to ensure that peak and cumulative SELs do not exceed estimated values (Table 4-4).
- The monitoring plan will describe the methods and equipment that will be used to document the extent of underwater sounds produced by pile driving, including the number, location, distances, and depths of the hydrophones and associated monitoring equipment.
- The monitoring plan will include a reporting schedule for daily summaries of the hydroacoustic monitoring results and for more comprehensive reports to be provided to the resource agencies on a monthly basis during the pile driving season.
- The daily reports will include the number of piles installed per day; the number of strikes per pile; the interval between strikes; the peak SPL, SEL, and RMS per strike; and the accumulated SEL per day at each monitoring station.
- The project proponent or its contractors will ensure that a qualified fish biologist is on site during impact pile driving to document any occurrences of stressed, injured, or

dead fish. If stressed, injured, or dead fish are observed during pile driving, the project proponent and/or its construction contractor will reduce the number of strikes per day to ensure that fish are no longer showing signs of stress, injury, or mortality.

Measure 7: Protect Water Quality and Prevent Erosion and Sedimentation in Drainages and Wetlands

The project proponent and/or their construction contractor will comply with all construction site BMPs specified in the Water Quality Assessment Report prepared for the project (ICF 2015) and the final SWPPP that will be developed for the project, as well as any other permit conditions to minimize introduction of construction-related contaminants and mobilization of sediment in the Sacramento River and the riparian forest/shrub wetland. Broadly, these BMPs will address soil stabilization, sediment control, wind erosion control, vehicle tracking control, non-storm water management, and waste management practices. The BMPs will be based on the best conventional and best available technology.

The proposed project is subject to storm water quality regulations established under the NPDES, described in Section 402 of the federal CWA. In California, the NPDES program requires that any construction activity disturbing 1 or more acres comply with the statewide General Permit, as authorized by the State Water Board. The General Permit requires elimination or minimization of non-storm water discharges from construction sites and development and implementation of a SWPPP for the site. The primary elements of the SWPPP include the following.

- Description of site characteristics—including runoff and streamflow characteristics and soil erosion hazard—and construction procedures
- Guidelines for proper application of erosion and sediment control BMPs
- Description of measures to prevent and control toxic materials spills
- Description of construction site housekeeping practices

In addition to these primary elements, the SWPPP specifies that the extent of soil and vegetative disturbance would be minimized by control fencing or other means and that the extent of soil disturbed at any given time would be minimized. The SWPPP must be retained at the construction site.

The BMPs will be selected to achieve maximum sediment removal and represent the best available technology that is economically achievable; they are subject to review and approval by the project proponent. The project proponent will perform routine

inspections of the construction area to verify that the BMPs are properly implemented and maintained. The project proponent will notify contractors immediately of a noncompliance issue and will require compliance.

The BMPs will include, but are not limited to, the following.

- All earthwork or foundation activities involving wetlands or the intermittent vegetated stream will occur in the dry season (between May 1 and October 31). All in-water work within the Sacramento River will be conducted between May 1 and November 30 to minimize or avoid potential impacts on sensitive life stages (migration, spawning, egg and embryo incubation, and rearing) of special-status fish species.
- Equipment used in and around drainages and wetlands will be in good working order and free of dripping or leaking engine fluids. All vehicle maintenance will be performed at least 300 feet from all streams. Any necessary equipment washing will be carried out where the water cannot flow into drainages or wetlands.
- Develop a hazardous material spill prevention control and countermeasure plan before construction begins. The plan will include strict onsite handling rules to keep construction and maintenance materials from entering the river, including procedures related to refueling, operating, storing, and staging construction equipment and to preventing and responding to spills. The plan also will identify the parties responsible for monitoring a spill response. During construction, any spills will be cleaned up immediately according to the spill prevention control and countermeasure plan. The project proponent will review and approve the contractors' spill prevention control and countermeasure plan before allowing construction to begin.
- Prohibit the following types of materials from being rinsed or washed into the streets, shoulder areas, or gutters: concrete, solvents and adhesives, thinners, paints, fuels, sawdust, dirt, gasoline, asphalt and concrete saw slurry, and heavily chlorinated water.
- Take any surplus concrete rubble, asphalt, or other rubble from construction to a local landfill.
- Prepare and implement an erosion and sediment control plan for the proposed project that will include the following provisions and protocols. The SWPPP for the project will detail the applications and type of measures and the allowable exposure of unprotected soils.
    - Discharge from dewatering operations, if needed, and runoff from disturbed areas will be made to conform to the water quality requirements of the waste discharge permit issued by the RWQCB.

- Apply temporary erosion control measures, such as sandbagged silt fences, throughout construction of the proposed project and remove them after the working area is stabilized or as directed by the engineer. Soil exposure will be minimized through use of temporary BMPs, groundcover, and stabilization measures. Exposed dust-producing surfaces will be sprinkled daily, if necessary, until wet; this measure will be controlled to avoid producing runoff. Paved roads will be swept daily following construction activities.
- The contractor will conduct periodic maintenance of erosion and sediment control measures.
- Plant an appropriate seed mix of native species on disturbed areas upon completion of construction.
- Cover or apply nontoxic soil stabilizers to inactive construction areas (previously graded areas inactive for 10 days or more) that could contribute sediment to waterways.
- Enclose and cover exposed stockpiles of dirt or other loose, granular construction materials that could contribute sediment to waterways. Material stockpiles will be located in non-traffic areas only. Side slopes will not be steeper than 2:1. All stockpile areas will be surrounded by a filter fabric fence and interceptor dike.
- Contain soil and filter runoff from disturbed areas by berms, vegetated filters, silt fencing, straw wattle, plastic sheeting, catch basins, or other means necessary to prevent the escape of sediment from the disturbed area.
- Use other temporary erosion control measures (such as silt fences, staked straw bales/wattles, silt/sediment basins and traps, check dams, geofabric, sandbag dikes, and temporary revegetation or other ground cover) to control erosion from disturbed areas as necessary.
- Avoid earth or organic material from being deposited or placed where it may be directly carried into the channel.

The project proponent also will obtain a 401 Water Quality Certification from the Central Valley RWQCB, which may contain additional BMPs and water quality measures to ensure the protection of water quality.

Measure 8: Monitor Turbidity in the Sacramento River

The project proponent will require the construction contractor to monitor turbidity levels in the Sacramento River during in-water construction activities (e.g., pile driving, extraction of temporary sheet piles used for cofferdams, placement of RSP). Turbidity

will be measured using standard techniques upstream and downstream of the construction area to determine whether changes in ambient turbidity levels exceed 20%, the threshold derived from the Sacramento and San Joaquin Rivers Basins Plan (Central Valley Regional Water Quality Control Board 2011). If it is determined that turbidity levels exceed the 20% threshold, then the project proponent and/or its contractors will adjust work to ensure that turbidity levels do not exceed the 20% threshold.

Measure 9: Implement Cofferdam Restrictions

The following restrictions will be implemented during installation of the cofferdams and cofferdam dewatering.

- The extent of cofferdam footprints will be limited to the minimum necessary to support construction activities.
- Sheet piles used for cofferdams will be installed and removed using a vibratory pile driver.
- Cofferdams will be installed and removed only during the proposed in-water work window (between May 1 and November 30).
- Cofferdams will not be left in place over winter where they could be overtopped by winter/spring flows and when juveniles of listed species are most likely to be present in the construction area.
- All pumps used during dewatering of cofferdams will be screened according to CDFW and NMFS guidelines for screens.
- Cofferdam dewatering and fish rescue/relocation from within cofferdams will commence immediately following cofferdam closure.

Measure 10: Prepare and Implement a Fish Rescue and Relocation Plan

The project proponent and/or its construction contractor will develop and implement a fish rescue and relocation plan to recover any fish trapped in cofferdams. The fish rescue and relocation plan will be submitted to the resource agencies (CDFW, NMFS, and USFWS) for approval at least 60 days before initiating activities to install cofferdams. At a minimum, the plan will include the following.

- A requirement that fish rescue and relocation activities will commence immediately after cofferdam closure and that dewatering has sufficiently lowered water levels inside cofferdams to make it feasible to rescue fish.
- A description of the methods and equipment proposed to collect, transfer, and release all fish trapped within cofferdams. Capture methods may include seining, dip netting,

and/or electrofishing as approved by CDFW, NMFS, and USFWS. The precise methods and equipment to be used will be developed cooperatively by CDFW, NMFS, USFWS, and the project proponent and/or contractor.

- A requirement that only CDFW-, NMFS-, and USFWS-approved fish biologists will conduct the fish rescue and relocation.
- A requirement that fish biologists will contact CDFW, NMFS, and USFWS immediately if any listed species are found dead or injured.
- A requirement that a fish rescue and relocation report be prepared and submitted to CDFW, NMFS, and USFWS within 5 business days following completion of the fish relocation. Data will be provided in tabular form and at a minimum will include the species and number rescued and relocated, approximate size of each fish (or alternatively, approximate size range if large number of individuals are encountered), date and time of their capture, and general condition of all live fish (e.g., good–active with no injuries; fair–reduced activity with some superficial injuries; poor–difficulty swimming/orienting with major injuries). For dead fish, additional data will include fork length and description of injuries and/or possible cause of mortality if it can be determined.

Measure 11: Prevent the Spread or Introduction of Aquatic Invasive Species

The project proponent or its contractors will implement the following actions to prevent the potential spread or introduction of AIS associated with the operation of barges and other in-water construction activities. Species of concern related to the operation of barges and other equipment in the lower Sacramento River include invasive mussels (e.g., quagga mussels [*Dreissena bugensis*] and zebra mussels [*Dreissena polymorpha*]) and aquatic plants (e.g., Brazilian waterweed [*Egeria densa*] and hydrilla [*Hydrilla verticillata*]) (California Department of Fish and Game 2008).

- The project proponent or its contractors will coordinate with the CDFW's Invasive Species Program to ensure that the appropriate BMPs are implemented to prevent the spread or introduction of AIS.
- Educate construction supervisors and managers about the importance of controlling and preventing the spread of AIS.
- Train vessel and equipment operators and maintenance personnel in the recognition and proper prevention, treatment, and disposal of AIS.
- To the extent feasible, prior to departure of vessels from their place of origin and before in-water construction equipment is allowed to operate within the waters of the Sacramento River, thoroughly inspect and remove and dispose of all dirt, mud, plant

matter, and animals from all surfaces that are submerged or may become submerged, or places where water can be held and transferred to the surrounding water.

Measure 12: Minimize or Avoid Temporary Construction Lighting and Permanent Bridge Lighting from Directly Radiating on Water Surfaces of the Sacramento River

The project proponent will minimize or avoid the effects of nighttime lighting on special-status fish species by implementing the following actions.

Temporary Construction Lighting

- Avoiding construction activities at night, to the maximum extent practicable.
- Using the minimal amount of lighting necessary to safely and effectively illuminate the work areas.
- Shielding and focusing lights on work areas and away from the water surface of the Sacramento River, to the maximum extent practicable.

Permanent Bridge Lighting

- Minimizing nighttime lighting of the bridge structure for aesthetic purposes.
- Using the minimal amount of lighting necessary to safely and effectively illuminate vehicular, bicycle, and pedestrian areas on the bridge.
- Shielding and focusing lights on vehicular, bicycle, and pedestrian areas and away from the water surface of the Sacramento River, to the maximum extent practicable.

4.1.7 Project Impacts

The following assessment addresses potential direct and indirect effects of the proposed project on special-status fish species, including listed species, and designated critical habitat (where applicable). Potential project effects on listed species and critical habitat include both short-term and long-term effects. Short-term effects include temporary construction-related impacts on fish and aquatic habitat that may last from a few hours to days (e.g., suspended sediment and turbidity, construction noise, artificial lighting). Long-term effects (addition of overwater structure, loss of aquatic habitat [substrate and water column], loss of SRA cover habitat) typically would last months or years, or would be permanent. These effects are generally due to physical alteration of important habitat attributes of the channel, shoreline, and adjacent bank. Short-term effects on listed fish species were evaluated qualitatively based on general knowledge of the impact mechanisms and species responses to construction actions. Long-term effects were measured in terms of the area and/or linear feet of artificial shade, aquatic habitat, and SRA cover habitat affected by the proposed project.

It should be noted that impacts on special-status fish species and designated critical habitat from project construction discussed below would be the same for all project roadway design alternatives and residential access alternatives, as the design and construction methods for the new bridge would be the same under all alternatives.

4.1.7.1 Direct Effects

Pile Driving Noise

Impact pile driving is of particular concern because of the intensity of sounds and known occurrences of fish kills associated with impact pile driving (Popper and Hastings 2009). The effects of pile driving noise on fish may include behavioral responses, physiological stress, temporary and permanent hearing loss, tissue damage (auditory and non-auditory), and direct mortality (Popper and Hastings 2009). In general, factors that may influence the magnitude of effects include species, life stage, and size of fish; type and size of pile and hammer; frequency and duration of pile driving; site characteristics (e.g., water depth); and distance of fish from the source of the underwater sound.

The primary source of underwater noise associated with the project would be driving the 200 16-inch piles with an impact hammer for the two in-water piers (i.e., piers 2 and 5) and two in-levee abutments (i.e., abutments 1 and 6) for the new bridge, the 160 16-inch piles for the temporary trestle and work platforms, the 60 16-inch piles for the bridge fender system, and the eight 16-inch spud piles for the barges (Figure 1-3). Additional sources of underwater noise associated with the project would occur during installation of the eight 108-inch steel casings for the two in-water piers (i.e., piers 3 and 4) for the lift span with a vibratory hammer and/or hydraulic-driven oscillator/rotator system, and installation and removal of temporary sheet piles with a vibratory hammer for the temporary cofferdams used to isolate the in-water construction areas for bridge piers 2 and 5. Only driving of piles with an impact hammer is expected to produce sound levels that could result in injury to fish.

Table 4-4. I Street Bridge Hydroacoustic Analysis (7-13-15)

Pile Location	Pile Diameter/ Type	Driver	Total Number of Piles to be Installed	Land or Water Installation	Piles per Day	Engineer's Estimate of Strikes per Pile	Total Strikes per Day	Attenuation (dB)	Underwater Sound Level Assumptions					Cumulative SEL at Reference Distance	Transmission Loss Constant	Distance (m) to Threshold			
																Onset of Physical Injury			Behavior RMS dB
																Peak dB	Cumulative SEL dB		
																	Fish ≥ 2 g	Fish < 2 g	
									Peak	SEL	RMS	Reference Distance (m)	Source for Sound Level Assumptions			206 dB	187 dB	183 dB	150 dB
Abutments 1 and 6	16-in diameter steel	Impact	100	Land	20	800	16000	0	198	171	183	10	Caltrans 2014. 20-inch steel pipe driven on land near the San Joaquin River.	213	15	<10	251	251	1,585

Spud piles	16-in diameter steel	Impact	8	Water	8	800	6,400	0	208	176	187	10	Caltrans 2014. 20-inch steel pipe driven in the San Joaquin River.	214	15	14	541	541	2,929
	16-in diameter steel	Impact	8	Water with attenuation system	8	800	6,400	-5	203	171	182	10	Caltrans 2014. 20-inch steel pipe driven in the San Joaquin River. 5 dB attenuation assumed from bubble curtain.	209	15	<10	251	251	1,359
Piers 3 and 4	108-in steel casings	Vibratory hammer and/or hydraulic driven oscillator/ rotator system	8	Water	2 weeks/ pile	NA	NA	NA	Vibratory pile driving is not known to cause injury to fish and is therefore not evaluated here. Hydraulic oscillator/rotator systems slowly rotate pile into place and do not generate high underwater noise levels.										

Note 1. Cofferdam sheet piles will be driven with a vibratory driver. Vibratory pile driving is not known to cause injury to fish and is therefore not evaluated.
Note 2. There is limited data available for concrete piles driven on land. Data taken from measurements at the Port of Oakland is used. In this case piles driven on land resulted in higher underwater sound levels than piles driven in water.
Note 3. Pile driving energy does not accumulate once the single strike SEL drops to 150 dB (i.e. “effective quiet”). The distance to the onset of physical injury therefore cannot extend beyond the distance to "effective quiet." Once the daily number of strikes exceeds 5,000 strikes per day the distance to the onset of injury does not increase.
For this reason the distances to the 183 dB and 187 dB thresholds are the same.

Table 4-4 presents a summary of the pile driving assumptions used in the analysis, including assumptions related to pile location (e.g., structure location, land, in-water, in de-watered cofferdam), pile size and type (e.g., steel pipe, steel H pile, concrete), the number of piles to be installed (e.g., total and number per day), type of driver to be used (e.g., impact, vibratory, hydraulic driven oscillator/rotator system), estimated total pile strikes (e.g., per pile and day), sound attenuation (e.g., bubble curtain, dewatered cofferdam, none), and underwater sound level assumptions. Because a specific pile type has not been determined, Table 4-4 presents pile driving assumptions for all possible pile driving scenarios, including with and without sound attenuation (i.e., bubble curtain).

The assessment of underwater noise impacts on fish is based on the overlap of construction activities (timing, location, duration) with the spatial and temporal distribution of sensitive species and life stages (Table 4-1), as well as the expected fish behavior if encountering underwater noise. An important measure for reducing the potential exposure of fish populations to pile driving noise is the restriction of in-water impact pile driving activities to May 1 through November 30, a period when the abundance of special-status fish in the construction area is reduced (Measure 4).

To further minimize direct effects on fish, the project proponents propose to use vibratory driving to drive all piles to the maximum depth possible before using an impact driver to complete the installation and to use sound attenuation measures—including cofferdam dewatering and bubble curtains—and hydroacoustic monitoring to minimize the exposure of special-status fish species to potentially harmful pile driving sounds (Measures 5 and 6). During in-water pile driving activities, the use of an impact driver will be limited to driving only the 16-inch piles that are needed for the piers and abutments of the new bridge, the temporary trestles, and the barges. All of the 108-inch steel casings will be installed with a vibratory hammer and/or hydraulic-driven oscillator/rotator system, and all of the temporary sheet piles for the cofferdams will be installed and extracted using a vibratory driver. Use of a vibratory driver and/or hydraulic-driven oscillator/rotator system to install the 108-inch steel casings and the vibratory driver to install and remove the temporary sheet piles for coffer dams is not expected to produce sound levels that result in injury to fish. Vibratory pile driving is a preferred method for minimizing the exposure of fish to potentially harmful pile driving sounds (National Marine Fisheries Service 2009b). Therefore, the following assessment focuses on the potential for injury to fish based on predicted noise levels associated with impact pile driving.

Because geotechnical information is not yet available, it is unknown how far piles would be advanced with a vibratory hammer before impact driving would be needed to complete the installation. Therefore, the following results are based on the estimated maximum number of

strikes that would be needed with an impact hammer to fully install each pile and represent a worst-case scenario for underwater sound levels. However, actual underwater sound levels from driving piles would likely be less than those levels reported here because some portion of the pile installation is expected to be accomplished with a vibratory hammer, thereby reducing the total number of strikes needed with an impact hammer to install each pile.

Injury Thresholds for Pile Driving Noise

The ability to predict impacts of pile driving noise on listed fish species is currently limited by a lack of information on the key variables and mechanisms linking pile driving sounds with the biological responses of the species of concern (Popper and Hastings 2009). Beginning in 2004, Caltrans—in coordination with the FHWA, Oregon Department of Transportation, and Washington Department of Transportation—established a Fisheries Hydroacoustic Working Group (FHWG) to coordinate and improve information related to the assessment of underwater noise impacts on fish from pile driving. Other member agencies include NMFS (West Coast Region [formerly Northwest and Southwest Regions]), USFWS, and CDFW.

The following assessment is based on application of interim noise criteria established by the FHWG in 2008 (Table 4-5). These criteria, based on recommendations developed by Popper at al. (2006) and revised by Carlson et al. (2007), are considered preliminary thresholds for assessing the potential for injury to listed fish species. The peak sound pressure level (SPL) is considered the maximum SPL a fish can receive from a single strike without injury. The cumulative sound exposure level (SEL) is considered the total amount of acoustic energy that a fish can receive from a single or multiple strikes without injury. Insufficient data are currently available to support the establishment of a noise threshold for behavioral effects (Popper et al. 2006); however, NMFS generally assumes that a noise level of 150 decibels root mean square (dB RMS) is an appropriate threshold for behavioral effects. Technical guidance on the application of these criteria to pile driving projects is presented by ICF Jones & Stokes and Illingworth and Rodkin (2009).

Table 4-5. Interim Criteria for Injury to Fish from Pile Driving Activities

Interim Criteria	Agreement in Principle
Peak sound pressure level (SPL)	206 dB re 1µPa (for all sizes of fish)
Cumulative sound exposure level (SEL)	187 dB re 1µPa^2-sec—for fish size ≥ 2 grams 183 dB re 1µPa^2-sec—for fish size < 2 grams
Behavioral (RMS)	150 dB re 1µPa (for all sizes of fish)

dB = decibel(s)
dB re 1µPa = dB referenced to a pressure of 1 microPascal
dB re 1µPa^2-sec = dB referenced to a pressure of 1 microPascal squared per second
RMS = root mean square

The potential for physical injury to fish from exposure to pile driving sounds was evaluated using the "NMFS Pile Driving Calculator," a spreadsheet model developed by NMFS to calculate the distances from the pile that sound attenuates to the peak or cumulative criteria. These distances define the area in which the criteria are expected to be exceeded as a result of impact pile driving (potential impact area). The NMFS spreadsheet calculates these distances based on estimates of the single-strike sound levels for each pile type (measured at 10 meters [32.8 feet] from the pile) and the rate at which sound attenuates with distance. To account for the exposure of fish to multiple pile driving strikes, the model computes a cumulative SEL for multiple strikes based on the single-strike SEL and the number of strikes per day or pile driving event. Estimated single-strike sound levels were based on measured sound levels produced by similar piles (California Department of Transportation 2009). The standard sound attenuation rate of 4.5 dB per doubling of distance was used in the absence of other data. The estimated number of pile strikes per day was provided by the project engineers. Because juveniles of some species in the project area could be smaller than 2 grams, the cumulative SEL threshold of 183 dB (i.e., the more protective threshold) is used in this analysis. It should be noted, however, that because the estimated daily number of strikes per day exceeds 5,000 strikes, the distance to the onset of physical injury does not increase because pile driving energy does not accumulate once the single strike SEL drops to 150 dB (i.e., "effective quiet"); therefore, the distance to the 183 dB and 187 dB thresholds are the same (see "Note 3" at bottom of Table 4-4).

16-Inch Piles for Temporary Trestles

A total of 160 16-inch piles would be installed to support trestles for the work platforms during construction. The trestles would be installed over a 3 week period in May in the first year of construction and would remain in place throughout the duration of bridge construction (Figure 1-4). It was assumed that up to 20 piles (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-4). The piles for the temporary trestles would be removed during October of the second construction season once bridge construction is completed. Two pile types are being considered: 16-inch-diameter steel and 16-inch H piles. Both pile types have been evaluated separately for noise impacts.

16-Inch-Diameter Steel Piles for Temporary Trestles

Impact driving of 16-inch-diameter steel piles is expected to produce a single-strike peak SPL of 208 dB and a single-strike SEL of 176 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4); the single-strike peak SPL exceeds the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend 14 meters (46 feet) from the source pile. Based on

an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile, with two pile drivers operating), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 541 meters (1,775 feet) away from the source pile. The project proponents propose to use a bubble curtain to reduce this distance to an estimated 251 meters (824 feet) (Table 4-4).

16-Inch H Piles for Temporary Trestles

Impact driving of 16-inch H piles is expected to produce a single-strike peak SPL of 195 dB and a single-strike SEL of 170 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile, with two pile drivers operating), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 215 meters (705 feet) away from the source pile. The project proponents propose to use a bubble curtain to reduce this distance to an estimated 100 meters (328 feet) (Table 4-4).

16-Inch Piles for Piers 2 and 5

A total of 100 (50 per pier) 16-inch piles would be installed to construct piers 2 and 5 for the two fixed-span approach structures that would tie into the Sacramento and West Sacramento banks of the river (Figure 1-3). The 16-inch piles for piers 2 and 5 would be installed inside dewatered cofferdams that would be constructed to isolate the construction site from the Sacramento River. The piles would be driven over a 1 week period in May in the first construction season (Figure 1-4). It was assumed that up to 20 piles (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-4). Two pile types are being considered: 16-inch-diameter steel and 16-inch-square precast concrete piles. Both pile types have been evaluated separately for noise impacts.

16-Inch-Diameter Steel Piles for Piers 2 and 5

Impact driving of 16-inch H piles for piers 2 and 5 in the dewatered cofferdams is expected to produce a single-strike peak SPL of 203 dB and a single-strike SEL of 171 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4).The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 251 meters (824 feet) away from the source pile. Because the piles would be driven in dewatered cofferdams, there are no opportunities to further attenuate noise levels.

16-Inch-Square Precast Concrete Piles for Piers 2 and 5

Impact driving of 16-inch-square concrete piles for piers 2 and 5 in the dewatered cofferdams is expected to produce a single-strike peak SPL of 183 dB and a single-strike SEL of 161 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4).The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 54 meters (177 feet) away from the source pile. Because the piles would be driven in dewatered cofferdams, there are no opportunities to further attenuate noise levels.

16-Inch Piles for Abutments 1 and 6

A total of 100 (50 per abutment) 16-inch piles would be installed to construct abutments 1 and 6 on the West Sacramento and Sacramento banks of the river, respectively (Figure 1-3). The piles would be installed over a 1 week period in May of the second construction season (Figure 1-4). It was assumed that up to 20 piles (4–10 per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-4). Two pile types are being considered: 16-inch-diameter steel and 16-inch-square precast concrete. Both pile types have been evaluated separately for noise impacts because of their proximity to the river.

16-Inch-Diameter Steel Piles for Abutments 1 and 6

Impact driving of 16-inch-diameter piles for abutments 1 and 6 is expected to produce a single-strike peak SPL of 198 dB and a single-strike SEL of 171 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 251 meters (824 feet) away from the source pile. Because the piles would be driven on land, there are no opportunities to attenuate noise levels.

16-Inch-Square Precast Concrete Piles for Abutments 1 and 6

Impact driving of 16-inch-square precast concrete piles for abutments 1 and 6 is expected to produce a single-strike peak SPL of 192 dB and a single-strike SEL of 174 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative

SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 398 meters (1,306 feet) away from the source pile. Because the piles would be driven on land, there are no opportunities to attenuate noise levels.

16-Inch-Diameter Concrete Piles for Bridge Fender System

A total of 60 (30 per pier) 16-inch-diameter concrete piles would be installed at piers 3 and 4 to construct the bridge fender system for the two movable span piers (Figure 3-1). The fender system would protect the piers from errant watercraft navigating the river. The piles would be installed over a 2-week period in October of the second construction season (Figure 1-4). It was assumed that up to 20 piles per day (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 20,000 strikes with an impact hammer to drive and test each pile (Table 4-4).

Impact driving of 16-inch-diameter concrete piles for the bridge fender system is expected to produce a single-strike peak SPL of 188 dB and a single-strike SEL of 166 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 20,000 strikes per day (20 piles per day at 1,000 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 117 meters (384 feet) away from the source pile. The project proponents propose to use a bubble curtain to reduce this distance to an estimated 54 meters (177 feet) (Table 4-4).

16-Inch-Diameter Steel Piles for Barge Installation

A total of 8 16-inch-diameter steel piles (spud piles) would be installed to anchor each barge to provide a floating work platform during bridge construction. One to two barges would be used during construction and would be installed over a 1 week period in May of the first and second construction season. The barges would be in use for approximately 24 months and would be moved approximately 4–6 times during anytime of the year. It was assumed that up to 8 piles per day would be driven on the days a barge would be moved, requiring up to 6,400 strikes with an impact hammer to drive each pile (Table 4-4).

Impact driving of 16-inch-diameter steel (spud) piles for the barges is expected to produce a single-strike peak SPL of 208 dB and a single-strike SEL of 176 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4); the single-strike peak SPL exceeds the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend 14 meters (46 feet) from the source pile. Based on an assumed maximum rate of 6,400 strikes per day (8 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 541 meters (1,775 feet) away from the source pile. The project

proponents propose to use a bubble curtain to reduce this distance to an estimated 251 meters (824 feet) (Table 4-4).

108-Inch Steel Casings for Piers 3 and 4

A total of 8 (4 per pier) 108-inch steel casings would be installed to construct piers 3 and 4 for the tower foundations (Figure 1-3). The 108-inch steel casings for piers 3 and 4 would be installed with a vibratory pile driver and/or hydraulic-driven oscillator/rotator system; therefore, this method of installation would not generate high underwater noise levels (Table 4-4). It was assumed that it will take approximately 7 weeks to install both 108-inch steel casings. The 108-inch steel casings would be installed from late May through early July in the first construction season (Figure 1-4).

Sheet Piles for Temporary Cofferdams

Two cofferdams would be installed to construct piers 2 and 5 (Figure 1-3). The sheet piles for the cofferdams would be installed and removed with a vibratory pile driver; therefore, this method of installation and removal would not generate high underwater noise levels (Table 4-4). The sheet piles for the two cofferdams would be installed at the same time over a 2 week period in May of the first construction season (Figure 1-4).

Effects of Pile Driving Noise on Fish

The proposed timing of pile driving activities, use of a vibratory hammer to first drive the piles to the maximum depth possible before using an impact driver to complete the installation, and use of sound attenuation measures are expected to minimize the exposure of listed fish species to potentially harmful pile driving sounds. Generally, the potential for injury or mortality of special-status fish species would be greatest for the 16-inch-square precast concrete piles for abutments 1 and 6 and would be the lowest for the 16-inch-square precast concrete piles for piers 2 and 5 driven in dewatered cofferdams and 16-inch-diameter concrete piles driven in water (with attenuation) for the bridge fender system. For the 16-inch-square precast concrete piles for abutments 1 and 6, the potential for injury and mortality would exist within areas of less than 10 meters (32.8 feet) for single-strike exposures and within areas of up to 398 meters (1,306 feet) of the source piles for multiple-strike exposures to impact pile driving sounds. By comparison, for 16-inch-square precast concrete piles for piers 2 and 5 driven in dewatered cofferdams and 16-inch-diameter concrete piles driven in water (with attenuation) for the bridge fender system, the potential for injury and mortality would still exist within areas of less than 10 meters (32.8 feet) of the source piles for single-strike exposures and within areas of up to 54 meters (177 feet) of the source piles for multiple-strike exposures to impact pile driving sounds.

Several factors that could influence the potential exposure and susceptibility of fish to injury from pile driving sounds include the size, mobility, and likely responses of the species and the

life stages of concern. Large, actively migrating adults and juveniles are capable of readily avoiding or migrating through the areas where potential injury may occur. In addition, because of their large size (>600 mm [24 inches]), adult salmonids and green sturgeon would be expected to tolerate higher sound pressures than the levels associated with the onset of injury in smaller fish (Table 4-5), such as juvenile salmonids and species whose individuals are relatively small (e.g., delta and longfin smelt). At a minimum, any adults or juveniles encountering pile driving noise may exhibit some form of behavioral response, including an avoidance response that could disrupt or delay their movement or feeding. Evidence suggests that some fish species avoid or disperse from areas subject to pile driving or other human-generated noises (Popper and Hastings 2009).

Installation of the temporary trestle piles and piles for piers 2 and 5 in May of the first year of construction presents the greatest concern for the potential of injury and mortality of fish from pile driving noise because of the relatively large number of piles (i.e., approximately 160 total piles) that would be installed and the relatively large channel area that would be subject to cumulative sound levels exceeding the injury thresholds (Table 4-4). In addition, relocation of the construction barges is of concern if impact driving is required to install the spud piles to anchor the barges during primary periods of species and life stage occurrence. However, unlike pile driving associated with the temporary trestles and bridge piers, pile driving associated with relocation of the barges would be infrequent (4–6 times over the course of construction) and would require that only 8 piles be driven over the course of one day, per event.

Winter-run, spring-run, fall-run, and late fall–run Chinook salmon, steelhead, green sturgeon, and river lamprey eggs and fry would not be exposed to underwater noise from pile driving activities because these activities are located well downstream of spawning areas or because these life stages would not be present during the proposed in-water construction period. Some overlap with green sturgeon and winter-run and spring-run Chinook salmon adults may occur at the end of the migration season in May and June, with late fall–run Chinook salmon and steelhead adults at the beginning of the migration season in November, and with steelhead and river lamprey adults in November. Adult fall-run Chinook salmon may be exposed to underwater noise from pile driving activities in early July and November, and some fall-run and spring-run Chinook salmon and steelhead smolts may be exposed to underwater noise from pile driving in May and June.

Pile driving associated with relocating the construction barges outside of May 1 to November 30 could potentially overlap peak migration and spawning periods for special-status fish species; however, because it is not known when barges would have to be moved it is not possible to

identify which species and life stages potentially would be affected. However, these pile driving activities would be infrequent and last for less than one day per event.

Based on the predicted levels of underwater noise, pile driving activities could lead to injury and/or direct and indirect mortality if individuals are within the range of noise levels that could cause physical harm or behavioral effects that lead to mortality (e.g., from predation). However, it is likely that only a small proportion of each fish population is at risk, based on the relatively limited overlap of pile driving activities with migration timing.

Although pile driving would occur over many days per season, pile driving will not be continuous and will be limited to daylight hours only, resulting in extended overnight periods each day for migrating fish to pass the construction site undisturbed. In addition, the project proponents propose to drive piles for in-water piers 2 and 5 in dewatered cofferdams and to install the 108-inch-diameter steel casings for in-water piers 3 and 4 using a vibratory hammer and/or hydraulic driven oscillator/rotator system, which would not generate the same underwater noise levels had these piles been driven in water with an impact hammer. Finally, the project proponents will require the contractor to employ sound attenuation devices (e.g., bubble curtains) during in-water pile driving.

Insufficient data are currently available to support the establishment of a noise threshold for behavioral effects (Popper et al. 2006). NMFS generally assumes that a noise level of 150 dB RMS is an appropriate threshold for behavioral effects. During in-water (with attenuation) impact driving of the 16-inch-diameter steel piles for abutments 1 and 6, the spreadsheet calculations indicate that underwater sounds exceeding 150 dB RMS would extend 1,585 meters (approximately 1 mile) from the source piles (Table 4-4). However, these calculations assume an unimpeded open water propagation path over this distance, which is not the case for the Sacramento River. The Sacramento River has major river channel bends within about 1,280 meters (4,200 feet) upstream and 1,830 meters (6,000 feet) downstream from the proposed bridge crossing that will result in diffraction and attenuation of sound waves. Thus, the distance within which 150 dB RMS is exceeded likely would be less than indicated in Table 4-4.

Based on the area of disturbance and timing of pile driving operations, some disturbance to the movement and feeding of special-status fish is anticipated. In addition, pile driving activities would not be continuous but would start and stop during the course of each day of pile driving (including cessation of pile driving activities at night), providing opportunities for fish to continue with their movements and feeding without substantial delays. In addition, general construction noise may act to disperse fish away from the construction area before impact driving is initiated.

Increased Exposure to Contaminants

Disturbance and resuspension of river bottom sediments during in-water construction pose a risk to juvenile and adult winter-run Chinook salmon because of potential increases in the exposure to contaminated sediments.

Sand, silt, and gravel characterize bottom substrate in the BSA. Non-soluble contaminants with a tendency to adsorb[1] to sediments (as opposed to soluble contaminants which have the tendency to be readily diluted in water) can accumulate in the substrate over time. Non-soluble contaminants that are known to be present in the Sacramento River include polychlorinated biphenyls (PCBs), mercury, pesticides and insecticides (i.e., dieldrin, chlorodane, DDT), and other unknown toxicities (State Water Resources Control Board 2011). Resuspension of sediments with adsorbed metals during in-water construction potentially could lead to degradation of water quality and food resources in the action area. In addition, resuspended particulate material could be transported to other locations in the Sacramento River as a result of transport by river currents, thus leading to potential degradation of water quality and food resources beyond the action area. Although special-status fish species may be present in the action area during any month, restricting in-water construction to the May 1–November 30 window will minimize or avoid exposure of most juvenile and adult winter-run Chinook salmon to contaminants because they occur less frequently in the Sacramento River during this time of year (Tables 4-1 and 4-2). Green sturgeon may be more susceptible than other fish species to contaminated sediments because they are more benthic oriented than other species and therefore may come into direct contact with contaminated sediments through ingestion of sediments along with benthic food organisms. In addition, their long life span allows them to accumulate high body burdens of contaminants, which potentially can reach concentrations with deleterious physiological effects.

In-water construction would be limited to pile driving and installation and removal of sheet piles for cofferdams. In addition, in-water construction would be limited to daylight hours each day. Thus, disturbance of channel substrate and the potential for increased contaminants would be temporary and localized. Assuming that mobilization of sediment is also an indication of contaminant mobilization, the proposed in-water construction methods and construction BMPs should minimize the increase in contaminants.

Given the relatively short exposure time and the restricted area of in-water construction relative to the distribution and temporal occurrence of adult and juvenile winter-run Chinook salmon between May 1 and November 30, the effect of contaminants mobilized by in-water construction

[1] *Adsorption* is the adhesion of atoms, ions, or molecules from a gas, liquid, or dissolved solid to a surface—in this case, a sediment particle.

is not expected to result in measurable effects to the survival and growth of winter-run Chinook salmon.

Contaminant Spills

Construction activities that occur in or near the Sacramento River channel can result in the discharge of contaminants that are potentially lethal to fish. The operation of heavy equipment, cranes, pile drivers, drilling rigs, tug boats, and other construction equipment during bridge construction can result in spills and leakage of fuel, lubricants, hydraulic fluids, and coolants. Other sources of potential contamination include asphalt, wet concrete, and other materials that may come into direct contact with surface water during construction activities. For example, concrete that is being poured for the bridge decking could be discharged accidentally to the river, thereby contaminating the river with uncured concrete (which can raise pH) and related compounds.

The potential magnitude of biological effects resulting from contaminants depends on a number of factors, including the proximity of spills to the river; the type, volume, concentration, and solubility of the contaminant; and the timing and duration of the spill or release of the contaminant into the water column. Contaminants can affect survival, growth, and reproductive success of fish and other aquatic organisms. The level of effect depends on the species, life stage sensitivity, duration of exposure, condition or health of exposed individuals, and the physical and chemical properties of the water (e.g., temperature, pH, dissolved oxygen, and other factors).

Implementation of Measure 5 would eliminate or minimize the risk of contaminant spills and the potential effects of any spills on fish and other aquatic organisms.

Erosion and Mobilization of Sediment

Site clearing, earthwork, driving of permanent piles, driving and removal of piles for the temporary trestles, and vibrating and removal of sheet piles for cofferdams will result in disturbance of soil and riverbed sediments, resulting in temporary increases in turbidity and suspended sediments in the Sacramento River. In addition, dewatering and soil removal from the inside of the cofferdams could result in temporary increases in turbidity and suspended sediments in the river, if water (and associated spoils) from within the cofferdams is not properly disposed of or contained and treated before being discharged back to the river.

The potential for disturbance of riverbed sediments and associated increases in sedimentation and turbidity in the Sacramento River are anticipated to be greatest during activities to extract the piles used for the temporary trestles and cofferdams. These activities would result in greater disturbance to riverbed sediments than would occur during pile driving for piers and the bridge fender system; these piles would be driven only and not extracted.

In addition to increasing exposure to contaminants as discussed previously, elevated levels of suspended sediments have the potential to result in physiological, behavioral, and habitat effects related to increased sediment concentrations in the water column. The severity of these effects depends on the sediment concentration, duration of exposure, and sensitivity of the affected life stage. Short-term increases in turbidity and suspended sediment may disrupt normal behavior patterns of fish, potentially affecting foraging, rearing, and migration. The level of disturbance may also cause juveniles to abandon protective habitat or reduce their ability to detect predators, potentially increasing their vulnerability to predators (e.g., striped bass and largemouth bass). Previous studies have documented these effects. For example, juvenile salmonids have been observed to avoid streams that are chronically turbid (Lloyd et al. 1987) or move laterally or downstream to avoid turbidity plumes (Sigler et al. 1984). Bisson and Bilby (1982) reported that juvenile coho salmon avoid turbidities exceeding 70 nephelometric turbidity units (NTUs). Chronic exposure to high turbidity and suspended sediment may affect growth and survival by impairing respiratory function, reducing tolerance to disease and contaminants, and causing physiological stress (Waters 1995). Sigler et al. (1984) found that prolonged exposure to turbidities between 25 and 50 NTUs resulted in reduced growth and increased emigration rates of juvenile coho salmon and steelhead compared to controls. Increased sediment delivery can also smother aquatic invertebrates (a fish food item), degrade forage habitat, and reduce cover for juvenile fish.

Green sturgeon may be at higher risk of exposure to construction-related impacts than other listed species because their benthic nature may make them more likely to encounter sediment plumes that may be more concentrated near the river bottom.

Implementation of Measure 7 would eliminate or minimize the potential for mobilization of sediment and increased sedimentation and turbidity in the Sacramento River. Some harassment of adult and juvenile fish may occur due to temporary, localized plumes of sediment during pile driving and installation and removal of temporary piles and sheet piles. Turbidity would be monitored throughout in-water construction (Measure 8).

Temporary and Permanent Loss of Aquatic Habitat

The proposed project would include the placement of temporary and permanent fill (bridge piers and RSP) below the OHWM and would result in the temporary and permanent loss of aquatic habitat area and volume, including spawning, larval and juvenile transport, rearing, and adult migration habitat for delta smelt. A total of up to 1.85 acre of permanent impacts on perennial stream and delta smelt habitat in the Sacramento River would result from the following bridge components and RSP to be placed below the OHWM (see Table 4-6 below).

- The two fixed-span approach structures for the new bridge would be constructed on center piers (Piers 2 and 5) with foundations each consisting of 50 driven or CIDH piles. The piles would be covered by pile caps and RSP. The footprint for Piers 2 and 5 on the river bottom would total 8,500 square feet (0.20 acre).
- The movable span section of the bridge would be constructed on a foundation of four 9-foot diameter cast-in-steel-shell (CISS) piles in the river bed. The CISS piles, consisting of hollow steel shells, would be driven into the channel bottom using drivers and cranes on the temporary trestle or mounted on barges to temporarily place the steel shells at the desired location for each pile. Once the steel shells are in place, the soil inside the shell would be drilled out, and concrete would be poured into the dewatered hollow shells. The piles would be covered by pile caps and RSP. The footprint for r Piers 3 and 4 on the river bottom would total 1,864 square feet (0.04 acre).
- A bridge fender system would be constructed around the movable span piers that would include approximately 30 driven piles around each pier. The footprint of the bridge fender system on the river bottom would total 85 square feet (0.002 acre).
- RSP (1/4-ton, Method B) would be installed along 1,600 linear feet of shoreline (900 linear feet on City of Sacramento shoreline and 700 linear feet on City of West Sacramento shoreline) below the OHWM. The total volume and area of RSP that would be placed below the OHWM would be up to 2,000 cubic yards and 70,000 square feet (1.61 acre), respectively. In addition, a total of up to 2,000 cubic yards of RSP would be placed above the OHWM.

Temporary impacts on perennial stream and delta smelt habitat would also occur from temporary installation of two cofferdams and trestle piles during bridge construction. Installation of sheet pile cofferdams to isolate the in-water construction areas for piers 2 and 5 from the water column during pier construction would result in the temporary loss of aquatic habitat (substrate and water column) equal to the enclosed area and volume of the in-water cofferdams. The cofferdams would remain in place only during construction of the new bridge piers. The proposed dimensions of each cofferdam are 25 feet by 80 feet, or 2,000 square feet. Together, the two cofferdams would result in a temporary loss of 4,000 square feet (0.09 acre) of substrate habitat and up to 73,640 cubic feet of water column habitat below the OHWM (based on a water surface elevation of +20 feet).

Approximately 141 16-inch-diameter pipe or H piles would be installed below the OHWM to support the temporary trestles, and would result in a temporary loss of 197 square feet (0.005 acre) of substrate habitat and up to 3,573 cubic feet of water column habitat below the OHWM. (Approximately 19 of the 160 piles for the temporary trestles would be installed above the

OHWM). The temporary trestle piles would remain in place throughout the duration of construction.

Installation of these features may result in direct and indirect effects by inhibiting establishment of riparian vegetation; inhibiting recruitment and retention of sediment and woody debris; and eliminating shallow, low-velocity river margins preferred by juvenile fish.

Compensation for impacts on perennial stream and designated critical habitat, as described below, would offset the effects of permanent impacts on the substrate and water column resulting from construction of the new bridge piers.

Table 4-6. Amount of Temporarily and Permanently Affected Aquatic Habitat in the Sacramento River Resulting from the Proposed Project

Feature/Habitat	Temporary Impact	Permanent Impact
Temporary Cofferdams		
Substrate Area (square feet [acre])	4,000 [0.09]	NA
Water Column Volume (cubic feet)	73,640	NA
Temporary Trestle Piles		
Substrate Area (square feet [acre])	197 [0.005]	NA
Water Column Volume (cubic feet)	3,573	NA

[2] 64 sf (piles) + 1,800 sf (RSP)

Temporary and Permanent Loss of Cottonwood Riparian Habitat (including SRA Cover Habitat)

Clearing of the existing cottonwood riparian forest vegetation within the proposed project footprint would result in the permanent loss of up to 1.44 acres and temporary loss of up to 1.52 acres of cottonwood riparian forest within the BSA, of which approximately 0.44 acre is below the OHWM and contributes to overhead (shade) and instream SRA cover (see additional

discussion below regarding SRA cover). The permanent loss of existing cottonwood forest would result from activities related to construction of the two fixed-span bridge approach structures, the bikeway along Jibboom Street in the City of Sacramento, and the new residential access road connecting B Street and 3rd Street in the City of West Sacramento (Figure 3-1). The temporary loss of cottonwood riparian forest would occur from trimming riparian vegetation and removing additional trees and understory vegetation to provide equipment access. Portions of this affected riparian forest also provide SRA cover habitat that is an important component of anadromous fish habitat (see additional discussion below). Clearing of the existing cottonwood riparian forest that contributes to SRA cover would result in the temporary and permanent loss of up to 890 linear feet (i.e., up to 513 linear feet on the City of Sacramento side of the Sacramento River and up to 377 linear feet on the City of West Sacramento side of the Sacramento River) of overhead SRA cover (shade) along the summer (low-flow) shoreline of the Sacramento River.

Riparian vegetation is important in controlling stream bank erosion, contributing to instream structural diversity, and maintaining undercut banks. In addition, canopy cover (overhanging vegetation [a form of SRA cover]) maintains shade that is necessary to reduce thermal input and provides an energy input to the aquatic habitats in the form of fallen leaves and insects (a food source for fish). SRA cover also provides fish with protection from predators in the form of undercut banks, branches, roots, and instream woody material (e.g., logs).

Without appropriate mitigation, removal of streamside vegetation is likely to adversely affect winter-run Chinook salmon and other fish species because riparian and SRA cover habitat are essential components of salmonid rearing habitat that may limit production and abundance of salmonids in the Sacramento River. Salmonid populations are highly influenced by the amount of available cover (Raleigh et al. 1984). The amount of existing riparian and SRA cover habitat in the BSA and in the region is of variable quality because of past and ongoing impacts, including levee construction and bank protection activities (i.e., placement of rock revetment).

USFWS mitigation policy identifies California’s riparian habitats, including SRA cover habitat, in Resource Category 2. The designation criteria for habitat in Resource Category 2 is "habitat to be impacted is of high quality for evaluation species and is relatively scarce or becoming scarce on a national basis or in the ecoregion section” (U.S. Fish and Wildlife Service 2015b), for which “no net loss of in-kind habitat value” is recommended (46 FR 7644, January 23, 1981). In addition, NMFS recommends re-vegetating onsite at a 3:1 ratio (3 units replaced for every 1 unit of affected habitat) with native riparian species to facilitate the development of SRA cover habitat (Rea pers. comm.; Appendix A).

Compensation for impacts on riparian habitat, including SRA cover habitat, as described below, would offset the effects of temporary and permanent loss of cottonwood riparian forest and SRA cover in the project area.

Fish Entrapment in Cofferdams

Cofferdams would be required in order to construct piers 2 and 5 for the new bridge. Cofferdams would be constructed of sheet piles; when installed, each cofferdam would be approximately 25 feet wide and 80 feet long. The potential exists for entrapment and mortality of fish following closure and dewatering of the cofferdam. The proposed timing of cofferdam installation (May) would avoid the primary period of occurrence of juvenile winter-run Chinook salmon; however, the potential would remain for some special-status fish species to become entrapped in the cofferdams. Implementation of Measures 9 and 10 will further minimize or avoid the risk of mortality for fish potentially stranded during cofferdam installation, closure, and dewatering.

Increase in Direct Lighting on Sacramento River

Temporary lighting of work areas to facilitate nighttime construction, especially at construction sites adjacent to or over the Sacramento River, may result in increased nighttime light intensity on the water surface of the Sacramento River. Increases in direct lighting of the Sacramento River at night may affect the migratory behavior of fish; alter behavior of animals that prey on fish (e.g., piscivorous birds, mammals, and fish) in adjacent and affected habitats; or make juvenile fish more visible to predators, thereby leading to increased mortality of fish through increased predation (Tabor et al. 2001). Implementation of Measure 15 would minimize the potential for effects of lighting on fish, including delta smelt, by requiring shielding and focusing of temporary lights on work areas to avoid and minimize the amount of nighttime lighting that directly radiates on to the Sacramento River, to the extent practicable.

4.1.7.2 Indirect Effects

Construction of the bridge would not promote or allow for urban or commercial development, or expand boating or other recreational activities in the action area; therefore, no indirect effects related to additional development and use of the Sacramento River would occur.

Potential indirect effects on winter-run Chinook salmon and their habitat include changes in impervious surface area and storm runoff; predator/competitor abundance or efficiency; and habitat suitability as a result of over-water structure (artificial shade). These indirect effects are discussed below.

Increases in Impervious Surface Area and Storm Water Runoff

The proposed project would result in added impervious surface which would have the potential to increase runoff volume in the Sacramento River. Increased traffic loads on the new bridge

resulting from improved access could result in increased deposition of particulates onto the bridge deck that could then be transported to the Sacramento River with road runoff.

Heavy metals, oil, grease, and polycyclic aromatic hydrocarbons (PAHs) are common pollutants in road runoff. Some of these pollutants can accumulate in stream sediments with lethal and sublethal consequences for fish and other aquatic species, particularly during "first flush" rain events. PAHs are organic compounds—containing only carbon and hydrogen—that occur in motor vehicle exhaust, petroleum products, materials associated with asphalt, and various other municipal and industrial sources. PAHs are widely distributed in the environment and are important environmental pollutants because of their carcinogenicity and tendency to bioaccumulate. PAHs are readily absorbed by fish and other aquatic organisms and, depending on concentration, can lead to lethal and deleterious sublethal effects in these organisms (Tuvikene 1995). PAHs tend to adsorb to any particulate matter, including fine sediment; therefore, relative concentrations of PAHs in aquatic ecosystems are generally highest in sediments, followed by aquatic biota and the water column (Tuvikene 1995). There is evidence that urban runoff containing roadway sediment may be an important PAH input to aquatic habitats and that a significant contribution to the PAH content of roadway sediment comes from materials associated with asphalt (Wakeham et al. 1980).

Although the new bridge would represent added impervious surface area, the proposed project would not result in a substantial increase in impervious surface area in the action area relative to existing conditions. The new bridge would replace the vehicle portion of the existing I Street Bridge, and existing traffic would be re-routed to the new bridge. In addition, storm water runoff from the new bridge would be directed to the existing storm water collection systems. Therefore, it is not anticipated that a decrease in water quality from added impervious surface area would be an indirect effect of the proposed project.

Increase in Overwater Structure (Artificial Shade)

Overwater structures can alter underwater light conditions and provide potential holding conditions for juvenile and adult fish, including species that prey on juvenile fishes. Temporary shading attributable to the presence of the temporary trestles, work platforms, and barges during bridge construction and permanent shading from the new bridge potentially could reduce primary productivity of affected habitats. Temporary shading also could increase the number of predatory fishes (e.g., striped bass, largemouth bass) holding in the action area and/or their ability to prey on juvenile fishes. Because the temporary trestles, work platforms, and barges would be present only during construction, effects of trestle, work platform, and barge shading would be temporary and localized.

Barge shading would occur year-round during construction of the new bridge. One to two barges, each approximately 60 feet wide and 190 feet long (11,400 square feet [0.26 acre]), would be present during construction and would provide a total of 11,400–22,800 square feet (0.26–0.52 acre) of temporary over-water structure (Table 4-7). Because the barges would be present only during construction and moved periodically as construction of the bridge progresses, effects of barge shading would be temporary and localized.

Shading by the temporary trestles and work platforms would occur year-round during construction of the new bridge. Two trestles, approximately 30 feet wide and varying in length and configuration (Figure 1-3), would be present during construction and would provide a total of approximately 30,000 square feet (0.69 acre) of temporary over-water structure (Table 4-7). Because the trestles and work platforms would be present only during construction, effects of trestle shading would be temporary and localized. Together, the barges and temporary trestles would create up to 52,800 square feet (1.21 acres) of temporary overwater structure (i.e., shade) (Table 4-7).

The new bridge would create approximately 55,000 square feet (1.26 acre) of permanent over-water structure where no over-water structure currently exists. The increased shading created by the new bridge could potentially affect the migration of adult and juvenile winter-run Chinook salmon, and other species. Within the Sammamish River, in Washington State, migrating adult salmon hold in shaded areas beneath bridges (Carrasquero 2001). Juvenile salmonids also prefer shaded areas created by bridges. Because of the height of the new bridge over the water, ambient light levels generally would be expected to penetrate into the water, thereby minimizing the effect of bridge shading on aquatic habitats in the Sacramento River. Compensation for impacts on critical habitat, as described below, would offset the effects of bridge shading on aquatic habitats in the Sacramento River.

Table 4-7. Amount of Artificial Overwater Structure (Shade) on the Sacramento River under Existing and With-Project Conditions

Overwater Structure	Square Feet of Shaded Area		
	Existing Conditions	With-Project Conditions (Barge/Trestle/Bridge)	Change
Barge (Temporary)	0	11,400–22,800[a]	+11,400–22,800[a]
Trestle (Temporary)	0	30,000	+30,000
Bridge (Permanent)	0	55,000	+55,000
Net Change (Temporary)			+41,400–52,800[a]
Net Change (Permanent)			+55,000

NA = Not Applicable.
[a] 1 barge–2 barges.

Introduction of Aquatic Invasive Species

During construction, the operation of barges and other in-water equipment originating from regions or areas outside the project area could result in the introduction and spread of aquatic invasive species (AIS), including the Asian overbite clam (*Corbula amurensis*), quagga mussel (*Dreissena bugensis*), zebra mussel (*Dreissena polymorpha*), hydrilla (*Hydrilla verticillata*), and Brazilian elodea (*Egeria densa*) (California Department of Fish and Game 2008). These species can adversely affect native fishes and other ecologically and economically important species through a number of mechanisms, including competition for resources, predation, parasitism, interbreeding, disease transmission, or changes in the physical or chemical attributes of aquatic habitat. The project proponent will address this impact by implementing Measure 11.

Increase in Direct Lighting on Sacramento River

Permanent lighting associated with the new bridge may result in increased nighttime light intensity on the water surface of the Sacramento River. Increases in direct lighting of the Sacramento River from permanent lighting may have the same effects on fish as described above for temporary lighting, except that the effects associated with permanent lighting of the new bridge could occur indefinitely. Implementation of Measure 12 will minimize the potential for effects of lighting on winter-run Chinook salmon by requiring shielding and focusing of temporary lights on work areas and permanent bridge lighting on the bridge only to avoid and minimize the amount of nighttime lighting that directly radiates on streams, to the extent practicable.

The proposed project is *likely to adversely affect* winter-run Chinook salmon based on temporary effects on water quality (increased turbidity and suspended sediment), rearing and movement habitat (noise and shade), and channel substrates (cofferdams and temporary trestles); temporary and permanent effects on riparian and SRA cover habitat (vegetation removal, bridge and bike path construction) and permanent effects on aquatic habitat (construction of bridge piers, shade, and placement of RSP) in the Sacramento River.

4.1.7.3 Impacts on Sacramento River Winter-Run Chinook Salmon Critical Habitat

The Sacramento River within the action area, which includes the aquatic portion of the BSA, is included in the designated critical habitat for Sacramento River winter-run Chinook salmon (58 FR 33212–33219, June 16, 1993). The primary constituent elements of critical habitat in the action area include freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of winter-run Chinook salmon. Critical habitat for winter-run Chinook salmon in the action area includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

The project is *likely to adversely affect* Sacramento River winter-run Chinook salmon designated critical habitat. Impacts on winter-run Chinook salmon critical habitat include temporary effects on the water column (underwater noise and sound pressure, and water quality impacts) and channel substrate (cofferdams and trestles), and permanent loss of aquatic habitat (water column and substrate) and riparian and SRA cover habitat in the Sacramento River. These impacts would be the same as those discussed above for winter-run Chinook salmon.

With implementation of Measures 1–12, impacts on Sacramento River winter-run Chinook salmon will be avoided or minimized. However, up to 55,000 square feet (1.26 acres) of critical habitat would be permanently impacted, including permanent loss of substrate and water column habitat from new bridge piers and shading of aquatic habitat by the bridge deck. In addition, the project would result in temporary effects to and permanent loss of cottonwood riparian forest, including 0.44 acre of riparian forest below the OHWM that supports SRA cover habitat.

NMFS recommends the purchase of channel enhancement credits at a 3:1 ratio (three acres/linear feet replaced for every acre/foot affected) at an NMFS-approved anadromous fish conservation bank for the footprint of the project area (Rea pers. comm.; Appendix A). In addition, NMFS recommends re-vegetating (preferably onsite) at a 3:1 ratio immediately following completion of the project with native riparian species to facilitate development of SRA cover habitat (Rea pers. comm.; Appendix A).

4.1.8 Modifications to the Project to Mitigate Effects

Implementation of Measure 13 will compensate for the permanent loss of perennial stream. In addition, implementation of Measures 14 and 15 will compensate for permanent impacts on designated critical habitat for Sacramento River winter-run Chinook salmon and loss of riparian vegetation (including SRA cover), respectively.

Measure 13: Compensate for Loss of Perennial Stream

The project proponents will comply with any regulatory requirements determined as part of the state (Section 401 Water Quality Certification or WDRs, LSAA) and federal (Section 404 and Section 10 permits) processes for the work that would occur in the Sacramento River. The project proponent will compensate for the permanent fill of up to 1.85 acre of other waters of the United States in the Sacramento River by purchasing mitigation bank credits, which can be in the form of preservation and/or creation credits using the following minimum ratios.

- A minimum of 2:1 (2 acres of mitigation for each acre filled), for a total of up to 3.7 acres, if credits are for preservation of habitat; or,

- A minimum of 1:1 (1 acre of mitigation for each acre filled), for a total of up to 1.85 acre, if credits are for creation of habitat.

The actual compensation ratios will be determined through coordination with the Central Valley RWQCB and USACE as part of the permitting process. The project proponent will compensate for permanent loss of perennial stream by implementing one or a combination of the following options.

- Purchase credits for created riparian stream channel at a USACE- approved mitigation bank with a service area that encompasses the project area, such as the Cosumnes Floodplain Mitigation Bank, Fremont Landing Conservation Bank, or Elsie Gridley Mitigation Bank. The project proponents will provide written evidence to the resource agencies that compensation has been established through the purchase of mitigation credits.
- Compensate out-of-kind for loss of perennial stream by implementing compensatory mitigation for cottonwood riparian forest impacts described in Measure 4. The acreage restored or created to compensate for loss of perennial stream will be added to the acreage restored or created for loss of riparian habitat.

Measure 14: Purchase Channel Enhancement Credits for Impacts on Critical Habitat

Permanent impacts on critical habitat (bank and substrate below the OHWM and water column habitat), totaling 3.11 acres (up to 80,449 square feet [1.85 acre] from the new bridge piers and RSP and up to 55,000 square feet [1.26 acre] from bridge shading of aquatic habitat) will be mitigated at a 3:1 ratio. The project proponent proposes to mitigate the permanent loss of critical habitat through purchase of 9.33 acres of mitigation credits at a NMFS-approved anadromous fish conservation bank.

Measure 15: Compensate for Temporary Effects to and Permanent Loss of Cottonwood Riparian Forest (including SRA Cover)

The project proponents will compensate for the permanent loss of up to 1.44 acres of riparian forest. In addition, any unavoidable temporary loss of riparian forest will be mitigated. The project proponents will implement onsite and, if necessary, offsite compensation measures and/or purchase mitigation bank credits to compensate for losses of cottonwood riparian forest on the waterside slope of the existing levees, including riparian forest supporting SRA cover habitat (as described above, portions of the cottonwood riparian forest in the BSA also provide SRA cover habitat for fish). Onsite compensation will be used to the maximum extent practicable. Compliance with the

USACE levee vegetation policy (U.S. Army Corps of Engineers 2014), the ULDC (California Department of Water Resources 2012b), or other engineering constraints may limit the ability to achieve full onsite compensation. Therefore, offsite compensation and/or purchase of mitigation bank credits may be needed to achieve no net loss of existing in-kind riparian and SRA cover habitat values. Each of these options is discussed below.

1. **Onsite and/or Offsite Restoration and/or Enhancement along the Sacramento River.** Riparian habitat restoration and/or enhancement onsite or offsite should occur in the same year construction is completed. For onsite or offsite replacement plantings, the project proponents will prepare a mitigation planting plan, including a species list and number of each species, planting locations, and maintenance requirements. Plantings will consist of cuttings taken from local plants or plants grown from local material. Planted species for the mitigation plantings will be similar to those removed from the project area and will include native species, such as Fremont cottonwood, valley oak, black walnut, Oregon ash, boxelder, and black willow. The final planting plan will be developed based on results of the arborist survey for species to be removed (see additional discussion below). All plantings will be fitted with exclusion cages or other suitable protection from herbivory. Plantings will be irrigated for up to 3 years or until established. Plantings will be monitored annually for 3 years or as required in the project permits. If 75 percent of the plants survive at the end of the monitoring period, the re-vegetation will be considered successful. If the survival criterion is not met at the end of the monitoring period, planting and monitoring will be repeated after mortality causes have been identified and corrected.

2. **Mitigation Bank Credit Purchase.** If this option is chosen, the project proponents will provide written evidence to the resource agencies that compensation has been established through the purchase of mitigation credits. The amount to be paid will be the fee that is in effect at the time the fee is paid. The mitigation will be approved by CDFW and may be modified during the permitting process. Mitigation can be in the form of creation and/or preservation credits. If mitigation is in the form of restoration/creation credits, the mitigation will be at a minimum ratio of 1:1 (1 acre of restored or created riparian habitat for each acre of riparian habitat removed). If mitigation is in the form of preservation credits, the mitigation will be at a minimum ratio of 2:1 (2 acres of preserved riparian habitat for each acre of riparian habitat removed). The final compensation ratio will be approved by CDFW in order to result in no net loss of riparian habitat. The project proponent will purchase riparian habitat

credits from an approved mitigation bank near the project, such as the Cosumnes Floodplain Mitigation Bank, Fremont Landing Conservation Bank, or Elsie Gridley Mitigation Bank. Replacement riparian forest habitat will include trees species that would support nesting Swainson's hawk (i.e., oak, cottonwood) and will occur within the range of nesting Swainson's hawk within the Sacramento Valley.

To provide a more accurate estimate of tree loss, an arborist survey will be conducted upon completion of 90% design plans for the project. In addition to a description of the tree, the arborist survey report will include the precise location of the trunk and size of the dripline for all trees whose trunk or canopy overlap with the project footprint. Riparian forest compensation will be consistent with the requirements of the City of West Sacramento and City of Sacramento tree ordinances to ensure compensation for losses of individual protected trees.

In addition to mitigating for the loss of riparian forest habitat, specific measures will be included to compensate for the loss of SRA cover (area and linear feet). However, the acreage will not be duplicated, such that the acreage of riparian forest habitat restored for SRA cover mitigation will apply towards riparian forest habitat mitigation requirements. SRA cover mitigation will include the following riparian replacement requirements:

- Replace the 890 linear feet and 0.44 acres of affected SRA cover vegetation (see "Temporary and Permanent Loss of Cottonwood Riparian Habitat (including SRA Cover Habitat") at a 3:1 replacement ratio (i.e., 3 linear feet replaced for every 1 foot affected and 3 acres replaced for every acre affected) by planting native riparian trees in temporary impact areas and along existing onsite or offsite unshaded banks along the Sacramento River.
- Plant native riparian trees onsite to the maximum extent practicable, followed by planting on adjacent reaches of the Sacramento River to minimize the need for purchasing offsite mitigation bank credits.
- Plant riparian trees that are intended to provide SRA cover along the water's edge at summer low flows up to the OHWM and at sufficient densities to provide shade along at least 85 percent of the bank's length when the trees reach maturity. This will ensure that riparian plantings intended for SRA cover mitigation will contribute to instream SRA cover when they are inundated during winter/spring flows and overhead cover (shade) during summer flows when they approach maturity.
- Monitor and evaluate the re-vegetation success of riparian plantings intended for SRA cover mitigation as described above.

If mitigation for SRA cover is in the form of offsite mitigation bank credits, credits will need to be purchased from an approved mitigation bank within the approved service area for the project that provides riparian forest floodplain conservation credits as off-site compensation for impacts on federally-listed anadromous salmonids, designated critical habitat, and EFH for Pacific salmon.

4.1.9 Cumulative Impacts

Under the ESA, cumulative effects are "those effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area of the federal action subject to consultation" (50 CFR 402.2). Future federal actions that are unrelated to the proposed action are not considered in this assessment because they require separate consultation pursuant to Section 7 of the ESA.

Caltrans is not aware of any future state or private activities that are reasonably certain to affect winter-run Chinook salmon or designated critical habitat within the area potentially affected by the proposed project.

4.2 Central Valley Spring-Run Chinook Salmon

4.2.1 Status and Distribution

The NMFS listed the Central Valley ESU of spring-run Chinook salmon as threatened on September 16, 1999 and reaffirmed this listing on June 28, 2005. The ESU includes naturally spawned populations in the Sacramento River and its tributaries, including the Feather River, and the artificial propagation program at Feather River Fish Hatchery (FRFH). NMFS proposed critical habitat for Central Valley spring-run Chinook salmon on December 10, 2004, and published a final rule designating critical habitat for this ESU on September 2, 2005. The Central Valley spring-run Chinook salmon ESU was listed as threatened under CESA in February 1999.

Spring-run Chinook salmon may have once been the most abundant of Central Valley Chinook salmon (Mills and Fisher 1994), historically occupying the upstream reaches of all major river systems in the Central Valley where there were no natural barriers. The San Joaquin populations were essentially extirpated by the 1940s; and populations in the upper Sacramento, Feather, and Yuba Rivers were eliminated with the construction of major dams during the mid-1900s (Yoshiyama et al. 1998). Naturally spawning populations of spring-run Chinook salmon currently are restricted to accessible reaches of the upper Sacramento River, Antelope Creek, Battle Creek, Beegum Creek, Big Chico Creek, Butte Creek, Clear Creek, Deer Creek, Mill Creek, Feather River, and Yuba River (California Department of Fish and Game 1998).

The abundance of Central Valley spring-run Chinook salmon, as measured by the number of adults returning to spawn, has averaged 7,800 natural spawning adults and 3,900 adults returning to hatcheries from 1993 to 2010 (CalFish 2011). Temporal and spatial overlap between spawning spring-run Chinook salmon and fall-run Chinook salmon in the Sacramento and Feather Rivers brings into question their genetic integrity. Genetically uncontaminated populations may exist in Deer Creek, Mill Creek, Butte Creek, and other eastside tributaries of the Sacramento River, including a growing population in Battle Creek.

The FRFH was constructed by DWR in the mid-1960s to mitigate for the loss of Chinook salmon and steelhead spawning habitat above Oroville Dam. The FRFH is the only hatchery in the Central Valley producing spring-run Chinook salmon. The current annual production target for spring-run Chinook salmon at the FRFH is 2 million smolts. From 2000 to 2009, annual releases of spring-run smolts ranged from approximately 0.75 to 1.3 million smolts (Cavallo et al. 2009).

4.2.2 Life History

Adult spring-run Chinook salmon enter the mainstem Sacramento River from February through September, with the peak upstream migration occurring from May through June (Yoshiyama et al. 1998). Adults generally enter tributaries from the Sacramento River between mid-April and mid-June (National Marine Fisheries Service 2006a). Spring-run Chinook salmon are sexually immature during upstream migration, and adults hold in deep, cold pools near spawning habitat until spawning commences in late summer and fall. Spring-run Chinook salmon spawn in the upper reaches of the mainstem Sacramento River and tributary streams (U.S. Fish and Wildlife Service 1995), with the largest tributary runs occurring in Butte, Deer, and Mill Creeks (Yoshiyama et al. 1998). Spawning typically begins in late August and may continue through October. Juveniles emerge in November and December in most locations but may emerge later when water temperature is cooler. Newly emerged fry remain in shallow, low-velocity edgewater (California Department of Fish and Game 1998).

Juvenile spring-run Chinook salmon typically spend up to 1 year rearing in fresh water before migrating to sea as yearlings, but some may migrate downstream as young-of-year juveniles. Rearing takes place in their natal streams, the mainstem of the Sacramento River, inundated floodplains (including the Sutter and Yolo Bypasses), and the Delta. Based on observations in Butte Creek and the Sacramento River, young-of-year juveniles typically migrate from November through May. Yearling spring-run Chinook salmon migrate from October to March, with peak migration in November (Cramer and Demko 1997; Hill and Webber 1999). Downstream migration of yearlings typically coincides with the onset of the winter storm season, and migration may continue through March (California Department of Fish and Game 1998).

4.2.3 Factors Affecting Abundance

Reasons for the decline and current status of Central Valley spring-run Chinook salmon fall into three general categories: (1) loss of historical spawning habitat; (2) degradation of remaining habitat; and (3) threats to the genetic integrity of the wild spawning populations. The construction of debris, hydropower, flood control, and water supply dams eliminated virtually all historical spawning habitat of spring-run Chinook salmon. Current spawning is restricted to limited areas in mainstem reaches below the lowermost impassable dams and in a few tributaries where the habitat has been degraded by a number of historical and ongoing activities. Major factors that contributed to declines—and that currently limit salmon and steelhead populations—include altered flows and water temperatures from dam operations and water diversions; losses of suitable spawning substrate; channel alterations (e.g., channelization, levees) associated with navigation and flood risk reduction; and associated losses of riparian, floodplain, and wetland habitat.

Land use activities such as agricultural conversion and industrial and urban development have resulted in substantial losses and degradation of salmonid habitat. For example, historical and ongoing land uses in the Feather River downstream of Oroville Dam, including hydraulic mining, gravel mining, levee construction, agricultural encroachment, and urbanization, have resulted in severe constriction and fragmentation of the active floodplain and associated riparian, floodplain, and wetland habitats that once bordered the river (California Department of Water Resources 2004). In addition, levee construction and bank protection have adversely affected salmonid habitat by disrupting the natural erosional processes that create and maintain riparian habitat, SRA cover, and floodplain connectivity. Bank stabilization (e.g., rock revetment) has further simplified the structural and hydraulic characteristics of natural shorelines, eliminating the shallow, low-velocity river margins used by juvenile fish to escape from fast currents, deep water, and predators (U.S. Fish and Wildlife Service 2004).

Habitat blockage by dams poses an additional threat to spring-run Chinook salmon by preventing the spatial and temporal separation between spring-run and fall-run spawners that minimized competition for spawning habitat and maintained the genetic integrity of these runs prior to dams and intensive hatchery programs. For example, overlap in spawning between spring-run and fall-run Chinook salmon in the low-flow channel below Oroville Dam limits spawning success and has likely resulted in significant hybridization of spring-run and fall-run in the Feather River. The continued practice of releasing large numbers of hatchery fall-run and spring-run Chinook salmon in San Pablo Bay results in substantial straying, further contributing the risk of genetic introgression of hatchery and wild stocks of spring-run and fall-run Chinook salmon (National Marine Fisheries Service 2009a).

4.2.4 Survey Results

Focused surveys for Central Valley spring-run Chinook salmon were not conducted. However, it is well documented that spring-run Chinook salmon use the action area as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, juvenile spring-run Chinook salmon use the lower reaches of the Sacramento River for rearing while emigrating to the ocean. Spawning and egg incubation do not occur in the action area (Moyle 2002).

The temporal occurrence and relative abundance of juvenile spring-run Chinook salmon in the action area can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015a). From January 2005 through March 2015, spring-run size juvenile Chinook salmon were detected in the trawls from December through May (Table 4-8).

4.2.5 Critical Habitat

Critical habitat includes those physical and biological features of the habitat that are essential to the conservation of the species and that may require special management consideration or protection. The Sacramento River within the action area, which includes the aquatic portion of the BSA, is included in the designated critical habitat for Central Valley spring-run Chinook salmon (70 FR 52488, September 2, 2005). The primary constituent elements of critical habitat in the action area include freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of spring-run Chinook salmon. Critical habitat for spring-run Chinook salmon in the action area includes the river water

column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

4.2.6 Avoidance and Minimization Efforts

Implementation of Measures 1–13 would further avoid or minimize the potential for construction-related effects on adult and juvenile spring-run Chinook salmon and designated critical habitat in the action area.

4.2.7 Project Impacts

Project impacts on Central Valley spring-run Chinook salmon would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.2.7.1 Impacts on Central Valley Spring-Run Chinook Salmon Critical Habitat

The Sacramento River within the action area, which includes the aquatic portion of the BSA, is included in the designated critical habitat for Central Valley spring-run Chinook salmon (70 FR 52488, September 2, 2005). The primary constituent elements of critical habitat in the BSA include freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of spring-run Chinook salmon. Critical habitat for spring-run Chinook salmon in the BSA includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

4.2.8 Modifications to the Project to Mitigate Effects

Implementation of Measure 13 will compensate for the permanent loss of perennial stream. In addition, implementation of Measures 14 and 15 will compensate for permanent impacts on designated critical habitat for Central Valley spring-run Chinook salmon and loss of riparian vegetation (including SRA cover), respectively. No further compensatory mitigation would be required.

4.2.9 Cumulative Impacts

Cumulative impacts on Central Valley spring-run Chinook salmon would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.3 Central Valley Steelhead

4.3.1 Status and Distribution

The California Central Valley (CCV) steelhead (*Oncorhynchus mykiss*) DPS was federally listed as threatened on March 19, 1998 (National Marine Fisheries Service 1998) (63 FR 13347). The threatened status of CCV steelhead was reaffirmed in NMFS's final listing determination on January 5, 2006 (71 FR 834) (National Marine Fisheries Service 2006a); at the same time, NMFS adopted the term *DPS*, in place of *ESU*, to describe Central Valley steelhead and other population segments of this species. NMFS originally designated critical habitat for CCV steelhead on February 16, 2000 (National Marine Fisheries Service 2000). However, following a lawsuit (*National Association of Home Builders et al. v. Donald L. Evans, Secretary of Commerce, et al.*), NMFS decided to rescind the listing and re-evaluate how to classify critical habitat for several ESUs (now DPSs) of steelhead. Critical habitat for CCV steelhead was redesignated by NMFS on September 2, 2005 (70 FR 52488) (National Marine Fisheries Service 2005b). The DPS includes all naturally spawned populations of steelhead in the Sacramento and San Joaquin Rivers and their tributaries, excluding steelhead from San Francisco and San Pablo Bays and their tributaries. Artificially propagated fish from Coleman National Fish Hatchery and FRFH are included in the DPS (National Marine Fisheries Service 2006a). CCV steelhead are not listed under CESA.

Steelhead ranged throughout the tributaries of the Sacramento and San Joaquin Rivers prior to dam construction, water development, and watershed perturbation dating from the 19th and 20th centuries. Wild stocks are now mostly confined to the upper Sacramento River downstream of Keswick Dam; upper Sacramento River tributaries such as Deer, Mill, and Antelope Creeks; and the Yuba River downstream of Englebright Dam. Populations may also exist in Big Chico and Butte Creeks, and a few wild steelhead are produced in the American and Feather Rivers (McEwan and Jackson 1996). The abundance of naturally reproducing CCV steelhead, as measured by the number of adults returning to spawn, is largely unknown. Natural escapement in 1995 was estimated to be about 1,000 adults each for Mill and Deer Creeks and the Yuba River (S. P. Cramer and Associates 1995). Hatchery returns have averaged around 10,000 adults (Mills and Fisher 1994). The most recent annual estimate of adults spawning upstream of RBDD is less than 2,000 fish (National Marine Fisheries Service 2006a).

4.3.2 Life History

Oncorhynchus mykiss have one of the most complex life histories of any salmonid species, exhibiting both anadromous and freshwater resident life histories. Freshwater residents typically are referred to as rainbow trout, and those exhibiting an anadromous life history are called

steelhead (National Marine Fisheries Service 1999). Steelhead exhibit highly variable life history patterns throughout their range but are broadly categorized into winter and summer reproductive ecotypes. Winter steelhead, the most widespread reproductive ecotype and the only type currently present in Central Valley streams (McEwan and Jackson 1996), become sexually mature in the ocean; enter spawning streams in summer, fall, or winter; and spawn a few months later in winter or late spring (Meehan and Bjornn 1991; Behnke 1992).

In the Sacramento River, adult winter steelhead migrate upstream during most months of the year, beginning in July, peaking in September, and continuing through February or March (Hallock 1987). Spawning occurs primarily from January through March but may begin as early as late December and may extend through April (Hallock 1987). Individual steelhead may spawn more than once, returning to the ocean between each spawning migration.

Juvenile steelhead rear a minimum of 1 year, and typically 2 or more years, in fresh water before migrating to the ocean as smolts. Juvenile migration to the ocean generally occurs from December through August. The peak months of juvenile migration are January to May (McEwan 2001). The importance of main channel and floodplain habitats to steelhead in the lower Sacramento River and upper Delta is not well understood. Steelhead smolts have been found in the Yolo Bypass during winter and spring inundation (Sommer pers. comm.), but the importance of this and other floodplain areas in the lower Sacramento River and upper Delta is not yet clear.

4.3.3 Factors Affecting Abundance

The decline in steelhead populations is attributable to changes in habitat quality and quantity. The availability of steelhead habitat in the Central Valley has been reduced by as much as 95% or more due to barriers created by dams (National Marine Fisheries Service 1996). Populations have been most severely affected by dams blocking access to the headwaters of all major tributaries; consequently, most runs are maintained through artificial production. The decline of naturally produced Central Valley steelhead has been more precipitous than that of hatchery stocks. Populations in the range's southern portion have experienced the most severe declines. Other factors contributing to the decline of steelhead in the Central Valley are mining, agriculture, urbanization, logging, harvest, hatchery influences, flow management (including reservoir operations), hydropower generation, and water diversion and extraction (National Marine Fisheries Service 1996).

Factors such as levee construction and bank armoring have altered the critical habitat of steelhead. These factors reduce floodplain habitat, change river bank substrate size, and decrease the amount of riparian and SRA habitat, which in turn, reduce habitat availability and quality (National Marine Fisheries Service 2006a).

4.3.4 Survey Results

Focused surveys for Central Valley steelhead were not conducted. However, it is well documented that steelhead use the action area, which includes the aquatic portion of the BSA, as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, juvenile steelhead seasonally use the lower reaches of the Sacramento River for rearing while emigrating to the ocean. Spawning and egg incubation do not occur in the action area (Moyle 2002).

The temporal occurrence and relative abundance of juvenile steelhead in the action area can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015a). From January 2005 through March 2015, adipose fin-clipped juvenile steelhead (indicating hatchery origin) and unclipped (wild) steelhead were detected in the trawls from January through June (Table 4-9).

4.3.5 Critical Habitat

Critical habitat includes those physical and biological features of the habitat that are essential to the conservation of the species and that may require special management consideration or protection. The Sacramento River within the action area, which includes the aquatic portion of the BSA, is included in the designated critical habitat for Central Valley steelhead (70 FR 52488, September 2, 2005). The primary constituent elements of critical habitat in the action include

freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of steelhead. Critical habitat for Central Valley steelhead in the action includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

4.3.6 Avoidance and Minimization Efforts

Implementation of Measures 1–13 will further avoid or minimize the potential for construction-related effects on adult and juvenile Central Valley steelhead and designated critical habitat in the action area.

4.3.7 Project Impacts

Project impacts on Central Valley steelhead would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.3.7.1 Impacts on Central Valley Steelhead Critical Habitat

The Sacramento River within the action area, which includes the aquatic portion of the BSA, is included in the designated critical habitat for Central Valley steelhead (70 FR 52488, September 2, 2005). The primary constituent elements of critical habitat in the action area include freshwater rearing habitat with water quantity and quality, natural cover, forage, and passage conditions supporting migration and rearing of steelhead. Critical habitat for Central Valley steelhead in the action area includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

4.3.8 Modifications to the Project to Mitigate Effects

Implementation of Measure 13 will compensate for the permanent loss of perennial stream. In addition, implementation of Measures 14 and 15 will compensate for permanent impacts on designated critical habitat for Central Valley steelhead and loss of riparian vegetation (including SRA cover), respectively. No further compensatory mitigation would be required.

4.3.9 Cumulative Impacts

Cumulative effects on Central Valley steelhead would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4 Southern Distinct Population Segment of North American Green Sturgeon

4.4.1 Status and Distribution

NMFS listed the southern DPS of North American green sturgeon as threatened under ESA on April 7, 2006 (National Marine Fisheries Service 2006b). The southern DPS includes the spawning population in the Sacramento River and Feather River (Moyle 2002; Van Eenennaam et. al. 2005). Critical habitat was designated by NMFS on October 9, 2009 (74 FR 52300).

On January 23, 2003, NMFS determined that green sturgeon (*Acipenser medirostris*) are comprised of two populations, a northern and a southern DPS (National Marine Fisheries Service 2003). The northern DPS includes populations extending from the Eel River northward, and the southern DPS includes populations south of the Eel River to the Sacramento River. The Sacramento River supports the southernmost spawning population of green sturgeon (Moyle 2002). On April 6, 2005, NMFS determined that the northern DPS does not warrant listing under ESA, but it remains on the Species of Concern List (National Marine Fisheries Service 2005c). On April 7, 2006, NMFS determined that the southern DPS of green sturgeon was threatened under ESA (National Marine Fisheries Service 2006b). On October 9, 2009, NMFS (74 FR 52300) designated critical habitat for the green sturgeon southern DPS throughout most of its occupied range.

Green sturgeon were classified as a Class 1 species of special concern by CDFW in 1995 (Moyle et al. 1995). Class 1 species of special concern are those that conform to the State definitions of threatened or endangered and could qualify for addition to the official list. On March 20, 2006, emergency green sturgeon regulations were put into effect by CDFW, requiring a year-round zero bag limit of green sturgeon in all areas of the state (California Department of Fish and Game 2006).

4.4.2 Life History

The green sturgeon is anadromous, but it is the most marine-oriented of the sturgeon species and has been found in nearshore marine waters from Mexico to the Bering Sea (Colway and Stevenson 2007; Moyle 2002; National Marine Fisheries Service 2005c). The northern DPS has included spawning populations in the Rogue, Klamath, and Eel Rivers. The southern DPS has two spawning populations, in the Sacramento River and Feather River (Van Eenennaam 2005; National Marine Fisheries Service 2005d, 2010). Adults typically migrate upstream into rivers between late February and late July. Spawning occurs from March to July, with peak spawning from mid-April to mid-June. Green sturgeon are believed to spawn every 3–5 years, although

recent evidence indicates that spawning may be as frequent as every 2 years (National Marine Fisheries Service 2005c, 2010).

Preferred spawning habitats are thought to contain large cobble in deep and cool pools with turbulent water (California Department of Fish and Game 2002; Moyle 2002; Adams et al. 2002). Little is known about the specific spawning habitat preferences of green sturgeon. Adult green sturgeon are believed to broadcast their eggs in deep, fast water over large cobble substrate, where the eggs settle into the interstitial spaces (Moyle 2002). Spawning is generally associated with water temperatures from 46 to 57 degrees Fahrenheit (°F). In the Central Valley, spawning occurs in the Sacramento River upstream of Hamilton City, perhaps as far upstream as Keswick Dam (Adams et al. 2002), and possibly in the lower Feather River (Van Eenennaam 2005; Moyle 2002). Water temperatures in spawning and egg incubation areas are critical; temperatures greater than 19 degrees Celsius (°C) (66.2°F) are lethal to green sturgeon embryos (Cech et al. 2000; Mayfield and Cech 2004; Van Eenennaam et al. 2005; Allen et al. 2006). Green sturgeon eggs hatch in approximately 8 days at 55°F (Moyle 2002). After 6 days, the larvae exhibit nocturnal swim-up activity (Deng et al. 2002). After about 10 days, they begin nocturnal downstream migrational movements (Kynard et al. 2005). Juvenile green sturgeon continue to exhibit nocturnal behavior beyond the metamorphosis from larval to juvenile stages. Larvae begin feeding 10 days after hatching. Young green sturgeon appear to rear for the first 1 to 2 months in the upper Sacramento River between Keswick Dam and Hamilton City (California Department of Fish and Game 2002). Metamorphosis to the juvenile stage is complete within 45 days of hatching. Juveniles spend 1 to 4 years in fresh and estuarine waters and migrate to salt water (Nakamoto et al. 1995) at lengths of 300–750 mm (National Marine Fisheries Service 2005c).

Little is known about movements, habitat use, and feeding habits of green sturgeon. Green sturgeon have been salvaged at the state and federal fish collection facilities in every month, indicating that they are present in the Delta year-round. Juveniles and adults are reported to feed on benthic invertebrates, including shrimp and amphipods, and small fish (National Marine Fisheries Service 2005c).

4.4.3 Factors Affecting Abundance

The historical decline of the southern DPS of green sturgeon has been largely attributed to the reduction of spawning habitat area. Keswick and Shasta Dams on the Sacramento River and Oroville Dam on the Feather River are impassable barriers that prevent green sturgeon from accessing what were likely historical spawning grounds upstream of these dams. Other potential migration barriers or impediments include RBDD, the Sacramento Deep Water Ship Channel locks, Fremont Weir, Sutter Bypass, the Delta Cross Channel in the Sacramento River, and

Shanghai Bench and Sunset Pumps on the Feather River. Other factors that have been identified as potential threats to green sturgeon are reductions in freshwater outflow in the Delta during larval dispersal and rearing, high water temperatures during spawning and incubation, entrainment by water diversions, contaminants, predation and other impacts by introduced species, and poaching (National Marine Fisheries Service 2005c).

Channelization of the lower Sacramento River has resulted in the removal of riparian and IWM, which simplify ecosystem functions. Simplification results in reduced food input and pollutant and nutrient processing (Sweeney et al. 2004 as cited in National Marine Fisheries Service 2006a). These factors have degraded habitat quality for larvae and post-larvae and, to a lesser extent, rearing and migrating juvenile and/or adult green sturgeon (National Marine Fisheries Service 2006a).

4.4.4 Survey Results

Focused surveys for North American green sturgeon were not conducted. However, it is well documented that green sturgeon use the action area, which includes the aquatic portion of the BSA, as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, juvenile green sturgeon use the lower reaches of the Sacramento River for seasonal rearing. Spawning and egg incubation do not occur in the action area (Moyle 2002).

Green sturgeon, which are benthic-oriented, generally are not susceptible to the USFWS trawls that sample the water column; therefore, little is known about their seasonal use of habitats and relative abundance in the action area. However, general information on their distribution and habitat use indicates that green sturgeon have the potential to occur in the action area year-round.

4.4.5 Critical Habitat

Critical habitat includes those physical and biological features of the habitat that are essential to the conservation of the species and that may require special management consideration or protection. The Sacramento River within the action area, which includes the aquatic portion of the BSA, is included in the designated critical habitat for the southern DPS of North American green sturgeon (74 FR 52300, October 9, 2009). The primary constituent elements of critical habitat in the action area include freshwater areas with water flow, water quality, depth, forage, sediment quality, and passage conditions supporting migration and rearing of green sturgeon. Critical habitat for North American green sturgeon in the action area includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

4.4.6 Avoidance and Minimization Efforts

Implementation of Measures 1–13 will further avoid or minimize the potential for construction-related effects on adult and juvenile North American green sturgeon and designated critical habitat in the action area.

4.4.7 Project Impacts

Project impacts on North American green sturgeon would be similar to those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.4.7.1 Impacts on North American Green Sturgeon Critical Habitat

The Sacramento River within the action area, which includes the aquatic portion of the BSA, is included in the designated critical habitat for the southern DPS of North American green sturgeon (74 FR 52300, October 9, 2009). The primary constituent elements of critical habitat in the action area include freshwater areas with water flow, water quality, depth, forage, sediment quality, and passage conditions supporting migration and rearing of green sturgeon. Critical habitat for North American green sturgeon in the action area includes the river water column, river bottom, and adjacent riparian zone—up to the ordinary or mean high water elevation—which is used by adults for migration and juveniles for rearing.

4.4.8 Modifications to the Project to Mitigate Effects

Implementation of Measure 13 will compensate for the permanent loss of perennial stream. In addition, implementation of Measures 14 and 15 will compensate for permanent impacts on designated critical habitat for North American green sturgeon and loss of riparian vegetation (including SRA cover), respectively. No further compensatory mitigation would be required.

4.4.9 Cumulative Impacts

Cumulative effects on North American green sturgeon would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

4.5 Interrelated and Interdependent Actions

Caltrans does not anticipate any interrelated or interdependent actions associated with the proposed project.

4.6 Essential Fish Habitat

The MSA, as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267), requires federal agencies to consult with the National Oceanic and Atmospheric Administration (NOAA)

Fisheries on activities that may adversely affect EFH. Important components of EFH are substrate; water quality; water quantity, depth, and velocity; channel gradient and stability; food; cover and habitat complexity; space; access and passage; and habitat connectivity.

EFH for Chinook salmon could be affected by the project. The MSA-managed species occurring in the Sacramento River and in the action area, which includes the aquatic portion of the BSA, and potentially affected by the project include Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley fall- and late fall–run Chinook salmon. The species account for Central Valley fall- and late fall–run Chinook salmon is included below.

4.6.1 Central Valley Fall- and Late Fall–Run Chinook Salmon

4.6.1.1 Status and Distribution

The Central Valley fall-run and late fall–run Chinook salmon ESU includes all naturally spawning populations of fall-run and late fall–run Chinook salmon in the Sacramento and San Joaquin River basins and their tributaries east of the Carquinez Strait in California (64 FR 50394). On September 16, 1999, after reviewing the best available scientific and commercial information, NMFS determined that listing Central Valley fall- and late fall–run Chinook salmon was not warranted. On April 15, 2004, the Central Valley fall- and late fall–run Chinook salmon ESU was identified by NMFS as a species of concern (69 FR 19975).

The Central Valley fall- and late fall–run Chinook salmon ESU is not listed under CESA. However, Central Valley late fall–run Chinook salmon was classified as a Class 2 species of special concern by CDFG (now CDFW) in 1995 (Moyle et al. 1995). Class 2 species of special concern are species with low, scattered, or highly localized populations and require active management to prevent them from becoming Class 1 Species (i.e., species that conform to the state definitions of threatened or endangered species) (Moyle et al. 1995.)

Central Valley fall-run Chinook salmon historically spawned in all major tributaries, as well as the mainstems of the Sacramento and San Joaquin Rivers. The historical distribution of Central Valley late fall–run Chinook salmon is not well understood but is thought to be less extensive than that of fall-run. Late fall–run adults most likely spawned in the upper Sacramento and McCloud Rivers in reaches now blocked by Shasta Dam, as well as in major tributaries with adequate cold water in summer. There is also some evidence that they once spawned in the San Joaquin River in the Friant region and in other large San Joaquin tributaries (Yoshiyama et al. 1998).

The abundance of Central Valley fall- and late fall–run Chinook salmon escapement before 1952 is poorly documented. Reynolds et al. (1993) estimated that production of fall- and late fall–run Chinook salmon on the San Joaquin River historically approached 300,000 adults and probably averaged approximately 150,000 adults. Calkins et al. (1940) estimated fall- and late fall–run Chinook salmon abundance at 55,595 adults in the Sacramento River basin from 1931 to 1939. In the early 1960s, adult fall- and late fall–run Chinook salmon escapement was estimated to be 327,000 in the Sacramento River basin (California Department of Fish and Game 1965). In the mid-1960s, fall- and late fall–run Chinook salmon escapement to the San Joaquin River basin was estimated to be about 2,400 fish (Reynolds et al. 1993).

Long-term trends in adult fall-run Chinook salmon escapement since 1953 indicate that abundance in the Sacramento River has been consistently higher than abundance in the San Joaquin River. Annual escapement on the Sacramento River has been characterized by relatively high variability, ranging from approximately 100,000 to over 800,000 fish. Sacramento River escapement showed a marked increase in abundance between 1990 and 2003, followed by a decline in abundance from 2004 to the present. In 2009, adult fall-run Chinook salmon returns to Central Valley rivers showed a substantial decline in both the Sacramento and San Joaquin River systems (CalFish 2010). Similar declines in adult escapement also were observed for coho salmon and Chinook salmon returning to other river systems in California (MacFarlane et al. 2008). Trends in adult fall-run Chinook salmon escapement in the San Joaquin River tributaries have been relatively low since the 1950s, ranging from several hundred adults to approximately 100,000 adults (Reynolds et al. 1993).

Adult escapement estimates for late fall–run Chinook salmon returning to the Sacramento River from 1971 through 2009 have ranged from several hundred adults to over 40,000 adults. Adult escapement showed a general trend of declining abundance between 1971 and 1997. During the late 1990s and continuing through 2006, escapement increased substantially but was characterized by high interannual variability. The 2008 and 2009 escapement estimates were lower than the previous 4 years but were not characterized by the severe decline observed for fall-run Chinook salmon (CalFish 2010).

4.6.1.2 Life History

Adult fall-run Chinook salmon migrate through the Delta and into Central Valley rivers from June through December and spawn from September through December. Peak spawning activity usually occurs in October and November. The life history characteristics of late fall–run Chinook salmon are not well understood. Adult late fall–run Chinook salmon migrate through the Delta and into the Sacramento River from October through April and may wait for 1 to 3 months before spawning from December through April. Peak spawning activity occurs in February and

March. Chinook salmon typically mature between 2 and 6 years of age (Myers et al. 1998). The majority of Central Valley fall-run Chinook salmon spawn at age 3 (Moyle 2002).

Chinook salmon spawn in clean, loose gravel in swift, relatively shallow riffles, or along the margins of deeper river reaches where water temperatures, depths, and velocities are suitable for redd construction and egg incubation. Egg incubation for Central Valley fall-run Chinook salmon begins with spawning in September and can extend into March (Vogel and Marine 1991). Egg incubation for late fall–run Chinook salmon occurs from December through June (Vogel and Marine 1991; Earley et al. 2010).

Central Valley fall-run Chinook salmon fry (i.e., juveniles shorter than 2 inches long) generally emerge from December through March, with peak emergence occurring by the end of January. In general, fall-run Chinook salmon fry abundance in the Delta increases following high winter flows. Most fall-run Chinook salmon fry rear in fresh water from December through June, with smolt emigration occurring primarily from April through June. Smolts that arrive in the estuary after rearing upstream migrate quickly through the Delta and Suisun and San Pablo Bays. A very small number (generally less than 5%) of fall-run juveniles spend over a year in fresh water and emigrate as yearling smolts the following November through April. Central Valley late fall–run Chinook salmon fry generally emerge from April through June. Late fall fry rear in fresh water from April through the following April and emigrate as smolts from October through February (Snider and Titus 2000).

Upon emergence from the gravel, fry swim or are displaced downstream (Healey 1991). Fry seek nearshore habitats providing shallow water; vegetation; and substrates that provide aquatic and terrestrial invertebrates, cover and shelter from predators, and slower water velocities for resting (National Marine Fisheries Service 1996). These shallow-water habitats are considered to be more productive rearing habitat than the deeper main river channels. Higher juvenile salmon growth rates associated with greater prey consumption rates and favorable water temperatures have been observed on floodplains with extensive shallow-water habitats (Sommer et al. 2001).

4.6.1.3 Factors Affecting Abundance

Factors that contributed to the decline of Central Valley fall-/late fall–run Chinook salmon are similar to those described earlier for Sacramento River winter-run Chinook salmon and Central Valley spring-run Chinook salmon. Access to much or all of their historical spawning habitat was eliminated by dams, although fall-run Chinook salmon were less affected by these barriers because much of their historical spawning habitat included the lower gradient reaches downstream of these dams (Reynolds et al. 1993; McEwan 2001). However, changes in the seasonal hydrologic patterns resulting from water diversions and operation of upstream

reservoirs for water supply, flood control, and hydroelectric power generation have altered flows, water temperatures, and other habitat conditions for fall-run Chinook salmon and other species in these reaches (Williams 2006).

Properly functioning migration corridors for juvenile Central Valley fall- and late fall–run Chinook salmon consist of a wide range of habitat types, including primary and secondary channels, streambanks, floodplains, and marshes. Much of the Sacramento and San Joaquin River corridor and Delta have been leveed, channelized, and modified with rip-rap for flood risk reduction, thereby reducing and degrading the value and availability of natural habitat for rearing and emigrating juvenile Chinook salmon (Brandes and McLain 2001). Modification of natural flow regimes from upstream reservoir operations has resulted in dampening of the hydrograph, reducing the extent and duration of seasonal floodplain inundation and other flow-dependent habitat used by migrating juvenile Chinook salmon (70 FR 52488; Sommer et al. 2001; California Department of Water Resources 2005). Tidal and floodplain habitat areas provide important rearing habitat for foraging juvenile salmonids, including Central Valley fall-run Chinook salmon. Studies have shown that these salmonids may spend from 2 to 3 months rearing in these habitat areas, and losses resulting from land reclamation and levee construction are considered to be major stressors on juvenile salmonids (Williams 2009). Similarly, channel margins provide valuable rearing and connectivity habitat along migration corridors, particularly for smaller juvenile fry, such as fall-run Chinook salmon.

Predation on juvenile salmon by non-native fish has been identified as an important threat to fall- and late fall–run Chinook salmon in areas with high densities of non-native fish that prey on out-migrating juvenile salmon (e.g., smallmouth and largemouth bass, striped bass, and catfish) (Lindley and Mohr 2003). The low spatial complexity and reduced habitat diversity (e.g., lack of cover) of channelized waterways in the rivers and Delta reduce refuge space for salmon from predators (Raleigh et al. 1984; Missildine et al. 2001; 70 FR 52488).

Other factors that have contributed to the current status of Central Valley fall-run and late fall–run Chinook salmon and currently affect their abundance include harvest, artificial propagation programs (ecological and genetic effects), entrainment, and contaminants (Moyle 2002).

4.6.1.4 Survey Results

Focused surveys for Central Valley fall and late fall–run Chinook salmon were not conducted. However, it is well documented that fall and late fall–run Chinook salmon use the action area as a migration corridor during upstream (adult) and downstream (juvenile) migration. In addition, Central Valley fall and late fall–run Chinook salmon seasonally use the lower reaches of the

Sacramento River for rearing while emigrating to the ocean. Spawning and egg incubation do not occur in the action area (Moyle 2002).

The temporal occurrence and relative abundance of juvenile fall and late fall–run Chinook salmon in the action area can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the DJFMP (U.S. Fish and Wildlife Service 2015a). From January 2005 through March 2015, fall-run size juvenile Chinook salmon were detected in the trawls from December through August, although most were detected in the trawls from January through May (Table 4-10).

4.6.1.5 Project Impacts

Effects on EFH for Pacific salmon would be similar to the impacts on species and critical habitat effects described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section.

The following environmental conditions potentially affect Pacific salmon EFH.

- Disturbance and direct injury.
- Increased exposure to contaminants
- Sedimentation and turbidity.
- Hazardous materials and contaminants.
- Temporary and permanent loss of aquatic habitat.
- Temporary and permanent loss of SRA cover habitat.
- Permanent increase in overwater structure

Effects to Pacific salmon EFH associated with sedimentation and turbidity, hazardous materials and contaminants, disturbance and direct injury, and habitat loss would be temporary. Potential adverse effects to EFH of increased fine sediment and turbidity will be avoided or minimized through implementation of all applicable BMPs. The potential environmental effects of the project would be limited to short-term, localized, and minor increases in turbidity and suspended sediment. Implementation of the SWPPP along with applicable BMPs would substantially reduce

or eliminate the potential for an accidental spill and unintentional discharge of contaminants with potential associated effects to EFH. Potential injury and mortality to fish associated with pile driving will be avoided or minimized by the following.

- Limiting the number and size of piles to the minimum necessary to meet the engineering and design requirements of the project.
- Using vibratory hammers first to drive piles to the maximum depth possible before driving piles with an impact hammer.
- Using the smallest pile driver and minimum force necessary to complete the work.
- Using a bubble ring or similar device to minimize the magnitude and extent of potentially harmful underwater noise levels while driving piles with an impact hammer.
- Conducting pile driving during daylight hours only.
- Limiting in-water construction to the proposed in-water construction window (May 1–November 30).

Long-term and permanent effects on EFH would include the net loss of aquatic habitat (substrate, water column) associated with the new bridge piers and RSP (Table 4-6), and permanent loss of up to 1.44 acre and temporary loss of up to 1.52 acre of cottonwood riparian forest habitat, of which approximately 0.44 acre is below the OHWM and contributes to overhead (shade) and instream SRA cover habitat. However, implementation of proposed compensation measures for project effects on perennial stream, critical habitat, and cottonwood riparian forest habitat (including SRA cover habitat), as discussed above for Sacramento River winter-run Chinook salmon, will also compensate for project effects on EFH for Pacific salmon.

Chapter 5 Conclusions and Determinations

5.1 Conclusions

5.1.1 Effects on Listed Fish Species

Direct adverse effects of the proposed project on listed fish species are expected to occur largely from underwater noise levels generated by the proposed pile driving activities that are predicted to reach levels that can cause harassment, injury, and mortality of fish, depending on a number of factors that influence exposure levels of fish to pile driving noise. Turbidity and suspended sediment levels during in-water construction activities (cofferdam installation and removal, pile driving, in-water placement of RSP) are expected to reach levels that can cause harassment of fish, potentially resulting in behavioral responses that could disrupt migration and foraging activities. In addition, cofferdam construction and dewatering, and the in-water placement of RSP can cause injury and mortality of fish that become entrapped in cofferdams or come in direct contact with RSP as it is being installed. Temporary construction lighting could alter the behavior and movements of delta smelt or attract predators to work areas, leading to increased predation. Direct effects on listed fish may also result from the permanent and temporary loss of aquatic (substrate and water column) habitat associated with the new bridge piers and temporary piles, respectively, and from the permanent loss of SRA cover habitat associated with construction of the new bridge. Indirect adverse effects on listed fish species may occur from the degradation of existing riverine habitat from increased overwater structure (artificial shade) and increased nighttime light intensity from permanent bridge lighting that may make predators more success at preying on juveniles of listed species.

The project proponents propose to implement a number of measures to avoid or minimize potential adverse effects on listed fish species. All in-water construction activities will be conducted between May 1 and November 30 to avoid and minimize construction effects on green sturgeon and the primary Chinook salmon and steelhead migration seasons. Increased turbidity and suspended sediment would be limited to temporary, localized plumes of sediment during installation and removal of temporary trestle and sheet piles, during the installation of permanent 108-inch-diameter piles for piers 3 and 4 and the permanent piles for the bridge fender system, and during in-water placement of RSP. Because of the potential presence of listed species during proposed pile driving activities, the project proponents propose to implement a number of measures to minimize harassment and the risk of injury or mortality from elevated underwater sounds levels. Potential harassment, injury, and mortality of fish from pile driving noise will be minimized by completing all pile driving activities within the proposed construction work

window, using vibratory drivers to drive piles to the maximum possible depth , using a bubble ring or similar device to attenuate impact pile driving sounds to the maximum extent feasible, driving of piles for piers 2 and 5 in dewatered cofferdams, using a vibratory hammer and/or hydraulic driven oscillator/rotator system to install the 108-inch-diameter steel casings for piers 3 and 4, conducting pile driving during daylight hours only to provide a harassment-free period each day, and avoiding removing and re-installing the piles for the temporary trestles between the first and second construction seasons. To ensure that underwater sound levels do not exceed predicted values, the project proponents will develop and implement a NMFS-approved hydroacoustic monitoring plan to monitor underwater noise levels during impact pile driving activities (Table 4-4).

5.1.2 Effects on Critical Habitat

Project effects on critical habitat of Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, and North American green sturgeon include temporary effects on water quality (underwater noise and increased turbidity and suspended sediment), temporary effects on water column habitat and channel substrate (i.e., from temporary trestle pile and cofferdam installation and removal), and permanent losses of aquatic and SRA cover habitat in the Sacramento River from installation of new bridge piers and RSP. Because of the temporary nature of construction activities and the proposed compensation for permanent effects of the project on habitat structure and function, no long-term effects on the PCEs or conservation value of critical habitat for these species in the region would be expected.

5.1.3 Effects on Essential Fish Habitat

Project effects on EFH would be similar to the critical habitat effects discussed above. Adverse effects would be limited to minor, temporary reductions in the availability of EFH associated with increased turbidity, sedimentation, underwater noise, and temporary and permanent losses in water column habitat, natural substrates, and cottonwood riparian forest habitat (including SRA cover habitat).

5.2 Determination

In conclusion, the project is likely to adversely affect Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, North American green sturgeon, and designated critical habitat for all four species. The primary effect of the project would be temporary delays in migration or cessation of foraging activity in response to increased turbidity, suspended sediment, and underwater noise. Any behavioral effects would be temporary and are not expected to measurably affect growth, survival, or reproductive success.

During impact pile driving, some fish may encounter potentially harmful noise levels—leading to harassment, injury, or mortality of individuals—but the majority of the adult and juvenile population in the Sacramento River during construction would not be affected based on the proposed timing and frequency of pile driving and the migration timing of these species and life stages in the action area. Project effects on critical habitat include temporary effects on water quality (increased turbidity and suspended sediment), rearing and movement habitat (noise and shade), water column habitat and channel substrate (pile installation and removal), and permanent losses of aquatic and SRA cover habitat in the Sacramento River (new permanent bridge piers and RSP). Compensation is proposed for the permanent loss of critical habitat.

AUG 2 9 2015

Ms. Sue Bauer
Chief, Environmental Management, M-1 Branch
Department of Transportation, District 3
703 B Street
Marysville, CA 95901

Re: Endangered Species Act (ESA) Section 7(a)(2) Species List for I Street Bridge Replacement Project

Dear Ms. Bauer:

This is in response to your July 22, 2015, letter requesting technical assistance from NOAA's National Marine Fisheries Service (NMFS) regarding the California Department of Transportation's (Caltrans) proposed project to replace the I Street Bridge over the Sacramento River between the cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge, in Sacramento County, California. Waterways within the project area include the mainstem of the Sacramento River upstream of the Sacramento-San Joaquin Delta (Delta) and downstream of its confluence with the American River. Caltrans has requested NMFS to provide the species listed on the Federal List of Endangered and Threatened Wildlife (50 C.F.R. 70.11), or critical habitat designated that may occur within the project area.

Available information indicates that the following listed species and designated critical habitat could occur in the project area, or have the potential to be affected by the project (Table 1):

In addition, a comprehensive collection of species listing information, critical habitat designations, status reviews, distribution maps and Federal Register (FR) Notices for listed salmonids can be found on the NMFS West Coast Region website at: http://www.westcoast.fisheries.noaa.gov/protected_species/salmon_steelhead/salmon_and_steelhead_listings/salmon_and_steelhead_listings.html, and for green sturgeon at: http://www.westcoast.fisheries.noaa.gov/protected_species/green_sturgeon/green_sturgeon_pg.html.

Formal and informal consultation is initiated through a request that must include the following six pieces of information as described in CFR 402.14(c):

(1) A description of the proposed action to be covered;

(2) A description of the specific area that may be affected by the proposed action; Table 1—FR ESA listings for affected species and their critical habitat designations as applicable in or near the project area.

Species	ESU or DPS	Original Final FR Listing	Current Final Listing Status	Critical Habitat Designated
Chinook salmon (*Oncorhynchus tshawytscha*)	Central Valley (CV) spring-run ESU	9/16/1999 64 FR 50394 Threatened	6/28/2005 70 FR 37160 Threatened	9/2/2005 70 FR 52488
Chinook salmon (*O. tshawytscha*)	Sacramento River (SR) winter-run ESU	1/4/1994 59 FR 440 Endangered	6/28/2005 70 FR 37160 Endangered	6/16/1993 58 FR 33212
Steelhead (*O. mykiss*)	California Central Valley (CCV) DPS	3/19/1998 63 FR 13347 Threatened	1/5/2006 71 FR 834 Threatened	9/2/2005 70 FR 52488
North American (NA) Green sturgeon (*Acipenser medirostris*)	Southern DPS	4/7/2006 71 FR 17757 Threatened	4/7/2006 71 FR 17757 Threatened	10/9/2009 74 FR 52300

(3) A description of any listed species or critical habitat that may be affected by the proposed action;

(4) A description of the manner in which the action may affect any listed species or critical habitat, and an analysis of any direct, indirect, or cumulative effects.

a. Direct Effects: Effects to listed species of designated critical habitat that occur during implementation of the project.

b. Indirect Effects: Effects to listed species that occur later in time or offsite, but are reasonably certain to occur.

c. Cumulative Effects: For purposes of the ESA, cumulative effects are defined as the effects of future State or private activities, not involving Federal activities, that are reasonably certain to occur within an action area of the Federal action subject to consultation (50 CFR 402.02). Future Federal actions are not included here because they require separate consultation pursuant to Section 7 of the ESA;

(5) Relevant reports, including any environmental impact statements, environmental assessments, biological assessments or other analysis prepared regarding the proposal; and

(6) Any other relevant studies or other information available on the action, the affected listed species, or critical habitat.

The following is a description of critical habitat for SR winter-run Chinook salmon, CV spring-run Chinook salmon, and CCV steelhead in or near the project area:

Critical habitat includes the stream channels in the designated stream reaches and the lateral extent as defined by the ordinary high-waterline. In areas where the ordinary high-waterline has not been defined, the lateral extent will be defined by the bankfull elevation (defined as the level at which water begins to leave the channel and move into the floodplain; it is reached at a discharge that generally has a recurrence interval of 1 to 2 years on the annual flood series). Critical habitat for SR winter-run Chinook salmon, CV spring-run Chinook salmon, and CCV steelhead are defined as specific areas that contain the primary constituent elements (PCE) and physical habitat elements (PHE) essential to the conservation of the species. The following information discusses the inland habitat types used as PCEs for CV spring-run Chinook salmon and CCV steelhead and as PHEs for SR winter-run Chinook salmon that may occur along the Sacramento River mainstem near the project site.

PCEs for CV spring-run salmon and CCV steelhead and PHEs for SR winter-run Chinook salmon in the Sacramento River near the project site

Freshwater Rearing Habitat

Freshwater rearing sites are those with water quantity and floodplain connectivity to form and maintain physical habitat conditions and support juvenile growth and mobility; water quality and forage supporting juvenile development; and natural cover such as shade, submerged and overhanging large woody material, log jams and beaver dams, aquatic vegetation, large rocks and boulders, side channels, and undercut banks. Both spawning areas and migratory corridors comprise rearing habitat for juveniles, which feed and grow before and during their outmigration. Rearing habitat condition is strongly affected by habitat complexity, food supply, and the presence of predators of juvenile salmonids. The channelized, leveed, and riprapped river reaches and sloughs that are common in the Delta south of the project location have been significantly degraded by the placement of riprap. Freshwater rearing habitats are considered to have a high conservation value and recovery potential even if they are significantly degraded compared to their natural state.

Freshwater Migration Corridors

Ideal freshwater migration corridors are free of migratory obstructions, with water quantity and quality conditions that enhance migratory movements. They contain natural cover such as riparian canopy structure, submerged and overhanging large woody objects, aquatic vegetation, large rocks, and boulders, side channels, and undercut banks which augment juvenile and adult mobility, survival, and food supply. These corridors allow the upstream passage of adults, and the downstream emigration of outmigrant juveniles. The Sacramento River is a primary migration corridor for adult and juvenile salmon and steelhead. Freshwater migration corridors are considered to have a high conservation and recovery potential value even if they are significantly degraded compared to their natural state.

Estuarine Areas

Estuarine areas free of migratory obstructions with water quality, water quantity, and salinity conditions supporting juvenile and adult physiological transitions between fresh and salt water are included as a PCE. Natural cover such as submerged and overhanging large woody material, aquatic vegetation floodplains and side channels, are essential for juvenile and adult foraging. The project area is located along the Sacramento River mainstem just north of the Delta and may be a critical component of estuarine PCEs. Estuarine areas are considered to have a high conservation value as they provide factors which function to provide predator avoidance and as a transitional zone to the ocean environment. Estuarine areas are considered to have a high conservation and recovery potential value even if they are significantly degraded compared to their natural state.

The following is a description of critical habitat for the Southern DPS of NA green sturgeon in or near the project area:

Critical habitat for Southern DPS green sturgeon includes the stream channels and waterways in and near the Delta to the ordinary high waterline. There are several PCEs present that should be considered at the project location.

PCEs for the Southern DPS of NA green sturgeon in the Sacramento River near the project site

Food Resources

Abundant food items within estuarine habitats and substrates for juvenile, subadult, and adult life stages are required for the proper functioning of this PCE for green sturgeon. Prey species for juvenile, subadult, and adult green sturgeon within bays and estuaries primarily consist of benthic invertebrates and fish, including crangonid shrimp, callianassid shrimp, burrowing thalassinidean shrimp, amphipods, isopods, clams, annelid worms, crabs, sand lances, and anchovies. These prey species are critical for the rearing, foraging, growth, and development of juvenile, subadult, and adult green sturgeon within the bays and estuaries.

Water Flow

Within bays and estuaries adjacent to the Sacramento River (*i.e.*, the Delta and the Suisun, San Pablo, and San Francisco bays), sufficient flow into the bay and estuary to allow adults to successfully orient to the incoming flow and migrate upstream to spawning grounds is required. Sufficient flows are needed to attract adult green sturgeon into the Sacramento River from the bay and to initiate the upstream spawning migration into the upper river.

Water Quality

Adequate water quality, including temperature, salinity, oxygen content, and other chemical characteristics are necessary for normal behavior, growth, and viability of all life stages. Suitable water temperatures for juvenile green sturgeon should be below 24°C (75°F). At temperatures above 24°C, juvenile green sturgeon exhibit decreased swimming performance and increased cellular stress. Adequate levels of dissolved oxygen (DO) are also required to support

oxygen consumption by juveniles (ranging from 61.8 to 76.1 mg O_2 hr^{-1} kg^{-1}). Suitable water quality also includes water free of contaminants (*e.g.*, organochlorine pesticides, polyaromatic hydrocarbons (PAHs), or elevated levels of heavy metals) that may disrupt the normal development of juvenile life stages, or the growth, survival, or reproduction of subadult or adult stages.

Migratory Corridor

Safe and unobstructed migratory pathways are necessary for successful and timely passage of adult, sub-adult, and juvenile fish within the region's different estuarine habitats and between the upstream riverine habitat and the marine habitats. Within the waterways comprising the Delta, and bays downstream of the Sacramento River, safe and unobstructed passage is needed for juvenile green sturgeon during the rearing phase of their life cycle. Rearing fish need the ability to freely migrate from the river through the estuarine waterways of the Delta and bays and eventually out into the ocean. Passage within the bays and the Delta is also critical for adults and subadults for feeding and summer holding, as well as to access the Sacramento River for their upstream spawning migrations and to make their outmigration back into the ocean. Within bays and estuaries outside of the Delta and the areas comprised by Suisun, San Pablo, and San Francisco bays, safe and unobstructed passage is necessary for adult and subadult green sturgeon to access feeding areas, holding areas, and thermal refugia, and to ensure passage back out into the ocean.

Water Depth

A diversity of depths is necessary for shelter, foraging, and migration of juvenile, subadult, and adult life stages. Adults and subadults within the estuary primarily occupy waters over shallow depths of less than 10 meters, either swimming near the surface or foraging along the bottom. In a study of juvenile green sturgeon in the Delta, relatively large numbers of juveniles were captured primarily in shallow waters from 3 to 8 feet deep, indicating juveniles may require shallower depths for rearing and foraging. Thus, a diversity of depths is important to support different life stages and habitat uses for green sturgeon within estuarine areas.

Sediment Quality

Sediment quality (*i.e.*, chemical characteristics) is necessary for normal behavior, growth, and viability of all life stages. This includes sediments free of contaminants (*e.g.*, elevated levels of selenium, PAHs, and organochlorine pesticides) that can cause negative effects on all life stages of green sturgeon.

Essential Fish Habitat (EFH)

The proposed project site is within the region identified as EFH for Pacific salmon in Amendment 14 of the Pacific Salmon FMP. EFH is defined as those waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity. For the purposes of interpreting the definition of EFH, "waters" includes aquatic areas and their associated physical, chemical, and biological properties that are used by fish, and may include areas historically used

by fish where appropriate; "substrate" includes sediment, hard bottom, structures underlying the waters, and associated biological communities; "necessary" means habitat required to support a sustainable fishery and a healthy ecosystem; and, "spawning, breeding, feeding, or growth to maturity" covers all habitat types used by a species throughout its life cycle. In order to protect EFH, federal agencies are required to consult with NMFS on activities that may adversely affect EFH, and NMFS must provide EFH conservation recommendations to those agencies (section 305(b)(4)(A)).

Fall-run Chinook salmon have the potential to be present near the project location and are managed under the Pacific Coast Salmon Fisheries Management Plan (FMP). Habitat areas of particular concern (HAPCs), as designated under this FMP, include (1) complex channels and floodplain habitats, (2) thermal refugia, (3) spawning habitat, (4) estuaries, and (5) marine and estuarine submerged aquatic vegetation. Caltrans should identify and discuss HAPCs present, if any, along the Sacramento River mainstem near the project location.

ESA Section 7(a)(1) Conservation Recommendations

Section 7(a)(1) of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C 1531 *et seq.*), directs Federal agencies to utilize their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of threatened and endangered species. Conservation recommendations are discretionary agency activities intended to minimize or avoid adverse effects of a proposed project on listed species or critical habitat, to help implement recovery plans, or to develop information.

Bridge replacement projects have a high potential to further degrade habitat for anadromous fish and reduce their recovery potential. We recommend a pre-consultation meeting to discuss methods to minimize and avoid impacts of this project, including project timing. Some examples include:

(1) Re-vegetate onsite at a 3:1 ratio immediately following the completion of the proposed project for any area consisting of removed or disturbed vegetation with native riparian species in efforts to facilitate the development of shaded riverine aquatic (SRA) habitat. A detailed re-vegetation plan should be provided and should include a list of species and designs depicting the proposed location for each species and their density. The vegetation plan should also include proposed irrigation and vegetation monitoring schedules which will likely be needed for several years;

(2) Develop a monitoring plan to evaluate the success of the re-vegetation efforts which would indicate the overall performance of the planted vegetation at each site and include guidelines for replacing vegetation that fail to establish.

(3) Purchase rearing habitat credits at a 3:1 ratio for the placement of rock slope protection (RSP), if used, within the action area at a NMFS approved anadromous fish conservation bank;

(4) Implement best management practices, including Storm Water Pollution Prevention Program and Water Pollution Control Program, to minimize effects to federally listed fish and their designated critical habitat;

(5) Use a soil-rock mixture to facilitate re-vegetation of the proposed project area. A ratio of rock to soil (70:30) is recommended. We suggest a soil-rock mixture on top of the rock revetment to allow native riparian vegetation to be planted to ensure SRA habitat is replaced;

(6) Caltrans should use a vibratory hammer whenever possible to avoid acoustic impacts to ESA-listed fish when pile driving. If an impact hammer is necessary, a bubble curtain or other sound attenuation method should be used to reduce impacts;

(7) Construction should occur when vulnerable life stages of listed anadromous fish would be least likely to occur in the project area;

(8) To address potential fish migration concerns upstream and downstream of the RSP placement points, see NMFS Guidelines for Salmonid Passage at Stream Crossings at http://www.westcoast.fisheries.noaa.gov/publications/hydropower/fish_passage_at_stream_crossings_guidance.pdf.;

(9) Minimize bridge demolition impacts by removing the existing superstructure piece by piece and disposing of it in an environmentally conscious way off-site. This includes protecting the river below the bridge by routing any flow around the construction area;

(10) Stabilize and restore the affected project footprint area by applying appropriate soil stabilization and re-vegetation techniques. This may include the implementation of riparian plantings and locally native grass and/or forb seeds to reduce and offset construction impacts. Seeded areas should be covered with broadcast straw and/or seeded erosion control blankets;

(11) Caltrans should continue to work cooperatively with other State and Federal agencies, private landowners, governments, and local watershed groups to identify opportunities for cooperative analysis and funding to support salmonid and sturgeon habitat restoration projects within the Sacramento River watershed;

(12) Caltrans and other local, State, and Federal agencies should provide training for Caltrans environmental and engineering staff that will assist in avoiding or minimizing the impacts of transportation projects on ESA-listed salmonids, NA green sturgeon and their designated critical habitats; and

(13) Caltrans should purchase salmonid habitat restoration credits at a NFMS-approved anadromous fish conservation bank at a 3:1 ratio for the footprint of the project area. The purchase of credits is consistent with 7(a)(l) because it will result in the restoration and long-term preservation of valuable habitat attributes that will improve the survival and recovery of the species.

This response is provided as technical assistance with Caltrans. This response is not intended to take the place of formal comments or consultation as required under the ESA, and does not provide incidental take authorization pursuant to section 7(b)(4) and section 7(o)(2) of the ESA.

Please contact Dylan Van Dyne at (916) 930-3625, or via e-mail at Dylan.VanDyne@noaa.gov if you have any questions or require additional information.

Sincerely,

for Maria C. Rea

Project Name: I Street Bridge Replacement -- created on April 17, 2015 11:24

Subject: Updated list of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2)

of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Endangered Species Act Species List

There are a total of 9 threatened or endangered species on your species list. Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Critical habitats listed under the **Has Critical Habitat** column may or may not lie within your project area. See the **Critical habitats within your project area** section further below for critical habitat that lies within your project. Please contact the designated FWS office if you have questions.

Amphibians	**Status**	**Has Critical Habitat**	**Condition(s)**
California red-legged frog *(Rana draytonii)* Population: Entire	Threatened	Final designated	
California tiger Salamander *(Ambystoma californiense)* Population: U.S.A. (Central CA DPS)	Threatened	Final designated	
Birds			
Least Bell's vireo *(Vireo bellii pusillus)* Population: Entire	Endangered	Final designated	
Crustaceans			
Vernal Pool fairy shrimp *(Branchinecta lynchi)* Population: Entire	Threatened	Final designated	
Vernal Pool tadpole shrimp *(Lepidurus packardi)* Population: Entire	Endangered	Final designated	
Fishes			

Delta smelt *(Hypomesus transpacificus)* Population: Entire	Threatened	Final designated	
steelhead *(Oncorhynchus (=salmo) mykiss)* Population: Northern California DPS	Threatened	Final designated	
Insects			
Valley Elderberry Longhorn beetle *(Desmocerus californicus dimorphus)* Population: Entire	Threatened	Final designated	
Reptiles			
Giant Garter snake *(Thamnophis gigas)* Population: Entire	Threatened		

Critical habitats that lie within your project area

The following critical habitats lie fully or partially within your project area.

Fishes	Critical Habitat Type
Delta smelt *(Hypomesus transpacificus)* Population: Entire	Final designated

Appendix B Delineation of Waters of the United States for the I Street Bridge Replacement Project

May 3, 2016

Mr. Marc Fugler
U.S. Army Corps of Engineers
Sacramento District, Regulatory Division
1325 J Street, Room 1350
Sacramento, California 95814-2922

Subject: Request for preliminary jurisdictional determination of the delineation of the proposed I Street Bridge Project, Sacramento County and Yolo County, California

Dear Mr. Fugler:

On behalf of the City of Sacramento and the City of West Sacramento (Cities), ICF International is submitting a Request for Preliminary Jurisdictional Determination (PJD) for the Sacramento River at I Street Bridge project. The City of Sacramento, in cooperation with the City of West Sacramento and the California Department of Transportation, proposes to construct a new bridge over the Sacramento River to replace the existing vehicle crossing that is currently accommodated by the existing I Street Bridge in order to remove a series of functionally obsolete or structurally deficient bridges (i.e., approach structures). The new connection would also reduce future traffic congestion, improve operations and safety, serve multiple modes of transportation, and comply with current American Association of State Highway and Transportation Officials, Caltrans, and local agency design standards.

The Cities plan to submit a permit application for any work below OHWM or in the potential wetland. At this time, the Cities are requesting a PJD of the OHWM of the Sacramento River and the boundary of the potential wetland based on the discussion provided below and the attached delineation map (Exhibit A), photographs, and data forms.

Delineation Area

The delineation area comprises approximately 42 acres surrounding the proposed bridge and approaches (Exhibit A). The proposed bridge site is located over the Sacramento River between the Cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge (Figure 1). The delineation area consists of the Sacramento River, riparian woodland, and open space with bike/pedestrian trails along the Sacramento River, local roads, elevated road (viaduct) and bridge approach structures, residential areas, and commercial

development. The delineation area has a relatively high level of historical and ongoing disturbance. Elevations in the delineation area range from -6 to 64 feet above mean sea level.

According to soil data from the Natural Resources Conservation Service, the delineation area contains the following five soil map units and water:

- Orthents-Urban land complex, 0 to 2 percent slopes (Sacramento County)
- Urban land (Sacramento County)
- Lang sandy loam (Yolo County)
- Lang sandy loam, deep (Yolo County)
- Sycamore silt loam (Yolo County)

Of these, Sycamore soils are hydric and inclusions within the map units of Orthents-Urban land and Lang sandy loam are hydric. The soil profile has been disturbed by development in West Sacramento and construction activity in the Sacramento Railyards Specific Plan area.

Methods

ICF wetland ecologist/botanist Lisa Webber conducted the field study on April 8, 2015 on behalf of the Cities in support of the proposed I Street Bridge project. The field study included investigations to identify areas that could be subject to jurisdiction by the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA) and the California Department of Fish and Wildlife (DFW) and to evaluate possible environmental constraints. The investigation consisted of walking through the delineation area, mapping the observed OHWM where accessible with a sub-meter accuracy global positioning system (GPS) unit, sampling potential wetland areas using the routine on-site determination method described in the 1987 *Corps of Engineers Wetlands Delineation Manual*, and implementing the supplemental procedures and wetland indicators described in the 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual for the Arid West Region*. The wetland ecologist/botanist identified the OHWM of the Sacramento River in the field using the guidance provided in Regulatory Guidance Letter 05-05. This boundary was confirmed using site-specific topographic mapping to identify the location of the 19-foot elevation, which has been identified as the OHWM for the Sacramento River at the existing I Street bridge. Aerial and ground-view photographs of the study area were reviewed prior to the field study.

A total of four data points were examined in the delineation area—two data points to establish the riparian wetland boundary (DP-1w and DP-2u) and two data points to record upland conditions (DP-3u and DP-4u). The data forms are attached.

Results

The delineation area in the City of Sacramento east of the levee is developed, graded, or landscaped. The delineation area in the City of West Sacramento west of the levee includes residences and other buildings with landscaping, as well as ruderal woodland, which supports few native trees and predominantly tree of heaven (*Ailanthus altissima*) [FACU]. One other waters (the Sacramento River) and one potential wetland were identified in the delineation area. These features are further described below.

Other Waters—Sacramento River

The location of the OHWM in the Sacramento River was based on the elevation of 19 feet NGVD that was previously determined by the USACE at the I Street Bridge. Observations in the field further confirmed this location based on the presence of shelving, silt deposition, and wracking. The average width of the Sacramento River at the OHWM is approximately 672 feet, and the delineation area encompasses 4.877 acres of the river (Photo 1). The channel bottom is a natural substrate, presumably sand and sediment, but water turbidity prevented visual confirmation of the composition. The river banks are mostly steeply sloped and support riparian forest vegetation, with riprap near the bottom of the slope.

The cottonwood riparian community on the Sacramento River banks is predominantly mature Fremont cottonwood (*Populus fremontii*) [FAC] trees associated with valley oak (*Quercus lobata*) [FACU] and black walnut (*Juglans californica* var. *hindsii*) [FAC]. Other riparian tree species observed include Oregon ash (*Fraxinus latifolia*) [FACW], boxelder (*Acer negundo* var. *californicum*) [FACW], and black willow (*Salix gooddingii*) [FACW]. The riparian understory on the waterside of the levee is primarily rip-rap with nonnative annual grasses and forbs, however, there are also patches of more typical riparian species, such as narrow-leaf willow (*Salix exigua*) [FACW], Himalayan blackberry (*Rubus armeniacus*) [FACU], and mugwort (*Artemisia douglasiana*) [FAC].

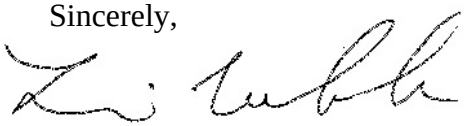
Riparian Wetland

A riparian forest/shrub wetland occurs in the delineation area within riparian habitat that meets all three federal wetland criteria (DP-1w). The riparian wetland is located in the northern portion of the delineation area on the east side of the Sacramento River within a basin (Photo 2). This basin appears to capture overflow from the Sacramento River during high flows. The vegetative composition of riparian forest/shrub wetlands is predominantly cottonwood, but also includes buttonwillow (*Cephalanthus occidentalis* var. *californicus*) [OBL], boxelder, and narrow-leaf willow. Hydric soils in the wetland met the redox depressions (F8) indicator. Wetland hydrology was indicated by observations of water marks (B1), sediment deposits (B2), and oxidized rhizospheres along living roots (C3).

The Cities request verification of the OHWM of the Sacramento River and the extent of the riparian wetland within the delineation area and a preliminary jurisdictional determination according to RGL 08-02. If you require additional information or have any questions regarding this request, please contact me at lisa.webber@icfi.com or Claire Bromund at claire.bromund@icfi.com or either of us by phone at (916) 737-3000.

Thank you for your assistance with this project.

Sincerely,



Lisa Webber
Wetland Ecologist

ICF International, Sacramento

Summary

The purpose of this Noise Study Report is to evaluate noise impacts and abatement, if necessary, under the requirements of Title 23 of the Code of Federal Regulations (CFR) Part 772, "Procedures for Abatement of Highway Traffic Noise," related to construction and operation of the I Street Bridge Replacement Project located in Sacramento, California.

A field investigation was conducted to identify land uses that could be subject to traffic and construction noise impacts resulting from the proposed project. Single-family and multifamily residences were identified as Activity Category B land uses in the project area. Outdoor use areas associated with parks were identified as Activity Category C land uses. Commercial (Activity Category F) and undeveloped (Activity Category G) land uses are also located in the study area. Activity Categories F and G uses do not have noise abatement criteria and therefore are not subject to noise impacts.

Traffic noise levels were predicted using the Federal Highway Administration (FHWA) Traffic Noise Model (TNM), Version 2.5. Existing worst-hour traffic noise levels were found to range from 46 to 71 A-weighted decibels hourly equivalent sound level (dBA Leq[h]).

For the design year (2040) under no-build conditions, predicted traffic noise levels were found to range from 49 to 73 dBA Leq(h). For the design year build conditions, noise levels were found to range from 49 to 74 dBA Leq(h). Traffic noise levels would approach or exceed the noise abatement criteria at single- and multifamily residential (Activity Category B) and park (Activity Category C) receivers identified in this analysis. Traffic noise impacts therefore are predicted to occur at these locations under design year build conditions. Two design options were evaluated for a realignment of Second Street, and roundabout and signalized configurations were evaluated for the I Street/I-5 interchange.

Pursuant to California Department of Transportation (Caltrans) and FHWA regulations and guidance, noise abatement must be considered for land uses where traffic noise impacts are predicted to occur. For noise-sensitive receptors where traffic noise levels were predicted to approach or exceed the noise abatement criteria, noise abatement in the form of barriers was considered. Noise barriers were evaluated for eight locations where Activity Category B or Activity Category C receivers were predicted to be affected due to the project. None of these barriers were found to be feasible because of driveway or public roadway access requirements, no presence of frequent outdoor use areas, or conflicts with public sidewalks.

During construction of the proposed project, noise from construction activities would intermittently dominate the noise environment in the immediate area of construction. Conventional construction equipment is expected to generate maximum noise levels ranging from 75 to 96 dB at a distance of 50 feet. Noise from pile driving would generate maximum noise levels of approximately 101 dB at a distance of 50 feet. Noise produced by construction equipment would diminish over distance at a rate of approximately 6 dB per doubling of distance. No adverse noise impacts from construction are anticipated because construction would be conducted in accordance with Caltrans' provisions in Section 14-8.02, "Noise Control," of the *Caltrans Standard Specifications* and applicable local noise standards.

Chapter 1 Introduction

The City of Sacramento, in cooperation with the City of West Sacramento and the California Department of Transportation (Caltrans), proposes to construct a new bridge over the Sacramento River to replace the vehicle crossing that is currently accommodated by the existing I Street Bridge in order to remove a series of functionally obsolete or structurally deficient bridges (i.e., approach structures). The new connection also would reduce future traffic congestion, improve operations and safety, serve multiple modes of transportation, and comply with current American Association of State Highway and Transportation Officials, Caltrans, and local agency design standards.

The project is subject to state and federal environmental review requirements because of use of federal Highway Bridge Program (HBP) funds from the Federal Highway Administration (FHWA). Accordingly, project documentation is being prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The City of Sacramento is the lead agency under CEQA, with the City of West Sacramento as a responsible agency, and Caltrans is the lead agency under NEPA. The FHWA's other responsibilities for environmental review, consultation, and any other action required in accordance with applicable federal laws for this project will be carried out by Caltrans under its assumption of responsibility pursuant to 23 U.S. Code (USC) 327.

This project is included in the Sacramento Area Council of Governments (SACOG) 2035 *Metropolitan Transportation Plan/Sustainable Communities Strategy* (MTP/SCS).

The purpose of this Noise Study Report (NSR) is to evaluate noise impacts and abatement under the requirements of Title 23, Part 772, of the Code of Federal Regulations (CFR), "Procedures for Abatement of Highway Traffic Noise," related to construction and operation of the I Street Bridge Replacement Project. Specifically, 23 CFR 772 provides procedures for preparing operational and construction noise studies and evaluating noise abatement considered for federal and federal-aid highway projects. According to 23 CFR 772.3, all highway projects that are developed in conformance with this regulation are deemed to be in conformance with FHWA noise standards.

Caltrans' Traffic Noise Analysis Protocol for New Highway Construction, Reconstruction, and Retrofit Barrier Projects (Protocol), dated May 2011, provides Caltrans policy for implementing 23 CFR 772 in California. The Protocol outlines the requirements for preparing NSRs.

1.1 Project Location

The proposed project is located over the Sacramento River between the cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge (Figures 1-1 and 1-2). The project limits starting within the City of Sacramento consist of Railyards Boulevard from 200 feet east of Bercut Drive on the east, continuing west over the Sacramento River into the City of West Sacramento along C Street, and terminating approximately 100 feet west of the 5th Street intersection. The project limits also extend along Bercut Drive approximately 500 feet

north of Railyards Boulevard, along Jibboom Street 550 feet north of Railyards Boulevard and 300 feet south of Railyards Boulevard, along 3rd Street 50 feet north and south of C Street, along 4th Street 50 feet north and south of C Street, and along 5th Street 50 feet north and south of C Street. The total length of the project is approximately 0.42 mile along C Street and Railyards Boulevard.

1.2 Purpose and Need

The proposed project would construct a new bridge over the Sacramento River between the Cities of Sacramento and West Sacramento to replace the vehicle crossing that is currently provided by the existing I Street Bridge. Construction of the proposed project has independent utility; the project is not dependent on other projects or improvements to meet the purpose and need.

Termini for the proposed project were developed through an iterative process involving engineering design and traffic operations analysis. Preliminary design concepts were tested with the traffic operations analysis model to evaluate how lane configurations influenced peak-hour conditions.

Figure 1-2
Proposed Project

1.2.1 Purpose

The purpose and objectives of the project are listed below.

- The project should construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.
- The new bridge should meet the requirements of the Neighborhood Friendly Bridge definition that the City of Sacramento City Council adopted by resolution on October 18, 2011, which is defined by the following elements.
  - A facility whose primary function is local connectivity rather than regional travel and primarily serves short local trips.
  - A bridge which serves all users, including motorists, bicyclists, pedestrians, low energy vehicles, and public transit riders.
  - A bridge with aesthetics and dimensions which are architecturally pleasing and contextually appropriate for the adjacent neighborhoods.
  - A bridge that does not exceed or expand the already-planned capacity of the approach roadways (i.e., no widening of approaches just to accommodate bridge flows).
  - A facility which is designed with a target speed equal to or less than the approach roadways.
  - A bridge which reduces the growth in vehicle miles traveled in the adjacent communities.
  - A bridge that does not connect directly to streets which are primarily residential in character.
  - A bridge that is consistent with the Need and Purpose statement [the adopted Sacramento River Crossings Alternatives Study statement] as articulated.
- In addition to the Neighborhood Friendly Bridge definition, the project should include pedestrian and bicycle facilities in the new public crossing that meet Americans with Disabilities Act (ADA) requirements, and facilitate connections to and from the new crossing and the Sacramento River Parkway and Riverfront Park trails.
- The proposed project also would need to construct a movable bridge that satisfies the vertical clearance and river navigation requirements of the U.S. Coast Guard (USCG).
- The project design should not preclude future addition of a streetcar, a separate, stand-alone project being developed by the Cities of West Sacramento and Sacramento.
- The new bridge also is intended to improve the connectivity to, and accessibility of, businesses, recreational areas, and new or redevelopment opportunity sites located in the urban core of Sacramento and West Sacramento.

1.2.2 Need

The project is needed for the following reasons.

- The existing I Street Bridge does not fully comply with current design and traffic operation standards due to the following conditions.
  - I Street Bridge limits or restricts traffic capacity and multimodal use. The current bridge width is not sufficient to provide adequate traffic operations, bicycle lanes, or the ability for transit service across the bridge.
  - The I Street Bridge and the four associated approach structures are on the federal eligible bridge list for federal funds for replacement and/or rehabilitation through the HBP. The I Street Bridge has been classified as functionally obsolete, and the existing approach structures have been classified as structurally deficient. The Cities of Sacramento and West Sacramento have decided to pursue replacement through the HBP.
- As adopted by the Sacramento City Council, new crossings of the Sacramento River between the City of Sacramento and City of West Sacramento shall be Neighborhood Friendly. In coordination with staff from the City of West Sacramento and SACOG, the definition for a Neighborhood Friendly Bridge was developed by the City of Sacramento and the Sacramento City Council adopted the definition by resolution in October 2011. The replacement bridge structure is required to be consistent with the Neighborhood Friendly Bridge definition.
- In addition to the Neighborhood Friendly Bridge requirements, lack of ADA compliance, non-standard and non-continuous sidewalks, and lack of bicycle facilities discourage walking and bicycling on the existing I Street Bridge.
- Section 9 of the Rivers and Harbors Act requires any local, state, or federal agency planning to construct a bridge over a navigable waterway to apply for a bridge permit through the USCG. The USCG requires the new bridge to meet or exceed the existing vertical clearance along the river, which is currently set by the US 50 Pioneer Bridge. In order to comply with the Neighborhood Friendly Bridge definition and meet the USCG requirements for navigation clearance, the new bridge will need to be movable.
- The SACOG MTP/SCS identifies that a proposed streetcar will cross over the new bridge from Sacramento to West Sacramento. While the streetcar will be a separate, stand-alone project, the bridge design must not preclude the future addition of a streetcar.
- Limited connectivity to the riverfront reduces the potential to achieve planned urban development and redevelopment of opportunity sites identified in the adopted plans of Sacramento and West Sacramento.

Chapter 2 Project Description

This section describes the proposed action and the design alternatives that were developed to meet the identified need through accomplishing the defined purpose(s), while avoiding or minimizing environmental impacts. The alternatives under consideration are one bridge alignment for the new bridge over the Sacramento River and two alternatives for portions of the roadway design in Sacramento and in West Sacramento.

- City of Sacramento Railyards Boulevard/Jibboom Street/Bercut Drive Intersection
  - Alternative 1—Signalized Intersection at Jibboom Street and Bercut Drive
  - Alternative 2—Roundabout Intersection at Jibboom Street and Bercut Drive
- City of West Sacramento Residential Access
  - Alternative 1—C Street Connection to B Street
  - Alternative 2—C Street Connection to 3rd Street
- No-Build (No-Project) Alternative

The proposed project is located in Sacramento and Yolo Counties, over the Sacramento River and between the Cities of Sacramento and West Sacramento, and approximately 1,000 feet north of the existing I Street Bridge (Figure 1-1). The total length of the project is approximately 0.42 mile along C Street and Railyards Boulevard. The purpose of the project is to construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento in order to remove a series of functionally obsolete or structurally deficient bridges, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.

2.1 Build Alternatives

One alignment is proposed for the new bridge over the Sacramento River. A new approximately 860-foot bridge, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides, is proposed. The bridge would include two fixed-span approach structures, approximately 200 feet and 270 feet in length, that tie into the Sacramento and West Sacramento banks of the river, respectively. The center span of the bridge would be an approximately 330-foot movable span that meets the USCG requirements. Roadway improvements on Railyards Boulevard in Sacramento and C Street in West Sacramento also are proposed. In both Sacramento and West Sacramento, two alternatives for portions of the roadway design are being considered.

- City of Sacramento Railyards Boulevard/Jibboom Street/Bercut Drive Intersection
  - Alternative 1—Signalized Intersection at Jibboom Street and Bercut Drive
  - Alternative 2—Roundabout Intersection at Jibboom Street and Bercut Drive

In the City of Sacramento, Alternative 1 consists of a signalized intersection at Jibboom Street and Bercut Drive, while Alternative 2 consists of a roundabout between these two intersections. Beyond the Jibboom Street and Bercut Drive intersections, the remaining project elements and limits in the City of Sacramento are similar under both alternatives.

- City of West Sacramento Residential Access
  - Alternative 1—C Street Connection to B Street
  - Alternative 2—C Street Connection to 3rd Street

In the City of West Sacramento, the proposed C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. Two alternatives are proposed for maintaining access to these parcels. Alternative 1 would construct a new connection to C Street, approximately 150 feet east of the C Street/3rd Street intersection, that would extend north to B Street and then ultimately connect to the 3rd Street/B Street intersection. Alternative 2 would connect to the same location at C Street as Alternative 1, approximately 150 feet east of the C Street/3rd Street intersection, but would continue north approximately 300 feet, then make a 90-degree left turn, and connect to 3rd Street approximately 300 feet north of C Street.

2.1.1 Common Design Features of the Build Alternatives

The proposed project would construct a new bridge over the Sacramento River between Sacramento and West Sacramento to replace the vehicular crossing that is provided by the existing I Street bridge. The project would facilitate vehicular and multimodal traffic over the river in order to reduce traffic congestion, improve safety, and remove a number of structurally deficient or functionally obsolete bridges that have reached the limit of their design life. While the existing I Street Bridge over the Sacramento River would remain in-place, the approach structures leading up to the bridge from both directions would be demolished. See Figure 1-2 for a depiction of the project limits and the approach structures that would be removed.

The Sacramento River is considered to be a navigable waterway of the United States. Under the provisions of the General Bridge Act of 1946, as amended, the USCG must approve proposed location and plans for bridges over navigable waters of the United States prior to commencing construction. In order to comply with the adopted Neighborhood Friendly Bridge definition and the USCG requirement to maintain navigation along the river, the new bridge is proposed to be a movable bridge.

Common design features of the build alternatives are listed below.

2.1.1.1 New Bridge Construction and Roadway Modifications

Bridge Construction

The proposed project would construct a new bridge over the Sacramento River. The total bridge length would be approximately 860 feet long, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides of the bridge. The bridge would include two fixed-

span approach structures that tie into the Sacramento and West Sacramento banks of the river and are approximately 200 feet and 270 feet in length, respectively. The center span of the bridge would be a movable span that meets the USCG requirements. The movable span is anticipated to be approximately 330 feet in length. The bridge soffit elevation would be set 3 feet above the 200-year water surface elevation to comply with the Central Valley Flood Protection Board (CVFPB) freeboard requirements.

The two fixed-span approach structures would be 72 feet wide, with a superstructure depth (or total bridge thickness) of approximately 6 feet. Each approach structure would be a two-span bridge. The abutment at one end of the structure would be constructed on the banks of the river, a center pier would be placed within the river approximately around the existing bank toe of slope, and the other end of the approach structure would be constructed on the piers for the movable span.

Based on coordination with the USCG, the movable span would provide a 278-foot clear channel opening approximately centered at the middle of the river. As such, the movable span has been identified as a vertical lift bridge, which would raise the bridge to a minimum vertical clearance of 59 feet over the maximum river elevation of 31 feet (measured to the NGVD 29 vertical datum). The truss depth of the movable span would be approximately 40 feet, with 6 feet of the structure being below the bridge deck and 34 feet above the bridge deck. The vertical towers would be approximately 130 feet tall, measured from the bridge soffit elevation. The vertical towers would be approximately 33 feet in thickness and the same width as the bridge deck. The total bridge width on the movable span would be 81 feet.

Due to the existing soil conditions, the bridge would be constructed on deep pile foundations. The abutments for the fixed-span approach structures at the river bank would consist of approximately 50 piles per abutment that are driven or cast-in-drill-hole (CIDH), to a depth of approximately 70 feet below the original ground elevation. The center piers for the two fixed-span approach structures (located approximately at the bank toe of slope in the river, below the ordinary high water mark) would consist of 50 driven or CIDH piles per pier that are approximately 70 feet below the original ground elevation. If driven piles are selected for either the abutments or piers, the piles would be precast concrete or steel. The foundations for the movable span would consist of four large-diameter cast-in-steel-shell piles per pier. Each pile would be 9 feet in diameter, extending approximately 140 feet below the original ground elevation.

Erosion control measures would be installed around the proposed bridge foundations to prevent future scour at the bridge supports. It is anticipated that rock slope protection (RSP) would be installed around the bridge abutments and piers within the water to control erosion.

A bridge fender system also is planned around the movable span piers to protect the piers from errant watercrafts that are navigating along the river. The fender system would include approximately 30 driven concrete or wooden piles around each of the movable span piers. The piles would be driven to a depth of approximately 30 feet below the original ground elevation.

Temporary Falsework

Temporary falsework platforms would be required to construct the proposed bridge foundations and approach structures. The platforms would be constructed using temporary piles within the river that would be installed on or after April 15; they would be removed by October 31 of each year, and following completion of construction. In addition, temporary cofferdams would be required to construct the bridge piers within the water. The cofferdams would consist of temporary sheetpiles installed around the individual piers. Dewatering inside the cofferdams would be required.

Roadway Modifications

City of Sacramento

In Sacramento, Bercut Drive would be modified from Railyards Boulevard north approximately 500 feet. Bercut Drive would be designed to have two northbound lanes at the Railyards Boulevard intersection, tapering down to one northbound lane at the northern project limits, and one southbound lane. Improvements to Bercut Drive south of Railyards Boulevard are not part of, nor needed for, the proposed project and would be constructed if needed as part of a separate future project.

Proposed improvements on Jibboom Street would extend 550 feet north of Railyards Boulevard. The roadway would consist of one travel lane in each direction, on-street Class II bike lanes, sidewalk along the west side of the roadway, and retaining walls of various heights along both sides of the road. Extension of Jibboom Street south of Railyards Boulevard is not included with, nor needed for, the proposed project and would be constructed if needed as part of a separate future project.

The proposed roadway profile for Railyards Boulevard would be approximately 6 feet higher than the original ground elevation at the Jibboom Street intersection. The profile adjustment is needed in order to satisfy the CVFPB requirements to provide 3 feet of clearance between the 200-year-flood water surface elevation and the bridge soffit (or low chord of the bridge).

City of West Sacramento

Between the bridge touchdown location along C Street in West Sacramento and the 4th Street/ C Street intersection, the roadway would consist of one westbound travel lane, two eastbound travel lanes (the two eastbound travel lanes would taper down to one eastbound lane east of the 3rd Street intersection), a center left-turn lane, on-street Class II bike lanes, on-street parking along the north side of the roadway, and sidewalks along both sides of the roadway. As the roadway through this section currently consists of the proposed number of travel lanes, the widening through this area is primarily needed to support the Class II bike lanes and wider sidewalks.

Along C Street between 4th Street and 5th Street, the roadway would consist of one travel lane in each direction, left-turn lanes, on-street Class II bike lanes, and sidewalks along both sides of the

road. All of the improvements through this section would be accommodated within the existing roadway limits.

2.1.1.2 Class I Bikeway and Levee Modifications and Improvements

City of Sacramento

The existing Class I Sacramento River Parkway along Jibboom Street would be reconstructed approximately 500 feet north and 300 feet south of Railyards Boulevard as part of the proposed project. In order to maintain a continuous off-street Class I path along this section, the path would be grade-separated under the proposed bridge structure. Cyclists and pedestrians approaching Railyards Boulevard in either direction would have the option to continue along the path under the new structure, avoiding the need to cross the roadway. Cyclists and pedestrians who are traveling along the path also would have the option to connect to Railyards Boulevard and cross over the proposed bridge into West Sacramento or turn east into Sacramento. Due to the limited horizontal clearance between the river and the Interstate-5 (I-5) viaduct structure, retaining walls would be needed along the path to account for the vertical elevation difference between Jibboom Street and the path that continues under the proposed bridge structure. The maximum retaining wall height along the bike path would be 16 feet.

City of West Sacramento

The proposed project would require improvements to the existing levee along the West Sacramento side of the river, where the proposed bridge alignment would connect to C Street. The existing levee does not meet current standards required by Title 23 of the California Code of Regulations. Extending approximately 300 feet north and south of the proposed C Street alignment, the levee cross-section would be reconstructed to meet current design standards, which would require 3:1 side slopes on the landside and waterside of the levee, and a 20-foot-wide crown at the top of the levee. The levee improvements also would include a slurry cutoff wall extending to a depth of 110 feet below the original ground elevation. In addition, the proposed roadway profile would be approximately 6 feet higher than the original ground elevation as it crosses over the levee. In order to maintain access to the levee for inspection and maintenance services, access roads would be constructed from the new roadway to the top of the improved levee section. The proposed grading for the levee would require relocation of the existing water tower that is located along 2nd Street, just north of the proposed C Street alignment. The tower would be relocated to the northwest, approximately 43 feet from its existing location.

The new levee maintenance road also would serve as the future Class I River Walk Park trail extension in West Sacramento. Similar to the trail improvements proposed as part of the project in Sacramento, the trail would be grade-separated under the proposed bridge structure. Cyclists and pedestrians approaching C Street in either direction would have the option to continue along the trail under the new structure, avoiding the need to cross the roadway. Cyclists and pedestrians who are traveling along the trail also would have the option to connect to C Street to cross over the proposed bridge into Sacramento or head west on C Street.

2.1.1.3 Storm Water Drainage Management

Drainage for the proposed roadway would be conveyed to the existing storm drain system installed within Railyards Boulevard and C Street. Railyards Boulevard currently drains storm water to the east along the roadway and then into a retention basin south of Railyards Boulevard. C Street drains storm water west along the roadway and then ultimately south beyond the project limits.

As is standard with all construction projects, the contractor would be required to install temporary best management practices (BMPs) to control any runoff or erosion from the project site into the surrounding waterways. These temporary BMPs would be installed prior to any construction operations and would be in place for the duration of the contract. The removal of these BMPs would be the final operation, along with project site cleanup.

2.1.1.4 Structure Demolition and Roadway Modifications

Following completion of the new bridge connections at Railyards Boulevard and C Street, traffic would be diverted to the new bridge, and the four existing approach structures to the I Street Bridge would be removed. Bridge numbers 24C0364L, 24C0364R, 22-0033, and 22C0154 would be demolished and the foundations would be removed to a depth of 3 feet below the original ground elevation. Encroachment permits from Caltrans and Union Pacific Railroad would be needed to complete the bridge removal. The existing I Street Bridge is owned and operated by Union Pacific Railroad and would continue to remain in-place and used by trains following construction of the new bridge.

As part of the removal of the existing approach structures, the project would include modifications to I Street within the City of Sacramento from the southbound I-5 on-ramp east to the 5th Street intersection. The modification would include signing and striping revisions, demolition of existing roadway sections that are no longer required, and removal of bridge abutments and foundations.

2.1.1.5 Staging, Storage, and Proposed Access during Construction

Two staging areas would be used to store materials and equipment during construction, such as pipe materials, precast manholes and drop inlets, steel girders, piles, and rebar, along with the construction equipment when not in use. One area would be located south of Railyards Boulevard under I-5 in Sacramento; the other area would be located west of the landward side of the levee, south of the new bridge location in West Sacramento. The staging area located along Railyards Boulevard would be accessed via the existing intersection at Jibboom Street. The staging area in West Sacramento would be accessed via the existing 2nd Street connection at 3rd Street, south of C Street. The staging areas would be in use throughout the construction duration; the areas would be returned to their pre-project conditions at the completion of the project.

2.1.1.6 Utility Relocations

A number of public and private utilities would need to be relocated or adjusted to grade as part of the project, including existing water, sewer, gas, electric, and communication facilities within Jibboom Street, Bercut Drive, C Street, and 2nd Street.

2.1.1.7 Traffic Management and Detours during Construction

While most of the project would be constructed outside of existing roadways, some areas would require temporary detours or staged construction.

Along Jibboom Street at the proposed Railyards Boulevard intersection, the new roadway profile would be raised approximately 6 feet above the original ground elevation. To maintain access to the existing Jibboom Street viaduct south of Railyards Boulevard during the roadway construction, a temporary access road would be needed. The proposed temporary access road would connect to the existing Jibboom Street viaduct abutment approximately 350 feet south of Railyards Boulevard. The temporary road would then continue under I-5 and connect to the Railyards Boulevard/Bercut Drive intersection. The temporary road would require placement of temporary fill material and a roadway structural section that would be removed after construction of the new bridge. Traffic traveling north along Jibboom Street would continue north along Bercut Drive to access the Richards Boulevard/I-5 interchange.

In order to complete the improvements at Jibboom Street and Railyards Boulevard, Jibboom Street would be closed to traffic approximately 600 feet north of Railyards Boulevard. Traffic traveling south along Jibboom Street to continue over the existing I Street Bridge into West Sacramento would be detoured over to Bercut Drive at Richards Boulevard. Traffic would then use the temporary access road to connect to the Jibboom Street viaduct structure. The temporary access road would be in place for approximately 2 years, after which traffic would use the new roadways and new bridge.

The Sacramento River Parkway trail along Jibboom Street also would require temporary re-routing during construction. The temporary alignment for the trail would follow the temporary Jibboom Street alignment south of Railyards Boulevard. Cyclists and pedestrians would then continue following a detour north along Bercut Drive to Richards Boulevard, where they could then connect back to the Parkway on the west side of I-5. The detour would be in place for approximately 2 years.

During construction, traffic along C Street would be maintained along the existing approach structure until the new bridge is constructed.

2.1.1.8 Project Construction Sequence

New bridge and roadway construction would occur first, followed by demolition of the four approach structures that connect to the existing I Street Bridge. Once the new bridge and roadways are constructed, traffic would be diverted to the new bridge in order to allow demolition adjacent to the existing bridge. Construction of the project is expected to take approximately 30 months.

2.1.1.9 Property Acquisition

The project would require temporary and permanent property acquisitions along C Street, 3rd Street, and 2nd Street within the City of West Sacramento and along Railyards Boulevard, Jibboom Street, Bercut Drive, and I Street within the City of Sacramento.

Along C Street, temporary and permanent acquisitions would be required along the south side of the roadway to accommodate the construction of standard shoulders, bike lanes, and sidewalks—from the intersection of 4th Street to the Sacramento River.

Along 3rd Street and 2nd Street, temporary and permanent acquisitions would be needed from the Union Pacific Railroad on the south, to just north of the B Street intersections, for construction of the proposed roadway and levee improvements.

Along Railyards Boulevard, Jibboom Street, and Bercut Drive, temporary and permanent acquisition would be needed from the current state-owned right-of-way for I-5, for construction of the roadway. In addition, temporary and permanent acquisitions would be needed along Jibboom Street for the proposed temporary detour road and Class I bikeway improvements.

Temporary acquisition would be required along the existing I Street connection to facilitate removal of the existing viaduct structures. Due to the limited space available in Old Sacramento, it is anticipated that construction activities would occur from the parking lot at the intermodal station.

2.1.2 Unique Features of Build Alternatives

In both the City of Sacramento and the City of West Sacramento, two alternatives for portions of the roadway design are being considered.

2.1.2.1 City of Sacramento Railyards Boulevard/Jibboom Street/Bercut Drive Intersection

Alternative 1 consists of a signalized intersection at Jibboom Street and Bercut Drive, while Alternative 2 consists of a roundabout between these two intersections. Beyond the Jibboom Street and Bercut Drive intersections, the remaining project elements and limits are similar under both alternatives.

Alternative 1—Signalized Intersection at Jibboom Street and Bercut Drive

Under Alternative 1, Railyards Boulevard would be extended west over the Sacramento River; east of Bercut Drive. Railyards Boulevard would consist of two westbound lanes and one eastbound lane. Between Jibboom Street and Bercut Drive, Railyards Boulevard would consist of two westbound lanes and three eastbound lanes; two eastbound lanes would be trapped into left-turn lanes onto Bercut Drive, and one eastbound lane would continue along Railyards Boulevard. West of the Jibboom Street intersection, Railyards Boulevard would consist of one lane in each direction.

Alternative 2—Roundabout Intersection at Jibboom Street and Bercut Drive

Under Alternative 2, Railyards Boulevard would be extended west over the Sacramento River. East of Bercut Drive, Railyards Boulevard would consist of two westbound lanes and one eastbound lane. Between Jibboom Street and Bercut Drive, Railyards Boulevard would consist of a roundabout with two lanes in each direction. One westbound lane would be a trap onto northbound Jibboom Street, and one westbound lane would continue onto the new bridge. One eastbound lane would be trapped into left-turn lanes onto Bercut Drive, and one eastbound lane would continue along Railyards Boulevard. West of Jibboom Street, Railyards Boulevard would consist of one lane in each direction.

2.1.2.2 City of West Sacramento Residential Access

The new C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. Two alternatives are proposed for maintaining access to these parcels.

Alternative 1—C Street Connection to B Street

Alternative 1 would construct a new connection to C Street approximately 150 feet east of the 3rd Street intersection. The new access road would be 30 feet wide, extend north to B Street, and then ultimately connect to the 3rd Street/B Street intersection. This alternative would require right-of-way acquisitions from six individual parcels and removal of two structures. One structure is located on APN 010-101-010 and appears to be an individual residence. Another structure is located on APN 010-101-013 and appears to be an apartment building that supports up to four individual apartments. As B Street currently is constructed along the existing levee, the roadway improvements also would require an additional 500 feet of improvements to the levee. Similar to the improvements identified along C Street, the levee cross-section would be reconstructed to meet current design standards, which require 3:1 side slopes on the landside and waterside of the levee, with a 20-foot-wide crown at the top of the levee. The levee improvements also would include a slurry cutoff wall that extends to a depth of 110 feet below the original ground elevation.

Alternative 2—C Street Connection to 3rd Street

Alternative 2 would connect to the same location at C Street, approximately 150 feet east of the 3rd Street intersection and continue north approximately 300 feet. This alternative would then make a 90-degree left turn and connect to 3rd Street approximately 300 feet north of C Street. This alternative would require right-of-way acquisition from seven individual parcels and removal of three structures. One structure is located on APN 010-101-010 and appears to be an individual residence. Another structure is located on APN 010-101-013 and appears to be an apartment building that supports up to one individual apartment. The last structure is located on APN 010-101-004 and appears to be an individual residence.

2.2 No Build (No-Project) Alternative

Under the No Build Alternative, the existing I Street Bridge would remain in use for vehicle, bicycle, and pedestrian access between the Cities of Sacramento and West Sacramento. No changes to traffic patterns on I Street or C Street would occur. The four approach structures would remain in place and in use; and there would be no changes to existing roadways, levees or Class I bikeways.

Improvements and development of transportation infrastructure would continue following the General Plans of both cities, the Sacramento Railyards Specific Plan (approved December 2007), and the Washington Specific Plan (adopted May 1996). The Sacramento Railyards Specific Plan identifies the extension of Railyards Boulevard west to a Tee intersection at Jibboom Street. Railyards Boulevard at Bercut Drive would consist of two westbound lanes and one eastbound lane. The same number of lanes on Railyards Boulevard would extend west to the intersection with Jibboom Street; at this point, the left westbound lane on Railyards Boulevard would become a dedicated left-turn onto southbound Jibboom Street, and the right westbound lane would be a dedicated right-turn onto northbound Jibboom Street.

In West Sacramento, future changes to C Street would be based on the Washington Specific Plan, which identifies 12-foot-wide sidewalks and 7-foot-wide Class II bike lanes along the roadway. The connection to the I Street Bridge would not change.

2.3 Permits and Approvals Needed

The following permits and coordination likely will be required for the project.

Table 2-1. Permits and Approvals Needed

Agency	Permit/Approval	Status
U.S. Coast Guard	Authorization under General Bridge Act of 1946, as amended, for new bridge over navigable waters of the United States	Initiated
U.S. Army Corps of Engineers	Section 404 Clean Water Act authorization for fill of waters of the United States	Not yet initiated
National Marine Fisheries Service	Coordination regarding threatened and endangered species	Not yet initiated
U.S. Fish and Wildlife Service	Coordination regarding threatened and endangered species	Not yet initiated
California Department of Fish and Wildlife	Section 1602 Department of Fish and Game Code Streambed Alteration Agreement	Not yet initiated
Central Valley Regional Water Quality Control Board	Section 401 Water Quality Certification and coverage under the existing Caltrans National Pollutant Discharge Elimination System Permit (Order No. 00-06-DWQ)	Not yet initiated
Central Valley Flood Protection Board	Encroachment Permit	Not yet initiated
State Lands Commission	Lease of State Lands	Not yet initiated
Sacramento Area Flood Control Agency	Approval of changes to levee	Not yet initiated
West Sacramento Area Flood Control Agency	Approval of changes to levee	Not yet initiated
Sacramento Metropolitan Air Quality Management District	Formal notification prior to construction	Not yet initiated
Yolo-Solano Air Quality Management District	Formal notification prior to construction	Not yet initiated

Chapter 3 Fundamentals of Traffic Noise

This section contains a brief discussion of fundamental traffic noise concepts. For a detailed discussion, please refer to the Caltrans *Technical Noise Supplement* (TeNS) (Caltrans 2013), a technical supplement to the Protocol, which is available on the Caltrans website (<http://www.dot.ca.gov/hq/env/noise/pub/TeNS_Sept_2013B.pdf>).

3.1 Sound, Noise, and Acoustics

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air) to a hearing organ, such as a human ear. *Noise* is defined as loud, unexpected, or annoying sound.

In the science of acoustics, the fundamental model consists of a sound (or noise) source, a receptor, and the propagation path between the two. The loudness of the noise source and obstructions or atmospheric factors affecting the propagation path to the receptor determine the sound level and characteristics of the noise perceived by the receptor. The field of acoustics deals primarily with the propagation and control of sound.

3.2 Frequency

Continuous sound can be described by frequency (pitch) and amplitude (loudness). A low-frequency sound is perceived as low in pitch. Frequency is expressed in terms of cycles per second, or Hertz (Hz) (e.g., a frequency of 250 cycles per second is referred to as 250 Hz). High frequencies are sometimes more conveniently expressed in kilohertz (kHz), or thousands of Hertz. The audible frequency range for humans is generally between 20 and 20,000 Hz.

3.3 Sound Pressure Levels and Decibels

The amplitude of pressure waves generated by a sound source determines the loudness of that source. Sound pressure amplitude is measured in micro-Pascals (μPa). One μPa is approximately one hundred billionth (0.00000000001) of normal atmospheric pressure. Sound pressure amplitudes for different kinds of noise environments can range from less than 100 to 100,000,000 μPa. Because of this huge range of values, sound is rarely expressed in terms of μPa. Instead, a logarithmic scale is used to describe sound pressure level (SPL) in terms of decibels (dB). The threshold of hearing for young people is about 0 dB, which corresponds to 20 μPa.

3.4 Addition of Decibels

Because decibels are logarithmic units, SPLs cannot be added or subtracted through ordinary arithmetic. Under the decibel scale, a doubling of sound energy corresponds to a 3-dB increase. In other words, when two identical sources are each producing sound of the same loudness, the resulting sound level at a given distance would be 3 dB higher than one source under the same conditions. For example, if one automobile produces an SPL of 70 dB when it passes an observer, two cars passing simultaneously would not produce an SPL of 140 dB—rather, they would combine to produce an SPL of 73 dB. Under the decibel scale, three sources of equal loudness together produce a sound level 5 dB louder than one source.

3.5 A-Weighted Decibels

The decibel scale alone does not adequately characterize how humans perceive noise. The dominant frequencies of a sound substantially affect the human response to that sound. Although the intensity (energy per unit area) of the sound is a purely physical quantity, the loudness or human response is determined by the characteristics of the human ear.

Human hearing is limited in the range of audible frequencies as well as in the way it perceives the SPL in that range. In general, people are most sensitive to the frequency range of 1,000–8,000 Hz and perceive sounds within that range better than sounds of the same amplitude in higher or lower frequencies. To approximate the response of the human ear, sound levels of individual frequency bands are weighted, depending on the human sensitivity to those frequencies. Then, an A-weighted sound level (expressed in units of dBA [A-weighted decibels]) can be computed based on this information.

The A-weighting network approximates the frequency response of the average young ear when listening to most ordinary sounds. When people make judgments regarding the relative loudness or annoyance of a sound, their judgments correlate well with the A-scale sound levels of those sounds. Other weighting networks have been devised to address high noise levels or other special problems (e.g., B, C, and D scales), but these scales are rarely used in conjunction with highway traffic noise. Noise levels for traffic noise reports are typically reported in terms of dBA. Table 3-1 describes typical A-weighted noise levels for various noise sources.

Table 3-1. Typical A-Weighted Noise Levels

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	— 110 —	Rock band
Jet fly-over at 1,000 feet		
	— 100 —	
Gas lawnmower at 3 feet		
	— 90 —	
Diesel truck at 50 feet at 50 mph		Food blender at 3 feet
	— 80 —	Garbage disposal at 3 feet
Noisy urban area, daytime		
Gas lawnmower at 100 feet	— 70 —	Vacuum cleaner at 10 feet
Commercial area		Normal speech at 3 feet
Heavy traffic at 300 feet	— 60 —	
		Large business office
Quiet urban daytime	— 50 —	Dishwasher (next room)
Quiet urban nighttime	— 40 —	Theater; large conference room (background)
Quiet suburban nighttime		
	— 30 —	Library
Quiet rural nighttime		Bedroom at night; concert
	— 20 —	
		Broadcast/recording studio
	— 10 —	
Lowest threshold of human hearing	— 0 —	Lowest threshold of human hearing

3.6 Human Response to Changes in Noise Levels

As discussed above, doubling sound energy results in a 3-dB increase in sound. However, given a sound level change measured with precise instrumentation, the subjective human perception of a doubling of loudness will usually be different from what is measured.

Under controlled conditions in an acoustical laboratory, the trained healthy human ear is able to discern 1-dB changes in sound levels when exposed to steady single-frequency (pure-tone) signals in the mid-frequency (1,000–to 8,000-Hz) range. In typical noisy environments, changes in noise of 1 to 2 dB are generally not perceptible. However, it is widely accepted that people are able to begin to detect sound level increases of 3 dB in typical noisy environments. Further, a 5-dB increase is generally perceived as a distinctly noticeable increase, and a 10-dB increase is generally perceived as a doubling of loudness. Therefore, a doubling of sound energy (e.g.,

doubling the volume of traffic on a highway), which would result in a 3-dB increase in sound, would generally be perceived as barely detectable.

3.7 Noise Descriptors

Noise in our daily environment fluctuates over time. Various noise descriptors have been developed to describe time-varying noise levels. The noise descriptors most commonly used in traffic noise analysis are listed below.

- **Equivalent Sound Level (Leq):** Leq represents an average of the sound energy occurring over a specified period. In effect, Leq is the steady-state sound level containing the same acoustical energy as the time-varying sound that actually occurs during the same period. The 1-hour A-weighted equivalent sound level (Leq[h]) is the energy average of A-weighted sound levels occurring during a 1-hour period, and it is the basis for noise abatement criteria (NAC) used by Caltrans and FHWA.
- **Percentile-Exceeded Sound Level (Lxx):** Lxx represents the sound level exceeded for a given percentage of a specified period (e.g., L10 is the sound level exceeded 10 percent of the time, and L90 is the sound level exceeded 90 percent of the time).
- **Maximum Sound Level (Lmax):** Lmax is the highest instantaneous sound level measured during a specified period.
- **Day-Night Level (Ldn):** Ldn is the energy average of A-weighted sound levels occurring over a 24-hour period, with a 10-dB penalty applied to A-weighted sound levels occurring during nighttime hours between 10 p.m. and 7 a.m.
- **Community Noise Equivalent Level (CNEL):** Similar to Ldn, CNEL is the energy average of the A-weighted sound levels occurring over a 24-hour period, with a 10-dB penalty applied to A-weighted sound levels occurring during the nighttime hours between 10 p.m. and 7 a.m., and a 5-dB penalty applied to the A-weighted sound levels occurring during evening hours between 7 p.m. and 10 p.m.

3.8 Sound Propagation

When sound propagates over a distance, it changes in level and frequency content. The manner in which noise reduces with distance depends on the factors listed below.

3.8.1 Geometric Spreading

Sound from a localized source (i.e., a *point source*) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and, hence, can be treated as a *line source*, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as

cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source.

3.8.2 Ground Absorption

The propagation path of noise from a highway to a receptor is usually very close to the ground. Noise attenuation from ground absorption and reflective-wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation also has been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 feet. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receptor, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., soft dirt, grass, or scattered bushes and trees), an excess ground-attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance.

3.8.3 Atmospheric Effects

Receptors located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can experience lowered noise levels. Sound levels can be increased at large distances from the highway (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence also can cause significant effects.

3.8.4 Shielding by Natural or Human-Made Features

A large object or barrier in the path between a noise source and a receptor can substantially attenuate noise levels at the receptor. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Natural terrain features (e.g., hills and dense woods) and human-made features (e.g., buildings and walls) can substantially reduce noise levels. Walls often are constructed between a source and a receptor for the specific purpose of noise reduction. A barrier that breaks the line of sight between a source and a receptor typically will result in at least 5 dB of noise reduction. Taller barriers provide increased noise reduction. Vegetation between the highway and receptor is rarely effective in reducing noise because it does not create a solid barrier.

Chapter 4 Federal Regulations and State Policies

4.1 Federal Regulations

Federal guidelines for assessing traffic noise are contained in 23 CFR 772, "Procedures for Abatement of Highway Traffic Noise and Construction Noise." These regulations constitute the federal noise standard. Projects complying with this standard are also in compliance with the requirements of NEPA.

4.1.1 Title 23 Code of Federal Regulations, Part 772

Provided in 23 CFR 772 are procedures for preparing operational and construction noise studies and for evaluating noise abatement considered for federal and federal-aid highway projects. Under 23 CFR 772.7, projects are categorized as Type I, Type II, or Type III projects. FHWA defines a Type I project as a proposed federal or federal-aid highway project for construction of a highway at a new location, the physical alteration of an existing highway that significantly changes either the horizontal or vertical alignment, or an increase in the number of through traffic lanes. A Type II project is a noise barrier retrofit project that involves no changes to highway capacity or alignment. Type III projects are projects that do not meet the classifications of either a Type I or Type II project. Type III projects do not require a noise analysis.

Type I projects include those that create a completely new noise source, as well as those that increase the volume or speed of traffic or move the traffic closer to a receptor. Type I projects include those that add an interchange, ramp, auxiliary lane, or truck-climbing lane to an existing highway or widen an existing ramp by a full lane width for its entire length. Projects that are unrelated to increased noise levels, such as striping, lighting, signing, and landscaping projects, are not considered Type I projects. The I Street Bridge Replacement Project is a Type I project.

Under 23 CFR 772.11, noise abatement must be considered for Type I projects if the project is predicted to result in a traffic noise impact. In such cases, 23 CFR 772 requires the project sponsor to consider noise abatement before adoption of the final NEPA document. This process involves identification of noise abatement measures that are reasonable, feasible, and likely to be incorporated into the project, as well as noise impacts for which no apparent solution is available.

Traffic noise impacts, as defined in 23 CFR 772.5, occur when the predicted noise level in the design year approaches or exceeds the NAC specified in 23 CFR 772, or a predicted noise level substantially exceeds the existing noise level (a substantial noise increase). However, 23 CFR 772 does not specifically define the terms *approach* or *substantial increase*; these criteria are defined in the Protocol, as described below.

Table 4-1 summarizes the NAC corresponding to various land use activity categories. Activity categories and related traffic noise impacts are determined according to actual land uses in a given area.

Table 4-1. Activity Categories and Noise Abatement Criteria

Activity Category	Noise Abatement Criteria, Hourly A-Weighted Noise Level (dBA Leq[h])[1] (Evaluation Location)	Description of Activities
A	57 (Exterior)	Lands on which serenity and quiet are of extraordinary significance and serve an important public need, and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B2	67 (Exterior)	Residential.
C2	67 (Exterior)	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings.
D	52 (Interior)	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E	72 (Exterior)	Exterior hotels, motels, offices, restaurants/bars, and other developed lands, properties, or activities not included in A–D or F.
F	N/A	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing.
G	N/A	Undeveloped lands that are not permitted.

[1] The 1-hour A weighted equivalent sound level (Leq[h]) activity criteria values are for impact determination only and are not design standards for noise abatement measures. All values are A-weighted decibels (dBA).

[2] Includes undeveloped lands permitted for this activity category.

N/A = Not applicable. There is no noise abatement criteria for this activity category.

Source: 23 CFR 772.

In identifying noise impacts, primary consideration is given to exterior areas with frequent human use. In situations where there are no exterior activities or where the exterior activities are far from the roadway or physically shielded in a manner that prevents an impact on exterior activities, the interior criterion (Activity Category D) is used as the basis for determining a noise impact.

4.2 State Regulations and Policies

4.2.1 Traffic Noise Analysis Protocol for New Highway Construction and Reconstruction Projects

The Protocol specifies the policies, procedures, and practices to be used by agencies that sponsor new construction or reconstruction of federal or federal-aid highway projects. The NAC specified in the Protocol are the same as those specified in 23 CFR 772. The Protocol defines a noise increase as *substantial* when the predicted noise levels with project implementation exceed existing noise levels by 12 dB. The Protocol also states that a sound level is considered to approach an NAC level when the sound level is within 1 dB of the NAC identified in 23 CFR 772 (e.g., 66 dBA is considered to approach the NAC of 67 dBA but 65 dBA is not).

The TeNS of the Protocol provides detailed technical guidance for evaluation of highway traffic noise. This includes field measurement methods, noise modeling methods, and report preparation guidance.

4.2.2 Section 216 of the California Streets and Highways Code

Section 216 of the California Streets and Highways Code relates to the noise effects of a proposed freeway project on public and private elementary and secondary schools. Under this code, a noise impact occurs if, as a result of a proposed freeway project, noise levels exceed 52 dBA Leq(h) in the interior of public or private elementary or secondary classrooms, libraries, multi-purpose rooms, or spaces. This requirement does not replace the “approach” or “exceed” NAC criterion for FHWA Activity Category D for classroom interiors, but it is a requirement that must be addressed in addition to the requirements of 23 CFR 772.

If a project results in a noise impact under this code, noise abatement must be provided to reduce classroom noise to a level that is at or below 52 dBA Leq(h). If the noise levels generated from freeway and non-freeway sources exceed 52 dBA Leq(h) prior to construction of the proposed freeway project, noise abatement must be provided to reduce the noise to the level that existed prior to construction of the project.

Chapter 5 Study Methods and Procedures

5.1 Methods for Identifying Land Uses and Selecting Noise Measurement and Modeling Receptor Locations

A field investigation was conducted to identify land uses that could be subject to traffic and construction noise impacts from the proposed project. Land uses in the project area were categorized by land use type; activity category, as defined in Table 4-1; and the extent of frequent human use. Although all developed land uses are evaluated in this analysis, as stated in the Protocol, the focus of this impact analysis is on locations of frequent human use that would benefit from a lowered noise level, such as locations with defined outdoor activity areas. For this project, the potentially affected noise-sensitive uses with defined outdoor activity areas consist of the backyards of residential land uses. The noise monitoring and modeling locations are shown in Figure 5-1.

Short-term measurement locations were selected to represent frequent outdoor use areas along the project alignment. Additionally, a long-term measurement was conducted to capture the day-night traffic noise level patterns in the project area. Short-term and long-term measurement locations also were used as noise prediction model locations. Additional locations were selected as prediction sites to characterize the noise environment at frequent outdoor use areas along the project alignment.

5.2 Field Measurement Procedures

A field noise study was conducted in accordance with recommended procedures in the TeNS. The following is a summary of the procedures that were used to collect short-term and long-term sound level data.

5.2.1 Short-Term Measurements

Short-term monitoring was conducted at five locations along the project alignment on Thursday, April 16, 2015, using a Larson Davis Model 812 Type 1 (precision-grade) sound level meter. The short-term measurement locations are identified in Figure 5-1. Short-term measurements were attended by field staff to count traffic and record observations concurrent with each measurement. The Leq values calculated by the sound level meter during each measurement period (15 minutes in duration) were logged manually on field data sheets for each measurement location. Dominant noise sources observed and other relevant measurement conditions were identified and logged manually on the field data sheets. The calibration of the meter was checked before and after the measurement, using a Larson-Davis Model CAL 200 calibrator.

Temperature, wind speed, and humidity were recorded manually during the short-term monitoring sessions using a Kestrel 3000 portable weather station. During the short-term

measurements, skies were clear, with wind speeds below 3 mph, and temperatures ranged from 79 to 86 °F.

5.2.2 Long-Term Measurements

Long-term monitoring was conducted at one location (LT-1) in the project area (Figure 5-1) using a Piccolo Type 2 sound level meter. The purpose of this measurement was to quantify the daily trend in noise levels throughout a 24-hour period and identify the peak traffic noise hour or "loudest" hour. The results of this measurement were used to describe variations in sound levels throughout the day, rather than absolute sound levels at a specific receptor of concern. The long-term sound level data were collected between Thursday, April 16 and Tuesday, April 21, 2015. Field notes are included in Appendix C.

5.3 Traffic Noise Levels Prediction Methods

Traffic noise levels were predicted using the FHWA Traffic Noise Model (TNM), Version 2.5. TNM is a computer model based on two FHWA reports: FHWA-PD-96-009 and FHWA-PD-96-010 (FHWA 1998a, 1998b). Key inputs to the traffic noise model were the locations of roadways, shielding features (e.g., topography and buildings), noise barriers, receptors, and ground type. Three-dimensional representations of these inputs were developed using CAD drawings, aerials, and topographic contours provided by the project engineer.

Raw traffic data for the project was provided by Fehr & Peers (2015). Traffic data used in the model are summarized in Appendix A.

Traffic noise was evaluated under existing (2014) conditions, design year (2040) no-build conditions, and design year build conditions. Traffic volumes from the project traffic study during the p.m. peak hour were used to model design year no-build and build traffic volumes for ramps and local streets, as p.m. peak traffic volumes were generally higher than a.m. volumes. The traffic mix of cars, medium trucks and heavy trucks were included in raw traffic data provided by Fehr & Peers. The vehicle mixes for each roadway model case are shown in Appendix A.

Figure 5-1
Noise Measurement and Prediction Locations

5.4 Methods for Identifying Traffic Noise Impacts and Consideration of Abatement

Traffic noise impacts occur at receptor locations where predicted design year noise levels approach or exceed the NAC for the applicable activity category, or where substantial noise increases above existing noise levels in the build or no-build condition would occur. Where traffic noise impacts are identified, noise abatement must be considered for reasonableness and feasibility, as required by 23 CFR 772 and the Protocol.

According to the Protocol, abatement measures are considered acoustically feasible if a minimum noise reduction of 5 dB is predicted for at least one affected receptor with implementation of the abatement measures. Any receptor that is predicted to receive 5 dB or more of noise reduction from an abatement measure is identified as a "benefited" receptor. In addition, barriers should be designed to intercept the line of sight from the exhaust stack of a truck to the first tier of receptors, as stated in the Caltrans *Highway Design Manual*, Chapter 1100 (California Department of Transportation 2012). Other factors that affect feasibility include topography, access requirements for driveways and ramps, the presence of local cross streets, utility conflicts, other noise sources in the area, and safety considerations. The overall reasonableness of noise abatement is determined by the following three factors.

- The noise reduction design goal
- The cost of noise abatement
- The viewpoints of benefited receptors (including property owners and residents of the benefited receptors)

To meet the noise reduction design goal, a barrier must provide at least 7 dB of noise reduction at one or more benefited receptors. This design goal applies to any receptor and is not limited to affected receptors.

The Protocol defines the procedure for assessing reasonableness of noise barriers from a cost perspective. A cost-per-residence allowance is calculated for each benefited residence (i.e., residences that receive at least 5 dB of noise reduction from a noise barrier that provides 7 dB for at least one receptor). The 2015 allowance is $71,000 per benefited residence. Total allowances are calculated by multiplying the cost per residence by the number of benefited residences.

Chapter 6 Existing Noise Environment

6.1 Existing Land Uses

A field investigation was conducted to identify land uses that could be subject to traffic and construction noise impacts resulting from the proposed project. Single-family and multifamily residences were identified as Activity Category B land uses in the project area. Outdoor recreational uses and parks were identified as Activity Category C land uses. Several commercial (Activity Category F) and undeveloped (Activity Category G) land uses are not subject to noise impacts, as discussed in Chapter 4.

Although all land uses were evaluated in this analysis, as required by the Protocol, noise abatement was considered only for areas of frequent human use that would benefit from a lower noise level. Accordingly, the impact analysis focuses on locations with defined outdoor activity areas, such as residential backyards and common use areas at multifamily residences.

6.2 Noise Measurement Results

The existing noise environment is characterized below based on the short- and long-term noise monitoring that was conducted in the bridge replacement project area.

6.2.1 Short-Term Measurements

Results of short-term noise monitoring are shown in Table 6-1 in terms of measured Leq and traffic data collected concurrently with each measurement. Counted traffic volumes were normalized to 1 hour for calibration purposes, and vehicles classified according to TNM vehicle categories (automobiles, medium trucks, heavy trucks). Traffic noise was observed to be the dominant ambient noise source at all sites. Short-term monitoring locations are shown in Figure 5-1.

Short-term noise measurements and respective traffic counts were conducted to characterize the noise environment adjacent to the project study area and to validate the accuracy of the TNM model calculations using traffic counted concurrently with measurements. Vehicle speeds were estimated by driving a test car concurrently with traffic on roadways where counts were conducted.

Table 6-1. Summary of Short-Term Measurements

Receptor	Address	Land Uses/ Activity Category	Start Date/ Time	Duration (minutes)	Leq
ST-1	4th Street & C Street	Undeveloped / G	4/16/15 1:44	15	57.0
ST-2	281 4th Street	Residential / B	4/16/15 11:25	15	58.7
ST-3	Vacant lot, 2nd Street	Undeveloped / G	4/16/15 11:50	15	59.4
ST-4	212 2nd Street	Residential / B	4/16/15 2:38	15	50.3
ST-5	End of B Street	Residential / B	4/16/15 2:11	15	51.1

Leq = equivalent sound level

6.2.2 Long-Term Measurements

Long-term monitoring was conducted at one location. The purpose of the long-term noise measurement was to determine the changes in noise levels within the project area throughout a typical day. The data are presented for documentation purposes and are not used in the prediction analysis. Long-term sound level data were collected for 1 full day on April 20, 2015.

Long-term monitoring site LT-1 (shown in Figure 5-1) was mounted on a utility pole at the corner of C Street and 2nd Street. The worst-hour noise level measured was 67.6 dBA Leq(h) during the 7:00 a.m. hour. Hourly noise levels and offsets between the worst-hour noise and each of the 24 hours of the measurement period are shown in Table 6-2.

Table 6-2. Summary of Long-Term Measurements at Location LT-1: C Street

Date	Time (hour beginning)	1-Hour Leq (dBA)	Difference from Worst-Hour Noise (dB)
April 20, 2015	0:00:00	58	-9.6
	1:00:00	59 [1]	-8.6
	2:00:00	57.3	-10.3
	3:00:00	56.5	-11.1
	4:00:00	59.5	-8.1
	5:00:00	65.2	-2.4
	6:00:00	65.6	-2
	7:00:00	**67.6**	**0**
	8:00:00	66.6	-1
	9:00:00	65.8	-1.8
	10:00:00	64.4	-3.2
	11:00:00	59.3	-8.3
	12:00:00	67.1	-0.5
	13:00:00	58.7	-8.9
	14:00:00	61.5	-6.1
	15:00:00	66.3	-1.3
	16:00:00	63.6	-4
	17:00:00	63.8	-3.8
	18:00:00	63.9	-3.7
	19:00:00	62.3	-5.3
	20:00:00	63.9	-3.7

Date	Time (hour beginning)	1-Hour Leq (dBA)	Difference from Worst-Hour Noise (dB)
	21:00:00	66.6	-1
	22:00:00	68.6	-2.6
	23:00:00	64.3	-3.3
Maximum		67.6	
Minimum		56.5	

Note: Worst-hour noise is **bolded**.
dBA Leq[h] = A-weighted equivalent sound level; dB = decibels
[1] Adjusted noise level due to an impulsive noise event not typical of ambient levels.

6.2.3 Traffic Noise Model Calibration

TNM was used to compare measured traffic noise levels to modeled noise levels at field measurement locations, using traffic count data collected at the time of the noise measurements. At measurement locations where modeled existing sound level values differed from measured values by more than 3 dB, calibration factors (K-factors) were used to adjust modeled noise levels at those locations and at nearby prediction locations.

K-factors and a comparison between measured and modeled noise levels at each measurement location are shown in Table 6-3. Two of the short-term measurements were measurements of background ambient levels in the neighborhood, which included distant traffic noise, but these were not used to calibrate the model. Two short-term measurements were within 3 dB of model prediction values. One short-term measurement location was 3.7 dB below measured levels. A K-factor of plus-4 dB (+4 dB) was applied to existing and future models at these locations, as well as at nearby receivers. After applying the K-factors, noise levels at all measurement sites were in close agreement with measured levels.

Table 6-3. Comparison of Measured with Modeled Worst-Hour Noise Sound Levels

Measurement Location	Measured Existing Sound Level (dBA)	Modeled Existing Sound Level (dBA)	Measured Minus Modeled (dB)	K-Factor Used (dB)
ST-1	57.0	56.0	- 1.0	--
ST-2	58.7	56.7	- 2.0	--
ST-3	59.4	55.7	- 3.7	+ 4.0
ST-4	50.3	-- [1]	-- [1]	-- [1]
ST-5	51.1	-- [1]	-- [1]	-- [1]

dBA = A weighted decibels; dB = decibels
[1] Ambient measurement only, not calibrated in TNM.

6.2.4 Existing Modeled Noise Levels

Predicted traffic noise levels under existing conditions are shown in Appendix B. As shown in Table B-1, existing worst-hour traffic noise levels range from 46 to 71 dBA Leq(h). Traffic on I-5 and C Street are the dominant noise sources in the study area.

Chapter 7 Future Noise Environment, Impacts, and Considered Abatement

7.1 Future Noise Environment and Impacts

Traffic noise modeling results for existing conditions and design year (2040) conditions with and without the project under the various alternative conditions are summarized in Tables B-1 through B-4 (see Appendix B).

- Table B-1: 2nd Street Alternative 1 and I Street Roundabout
- Table B-2: 2nd Street Alternative 1 and I Street Signalized Intersection
- Table B-3: 2nd Street Alternative 2 and I Street Roundabout
- Table B-4: 2nd Street Alternative 2 and I Street Signalized Intersection

Predicted design year build condition traffic noise levels are compared with existing conditions and design year no-build conditions. The comparison with existing conditions is included in the analysis to identify traffic noise impacts according to 23 CFR 772. The comparison to without-project conditions indicates the direct effect of the project. As stated in the TeNS, modeling results are rounded to the nearest decibel.

As shown in Table B-1, traffic noise levels for design year no-build conditions range from 49 to 73 dBA Leq(h). Under design year build conditions, predicted traffic noise levels range from 49 to 74 dBA Leq(h). This range of noise levels applies to both design options for 2nd Street and the I Street/I-5 interchange. Traffic noise levels would approach or exceed the NAC for residential uses (Activity Category B) and park uses (Activity Category C).

Because traffic noise impacts are predicted to occur at Activity Category B and Activity Category C land uses in the project area, noise abatement must be considered.

7.2 Preliminary Noise Abatement Analysis

According to 23 CFR 772(13)(c), federal funding may be used for the following abatement measures.

- Construction of noise barriers, including acquisition of property rights, either within or outside the highway right-of-way. Landscaping is not a viable noise abatement measure.
- Traffic management measures including, but not limited to, traffic control devices and signage for prohibition of certain vehicle types, time-use restrictions for certain vehicle types, modified speed limits, and exclusive lane designations.
- Alteration of horizontal and vertical alignments.

- Acquisition of real property or interests therein (predominantly unimproved property) to serve as a buffer zone to preempt development that would be adversely affected by traffic noise.
- Noise insulation of Activity Category D land use facilities. Post-installation maintenance and operational costs for noise insulation are not eligible for federal-aid funding.

Among these options, noise barriers are the only feasible abatement measure for the proposed project. Noise barriers are evaluated for feasibility based on achievable noise reduction. For each noise barrier found to be acoustically feasible, reasonable cost allowances were calculated. For any noise barrier to be considered reasonable from a cost perspective, the estimated cost of the noise barrier should be equal to or less than the total cost allowance calculated for the barrier. The cost calculations of the noise barrier should include all items appropriate and necessary for construction of the barrier, such as traffic control, drainage modification, and retaining walls.

The following is a discussion of noise abatement evaluated for the project. The discussion applies to all design options for 2nd Street and the I Street/I-5 interchange. Locations of evaluated noise-sensitive receivers are shown in Figure 5-1.

7.2.1 West of 6th Street, between California Street and Elizabeth Street

The traffic noise modeling results in Appendix B indicate that noise levels of up to 68 dBA Leq(h) are predicted at four residential outdoor use areas located along this segment of the project. This traffic noise level exceeds the NAC for residential use (Activity Category B). Therefore, traffic noise impacts are predicted to occur at this location and noise abatement must be considered. Traffic noise levels would increase by up to 4 dB relative to existing conditions, which would not result in a substantial increase in noise levels.

A noise barrier would not be feasible along 6th Street due to driveway access requirements to residences in this area. Therefore, a noise barrier was not considered further.

7.2.2 North of C Street, between 6th Street and 5th Street

The traffic noise modeling results in Appendix B indicate that noise levels of up to 67 dBA Leq(h) are predicted at one residential outdoor use area located along this segment of the project. This traffic noise level exceeds the NAC for residential use (Activity Category B). Therefore, traffic noise impacts are predicted to occur at this location and noise abatement must be considered. Traffic noise levels would increase by up to 5 dB relative to existing conditions, which would not result in a substantial increase in noise levels.

A noise barrier would not be feasible along C Street due to driveway access requirements to residences in this area. Therefore, a noise barrier was not considered further.

7.2.3 East of 6th Street/C Street, between California Street and 5th Street

The traffic noise modeling results in Appendix B indicate that noise levels of up to 72 dBA Leq(h) are predicted at seven residential outdoor use areas located along this segment of the project. This traffic noise level exceeds the NAC for residential use (Activity Category B). Therefore, traffic noise impacts are predicted to occur at this location and noise abatement must be considered. Traffic noise levels would increase by up to 5 dB relative to existing conditions, which would not result in a substantial increase in noise levels.

A noise barrier would not be feasible along 6th Street/C Street due to driveway access requirements to residences in this area. Therefore, a noise barrier was not considered further.

7.2.4 South of C Street, between 5th Street and 4th Street

The traffic noise modeling results in Appendix B indicate that noise levels of up to 71 dBA Leq(h) are predicted at eight multifamily residential units located along this segment of the project. This traffic noise level exceeds the NAC for residential use (Activity Category B). Therefore, traffic noise impacts are predicted to occur at this location and noise abatement must be considered. Traffic noise levels would increase by up to 5 dB relative to existing conditions, which would not result in a substantial increase in noise levels.

There are no outdoor areas of frequent human use that would benefit from a lowered noise level at the apartment units. Furthermore, a noise barrier would not be feasible along C Street because the façade of the apartment building is adjacent to a public sidewalk. Therefore, a noise barrier was not considered further.

7.2.5 North of C Street, between 4th Street and 3rd Street

The traffic noise modeling results in Appendix B indicate that noise levels of up to 70 dBA Leq(h) are predicted at eight multifamily townhouse units located along this segment of the project. This traffic noise level exceeds the NAC for residential use (Activity Category B). Therefore, traffic noise impacts are predicted to occur at this location and noise abatement must be considered. Traffic noise levels would increase by up to 4 dB relative to existing conditions, which would not result in a substantial increase in noise levels.

There are no common outdoor areas of frequent human use facing C Street that would benefit from a lowered noise level at the townhouse units. Furthermore, a noise barrier would not be feasible along C Street because the façade of the building is adjacent to a public sidewalk. Therefore, a noise barrier was not considered further.

7.2.6 South of C Street, between 4th Street and 3rd Street

The traffic noise modeling results in Appendix B indicate that noise levels of up to 66 dBA Leq(h) are predicted at one residential outdoor use area located along this segment of the

project. This traffic noise level exceeds the NAC for residential use (Activity Category B). Therefore, traffic noise impacts are predicted to occur at this location and noise abatement must be considered. Traffic noise levels would increase by up to 4 dB relative to existing conditions, which would not result in a substantial increase in noise levels.

A noise barrier would not be feasible along C Street or 3rd Street due to driveway access requirements to residences in this area. Therefore, a noise barrier was not considered further.

7.2.7 North of C Street, between 3rd Street and 2nd Street

The traffic noise modeling results in Appendix B indicate that noise levels of up to 69 dBA Leq(h) are predicted at two multifamily townhouse units located along this segment of the project. This traffic noise level exceeds the NAC for residential use (Activity Category B). Therefore, traffic noise impacts are predicted to occur at this location and noise abatement must be considered. Traffic noise levels would increase by up to 4 dB relative to existing conditions, which would not result in a substantial increase in noise levels.

The individual townhouse units have balconies that face east toward the future I Street Bridge alignment, however, there are no common outdoor areas of frequent human use facing C Street that would benefit from a lowered noise level. Under the 2nd Street Design Alternative 1, a noise barrier would not be feasible along C Street because the façade of the building is adjacent to a public sidewalk. Under the 2nd Street Design Alternative 2, a noise barrier would not be feasible because of access requirements to the realigned 2nd Street, which would pass along the eastern façade of the townhouse units. Therefore, a noise barrier was not considered further.

7.2.8 Matsui Waterfront Park, Jibboom Street

The traffic noise modeling results in Appendix B indicate that noise levels of up to 73 dBA Leq(h) are predicted at recreational outdoor and park uses at Matsui Waterfront Park located along this segment of the project. This traffic noise level exceeds the NAC for outdoor recreational use (Activity Category C). Therefore, traffic noise impacts are predicted to occur at this location and noise abatement must be considered. Traffic noise levels would increase by up to 2 dB relative to existing conditions, which would not result in a substantial increase in noise levels.

A noise barrier would not be feasible along Jibboom Street due to roadway access requirements to parking lots at Matsui Waterfront Park. Furthermore, I-5 is a significant source of traffic noise in this area. For noise abatement measures to be effective, they would need to be designed to reduce noise from traffic on I-5, and improvements to I-5 are not included in the project. Therefore, a noise barrier was not considered further.

Chapter 8 Construction Noise

During construction of the project, noise from construction activities may intermittently dominate the noise environment in the immediate area of construction. Construction noise is regulated by provisions in Section 14-8.02, "Noise Control," of the Caltrans *Standard Specifications* which states the following.

- Do not exceed 86 dBA Lmax at 50 feet from the job site activities from 9 p.m. to 6 a.m.
- Equip an internal combustion engine with the manufacturer-recommended muffler. Do not operate an internal combustion engine on the job site without the appropriate muffler.

Two types of short-term noise impacts would occur during project construction. The first type would be from construction crew commutes and the transport of construction equipment and materials to the project site, which would incrementally raise noise levels on access roads leading to the site. The pieces of heavy equipment for grading and construction activities would be moved onsite, would remain for the duration of each construction phase, and would not add to the daily traffic volume in the project vicinity. A high single-event noise exposure potential at a maximum level of 87 dBA Lmax from trucks passing at 50 feet would exist. However, the projected construction traffic would be minimal when compared to existing traffic volumes on other affected streets, and the associated long-term noise level change would not be perceptible. Therefore, construction-related worker commutes and equipment transport noise impacts would be short term and would not be adverse.

The second type of short-term noise impact would be from construction activities. Construction is performed in distinct steps, each of which has its own mix of equipment and consequently its own noise characteristics. These various sequential phases would change the character of the noise generated and the noise levels along the project alignment as construction progresses. Despite the variety in the type and size of construction equipment, similarities in the dominant noise sources and patterns of operation allow construction-related noise ranges to be categorized by work phase. Table 8-1 lists typical construction equipment noise levels (Lmax) recommended for noise impact assessments, based on a distance of 50 feet between the equipment and a noise receptor.

Typical noise levels at 50 feet from an active construction area range up to 91 dBA Lmax during the noisiest construction phases. The site preparation phase, which includes grading and paving, tends to generate the highest noise levels because the noisiest construction equipment is earthmoving equipment. Earthmoving equipment includes excavation machinery such as backfillers, bulldozers, and front loaders. Earthmoving and compacting equipment includes compactors, scrapers, and graders. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full-power operation followed by 3 or 4 minutes at lower power settings.

Table 8-1. Typical Construction Equipment Noise Levels

Type of Equipment	Range of Maximum Sound Levels (dBA Lmax at 50 feet)	Suggested Maximum Sound Levels for Analysis (dBA Lmax at 50 feet)
Pile drivers	81 to 96	93
Rock drills	83 to 99	96
Jackhammers	75 to 85	82
Pneumatic tools	78 to 88	85
Pumps	74 to 84	80
Scrapers	83 to 91	87
Haul trucks	83 to 94	88
Cranes	79 to 86	82
Portable generators	71 to 87	80
Rollers	75 to 82	80
Dozers	77 to 90	85
Tractors	77 to 82	80
Front-end loaders	77 to 90	86
Hydraulic backhoe	81 to 90	86
Hydraulic excavators	81 to 90	86
Graders	79 to 89	86
Air compressors	76 to 89	86
Trucks	81 to 87	86

dBA = A-weighted decibels; Lmax = maximum instantaneous noise level
Source: Bolt, Beranek & Newman 1987

In addition to standard construction equipment, bridge construction would require the use of pile drivers. As shown in Table 8-1, pile-driving generates noise levels of up to 96 dBA Lmax at 50 feet.

Construction of the proposed project is expected to require the use of pile drivers, earthmovers, bulldozers, paving machines, water trucks, dump trucks, concrete trucks, rollers, and pickup trucks. Noise associated with the use of construction equipment is estimated between 79 and 89 dBA Lmax at a distance of 50 feet from the active construction area for the grading phase. As seen in Table 8-1, the maximum noise level generated by each earthmover is assumed to be approximately 86 dBA Lmax at 50 feet from the earthmover in operation. Each bulldozer would generate approximately 85 dBA Lmax at 50 feet. The maximum noise level generated by water trucks and pickup trucks is approximately 86 dBA Lmax at 50 feet from these vehicles. Each doubling of the sound source with equal strength increases the noise level by 3 dBA.

Each piece of construction equipment operates as an individual point source. The worst-case composite noise level at the nearest residence during this phase of construction would be 91 dBA Lmax (at a distance of 50 feet from an active construction area).

No adverse noise impacts from construction are anticipated because construction would be conducted in accordance with provisions in Section 14-8.02, “Noise Control,” of the *Caltrans Standard Specifications* and applicable local noise standards. Construction noise would be short term, intermittent, and typically overshadowed by local traffic noise.

L50	54.2
L90	47.4

Overall Leq (Include "O" minutes, Exclude "X" minutes) = _____ dBA

Subset Leq (Exclude "O" and "X" minutes) = _____ dBA

"O" = other characteristic sources that contributed to the Leq

"X" = exclude from Leq calculation; a non-typical source contaminated the measurement

NOISE MEASUREMENT SITE INFORMATION SHEET

Jones & Stokes

PROJECT NAME: ~~3~~ I Street Bridge

PROJECT #: 0203.14

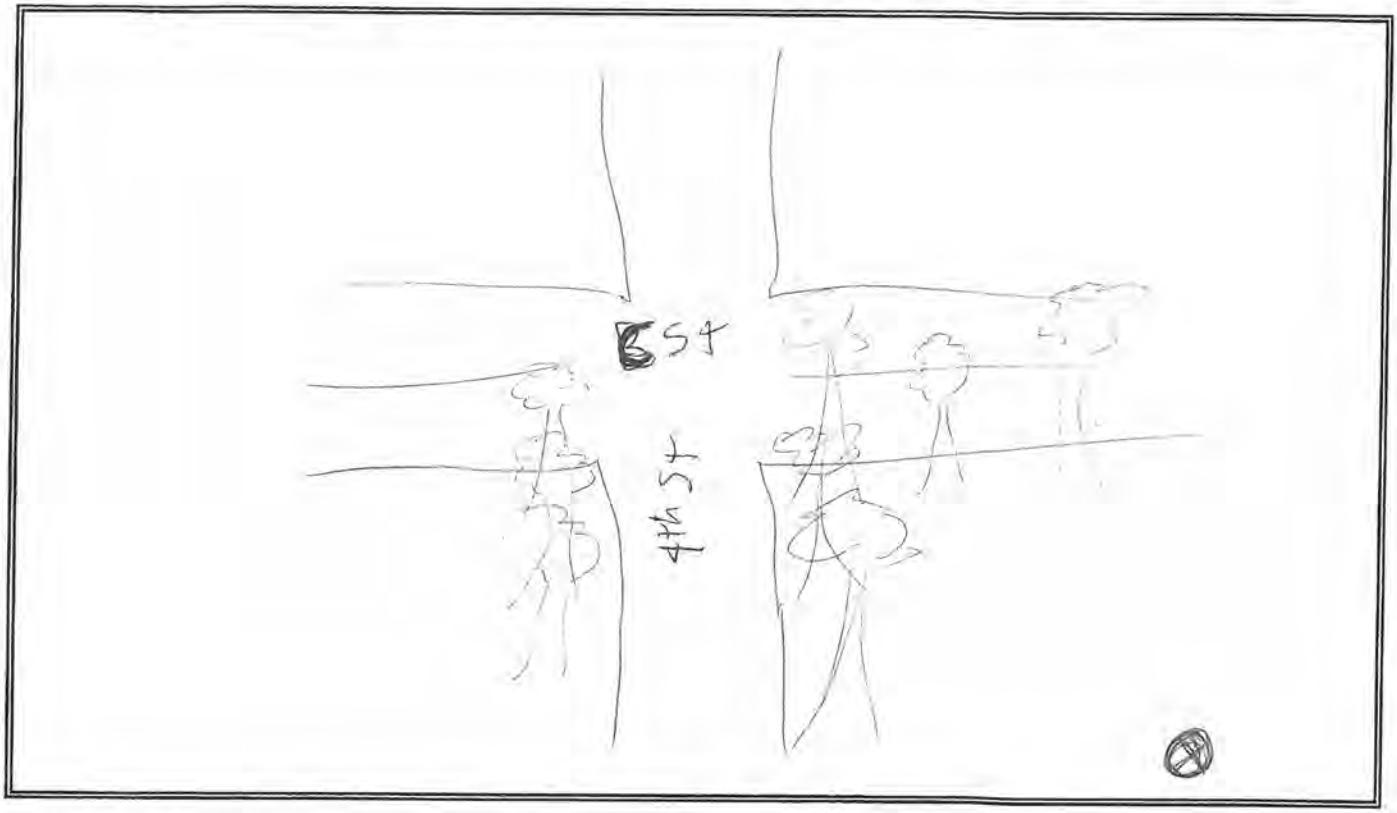
SITE NUMBER: ST - 1

DATE/TIME: 04/16/15

LOCATION/ADDRESS: 4th & ~~6~~ - field -

ENGINEERS: D. Traeger & C Matsui

SITE SKETCH: Show microphone location, nearby residences/buildings, potential reflective surfaces, project roadways, local roadways, driveways, ground type, trees. Indicate reference distances between objects, arrows showing wind direction, North, and camera locations/directions. Describe the line-of-sight and topography/elevation changes relative to noise sources.



WEATHER DATA: (temperature, wind speed/direction, sky conditions, relative humidity)

28.5°C, 1.2 mph, Sunny

EQUIPMENT DATA: (sound level meter, microphone, preamp, calibrator, factory cal. date)

0507 114.0

ESTIMATED CONSTRUCTION DATE OF RESIDENCES: (Pre-1978, or new construction)

POSTED SPEED: 30 - 35 COMMENTS:

TRAFFIC COUNTS:

TETRA TECH

MEMORANDUM

TO:	Don Trieu, PE (MBK Engineers)
FROM:	Dragi Stefanovic, PhD, PE; Ira Artz, PE (Tetra Tech)
JOB TITLE:	I-Street Bridge Replacement
SUBJECT:	Scour Analysis
DATE:	May 2, 2016

This technical memorandum describes the scour analysis for the I-Street crossing over the Sacramento River, California that was conducted by Tetra Tech to support the MBK bridge replacement design (Figure 1). The analysis described here pertains to with-project (proposed) conditions, assuming that the existing I-Street Bridge remains in place, about 1,100 feet downstream of the proposed bridge location. Descriptions of the assumptions, inputs, methodologies, and results of this analysis are provided below.

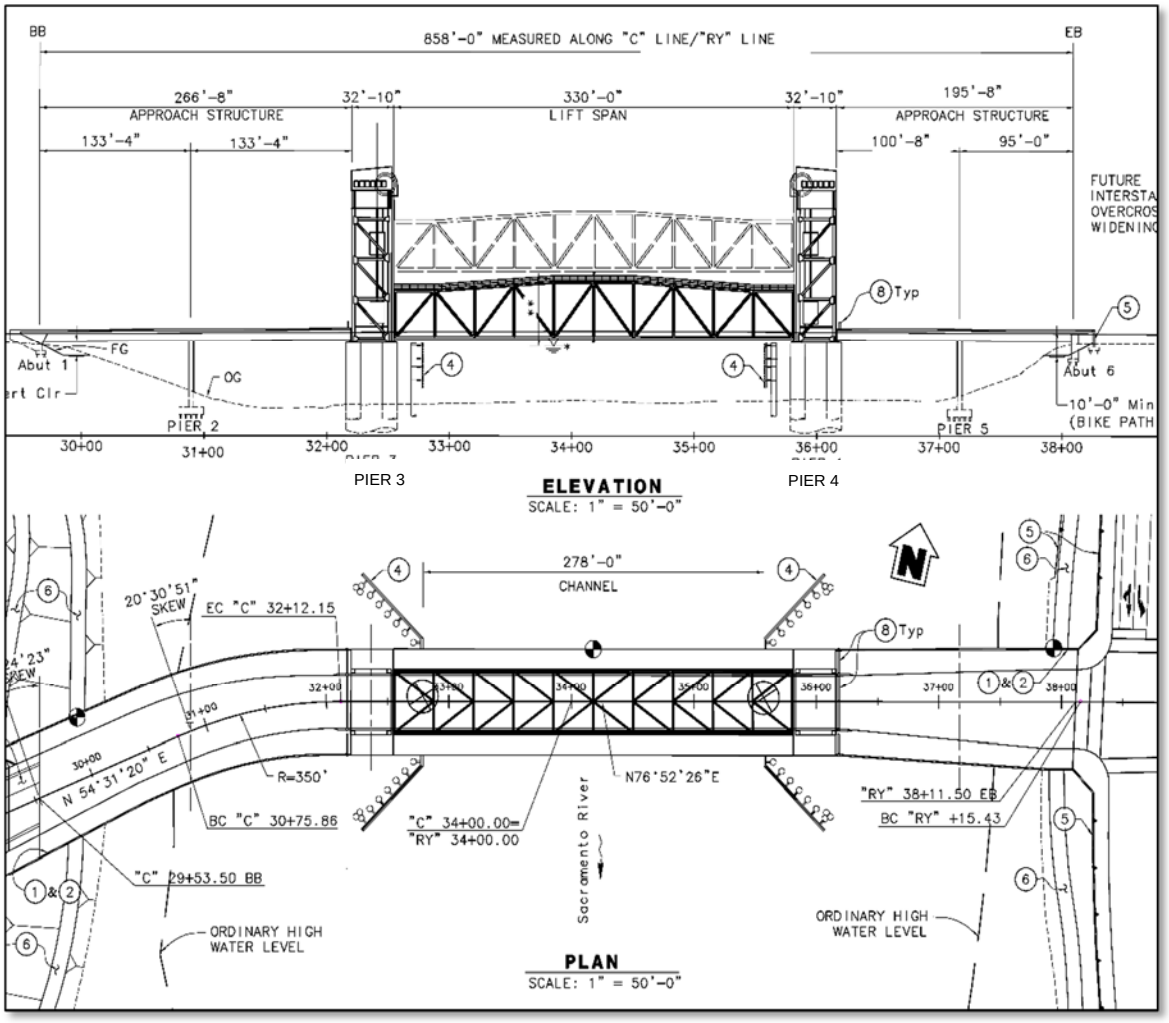

Figure 1. I-Street Bridge Proposed Design

Hydraulic Analysis

A hydraulic analysis was carried out in the vicinity of the bridge crossing using a hydraulic (HEC-RAS) model of the Sacramento River study reach downstream of the confluence with the American River. The study reach was extracted from an unsteady hydraulic model of the Sacramento River Basin (developed by USACE Sacramento District) and was ported into latest HEC-RAS 5.0. The 26-mile modeling reach extended from the confluence with the American River on the upstream side (River Station RS 60.3928) to the confluence with Sutter Slough on the downstream side (RS 34.3042). The maximum design discharges for a range of return frequencies were extracted from the USACE model at RS 60.3928 at the maximum water surface elevation (see Table 1). The downstream boundary condition at RS 34.3042 was set to normal depth with an average energy slope of 0.000115 (this slope is fairly uniform within the analyzed range of discharges and was extracted from the unsteady hydraulic model for the maximum water surface profile).

Table 1. Sacramento River Maximum Design Discharges

Frequency	50-year	100-year	200-year
Discharge (cfs)	113,796	117,655	130,674

There are 8 bridge piers considered in this scour analysis as shown in

www.tetratech.com

Figure 2 is oriented from left to right, looking downstream, while the pier stationing on the bridge plans (Figure 1) is oriented from left to right, looking upstream. For reference

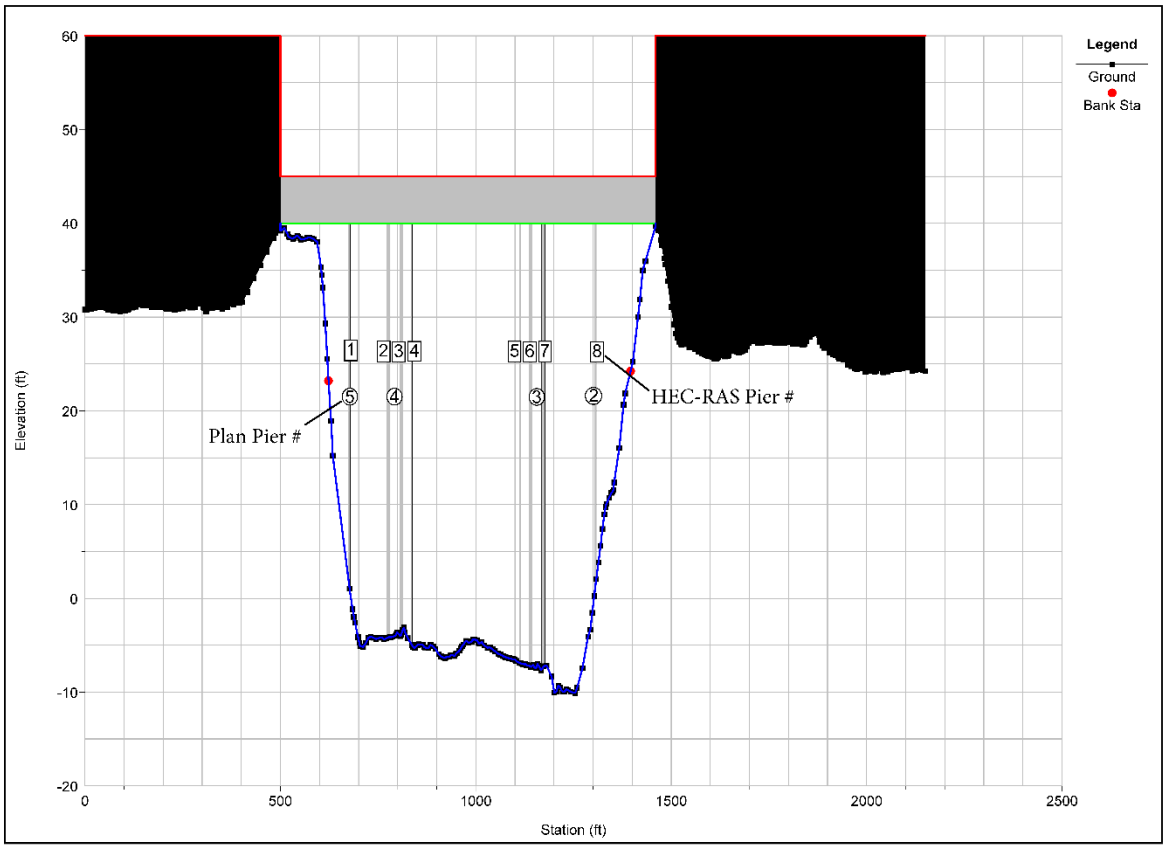

Figure 2 shows the HEC-RAS pier numbers in square boxes and the corresponding design plan pier numbers in circles. The lift tower piers, labeled 3 & 4 on the plans (Figure 1), have two 9-ft diameter piers on each side (labeled 2 & 3 and 6 & 7 in Figure 2). Exterior piers, labeled 2 & 5 on the plans, have a diameter of 5.5 feet. The bridge fender system (inside the lift span; see Figure 1) is carried by two most interior 4-ft diameter piers (labeled 4 and 5 in Figure 2).

Potential debris loading in the form of floatable trash was considered for each pier in the HEC-RAS model according to the USACE *Memorandum on Debris Loading on Bridges and Culverts* (2004). Two feet of debris on each side of each pier was assumed for the full depth of flow at piers without sloping pier extensions. According to the *Memorandum*, no debris loading was assumed for piers with widths greater than six feet.

The effect of debris loading on pier scour was accounted for using the concept of *effective pier width*, which has been widely accepted as a way to quantitatively assess the extent to which debris affects scour at piers (NCHRP, 2010). Based on the laboratory scour data, the recommended design equation for estimating an equivalent pier width b_e for use with the CSU pier scour equation is:

$$b_e = \frac{K_1(TW) + (y - K_1 T)a}{y} \quad (1)$$

17885 Von Karman Avenue, Suite 500, Irvine, CA 92614
Tel: 949.809.5124 Fax: 949.809.5010
www.tetratech.com

where:
b_e = effective width of the pier
K_1 = 0.79 for rectangular debris loading
T = thickness of debris (assumed equal to flow depth)
W = width of debris normal to flow
a = pier width (without debris) normal to flow
y = depth of approach flow

A summary of pier parameters is given in Table 2. The approach flow depth *y* and velocity *V* were calculated using the simplified (1-D) Flow Distribution option in HEC-RAS.

Table 2. I-Street Bridge Pier Characteristics

HEC-RAS Pier #	Design Plan Pier #	HEC-RAS Station	*a* (ft)	*W* (ft)	b_e (ft)	*y* (ft)	*V* (ft/s)

a = pier width; *W* = debris width; b_e = effective pier width; *y* = 100-year approach flow depth; *V* = 100-year approach flow velocity;

Scour Analysis

A scour analysis was carried out at the proposed I-Street Bridge crossing (RS 59.904) using the results of the steady HEC-RAS model described above. The hydraulic analysis was performed assuming that the existing bridge remains at RS 59.687, about 1,100 feet downstream of the proposed bridge. The results of the scour analysis are intended to assist in developing recommendations for pier foundation burial depths at the proposed river crossing.

Scour Analysis Procedure

The total scour that is expected to occur at a particular river location typically consists of five primary components:

1. Long-term degradation
2. Bend scour
3. Contraction scour
4. Bedform scour
5. Local scour (pier scour, impinging scour)

Long-term aggradation and degradation represent bed elevation changes that result from an imbalance in the sediment supplied to a reach of the river and the capacity of the reach to transport the sediment. Aggradation (deposition of sediment on the channel bed) occurs when the upstream sediment supply is greater than the transport capacity, and degradation (erosion of the streambed) occurs when the transport capacity is greater than the supply.

17885 Von Karman Avenue, Suite 500, Irvine, CA 92614
Tel: 949.809.5124 Fax: 949.809.5010
www.tetratech.com

Historical evidence and sediment transport simulations indicate that the Sacramento River in the vicinity of the proposed I-Street crossing (RS 59.904) is vertically stable (NHC, 2012). The summary results of simulated long-term bed aggradation/degradation in the Sacramento River are shown in Table 3.

Table 3. Simulated Long-Term Bed Aggradation/Degradation (NHC, 2012)

*Positive = aggradation, negative = degradation

As shown in Table 3, the sub-reach River Mile (RM=RS) 60-50 experiences a slight aggradation trend on the order of 1 foot. For the purposes of this scour analysis, it was, therefore, assumed that long-term aggradation and degradation are not likely to affect the I-Street Bridge crossing.

Bend scour occurs on the outside of a bend due to the increased flow velocity and shear stress that results from the acceleration of flow around the bend. Because of the proposed bridge location in a bend (with a radius of 6,475 feet), the pier foundations could potentially be affected by bend scour. Several different methods have been proposed in literature for computing bend scour that are based on empirical and semiempirical relationships. Based on a comparison of conditions in the Sacramento River with the conditions for which it was developed (i.e. increased toe scour of armored bank revetment), the following relationship by Maynord (1996) was adopted for this study:

$$\frac{y_{bs}}{y} = 1.8 - 0.051\frac{r_c}{B} + 0.0084\frac{B}{y} \quad (2)$$

where:
y_{bs}= ultimate flow depth in scoured section
y = hydraulic depth in the approach bend section
B = flow top width
r_c = centerline radius of bend curvature

Bend scour is then equal to the predicted ultimate flow depth (y_{bs}) in the scoured section minus the initial flow depth.

17885 Von Karman Avenue, Suite 500, Irvine, CA 92614
Tel: 949.809.5124 Fax: 949.809.5010
www.tetratech.com

Contraction scour represents general erosion of the channel bed that results from a contraction in the flow area or a local increase in the unit discharge due to overbank flows being forced into the main channel. Two types of contraction scour can occur, depending upon the ability of the upstream channel to transport sediment into the contracted section: live-bed contraction scour occurs when bed material is transported into the contracted section, and clear-water contraction scour occurs when there is negligible transport of bed material into the contracted section or the material from upstream is transported through the contracted section at less than the capacity of the flow. Contraction scour was considered at the bridge site due to constriction from piers. The scour was computed using the following relation from the Federal Highway Administration (FHWA) Hydraulic Circular No. 18, Evaluation of Scour at Bridges (2001), which is based on live-bed conditions:

$$\frac{y_2}{y_1} = \left(\frac{Q_2}{Q_1}\right)^{6/7} \left(\frac{W_1}{W_2}\right)^{k_1} \quad , \quad y_s = y_2 - y_0 \tag{3}$$

where:
y_s = average scour depth
y_2 = average depth in the contracted section
y_1 = average depth in the upstream main channel
y_0 = existing depth in the contracted section before scour
Q_1 = flow in the upstream channel transporting sediment
Q_2 = flow in the contracted channel transporting sediment
W_1 = bottom width of the upstream main channel
W_2 = bottom width of the main channel in the contracted section
k_1 = 0.64 assuming that some of the bed material would be carried in suspension

Bedform scour is the increase in scour depth that can occur as bedforms pass through the site during high flows. Because the Sacramento River has a sand bed within the study area, antidune scour was considered at the crossing site (median grain size D_{50} ~ 0.5 mm; upper regime bedforms, such as antidunes, are possible based on the grain Froude number evaluation). The antidune height was computed using the following relation from Kennedy (1963):

$$h_a = 0.14 \frac{2\pi V^2}{g} \tag{4}$$

where:
h_a= antidune height
V = flow velocity
g = acceleration due to gravity

Scour associated with antidunes is one-half the antidune height predicted by Equation 4.

Local scour results from the removal of material around obstructions to the flow such as bridge piers, abutments, spurs and embankments due to acceleration of the flow and the resulting turbulent vortices induced by the obstructions. The potential pier scour depth was computed using the CSU relation from HEC-18 (FHWA, 2001):

17885 Von Karman Avenue, Suite 500, Irvine, CA 92614
Tel: 949.809.5124 Fax: 949.809.5010
www.tetratech.com

$$y_s = 2K_1K_2K_3K_4\left(\frac{a}{y_1}\right)^{0.65} F_r^{0.43} \quad (5)$$

where:
y_s = pier scour depth
y_1 = flow depth directly upstream of pier
K_1 = correction factor for pier nose shape = 1.1 for square nose (with debris loading)
K_2 = correction factor for angle of attack of flow = 1.0 for flow aligned with the pier
K_3 = correction factor for bed condition = 1.0 (bedform scour calculated separately)
K_4 = correction factor for armoring by bed material = 1.0 for no armoring potential
a = pier width
F_r = Froude number directly upstream of pier

Because the proposed I-Street Bridge location is relatively close to the Sacramento River and American River confluence (approximately 2,300 feet downstream of the confluence), an additional local scour component can result from the American River flow impinging on the right (west) bank of the Sacramento River. The evidence of this scour can be observed in the bridge cross section (see Figure 2) where the right bank toe is currently about 6 feet lower than the corresponding left (east) side. An approximation of the potential scour depth at the Sacramento River right bank toe is based on the following formulation for impinging scour along a floodwall (Mussetter et al., 1994):

$$\frac{Y_S}{Y_1} = (0.73 + 0.14\pi F_r^2)cos\theta \quad (6)$$

where:
Y_S = equilibrium depth of scour (measured from the mean bed level to the bottom of the scour hole)
Y_1 = average upstream flow depth in the main channel
F_r = upstream Froude number
θ = deflection angle between flow direction and floodwall

The above input parameters were based on the American River hydraulics (from the USACE HEC-RAS model) immediately upstream of the confluence with the Sacramento River, assuming a 30-degree deflection angle θ.

Scour Analysis Results

The scour analysis results for the 50-year, 100-year, and 200-year flow events are summarized in Table 4. The most significant component of the calculated scour is the Sacramento River outside bend scour, which accounts for about 60 percent of the total scour at the site. It should be noted that this bend scour was added only to the western piers 1-4 (which are closer to the outside bank), while the eastern piers 5-8 were assumed to be impacted by the impinging flow from the American River. The total scour varies 2-4 feet between the analyzed flow events, being the largest for the 100-year and 200-year frequencies. The potential scour holes are shown in Figure 3 (this is a HEC-RAS plot of combined pier and contraction scour). The scour hole width on each side of the pier is

17885 Von Karman Avenue, Suite 500, Irvine, CA 92614
Tel: 949.809.5124 Fax: 949.809.5010
www.tetratech.com

calculated as 2 times the depth of local scour y_s from Equation 5 (per FHWA, 2001). As shown in Figure 3, piers 2-4 and piers 5-7 have overlapping scour holes, combining into a single scour hole with the lowest bottom elevation.

*Sacramento River bend scour for outside piers 1-4; American River confluence scour for inside piers 5-8

As seen in Table 4, the maximum predicted scour is on the order of 40 feet (piers 2 & 3). This estimate includes conservative assumptions on pier shape, debris width, riverbed conditions, and no armoring potential by coarser bed material. In addition, bend scour was conservatively evaluated using the Maynord (1996) formulation for increased toe scour of armored bank revetments. Therefore, no additional safety factor was applied when determining the maximum total scour. For comparison, a previous (two-dimensional) pipeline scour study on the Sacramento River by Mussetter Engineers (2002) predicted the maximum 200-year bed scour at RS 62 on the order of 39 feet (predominantly bend scour without bridge piers) and 51 feet (for alternate pipeline alignment with additional pier scour).

Figure 3. Pier and Contraction Scour Extents at Proposed I-Street Bridge

Scour Elevations

In the design of bridge pier foundations, the scour elevations should be at or below the total depth of scour. Based on Table 4, the minimum recommended scour elevations for the bridge pier foundations are listed in Table 5 below. A detailed structural/geotechnical analysis needs to be performed do determine actual foundation depths, accounting for the given minimum scour elevations.

Table 5. Minimum Recommended Scour Elevations

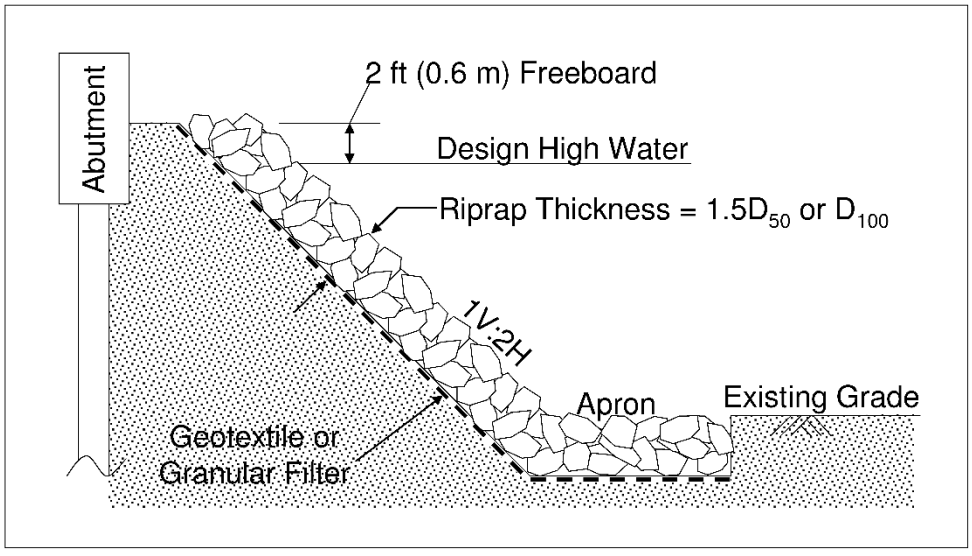
HEC-RAS Pier #	Design Plan Pier #	Minimum Ground Elevation* (ft)	Total Scour (ft)	Scour Elevation (ft)
1	5	0.6	35.9	-35.3
2, 3, 4	4	-5.2	39.5	-44.7
5, 6, 7	3	-7.6	30.4	-38.0
8	2	0.2	27.5	-27.3

*based on HEC-RAS ground points at pier location in cross section 59.912; these elevations should be verified against design plans

In the next design phase, a two-dimensional (2-D) hydrodynamic modeling, that provides more accurate prediction of the flow pattern at the proposed I-Street Bridge crossing (particularly because the bridge is located in the impinging scour impact zone of the American River confluence), would be necessary for a refined scour analysis.

Abutment Protection

According to HEC-23 (FHWA, 2009), the bridge abutments should be protected from local scour using rock riprap or guide banks. The toe or apron of the riprap serves as the base for the slope protection and must be carefully designed to resist scour while maintaining the support for the slope protection. A typical cross section for abutment riprap is shown in Figure 4.



17885 Von Karman Avenue, Suite 500, Irvine, CA 92614

www.tetratech.com

Figure 4. Typical cross section for abutment riprap (Lagasse et al. 2006)

For Froude numbers less than 0.8, the recommended design equation for sizing rock riprap for spill-through and vertical wall abutments is in the form of the Isbash relationship:

$$\frac{D_{50}}{y} = \frac{K}{(S_s - 1)}\left[\frac{V^2}{gy}\right] \quad (7)$$

where:
D_{50} = median stone diameter
V = characteristic average velocity in the contracted section
S_s = specific gravity of rock riprap
g = gravitational acceleration
y = depth of flow in the contracted bridge opening
K = 0.89 for a spill-through abutment; 1.02 for a vertical wall abutment

The characteristic average velocity in the I-Street Bridge contracted section is V= 4.7 ft/s for the 200-year flood event. This results in a minimum recommended median stone diameter D_{50}= 5 in. The layer thickness should not be less than 1 foot for practical placement. Table 6 provides recommended gradations for ten standard classes of riprap (FHWA, 2009) based on the median particle diameter D_{50} as determined by the dimension of the intermediate ("B") axis. According to Table 6, Class I riprap should be selected. Geotextile filters or granular filters should also be used in conjunction with riprap bank protection.

Table 6. Minimum and Maximum Allowable Riprap Size in Inches (FHWA, 2009)

Summary of Findings, Conclusions and Determinations

The City of Sacramento, in cooperation with the City of West Sacramento and the California Department of Transportation (Caltrans), proposes to construct a new bridge over the Sacramento River to replace the vehicle crossing that is currently accommodated by the existing I Street Bridge in order to remove a series of functionally obsolete or structurally deficient bridges (i.e., approach structures). The new connection also would reduce future traffic congestion, improve operations and safety, serve multiple modes of transportation, and comply with current American Association of State Highway and Transportation Officials, Caltrans, and local agency design standards. The new approximately 860-foot-long bridge, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides, would be located north of the existing I Street Bridge. The proposed bridge would be a five-span bridge, with an approximately 330-foot-long movable center span to meet U.S. Coast Guard (USCG) requirements. Both in-water and out-of-water construction activities would be required.

The purpose of this biological assessment (BA) is to provide technical information and to review the proposed project in sufficient detail to determine to what extent the proposed project may affect species that are federally threatened, endangered, or proposed for threatened or endangered status. This BA was prepared in accordance with legal requirements found in Section 7(a)(2) of the Endangered Species Act (ESA) (16 U.S. C 1536[c]) and based on Federal Highway Administration (FHWA) and Caltrans regulation, policy and guidance.

S.1 Summary of Federally Listed Species Impacts

The biological study area (BSA) currently supports suitable habitat for two federally listed species, valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) and delta smelt (*Hypomesus transpacificus*) (both listed as threatened under the ESA), and is considered designated critical habitat for delta smelt.

S.1.1 Valley Elderberry Longhorn Beetle

The proposed project is *likely to adversely affect* valley elderberry longhorn beetle (VELB) through the destruction of suitable habitat for the species. Construction of the proposed project would result in the removal of five elderberry shrubs and indirect effects on two shrubs.

Implementation of avoidance and minimization measures prior to and during construction will minimize indirect effects on VELB. Permanent removal of five shrubs with 26 stems greater than 1 inch in diameter will be mitigated through the planting of 34 elderberry seedlings and 34 associated native plants at a U.S. Fish and Wildlife Service approved mitigation bank.

S.1.2 Delta Smelt

The project is *likely to adversely affect* delta smelt and designated critical habitat. The primary effect of the project would be the exposure of some fish to harmful noise levels during impact pile driving, potentially resulting in harassment, injury or death of individuals. The probability of injury or death is difficult to predict and would be based on the timing and frequency of pile driving; the extent that vibratory drivers and attenuation devices would minimize the duration and intensity of impact pile driving; and the numbers, size, and mobility of listed species that may occur in the vicinity of the construction area while impact pile driving is occurring. In addition, cofferdam construction and dewatering may cause delta smelt to be injured or killed if they become trapped in cofferdams as they are being installed. Even with implementation of the proposed avoidance and minimization measures, construction activities may cause fish to delay their migration or cease spawning in response to increased turbidity, suspended sediment, and underwater noise; however, any behavioral effects would be temporary and are not expected to measurably affect growth, survival, or reproductive success. The project may also result in indirect effects on delta smelt including the potential for increases in predation rates resulting from the added overwater structure (shade) and nighttime lighting of the bridge during and after construction, from the accidental introduction of invasive aquatic species, and from a reduction in water quality associated with added runoff from increased impervious surfaces.

The proposed project would also result in a permanent loss of 1.44 acres of cottonwood riparian forest habitat, supporting 0.44 acre and 890 linear feet of shaded riverine aquatic (SRA) cover habitat; aquatic habitat (substrate and water column) for delta smelt equal to the permanent loss of 10,449 square feet (0.24 acre) of substrate area; and a net permanent loss of 32,650 cubic feet of water column (aquatic) habitat from construction of the new in-water bridge piers and pilings for the new bridge fender system. In addition, construction of the new bridge would result in the creation of approximately 55,000 square feet (1.26 acres) of permanent over-water structure (shade) on the Sacramento River from the deck of the new bridge.

Project effects on critical habitat for delta smelt include temporary effects on water quality (underwater noise and increased turbidity and suspended sediment). No permanent effects on critical habitat for delta smelt would occur from construction of the new bridge because the footprint of the new bridge is not located within designated critical habitat for delta smelt. Because of the temporary nature of construction activities and the proposed compensation for permanent effects of the project on habitat structure and function, no long-term effects on the primary constituent elements (PCEs) or conservation value of critical habitat in the region would be expected.

S.2 Summary of Mitigation Agreements

The project proponents are proposing to implement the following measures to avoid and minimize project effects on federally listed species (these measures are discussed in more detail in Chapter 4).

- Measure 1: Install Orange Construction Fencing between the Construction Area and Adjacent Sensitive Biological Resources
- Measure 2: Conduct Environmental Awareness Training for Construction Employees
- Measure 3: Conduct Periodic Biological Monitoring
- Measure 4: Avoid and Minimize Impacts on Valley Elderberry Longhorn Beetle
- Measure 5: Transplant Elderberry Shrubs That Cannot Be Avoided
- Measure 6: Compensate for Impacts on Valley Elderberry Longhorn Beetle Habitat
- Measure 7: Conduct All In-Water Construction Activities between May 1 and November 30 and during Daylight Hours Only
- Measure 8: Implement Measures to Minimize Exceedance of Interim Threshold Sound Levels during Pile Driving
- Measure 9: Develop and Implement a Hydroacoustic Monitoring Plan
- Measure 10: Protect Water Quality and Prevent Erosion and Sedimentation in Drainages and Wetlands
- Measure 11: Monitor Turbidity in the Sacramento River
- Measure 12: Implement Cofferdam Restrictions
- Measure 13: Prepare and Implement a Fish Rescue and Relocation Plan
- Measure 14: Prevent the Spread or Introduction of Aquatic Invasive Species
- Measure 15: Minimize or Avoid Temporary Construction Lighting and Permanent Bridge Lighting from Directly Radiating on Water Surfaces of the Sacramento River
- Measure 16: Compensate for Loss of Perennial Stream
- Measure 17: Compensate for Temporary Effects to and Permanent Loss of Cottonwood Riparian Forest (including SRA Cover)

S.3 Summary of Determinations

S.3.1 Valley Elderberry Longhorn Beetle

The proposed project is *likely to adversely affect* VELB based on the "take" of VELB habitat during project construction. To minimize indirect effects, the project proponents will implement avoidance and minimization measures prior to and during construction and will compensate for effects on VELB habitat as described in Chapter 4.

S.3.2 Delta Smelt

The proposed project is *likely to adversely affect* delta smelt based on the potential for "take" of delta smelt during project construction. The greatest potential for take would occur during impact pile driving, which would generate underwater noise levels that are predicted to reach levels that can cause harassment, injury, and mortality of fish; and during the installation and dewatering of cofferdams, which could entrap individuals and result in mortality. In addition, temporary delays in movement or cessation of spawning activity may occur in response to increased turbidity, suspended sediment, or underwater noise. Any behavioral effects, however, would be temporary and are not expected to measurably affect growth, survival, or reproductive success. To minimize direct and indirect effects, the project proponent will implement avoidance and minimization measures prior to and during construction, and will compensate for temporary effects on, and loss of habitat for, delta smelt as described in Chapter 4. Therefore, the project is not expected to reduce appreciably the survival and recovery of delta smelt in the Sacramento River or region.

Project effects on critical habitat include temporary effects on water quality during construction from temporary increases in turbidity and suspended sediment. The project proponents will implement avoidance and minimization measures prior to and during construction to minimize and avoid temporary construction effects on water quality, as described in Chapter 4. In addition, the project proponents will compensate for effects on designated critical habitat for anadromous salmonids and green sturgeon as part of the consultation process with NMFS, and this compensation will also likely benefit delta smelt. No permanent effects on critical habitat would occur from construction of the new bridge. Therefore, no further compensation for designated critical habitat would be required.

Chapter 1 Introduction

The purpose of this biological assessment (BA) is to evaluate the effects of the proposed I Street Bridge Replacement Project on species that are federally-listed threatened, endangered, and proposed for threatened or endangered status. This BA is prepared in accordance with legal requirements found in Section 7(a)(2) of the Endangered Species Act (ESA) (16 U.S.C 1536[c]) and based on Federal Highway Administration (FHWA) and California Department of Transportation (Caltrans) regulation, policy, and guidance.

The project is subject to state and federal environmental review requirements because of use of federal Highway Bridge Program (HBP) funds from the FHWA. Accordingly, project documentation is being prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The City of Sacramento is the lead agency under CEQA, with the City of West Sacramento as a responsible agency, and Caltrans is the lead agency under NEPA. NEPA approval is expected to be achieved with an Environmental Assessment. CEQA approval will be achieved with an Environmental Impact Report.

The FHWA's other responsibilities for environmental review, consultation, and any other action required in accordance with applicable federal laws for this project are being, or have been, carried out by Caltrans under its assumption of responsibility pursuant to 23 U.S. Code (USC) 327.

1.1 Project History and Background

The City of Sacramento, in cooperation with the City of West Sacramento and Caltrans, propose to construct a new bridge over the Sacramento River (approximately river mile [RM] 59.5) between the cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge (Figure 1-1). The project limits start within the City of Sacramento and consist of Railyards Boulevard from 200 feet east of Bercut Drive on the east, continuing west over the Sacramento River into the City of West Sacramento along C Street, and terminating approximately 100 feet west of the 5th Street intersection (Figure 1-2). The project limits also extend along Bercut Drive approximately 500 feet north of Railyards Boulevard, along Jibboom Street 550 feet north of Railyards Boulevard and 300 feet south of Railyards Boulevard, along 3rd Street 50 feet north and south of C Street, along 4th Street 50 feet north and south of C Street, along 5th Street 50 feet north and south of C Street, and includes the existing roadway approach structures leading to both sides of the existing I Street Bridge. The total length of the project is approximately 0.42 mile along C Street and Railyards Boulevard. This project is

included in the Sacramento Area Council of Governments (SACOG) 2035 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS).

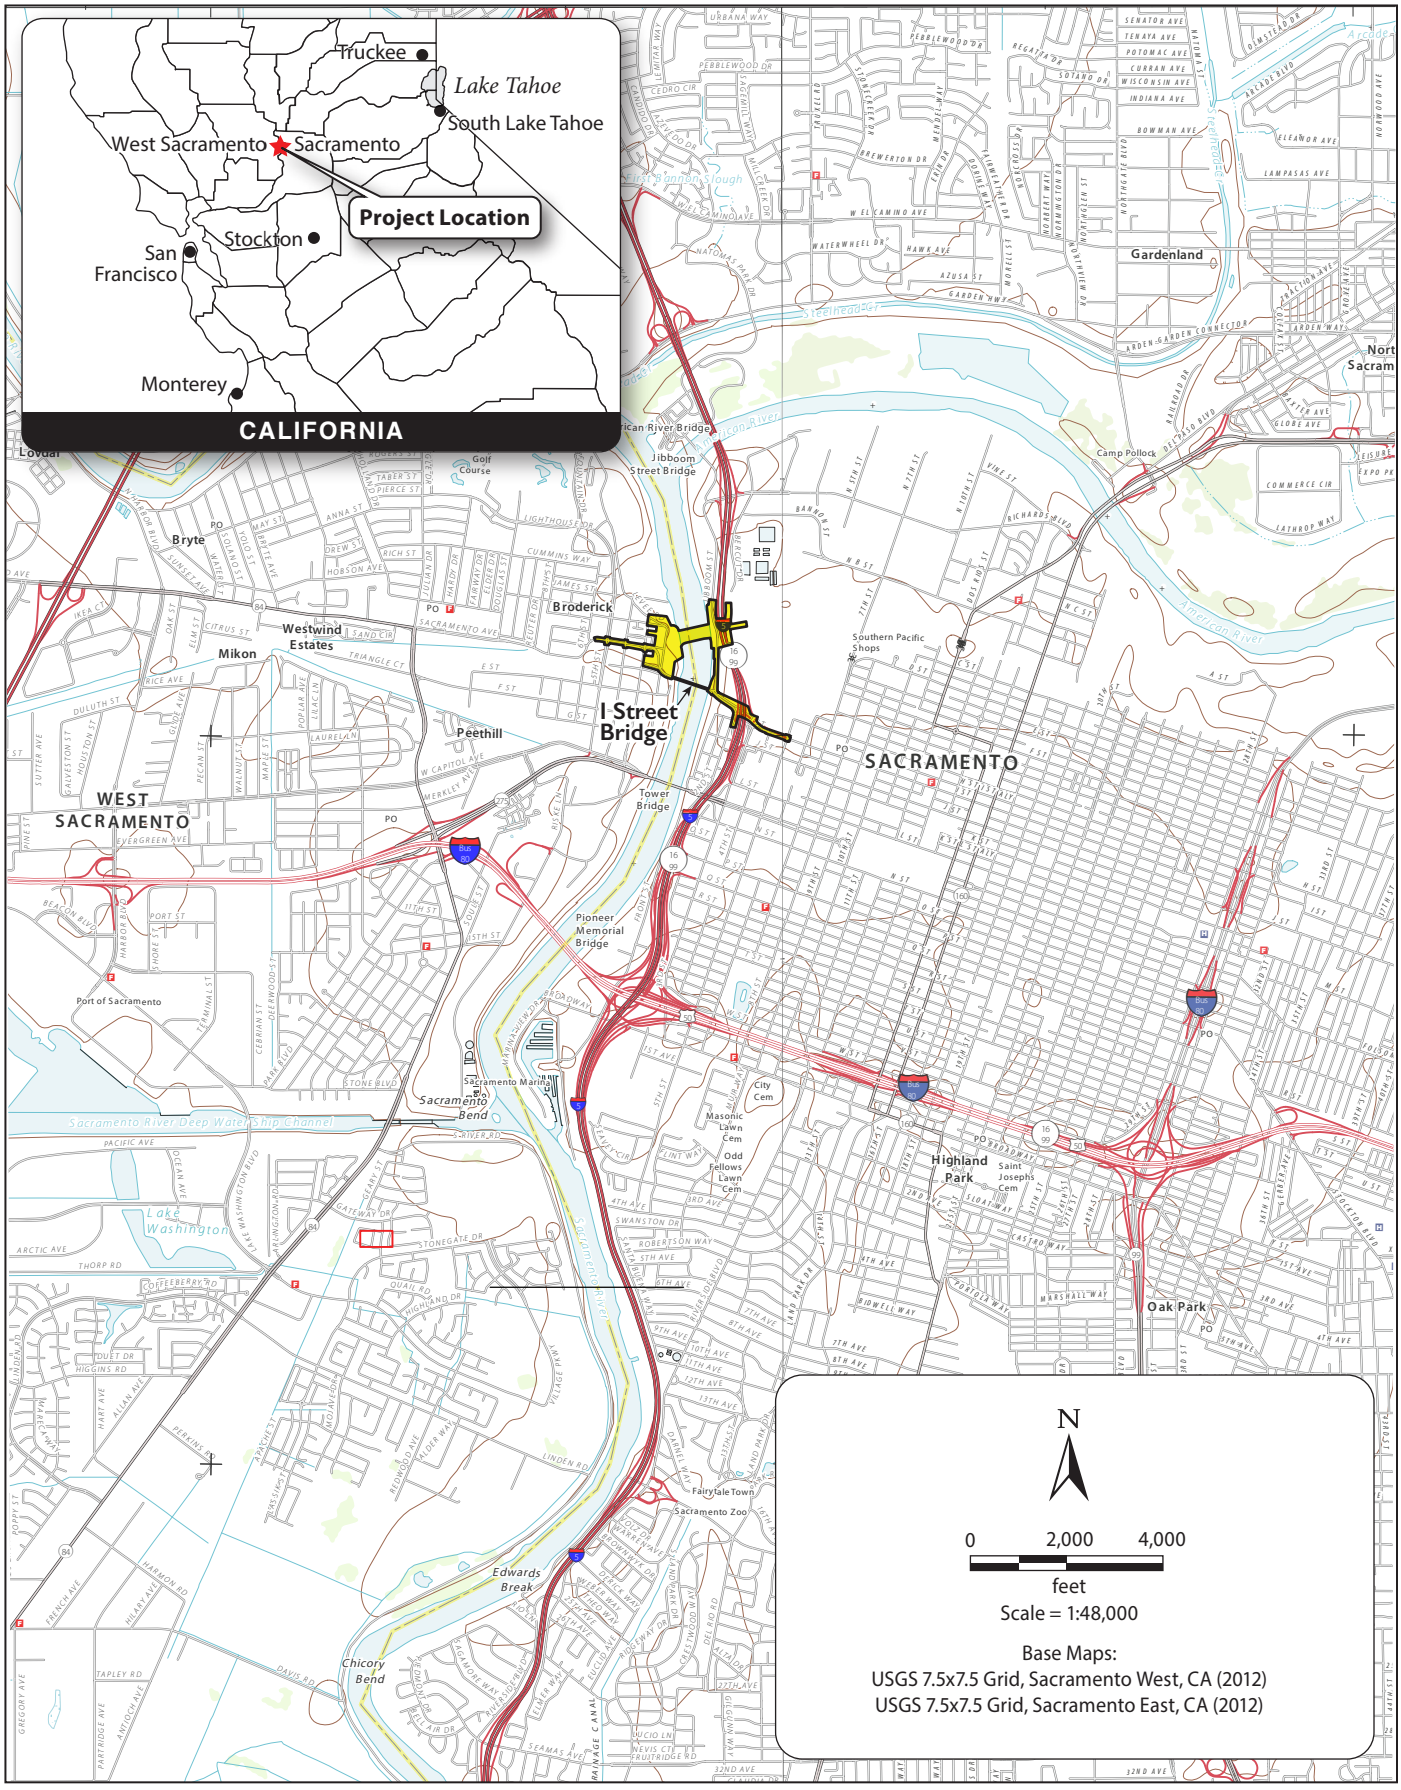
Constructed in 1911, the existing I Street Bridge is a historic double-deck, steel truss swing bridge. The lower level of the bridge provides rail access across the Sacramento River, while the upper level provides highway and pedestrian access. In 2011, the cities of Sacramento and West Sacramento completed the Sacramento River Crossings Alternatives Study, which identified the purpose and need for new bridge crossings. The study concluded that a North Market Area (the area north of I Street) crossing was needed to replace the existing I Street Bridge, which has lanes that are too narrow to serve buses, lacks bicycle lanes, and has sidewalks that are too narrow to meet accessibility standards.

1.1.1 Purpose and Need

The purpose of the project is to construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento in order to remove a series of functionally obsolete or structurally deficient bridges, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.

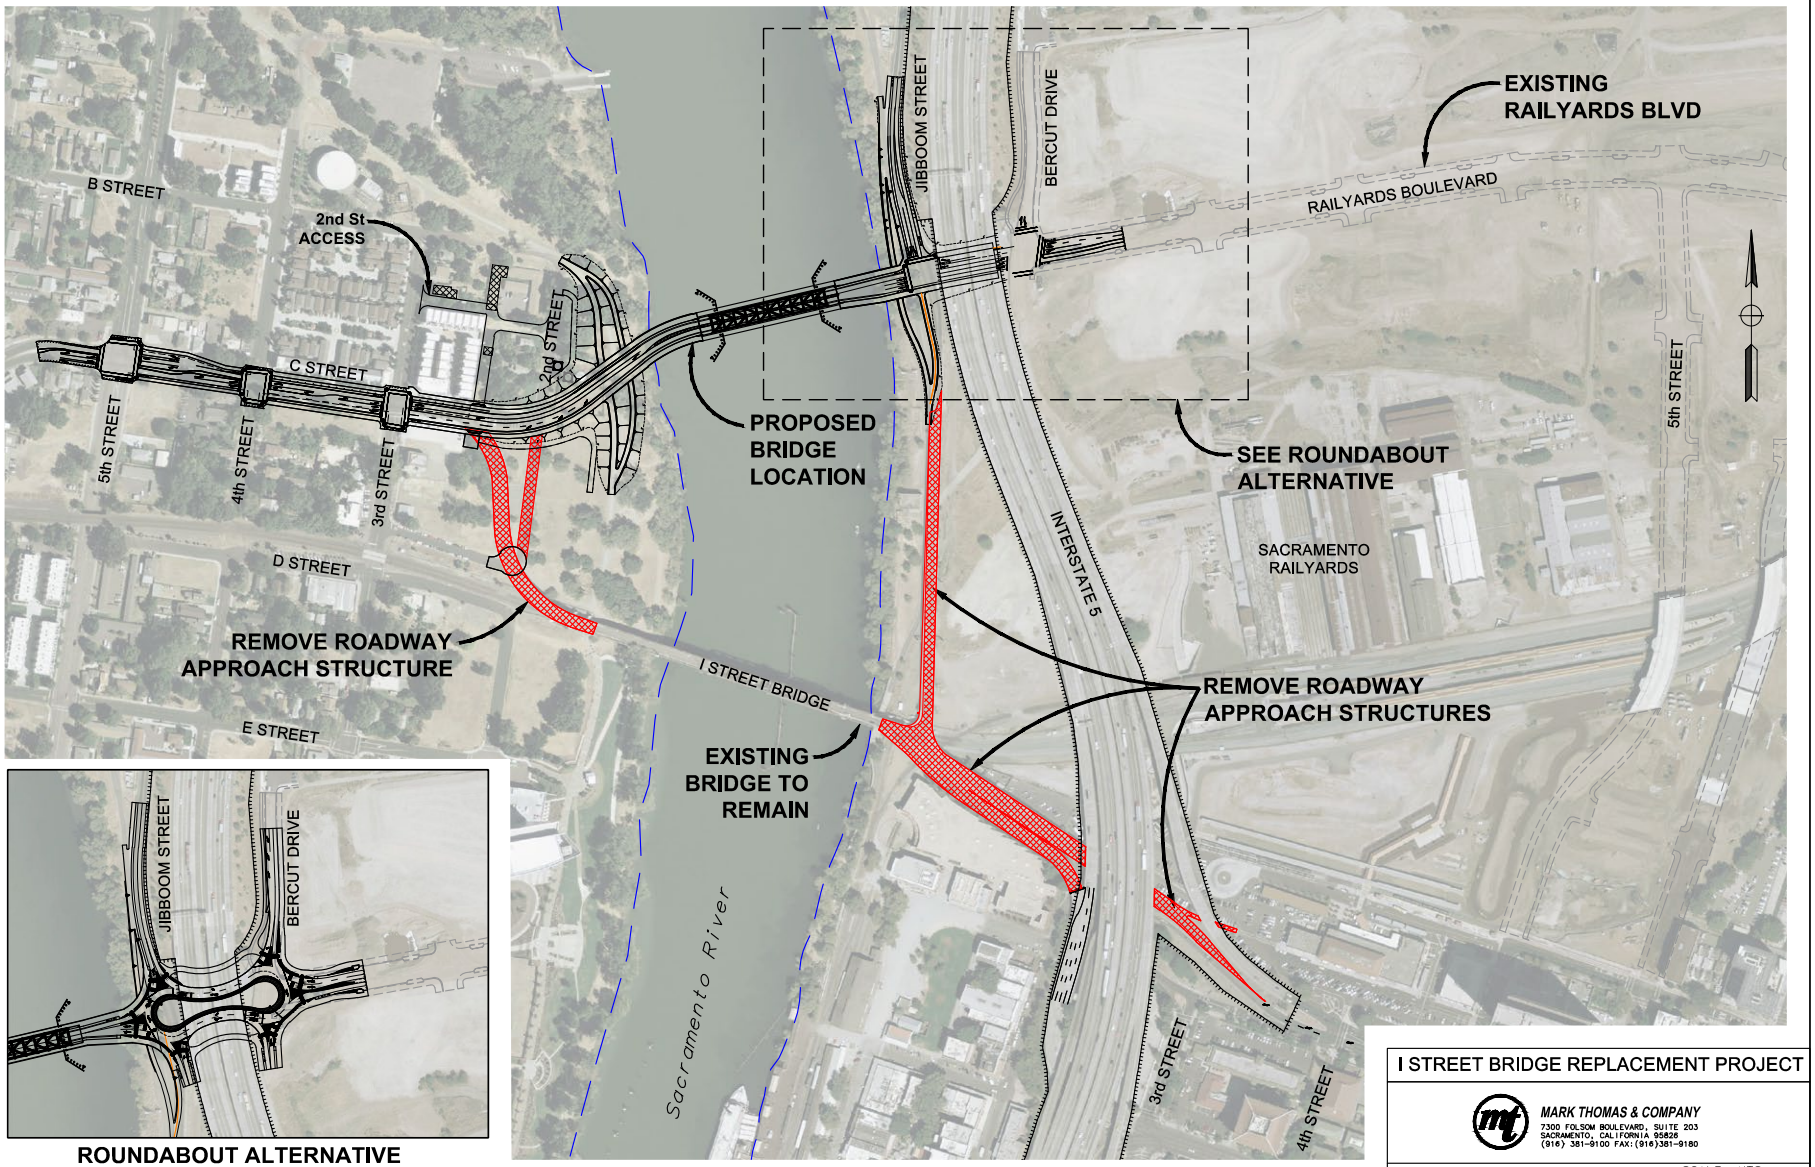
The purpose and objectives of the project are listed below.

- The project should construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge from C Street in the City of West Sacramento to Railyards Boulevard in the City of Sacramento, consistent with the adopted findings of the Sacramento River Crossings Alternatives Study for Bridge Location 2 in the North Market Area.
- The new bridge should meet the requirements of the Neighborhood Friendly Bridge definition that the City of Sacramento City Council adopted by resolution on October 18, 2011, which is defined by the following elements.
  - A facility whose primary function is local connectivity rather than regional travel and primarily serves short local trips.
  - A bridge which serves all users, including motorists, bicyclists, pedestrians, low energy vehicles, and public transit riders.
  - A bridge with aesthetics and dimensions which are architecturally pleasing and contextually appropriate for the adjacent neighborhoods.
  - A bridge that does not exceed or expand the already-planned capacity of the approach roadways (i.e., no widening of approaches just to accommodate bridge flows).



Graphics ... 00203.14 (6/19/15) AB

Figure 1-1
Vicinity Map



Graphics ... 00203.14 (2/17/16) AB

Figure 1-2
Proposed Project

  - A facility which is designed with a target speed equal to or less than the approach roadways.
  - A bridge which reduces the growth in vehicle miles traveled in the adjacent communities.
  - A bridge that does not connect directly to streets which are primarily residential in character.
  - A bridge that is consistent with the Need and Purpose statement [the adopted Sacramento River Crossings Alternatives Study statement] as articulated.
- In addition to the Neighborhood Friendly Bridge definition, the project should include pedestrian and bicycle facilities in the new public crossing that meet Americans with Disabilities Act (ADA) requirements, and facilitate connections to and from the new crossing and the Sacramento River Parkway and Riverfront Park trails.
- The proposed project also would need to construct a movable bridge that satisfies the vertical clearance and river navigation requirements of the U.S. Coast Guard (USCG).
- The project design should not preclude future addition of a streetcar, a separate, stand-alone project being developed by the Cities of West Sacramento and Sacramento.
- The new bridge also is intended to improve the connectivity to, and accessibility of, businesses, recreational areas, and new or redevelopment opportunity sites located in the urban core of Sacramento and West Sacramento.

The project is needed for the following reasons.

- The existing I Street Bridge does not fully comply with current design and traffic operation standards due to the following conditions.
  - I Street Bridge limits or restricts traffic capacity and multimodal use. The current bridge width is not sufficient to provide adequate traffic operations, bicycle lanes, or the ability for transit service across the bridge.
  - The I Street Bridge and the four associated approach structures are on the federal eligible bridge list for federal funds for replacement and/or rehabilitation through the HBP. The I Street Bridge has been classified as functionally obsolete, and the existing approach structures have been classified as structurally deficient. The Cities of Sacramento and West Sacramento have decided to pursue replacement through the HBP.
- As adopted by the Sacramento City Council, new crossings of the Sacramento River between the City of Sacramento and City of West Sacramento shall be Neighborhood Friendly. In coordination with staff from the City of West Sacramento and SACOG, the definition for a Neighborhood Friendly Bridge was developed by the City of Sacramento and the Sacramento City Council adopted the definition by resolution in October 2011. The

replacement bridge structure is required to be consistent with the Neighborhood Friendly Bridge definition.

- In addition to the Neighborhood Friendly Bridge requirements, lack of ADA compliance, non-standard and non-continuous sidewalks, and lack of bicycle facilities discourage walking and bicycling on the existing I Street Bridge.
- Section 9 of the Rivers and Harbors Act requires any local, state, or federal agency planning to construct a bridge over a navigable waterway to apply for a bridge permit through the USCG. The USCG requires the new bridge to meet or exceed the existing vertical clearance along the river, which is currently set by the US 50 Pioneer Bridge. In order to comply with the Neighborhood Friendly Bridge definition and meet the USCG requirements for navigation clearance, the new bridge would need to be movable.
- The SACOG MTP/SCS identifies that a proposed streetcar would cross over the new bridge from Sacramento to West Sacramento. While the streetcar would be a separate, stand-alone project, the bridge design must not preclude the future addition of a streetcar.
- Limited connectivity to the riverfront reduces the potential to achieve planned urban development and redevelopment of opportunity sites identified in the adopted plans of Sacramento and West Sacramento.

1.2 Project Description

1.2.1 Proposed Project

A new 860-foot-long bridge is proposed to be constructed to the north of the existing I Street Bridge (Figure 1-2). The proposed bridge alignment would connect Railyards Boulevard in the City of Sacramento with C Street in the City of West Sacramento. This alignment also allows the existing I Street Bridge to remain in operation during construction of the new bridge. Once construction of the new bridge is complete, the roadway approach structures leading up to the existing I Street Bridge from both directions would be demolished; however, the existing I Street Bridge would continue to be used by the railroad.

Roadway improvements on Railyards Boulevard in Sacramento and C Street in West Sacramento also are proposed. In the City of Sacramento, the intersection at Jibboom Street and Bercut Drive would be controlled by a signal or consist of a roundabout. In the City of West Sacramento, the proposed C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. To maintain access to these parcels, a new connection to C Street would be constructed approximately 150 feet east of the C Street/3rd Street intersection, and would continue north approximately 300 feet, then make a 90-degree turn, and connect to 3rd Street approximately 300 feet north of C Street.

1.2.1.1 New Bridge Construction and Roadway Modifications

Bridge Construction

The proposed project would construct a new bridge over the Sacramento River. The total bridge length would be approximately 860 feet long, consisting of two vehicle lanes, on-street Class II bike lanes, and sidewalks along both sides of the bridge. The bridge would include two fixed-span approach structures that tie into the Sacramento and West Sacramento banks of the river and are approximately 200 feet and 270 feet in length, respectively (see Figure 1-3). The center span of the bridge would be a movable span that meets the USCG requirements. The movable span is anticipated to be approximately 330 feet in length. The bridge soffit elevation would be set 3 feet above the 200-year water surface elevation to comply with the Central Valley Flood Protection Board (CVFPB) freeboard requirements.

The two fixed-span approach structures would be 72 feet wide, with a superstructure depth (or total bridge thickness) of approximately 6 feet. Each approach structure would be a two-span bridge. The abutment at one end of the structure would be constructed on the banks of the river, a center pier would be placed within the river approximately around the existing bank toe of slope, and the other end of the approach structure would be constructed on the piers for the movable span.

Based on coordination with the USCG, the movable span would provide a 278-foot clear channel opening approximately centered at the middle of the river. As such, the movable span has been identified as a vertical lift bridge, which would raise the bridge to a minimum vertical clearance of 59 feet over the maximum river elevation of 31 feet (measured to the NGVD 29 vertical datum). The truss depth of the movable span would be approximately 40 feet, with 6 feet of the structure being below the bridge deck and 34 feet above the bridge deck. The vertical towers would be approximately 130 feet tall, measured from the bridge soffit elevation. The vertical towers would be approximately 33 feet in thickness and the same width as the bridge deck. The total bridge width on the movable span would be 81 feet.

Due to the existing soil conditions, the bridge would be constructed on deep pile foundations. Table 1-1 summarizes the type and size of piles that would be used during construction of the new bridge, and the depth to which the piles would be installed. The abutments for the fixed-span approach structures at the river bank would consist of approximately 50 piles per abutment that are driven or cast-in-drill-hole (CIDH), to a depth of approximately 70 feet below the original ground elevation. The center piers for the two fixed-span approach structures (located approximately at the bank toe of slope in the river, below the ordinary high water mark) would consist of 50 driven or CIDH piles per pier that are approximately 70 feet below the original ground elevation. If driven piles are selected for either the abutments or piers, the piles would be

precast concrete or steel. The foundations for the movable span would consist of four large-diameter cast-in-steel-shell piles per pier. Each pile would be 9 feet in diameter, extending approximately 140 feet below the original ground elevation, and would be driven with a vibratory hammer and/or with a hydraulic oscillator/rotator system.

Table 1-1. Piles Proposed to Construct I Street Bridge

Pile Location	Pile Diameter/ Type	Total Number of Piles to be Installed	Depth of Installation (feet)	Temporary or Permanent Installation
Abutments 1 and 6	16-in diameter steel 16-in square precast concrete (alternative to 16-in diameter steel above)	100	70	Permanent
Piers 2 and 5	16-in diameter steel 16-in square precast concrete (alternative to 16-in diameter steel above)	100	70	Permanent
Piers 3 and 4	108-in steel casings	8	140	Permanent
Bridge Fender System	16-in diameter concrete	60	30	Permanent
Temporary trestle	16-in diameter steel 16-in H pile (alternative to 16-in diameter steel pile above)	160	70	Temporary
Spud piles	16-in diameter steel	8	40	Temporary
Cofferdams	Sheet piles	180	25	Temporary

Erosion control measures would be installed around the proposed bridge foundations to prevent future scour at the bridge supports. It is anticipated that rock slope protection (RSP) would be installed around the bridge abutments and piers within the water to control erosion.

A bridge fender system also is planned around the movable span piers to protect the piers from errant watercrafts that are navigating along the river. The fender system would include approximately 30 driven concrete or wooden piles around each of the movable span piers (Table 1-1). The piles would be driven to a depth of approximately 30 feet below the original ground elevation.

Temporary Falsework and Cofferdams

Temporary falsework platforms (trestles) would be required to construct the proposed bridge foundations and approach structures. The platforms would be constructed during the first construction season using temporary piles within the river. Each temporary platform would include approximately 80 driven steel piles; the piles would be either 16-inch diameter or 16-inch H piles (Table 1-1). Once installed, the temporary trestle piles would remain in the river throughout the duration of construction and would be removed in the second construction season following completion of construction. In addition, temporary cofferdams would be required to construct piers 2 and 5 for the new bridge, which would be within the water. The cofferdams

Figure 1-3
Proposed I Street Bridge: Plan View, Profile, and Elevation

would consist of temporary sheet piles installed around the individual piers. The sheet piles would be installed and removed with a vibratory hammer. Dewatering inside the cofferdams would be required.

Bridge Construction Sequence

Figure 1-4 shows the sequencing of construction activities. All in-water work would be conducted between May 1 and November 30 during the two construction seasons. This schedule is intended to reduce the number of construction seasons to construct the bridge, while minimizing or avoiding construction effects on sensitive fish and wildlife species.

1.2.1.2 Roadway Modifications

City of Sacramento

In Sacramento, Railyards Boulevard would be extended west over the Sacramento River. East of Bercut Drive, Railyards Boulevard would consist of two westbound lanes and one eastbound lane. Between Jibboom Street and Bercut Drive, Railyards Boulevard would consist of two westbound lanes and three eastbound lanes with a signalized intersection at Jibboom Street and Bercut Drive, or consist of a roundabout with two lanes in each direction. West of the Jibboom Street intersection, Railyards Boulevard would consist of one lane in each direction.

Bercut Drive would be modified from Railyards Boulevard north approximately 500 feet. Bercut Drive would be designed to have two northbound lanes at the Railyards Boulevard intersection, tapering down to one northbound lane at the northern project limits, and one southbound lane. Improvements to Bercut Drive south of Railyards Boulevard are not part of, nor needed for, the proposed project and would be constructed if needed as part of a separate future project.

Proposed improvements on Jibboom Street would extend 550 feet north of Railyards Boulevard. The roadway would consist of one travel lane in each direction, on-street Class II bike lanes, sidewalk along the west side of the roadway, and retaining walls of various heights along both sides of the road. Extension of Jibboom Street south of Railyards Boulevard is not included with, nor needed for, the proposed project and would be constructed if needed as part of a separate future project.

The proposed roadway profile for Railyards Boulevard would be approximately 6 feet higher than the original ground elevation at the Jibboom Street intersection. The profile adjustment is needed in order to satisfy the CVFPB requirements to provide 3 feet of clearance between the 200-year-flood water surface elevation and the bridge soffit (or low chord of the bridge).

City of West Sacramento

The new C Street alignment would cut off access to four residential parcels and one multifamily parcel located along 2nd Street, north of C Street. The new alignment would connect to C Street approximately 150 feet east of the 3rd Street intersection and continue north approximately 300 feet. This new alignment would then make a 90-degree left turn and connect to 3rd Street approximately 300 feet north of C Street. This new alignment would require right-of-way acquisition from seven individual parcels and removal of three structures. One structure is located on APN 010-101-010 and appears to be an individual residence. Another structure is located on APN 010-101-013 and appears to be an apartment building that supports up to one individual apartment. The last structure is located on APN 010-101-004 and appears to be an individual residence.

Between the bridge touchdown location along C Street in West Sacramento and the 4th Street/ C Street intersection, the roadway would consist of one westbound travel lane, two eastbound travel lanes (the two eastbound travel lanes would taper down to one eastbound lane east of the 3rd Street intersection), a center left-turn lane, on-street Class II bike lanes, on-street parking along the north side of the roadway, and sidewalks along both sides of the roadway. As the roadway through this section currently consists of the proposed number of travel lanes, the widening through this area is primarily needed to support the Class II bike lanes and wider sidewalks.

Along C Street between 4th Street and 5th Street, the roadway would consist of one travel lane in each direction, left-turn lanes, on-street Class II bike lanes, and sidewalks along both sides of the road. All of the improvements through this section would be accommodated within the existing roadway limits.

1.2.1.3 Class I Bikeway and Levee Modifications and Improvements

City of Sacramento

The existing Class I Sacramento River Parkway along Jibboom Street would be reconstructed approximately 500 feet north and 300 feet south of Railyards Boulevard as part of the proposed project. In order to maintain a continuous off-street Class I path along this section, the path would be grade-separated under the proposed bridge structure. Cyclists and pedestrians approaching Railyards Boulevard in either direction would have the option to continue along the path under the new structure, avoiding the need to cross the roadway. Cyclists and pedestrians who are traveling along the path also would have the option to connect to Railyards Boulevard and cross over the proposed bridge into West Sacramento or turn east into Sacramento. Due to the limited horizontal clearance between the river and the Interstate 5 (I-5) viaduct structure, retaining walls would be needed along the path to account for the vertical elevation difference

Figure 1-4
Construction Schedule

between Jibboom Street and the path that continues under the proposed bridge structure. The maximum retaining wall height along the bike path would be 16 feet.

City of West Sacramento

The proposed project would require improvements to the existing levee along the West Sacramento side of the river, where the proposed bridge alignment would connect to C Street. The existing levee does not meet current standards required by Title 23 of the California Code of Regulations (CCR). Extending approximately 300 feet north and south of the proposed C Street alignment, the levee cross-section would be reconstructed to meet current design standards, which would require 3:1 side slopes on the landside and waterside of the levee, and a 20-foot-wide crown at the top of the levee. The levee improvements also would include a slurry cutoff wall extending to a depth of 110 feet below the original ground elevation. In addition, the proposed roadway profile would be approximately 6 feet higher than the original ground elevation as it crosses over the levee. In order to maintain access to the levee for inspection and maintenance services, access roads would be constructed from the new roadway to the top of the improved levee section. The proposed grading for the levee would require relocation of the existing water tower that is located along 2nd Street, just north of the proposed C Street alignment. The tower would be relocated to the northwest, approximately 43 feet from its existing location.

The new levee maintenance road also would serve as the future Class I River Walk Park trail extension in West Sacramento. Similar to the trail improvements proposed as part of the project in Sacramento, the trail would be grade-separated under the proposed bridge structure. Cyclists and pedestrians approaching C Street in either direction would have the option to continue along the trail under the new structure, avoiding the need to cross the roadway. Cyclists and pedestrians who are traveling along the trail also would have the option to connect to C Street to cross over the proposed bridge into Sacramento or head west on C Street.

1.2.2 Over-Water Construction-Site Access

Temporary trestles and barges would be used to provide the contractor with access to the river portion of the project area. Together, the trestles and barges would be used to stage construction materials, provide a working platform for cranes, and for general construction support. The temporary trestles would consist of steel piles that would be driven into place with an impact hammer. Although the temporary work platforms would be removed at the end of the first construction season before the onset of winter, the temporary trestle piles would remain in place for the duration of construction. The barges would be anchored to the river bottom with spud piles that would be driven into place with an impact hammer. Up to two barges would be anchored in the river at one time. The barges would be repositioned in the channel throughout

construction only as needed to complete the work. The barges would be removed after bridge construction is completed.

1.2.3 In-Water Construction Activities

In-water construction activities consist of those construction activities below the ordinary high water mark (OHWM). These activities would be limited to the period of May 1 to November 30 during the two construction seasons. This in-water construction window allows sufficient time for most in-water work to be completed within the first "in-water work season", thus limiting the potential impacts on fish and other species from these activities to primarily one construction season. This in-water work window was selected after consideration of agency in-water work restrictions, timing of presence of multiple special-status fish species, timing of breeding seasons for other special-status species in the project area, and other constraints. Other construction activities occurring above the OHWM (e.g., work on the abutments and approach superstructure, and demolition of existing approach structures) would not be limited to the in-water window of May 1 to November 30. Additional information on sequencing of construction activities is provided in Figure 1-4.

In-water construction activities would include the following.

- Installation and removal of 160 steel piles with an impact hammer for the temporary falsework platforms (trestles). The piles would be embedded approximately 70 feet below the original ground elevation, based on preliminary engineering and site analysis.
- Installation and removal of eight steel spud piles with an impact hammer for anchoring barges. The piles would be embedded approximately 40 feet into the substrate, based on preliminary engineering and site analysis.
- Installation of steel sheet piles with a vibratory driver for temporary cofferdams;
- Installation of 100 steel piles for piers 2 and 5 with an impact hammer for the new bridge (although work would occur within dewatered cofferdams, underwater sound would propagate beyond the dewatered cofferdams). The piles would be embedded approximately 70 feet into the substrate, based on preliminary engineering and site analysis.
- Installation of eight 108-inch-diameter steel casings for piers 3 and 4 with a vibratory hammer and/or hydraulic oscillator/rotator system for the new bridge. The piles would be embedded approximately 140 feet into the substrate, based on preliminary engineering and site analysis.
- Installation of 30 concrete piles with an impact hammer for the new bridge fender system. The piles would be embedded approximately 30 feet into the substrate, based on preliminary engineering and site analysis.

- Installation of RSP at piers 2–5 to prevent erosion.

To reduce the potential for effects on fish during pile driving, the City and/or its contractors will implement several mitigation measures (described in detail in Chapter 4), as well as the following best management practices (BMPs) to further avoid and minimize effects that may arise during the placement and driving of piles and temporary sheet piles for cofferdams, if needed. The cofferdams would be removed once pier column construction is completed.

- Bubble curtains will be installed around piles during impact driving and proofing operations to dampen underwater sound shockwaves (Figure 1-5).
- The construction contractor will conduct several dry or dead blows with the hammer initially to frighten fish away from the pile before the pile is driven or proofed with an impact pile driver. Implementation of several dry or dead blows with the hammer to initially frighten fish away is being proposed because the use of a cushioning block or similar feature would result in more strikes being needed to drive the piles, thereby resulting in a greater chance of exceeding the cumulative sound exposure levels (SELs) without significantly reducing peak SELs.

Figure 1-5. Example of an Unconfined Bubble Curtain and Supporting Frame
(Source: Caltrans 2009)

1.2.4 Above-Water Construction Activities

After the temporary cofferdams are installed around piers 2 and 5, forms would be constructed and concrete poured in the dewatered cofferdams to construct the pile caps. Work would then focus on pier 2 and 5 column construction. After the 108-inch-diameter casings for piers 3 and 4 are installed, a rebar cage would be placed into the pile and concrete would be poured into the steel shell. A cast-in-place concrete pier cap would be placed atop the columns to serve as the substructure.

Work would then focus on constructing the approach superstructure and vertical lift towers. The removable span would be constructed off-site, floated in, and erected once construction of the vertical lift towers is completed.

1.2.5 Storm Water Drainage Management

Drainage for the proposed roadway would be conveyed to the existing storm drain system installed within Railyards Boulevard and C Street. Railyards Boulevard currently drains storm water to the east along the roadway and then into a retention basin south of Railyards Boulevard. C Street drains storm water west along the roadway and then ultimately south beyond the project limits.

As is standard with all construction projects, the contractor would be required to install temporary BMPs to control any runoff or erosion from the project site into the surrounding waterways. These temporary BMPs would be installed prior to any construction operations and would be in place for the duration of the contract. The removal of these BMPs would be the final operation, along with project site cleanup.

1.2.6 Structure Demolition and Roadway Modifications

Following completion of the new bridge connections at Railyards Boulevard and C Street, traffic would be diverted to the new bridge, and the four existing approach structures to the I Street Bridge would be removed. Bridge numbers 24C0364L, 24C0364R, 22-0033, and 22C0154 would be demolished and the foundations would be removed to a depth of 3 feet below the original ground elevation. Encroachment permits from Caltrans and Union Pacific Railroad would be needed to complete the bridge removal. The existing I Street Bridge is owned and operated by Union Pacific Railroad and would continue to remain in-place and used by trains following construction of the new bridge.

As part of the removal of the existing approach structures, the project would include modifications to I Street within the City of Sacramento from the southbound I-5 on-ramp east to the 5th Street intersection. The modification would include signing and striping revisions,

demolition of existing roadway sections that are no longer required, and removal of bridge abutments and foundations.

1.2.7 Staging, Storage, and Proposed Access during Construction

Two staging areas would be used to store materials and equipment during construction, such as pipe materials, precast manholes and drop inlets, steel girders, piles, and rebar, along with the construction equipment when not in use. One area would be located south of Railyards Boulevard under I-5 in Sacramento; the other area would be located west of the landward side of the levee, south of the new bridge location in West Sacramento. The staging area located along Railyards Boulevard would be accessed via the existing intersection at Jibboom Street. The staging area in West Sacramento would be accessed via the existing 2nd Street connection at 3rd Street, south of C Street. The staging areas would be in use throughout the construction duration; the areas would be returned to their pre-project conditions at the completion of the project.

1.2.8 Utility Relocations

A number of public and private utilities would need to be relocated or adjusted to grade as part of the project, including existing water, sewer, gas, electric, and communication facilities within Jibboom Street, Bercut Drive, C Street, and 2nd Street.

1.2.9 Traffic Management and Detours during Construction

While most of the project would be constructed outside of existing roadways, some areas would require temporary detours or staged construction.

Along Jibboom Street at the proposed Railyards Boulevard intersection, the new roadway profile would be raised approximately 6 feet above the original ground elevation. To maintain access to the existing Jibboom Street viaduct south of Railyards Boulevard during the roadway construction, a temporary access road would be needed. The proposed temporary access road would connect to the existing Jibboom Street viaduct abutment approximately 350 feet south of Railyards Boulevard. The temporary road would then continue under I-5 and connect to the Railyards Boulevard/Bercut Drive intersection. The temporary road would require placement of temporary fill material and a roadway structural section that would be removed after construction of the new bridge. Traffic traveling north along Jibboom Street would continue north along Bercut Drive to access the Richards Boulevard/I-5 interchange.

In order to complete the improvements at Jibboom Street and Railyards Boulevard, Jibboom Street would be closed to traffic approximately 600 feet north of Railyards Boulevard. Traffic traveling south along Jibboom Street to continue over the existing I Street Bridge into West

Sacramento would be detoured over to Bercut Drive at Richards Boulevard. Traffic would then use the temporary access road to connect to the Jibboom Street viaduct structure. The temporary access road would be in place for approximately 2 years, after which traffic would use the new roadways and new bridge.

The Sacramento River Parkway trail along Jibboom Street also would require temporary re-routing during construction. The temporary alignment for the trail would follow the temporary Jibboom Street alignment south of Railyards Boulevard. Cyclists and pedestrians would then continue following a detour north along Bercut Drive to Richards Boulevard, where they could then connect back to the Parkway on the west side of I-5. The detour would be in place for approximately 2 years.

During construction, traffic along C Street would be maintained along the existing approach structure until the new bridge is constructed.

1.2.10 Project Construction Sequence

New bridge and roadway construction would occur first, followed by demolition of the four approach structures that connect to the existing I Street Bridge. Once the new bridge and roadways are constructed, traffic would be diverted to the new bridge in order to allow demolition adjacent to the existing bridge. Construction of the project is expected to take approximately 30 months.

1.2.11 Property Acquisition

The project would require temporary and permanent property acquisitions along C Street, 3rd Street, and 2nd Street within the City of West Sacramento and along Railyards Boulevard, Jibboom Street, Bercut Drive, and I Street within the City of Sacramento.

Along C Street, temporary and permanent acquisitions would be required along the south side of the roadway to accommodate the construction of standard shoulders, bike lanes, and sidewalks—from the intersection of 4th Street to the Sacramento River.

Along 3rd Street and 2nd Street, temporary and permanent acquisitions would be needed from the Union Pacific Railroad on the south, to just north of the B Street intersections, for construction of the proposed roadway and levee improvements.

Along Railyards Boulevard, Jibboom Street, and Bercut Drive, temporary and permanent acquisition would be needed from the current state-owned right-of-way for I-5, for construction

of the roadway. In addition, temporary and permanent acquisitions would be needed along Jibboom Street for the proposed temporary detour road and Class I bikeway improvements.

Temporary acquisition would be required along the existing I Street connection to facilitate removal of the existing viaduct structures. Due to the limited space available in Old Sacramento, it is anticipated that construction activities would occur from the parking lot at the intermodal station.

1.2.12 Proposed Equipment and Construction Schedule

Table 1-2 identifies the type of equipment that would be used to construct the project. Construction is expected to begin in spring 2018 and occur during three (two in-water) construction seasons. It is anticipated that the project would be completed by mid-summer 2020.

1.3 Summary of Consultation to Date

During preparation of this BA, ICF International (ICF) (formerly Jones & Stokes) coordinated with the USFWS. Coordination with the agency occurred during a meeting and a visit to the project site on November 17, 2015. Discussions focused on potential effects on federally listed species, the construction schedule and timing of activities, and avoidance, minimization, and compensation measures. A detailed summary of this coordination is included in the "Agency Coordination" section in Chapter 2.

A list of federally endangered and threatened species, and designated critical habitat that have the potential to occur in the project vicinity, was obtained from the Sacramento USFWS website on April 17, 2015, and an update of this list was obtained from the IPaC website on January 26, 2016 (Appendix A).

Table 1-2. Construction Phases and Equipment

Phase	Equipment	Number per Day

1.4 Document Preparation History

This BA was prepared for the proposed project during 2016 by ICF. Preparers of the document included wildlife biologist John Howe (valley elderberry longhorn beetle) and fish biologist Jeff Kozlowski (delta smelt). Wildlife biologist Jennifer Haire conducted peer/technical review of the BA. Overall review was conducted by ICF project manager Claire Bromund. Caltrans biologist Jennifer Osmondson reviewed and provided comments on the BA.

ICF prepared a wetland delineation report for the proposed project during 2015. ICF botanist/wetland ecologist. Lisa Webber conducted the wetland delineation and prepared the report and overall review was conducted by Claire Bromund. Caltrans biologist Jennifer Osmondson reviewed and provided comments on the wetland delineation report. The wetland delineation report is provided in Appendix B.

Chapter 2 Study Methods

2.1 Listed and Proposed Species Potentially in the Biological Study Area

A list of federally endangered and threatened species, and designated critical habitat that have the potential to occur in the project vicinity was obtained from the Sacramento USFWS and IPaC websites for the project area (U.S. Fish and Wildlife Service 2015a, 2016) (Appendix A).

Table 2-1 includes the potential for each listed species to occur in the BSA. Information collected during field surveys, review of existing documents and the California Natural Diversity Database (CNDDB) (California Department of Fish and Wildlife 2015), presence of suitable habitat, and professional judgment were used to determine potential presence of the federally listed species evaluated in this BA.

As shown in Table 2-1, the BSA contains suitable habitat for valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) (VELB) and delta smelt (*Hypomesus transpacificus*). The BSA also occurs within designated critical habitat for delta smelt. There is no suitable habitat in the BSA for, or the BSA is outside the known range of, the remaining species listed in Table 2-1.

A separate BA has been prepared for the National Marine Fisheries Service (NMFS) to address the potential effects of the project on Sacramento River winter-run Chinook salmon (*Oncorhynchus tshawytscha*), Central Valley spring-run Chinook salmon (*O. tshawytscha*), Central Valley steelhead (*O. mykiss*), North American green sturgeon (*Acipenser medirostris*), and designated critical habitat for these four species. Therefore, this BA addresses potential effects on VELB, delta smelt, and designated critical habitat for delta smelt only.

Table 2-1. Federally Listed and Proposed Species, and Critical Habitat Potentially Occurring in the Biological Study Area

Common Name	Scientific Name	Status	General Habitat Description	Habitat Present/ Absent	Rationale
Invertebrates					
Vernal pool fairy shrimp	*Branchinecta lynchi*	Threatened—59 FR 19856-19863; September 19, 1994	Found in Central Valley, central and south Coast Ranges from Tehama to Santa Barbara County; isolated populations also in Riverside County; common in vernal pools; also found in sandstone rock outcrop pools.	Absent	No suitable vernal pool habitat is present in the BSA.
Vernal pool tadpole shrimp	*Lepidurus packardi*	Endangered—59 FR 19856; September 19, 1994	Found from Shasta County south to Merced County; occurs in vernal pools and ephemeral stock ponds.	Absent	No suitable vernal pool habitat is present in the BSA.
Valley elderberry longhorn beetle	*Desmocerus californicus dimorphus*	Threatened—45 FR 52803; August 8, 1980	Streamside habitats below 3,000 feet throughout the Central Valley; occurs in riparian and oak savanna habitats with elderberry shrubs; elderberries are the host plant.	Present	Seven elderberry shrubs are present in the BSA. Only one shrub occurs within riparian habitat.
Fish					
Delta smelt	*Hypomesus transpacificus*	Threatened—58 FR 12854–12863; March 5, 1993)	Found primarily in the Sacramento–San Joaquin Estuary but has been found as far upstream as the mouth of the American River on the Sacramento River and Mossdale on the San Joaquin River; range extends downstream to San Pablo Bay; occurs in estuary habitat in the Delta where fresh and brackish water mix in the salinity range of 2–7 parts per thousand (Moyle 2002).	Present, Critical Habitat	The Sacramento River within the BSA provides migration, spawning, and seasonal rearing habitat and is designated as critical habitat for the species (59 FR 65256; December 19, 1994).

Common Name	Scientific Name	Status	General Habitat Description	Habitat Present/ Absent	Rationale
Amphibians					
California tiger salamander	*Ambystoma californiense*	Threatened—69 FR 47212; August 4, 2004	Breeds during the wet season in vernal pools and ponds, with a minimum 10-week inundation period; adults spend most of the year in grassland oak woodland habitat, primarily in small mammal burrows; occurs from Yolo to Kern County in the Central Valley and in the Sierra Nevada foothills from Amador to Tulare County, and from Sonoma to Santa Barbara County on the coast.	Absent	No vernal pools or ponds are present in the BSA, and the BSA is outside the known distribution of the species.
California red-legged frog	*Rana draytonii*	Threatened—61 FR 25813; May 23, 1996	Found along the coast and coastal mountain ranges of California from Mendocino to San Diego County and in the Sierra Nevada from Butte to Tuolumne County; occurs in permanent and semipermanent aquatic habitats, such as creeks and ponds, with emergent and submergent vegetation; uses upland areas for cover (burrows, logs, rocks, and crevices) and dispersal.	Absent	Considered extirpated from the valley floor (U.S. Fish and Wildlife Service 2002).
Reptiles					
Giant garter snake	*Thamnophis gigas*	Threatened—58 FR 5403; October 20, 1993	Sloughs, canals, low-gradient streams, and freshwater marsh habitats with a prey base of small fish and amphibians; also found in irrigation ditches and rice fields; requires grassy banks and emergent vegetation for basking and areas of high ground protected from flooding during winter.	Absent	The Sacramento River is not considered suitable aquatic habitat for the species. No other suitable habitat is present in the BSA.
Birds					
Least Bell's vireo	*Vireo bellii pusillus*	Endangered—51 FR 16474; May 2, 1986	Historically nested in riparian habitat throughout the Central Valley, but the majority of the population now occurs in southern California; recently documented nesting on the San Joaquin River west of Modesto; requires dense riparian vegetation for nesting and a dense, stratified canopy for foraging	Absent	The BSA lacks dense riparian vegetation with a stratified canopy.

2.2 Studies Required

It was determined that the following surveys would be required to identify habitat for and assess potential effects on federally listed species in the BSA.

- General habitat evaluation to determine whether suitable habitat exists for federally listed species.
- Elderberry shrub survey according to the USFWS's 1999 *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (Guidelines) to document suitable habitat for the federally listed valley elderberry longhorn beetle.
- General stream habitat survey to evaluate the occurrence and extent of shaded riverine aquatic (SRA) cover, including overhead vegetation, undercut banks, and instream woody material that exists for delta smelt in the BSA.

The following sources of information were reviewed prior to field surveys.

- CNDDB records search of the Sacramento West, Clarksburg, Saxon, Rio Linda, Sacramento East, Florin, Taylor Monument, Grays Bend, and Davis USGS 7.5-minute quadrangles (California Department of Fish and Wildlife 2015) (Appendix B).
- USFWS species list obtained from the USFWS website on April 7, 2014.

The *Sacramento-San Joaquin Delta Native Fishes Recovery Plan*, which was completed in 1996 (U.S. Fish and Wildlife Service 1996) was also reviewed during preparation of this BA.

2.3 Personnel and Survey Dates

ICF biologists conducted biological surveys in the BSA in 2014 and 2015 (Table 2-2). Methods and personnel involved in documenting wetlands and other waters of the United States and conducting wildlife and SRA cover habitat surveys are described below. Representative photographs taken during field surveys are provided in Appendix C.

Table 2-2 Biological Survey Personnel and Dates

Survey Type	Survey Date	Surveyors
Natural communities and habitat-based assessment for listed wildlife species	April 14, 2014	John Howe, ICF Wildlife Biologist, 18 yrs. experience Lisa Webber, ICF Botanist/Wetland Ecologist, 25 yrs. experience
Delineation of waters of the United States and waters of the State	April 8, 2015	Lisa Webber
Wildlife habitat assessment and elderberry shrub survey	April 8, 2015	John Howe
Shaded riverine aquatic cover habitat survey and fish passage reconnaissance assessment	May 8 and June 17, 2015	Jeff Kozlowski, ICF Fisheries Biologist, 29 yrs. experience Rita Wilson, ICF Research Assistant, 1 yr. experience

2.3.1 Waters of the United States, Including Wetlands

ICF botanist/wetland ecologist Lisa Webber conducted delineation field work in the BSA on April 8, 2015. The delineation was conducted using the routine onsite determination method described in the *U.S. Army Corps of Engineers Wetlands Delineation Manual* (Environmental Laboratory 1987) and the supplemental procedures and wetland indicators provided in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (U.S. Army Corps of Engineers 2008). The wetland delineation letter report is included as Appendix A.

2.3.2 Wildlife Resources

ICF biologist John Howe conducted habitat-based field assessments for listed wildlife in the BSA on April 14, 2014, and on April 8, 2015. During the assessments, Mr. Howe took notes on the general topography of the BSA, the vegetation present, and the amount of human activity/disturbance at the site; he recorded wildlife (or wildlife signs) observed during the visit. During the April 8, 2015 site visit, Mr. Howe conducted an elderberry shrub survey according to the USFWS's Guidelines to document the location of elderberry shrubs (the host plant for valley elderberry longhorn beetle) present in the project limits and within 100 feet of the project limits. During the elderberry shrub survey, Mr. Howe recorded information on the number and size of stems, presence or absence of exit holes, and habitat associations. A list of wildlife species observed in the BSA is provided in Chapter 3. The results of the wildlife surveys are presented in Chapters 3 and 4.

2.3.3 Fisheries Resources

On May 8, 2015, ICF fish biologist Jeff Kozlowski, accompanied by Rita Wilson, conducted an SRA cover habitat survey, a fish passage reconnaissance assessment, and a general reconnaissance-level field survey of the Sacramento River within the BSA. The reconnaissance-

level field survey focused on evaluating existing habitat conditions within the BSA relative to the needs of special-status fish species. In addition, Jeff Kozlowski and Rita Wilson took photographs of the banks and levees from the Sacramento River on June 17, 2015. No special-status fish surveys were conducted for the proposed project.

2.4 Agency Coordination and Professional Contacts

The following agency coordination has been conducted for the project.

2.4.1 Caltrans Office of Local Assistance

On June 25, 2014, District 3 Caltrans biologist Maureen Doyle participated in a site visit to the BSA to review and discuss the Preliminary Environmental Study (PES) with project representatives from the Cities of Sacramento and West Sacramento, management and engineering representatives from Mark Thomas and Company, and ICF project management and technical specialist representatives (including John Howe and Lisa Webber).

On June 3, 2015, Caltrans biologist Jennifer Osmondson, ICF biologist John Howe, and ICF botanist/wetland ecologist Lisa Webber participated in a conference call to discuss proposed mitigation for sensitive biological resources.

On June 11, 2015, Ms. Osmondson and Ms. Webber discussed by phone the format of the letter report for the delineation of waters of the United States to be submitted to the U.S. Army Corps of Engineers (USACE).

On October 28, 2015, Ms. Osmondson sent to the NMFS, USFWS, USACE, and CDFW an email invitation for a November 17, 2015 resource agency meeting and site visit with project representatives from the Cities of Sacramento and West Sacramento, management and engineering representatives from Mark Thomas and Company, and ICF project management and technical specialist representatives. The purpose of the meeting was to discuss the design of the project and the potential biological impacts, and to get feedback from the agencies regarding likely mitigation requirements.

On November 17, 2015, Ms. Osmondson and representatives of the Cities of Sacramento and West Sacramento, Caltrans and members of the project consulting team, including Ms. Webber, Mr. Howe, and Mr. Kozlowski, attended the resource agency meeting. A summary of the proposed project and preliminary impact results was provided and input from the agencies regarding the impacts and likely mitigation requirements was solicited.

2.4.2 National Marine Fisheries Service

On June 9, 2015, Jeff Kozlowski, on behalf of Caltrans and the City of Sacramento, and in cooperation with the City of West Sacramento, requested a species list from Maria Rea, Assistant Regional Administrator for NMFS' California Central Valley Area Office for the project. On August 20, 2015, Caltrans obtained a list from NMFS of all proposed and listed endangered and threatened fish species and designated critical habitat that could occur in the vicinity of the project (Rea pers. comm.; Appendix A).

On November 17, 2015, Lieutenant Junior Grade Sean Luis attended the resource agency meeting and offered initial feedback regarding the project and in-water work windows.

2.4.3 U.S. Fish and Wildlife Service

On November 17, 2015, Mr. Armin Halston attended the resource agency meeting and offered initial feedback regarding the project. Mr. Halston was not able to participated for the full duration of the meeting or the site visit. The initial species list was obtained from the USFWS website on April 17, 2015, and was updated on January 27, 2016.

2.4.4 U.S. Army Corps of Engineers

Staff from the USACE was invited to attend the November 17, 2015, resource agency meeting but no representatives attended the meeting.

2.4.5 California Department of Fish and Wildlife

On November 17, 2015, Ms. Tanya Sheya attended the resource agency meeting and offered initial feedback regarding the project and mitigation requirements.

2.4.6 State Lands Commission

There has been no consultation with the State Lands Commission (SLC) to date, but a Land Use Lease will be required for bridge construction in the Sacramento River.

2.5 Limitations That May Influence Results

At the time of the delineation fieldwork, indicators of hydrophytic vegetation, hydric soils, wetland hydrology, and the mean high water line were evident and identifiable. Therefore, there were no limitations with regard to the survey for wetlands and other waters in the BSA.

The assumed presence of, and the impact assessment on, delta smelt depends largely on previously collected data; literature reviews; and general species distribution, habitat requirements, and life history. As stated previously, no fish surveys were conducted; however, it is well documented that delta smelt occur in the Sacramento River in the vicinity of the BSA based on trawl surveys in the Sacramento River (U.S. Fish and Wildlife Service 2015b).

Although designated critical habitat for delta smelt is not present in the BSA, the Sacramento River downstream of the existing I Street Bridge is designated critical habitat for delta smelt, which includes the action area (see section 3.1.1, *Biological Study Area*, for a description of the action area and its relationship to the BSA).

Chapter 3 Results: Environmental Setting

This chapter defines the BSA for the proposed project and describes the existing physical and biological conditions within the BSA.

3.1 Description of the Existing Biological and Physical Conditions

3.1.1 Biological Study Area

The extent of the BSA, which includes all permanent and temporary project impact areas, is shown in Figure 3-1. The BSA consists of the Sacramento River, riparian woodland and open space with bike/pedestrian trails along the Sacramento River, local roads, elevated roads (viaducts) and bridge approach structures, residential areas, and commercial development. The BSA has a relatively high level of historical and ongoing disturbance.

USFWS defines the action area as "all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action" (50 Code of Federal Regulations [CFR] 402.02). Accordingly, the action area includes the BSA defined above and portions of the Sacramento River that could be affected by elevated turbidity, sediment deposition, and underwater noise generated by in- and near-water construction activities. Because pile driving effects are anticipated to extend beyond water quality effects (with BMPs in place), the action area includes areas both upstream and downstream from pile driving activity where pile driving noise may have a physical or behavioral effect on delta smelt. Based on an analysis of sound expected to be generated by driving 12-inch-diameter steel piles for the temporary trestle without an attenuation device, the 183 decibel (dB) sound exposure level (SEL) accumulated interim criteria (see the pile driving assessment contained in Section 4.3.1.4 for definitions) could be exceeded a distance of up to 1,775 feet (541 meters) upstream and downstream the source. Although noise levels could exceed background levels beyond that point, a distance to any lesser threshold (e.g., 150 dB root mean square, which is sometimes used as a behavioral threshold) cannot be realistically predicted because of the physical geography of the river. The Sacramento River has river channel bends and the straight line distance of open water is 5,400 feet upstream and 5,600 feet downstream of the proposed bridge crossing, and these distances are considerably shorter than the calculated distance (9,600 feet) to which the 150 dB threshold could be exceeded. Consequently, the action area for this project is defined as the entire width of the Sacramento River channel and extending out 2,000 feet beyond the straight-line, open water distances to account for the diffraction and attenuation upstream and downstream of the proposed bridge crossing—that is, 7,400 feet upstream and 7,600 feet

downstream of the proposed bridge crossing (i.e., from approximately RM 58 to approximately RM 61).

3.1.2 Physical Conditions

The BSA is located in the Sacramento Valley subregion of the California Floristic Province (Baldwin et al. 2012:43). The topography in the BSA varies from relatively level to moderate slopes on the Sacramento River levees, and elevations range from approximately -6 to 64 feet above mean sea level.

According to soil data from the Natural Resources Conservation Service, the BSA contains the following five soil map units and water (Natural Resources Conservation Service 2014a).

- Orthents-Urban land complex, 0 to 2 percent slopes (Sacramento County)
- Urban land (Sacramento County)
- Lang sandy loam (Yolo County)
- Lang sandy loam, deep (Yolo County)
- Sycamore silt loam (Yolo County)

The soil profile has been disturbed by development in West Sacramento and construction activity in the Sacramento Railyards area.

Based on the project's Preliminary Geotechnical Report (GEI Consultants 2014), subsurface conditions in the project area are described as follows:

> *The existing borings and cone penetration tests (CPT) performed for levee evaluations on the crest and in the vicinity of the West Sacramento levee (the west end of the planned bridge), encountered approximately 15 feet of loose sand with silt (SP-SM) in the embankment. The sand with silt was underlain by an approximately 9 foot layer of clay (CL), followed by an approximately 16 feet thick layer of sandy silt (ML). The sandy silt was underlain by approximately 35 feet of sand with silt (SP-SM). The apparent densities of the sand with silt ranged from medium dense to very dense. The sand with silt was underlain by approximately 25 feet of very dense gravel (GP), followed by a layer of clay (CL). The maximum depth explored was approximately 115 feet.*
>
> *The existing borings and cone penetration tests on the east end (city of Sacramento) of the planned bridge at the crest of existing levee encountered approximately 6 feet of loose sand with silt (SP-SM). The sand with silt was underlain by approximately 10 feet of loose sand (SP), followed by approximately 7 feet of sandy silt (ML). The sandy silt layer was underlain by approximately 50 feet of sand with silt (SP-SM). The densities of the*

Figure 3-1
Impacts on Landcover Types and Sensitive Biological Resources in the Biological Study Area

sand with silt layer varied from loose to medium dense. The sand with silt layer was underlain by an approximately 23 feet thick layer of medium dense to very dense gravel (GP), followed by a layer of clay (CL). The maximum depth explored was approximately 110 feet.

The substrate in the Sacramento River channel is sand with silt, overlying sand with gravel and gravel (GEI Consultants 2014).

The BSA is within the Lower Sacramento watershed hydrologic unit (hydrologic unit code [HUC] 18020109) (U.S. Environmental Protection Agency 2015). The primary river in the delineation area is the Sacramento River, a traditional navigable water (TNW) that qualifies as another water of the United States (which also is considered a water of the State). The specific characteristics of waters of the United States (including wetlands) in the BSA are further described below in the "Natural Communities" section and in the wetland delineation report (Appendix A).

The climate is generally Mediterranean, with cool, wet winters and hot, dry summers. Precipitation occurs primarily in the winter, generally from November to April, with a distinct dry period from May to October. The average total annual precipitation is approximately 18.20 inches (Western Regional Climate Center 2005).

3.1.3 Biological Conditions in the Biological Study Area

3.1.3.1 Natural Communities

The natural communities in the BSA are interspersed with roadways, railroad tracks, commercial and industrial areas, and residential development. The term *land cover type* is used in this BA to refer to vegetation communities, open water, and unvegetated developed or disturbed areas. Land cover types mapped during field surveys are described below and shown in Figure 3-1. Representative photographs of land cover types within the BSA are provided in Appendix C.

The BSA supports both common vegetation communities and natural communities of special concern. Common vegetation communities are habitats with low species diversity that are widespread, reestablish naturally after disturbance, or support primarily non-native species. These communities generally are not protected by agencies unless the specific site is habitat for or supports special-status species (e.g., raptor foraging or nesting habitat, upland habitat in a wetland watershed). Common vegetation communities in the BSA are ruderal woodland and landscaped areas.

The distribution, representative vegetation, and typical wildlife species found in land cover types within the BSA are described below.

Cottonwood Riparian Forest

Cottonwood riparian forest in the BSA occurs along the upper banks and floodplains of the Sacramento River (Figure 3-1). The overstory of riparian forest is predominantly mature Fremont cottonwood (*Populus fremontii*) trees associated with valley oak (*Quercus lobata*) and black walnut (*Juglans californica* var. *hindsii)*. Other riparian tree species observed include Oregon ash (*Fraxinus latifolia*), boxelder (*Acer negundo* var. *californicum*), and black willow (*Salix gooddingii*). The riparian understory on the waterside of the levee is primarily rip-rap with non-native annual grasses and forbs; however, there are also patches of more typical riparian species, such as narrow-leaf willow (*Salix exigua*), Himalayan blackberry (*Rubus armeniacus*), and mugwort (*Artemisia douglasiana*). The invasive red sesbania (*Sesbania punicea*) shrub was observed in the riparian forest on the Sacramento side of the river. One blue elderberry shrub (*Sambucus nigra* ssp. *caerulea*), was found in riparian habitat on the Sacramento side of the river. One area of riparian forest exhibited positive indicators of all three federal wetland criteria and is discussed below under "Riparian Forest/Shrub Wetland." Riparian forest associated with the Sacramento River in the BSA is depicted in Photos 1 and 2 in Appendix C.

Riparian habitats are sensitive natural communities that provide important habitat for wildlife and SRA cover habitat for fish. Local, state, and federal agencies recognize riparian habitats as sensitive natural communities.

Riparian habitats provide cover, foraging and nesting habitat, and serve as migration and dispersal corridors for several bird and mammal species in the region. Common wildlife species that may occur in these habitats include black phoebe (*Sayornis nigricans*), yellow-rumped warbler (*Dendroica coronata*), house finch (*Carpodacus mexicanus*), American goldfinch (*Carduelis tristis*), yellow-billed magpie (*Pica nuttalli*), pocket gopher (*Thomomys bottae*), fox squirrel (*Sciurus niger*), common muskrat (*Ondatra zibethicus*), and raccoon (*Procyon lotor*).

Riparian Forest/Shrub Wetland

Riparian forest/shrub wetland occurs in the BSA within riparian habitat that meets all three federal wetland criteria (i.e., hydrophytic vegetation, hydric soils, and wetland hydrology). The riparian forest/shrub wetland is located in the northern portion of the BSA, on the west side of the Sacramento River within a low area (Figure 3-1) (Photos 3 and 4 in Appendix C). The vegetative composition of the riparian forest/shrub wetland is predominantly cottonwood but also includes buttonwillow (*Cephalanthus occidentalis* var. *californicus*), boxelder, and narrow-leaf willow. Additional information about the riparian forest/shrub wetland is provided in the wetland delineation report (Appendix A).

As noted above, riparian wetland habitats are sensitive natural communities that provide important cover, foraging, and nesting habitat, and serve as migration and dispersal corridors for several bird and mammal species in the region. Local, state, and federal agencies recognize riparian habitats as sensitive natural communities.

Ruderal Woodland

The West Sacramento section of the BSA includes several areas of naturalized vegetation on undeveloped parcels or parts of parcels that support mature trees with ruderal or non-native annual grassland in the understory. Several parcels between 2nd Street and the levee are predominantly vegetated by the invasive species tree of heaven (*Ailanthus altissima*); several riparian trees are interspersed, including black walnut and Fremont cottonwood. Another invasive tree species, black locust (*Robinia pseudoacacia*), also grows in this area. The understory vegetation in these areas of naturalized vegetation includes non-native annual grasses and forbs, such as wild oat (*Avena fatua*), ripgut brome (*Bromus diandrus*), foxtail barley (*Hordeum murinum* ssp. *leporinum*), star thistle (*Centaurea solstitialis*), vetch (*Vicia* spp.), and prickly lettuce (*Lactuca serriola*). Several blue elderberry shrubs grow in this community type (Figure 3-1). Representative photographs of ruderal woodland in the BSA are provided as Photos 5, 6, and 7 in Appendix C.

The ruderal woodland and associated ruderal grasslands provide nesting habitat for common birds, including northern mocking bird (*Mimus polyglottos*), western meadowlark (*Sturnella neglecta*), and killdeer (*Charadrius vociferous*) (in more open areas). Mallards from the adjacent river could use the denser areas of ruderal grassland for nesting. This ruderal area also provides foraging habitat for various bird species. Pocket gophers are known to occur in the ruderal woodlands of the BSA.

Perennial Stream (Sacramento River)

The Sacramento River is the only perennial stream in the BSA (see Figure 3-1). All perennial stream is unvegetated open water. The river averages 672 feet wide at the mean high water level in the BSA. The river banks are levees that are mostly steeply sloped and support riparian forest vegetation, as described above, with rip-rap near the bottom of the slope. Additional information about the perennial stream is provided in the wetland delineation report (Appendix A). Representative photographs of the Sacramento River in the BSA are provided as Photos 1 and 2 in Appendix C.

The Sacramento River is a TNW and a water of the United States subject to regulation under CWA Section 404 and Section 10 of the RHA, and is under the jurisdiction of the USACE. The river is considered a sensitive natural community. The RWQCB protects all waters of the State under the Porter-Cologne Act.

Riverine habitats like the Sacramento River provide habitat for amphibians, birds, and mammals. Common wildlife species that could be found in the river and along the shore of the river include American bullfrog (*Lithobates catesbeianus*), mallard (*Anas platyrhynchos*), great egret (*Ardea alba*), and river otter (*Lutra canadensis*). Numerous species of fish also are known to occur in the Sacramento River and are described below.

Landscaped

The vegetation in landscaped areas typically is comprised of ornamental species planted for decorative or landscaping purposes, including oleander (*Nerium oleander*), coast redwood (*Sequoia sempervirens*), California fan palm (*Washingtonia filifera*), Callery pear (*Pyrus calleryana*), Italian cypress (*Cupressus sempervirens*), pines (*Pinus* spp.), non-native oaks (*Quercus* sp.), and fruit trees (Figure 3-1). Landscaping is depicted in Photo 8 in Appendix C.

Common bird species may forage and nest in some of the landscaped areas, including mourning dove, American robin (*Turdus migratorius*), cliff swallow (*Petrochelidon pyrrhonota*) (nests on buildings and bridges), and western scrub jay (*Aphelocoma californica*).

Developed / Graded

Developed portions of the BSA consist of residential structures, commercial/industrial areas, and paved roadways and parking lots. Some small areas mapped as “Developed” on Figure 3-1 include landscaping, where the vegetated patches are small and interspersed with houses and other structures. Graded portions of the BSA include areas adjacent to roadways, the railroad, unpaved parking areas, and the area underneath and east of I-5. The vegetative composition of these areas is generally sparse and generally consists of nonnative species, particularly annual grasses and weedy forbs. Disturbed/ graded areas are depicted in Photos 9 and 10 in Appendix C.

Common wildlife species that would occur in developed areas would be the same as those described above in the landscaped areas.

3.1.3.2 Common Animal Species

Wildlife

The BSA supports common birds and mammals typical of both riverine, riparian, and urban areas. Wildlife species that were observed in the biological study area are western fence lizard (*Sceloporus occidentalis*), great blue heron (*Ardea herodias*), Canada goose (*Branta canadensis*), white-throated swift (*Aeronautes saxatalis*), western scrub jay, northern mockingbird, European starling (*Sturnus vulgaris*), rock dove (*Columbia livia*), yellow-billed magpie, feral house cat (*Felis catus*), black-tailed jackrabbit (*Lepus californicus*), fox squirrel, raccoon (tracks), and skunk (odor) (likely *Mephitis mephitis*).

In addition, several occupied and potential bats roots were observed under the I Street (both sides of the Sacramento River) and Jibboom Street approach structures. During the May 5, 2015 bat surveys, 30 expansion joints were mapped on the approach ramps for a total of 1,132 linear feet of potential bat roosting habitat. Of the 30 expansions joints, 16 were observed to be occupied by bats at the time of the May 15, 2015 survey; they were visually identified as Mexican free-tailed bats (*Tadarida brasiliensis*). Acoustic surveys conducted on the nights of May 5 and June 11, 2015, recorded Mexican free-tailed bats, big brown bats (*Eptesicus fuscus*), Yuma myotis (*Myotis yumanensis*), and western red bat (*Lasiurus blossevillii*)—a California species of special concern.

Wildlife Migration Corridors

The BSA consists of predominantly disturbed and developed areas along both sides of the Sacramento River, with a narrow band of riparian habitat along the river. Despite these existing conditions, the open water portion of the river serves as a migration corridor for aquatic species; and, even though limited, the riparian habitat can be used by birds and other wildlife for dispersing along the Sacramento River corridor. Fish passage and migration within the Sacramento River are discussed below.

Fish

The Sacramento River in the BSA falls within the Sacramento-San Joaquin Province (Central Valley Subprovince), one of six aquatic zoogeographic provinces in California, as defined by Moyle (2002). The Sacramento-San Joaquin Province is drained by the Sacramento and San Joaquin Rivers. Generally, four native fish assemblages can be recognized in Central Valley streams: rainbow trout assemblage, California roach assemblage, pikeminnow-hardhead-sucker assemblage, and deep-bodied fish assemblage (Moyle 2002). Based on its geographic location, the BSA lies at the interface between the zone characterized by the deep-bodied fish assemblage and the Sacramento-San Joaquin Estuary (i.e., the Delta).

Native fish species that occur where the Sacramento River meets the Delta include Sacramento sucker (*Catostomus occidentalis*), Sacramento pikeminnow (*Ptychocheilus grandis*), Sacramento splittail (*Pogonichthys macrolepidotus*), Sacramento blackfish (*Orthodon microlepidotus*), hitch (*Lavinia exilicauda*), Chinook salmon (winter-, spring-, fall-, and late fall–run), steelhead, green sturgeon, white sturgeon (*A. transmontanus*), Pacific lamprey (*Entosphenus tridentata*), river lamprey (*Lampetra ayresi*), delta smelt (*Hypomesus transpacificus*), longfin smelt (*Spirinchus thaleichthys*), tule perch (*Hysterocarpus traski*), and prickly sculpin (*Cottus asper*) (Moyle 2002). The dominant fishes, however, are all nonnative (alien) species: largemouth, smallmouth, and spotted bass (*Micropterus* spp.); white and black crappie (*Pomoxis* spp.); bluegill (*Lepomis macrochirus*); American (*Alosa sapidissima*) and threadfin shad (*Dorosoma petenense*); striped

bass (*Morone saxatilis*); bigscale logperch (*Percina macrolepida*); red shiner (*Cyprinella lutrensis*); inland silverside (*Menidia beryllina*); white catfish (*Ameiurus catus*); black and brown bullhead (*Ameiurus* spp.); and common carp (*Cyprinus carpio*) (Moyle 2002).

The Sacramento River is wide and deep and provides unimpeded passage for migratory and resident fish species in the BSA. Although the existing I Street Bridge is supported on three in-water piers, the existing piers do not confine flows or create hydraulic conditions (e.g., shallow water depths or excessive water velocities) that adversely affect the upstream or downstream passage of fish or other aquatic organisms in the Sacramento River.

3.1.3.3 Invasive Species

Invasive plant species include species designated as federal noxious weeds by the USDA, species listed by the California Department of Food and Agriculture (CDFA), and invasive plants identified by Cal-IPC. Invasive plants displace native species, change ecosystem processes, alter plant community structure, and lower wildlife habitat quality (California Invasive Plant Council 2006:1). Road, highway, and related construction projects are some of the principal dispersal pathways for invasive plants and their propagules. FHWA requires that state departments of transportation use the state's noxious weed list to identify invasive plant species that could be spread by construction of transportation projects. Accordingly, Table 3-1 lists the invasive plant species identified by the CDFA and Cal-IPC that are known to occur in the BSA (Natural Resources Conservation Service 2003; California Invasive Plant Council 2006, 2007). No plant species designated as federal noxious weeds have been identified in the BSA (Natural Resources Conservation Service 2014b). Invasive plant species occur in ruderal woodland, disturbed/graded areas, and, to a lesser extent, riparian forest.

Invasive aquatic species occurring in the BSA include many of the non-native fish species listed above, as well as the freshwater clam *Corbicula* (spp.) and several species of aquatic plants (e.g., Brazilian waterweed [*Egeria densa*] and water hyacinth [*Eichhornia crassipes*]).

Table 3-1. Invasive Plant Species Identified in the Biological Study Area

Species	CDFA	Cal-IPC
Tree of heaven (*Ailanthus altissima*)	–	Moderate
Wild oat (*Avena fatua*)	–	Moderate
Black mustard (*Brassica nigra*)	–	Moderate
Ripgut brome (*Bromus diandrus*)	–	Moderate
Soft chess (*Bromus hordeaceus*)	–	Limited
Red brome (*Bromus madritensis* ssp. *rubens*)	–	High
Cheatgrass (*Bromus tectorum*)	–	High
Italian thistle (*Carduus pycnocephalus*)	C	Moderate
Yellow star-thistle (*Centaurea solstitialis*)	C	High
Bindweed (*Convolvulus arvensis*)	C	–
Bermuda grass (*Cynodon dactylon*)	C	Moderate
Red-stemmed filaree (*Erodium cicutarium*)	–	Limited
Rattail fescue (*Festuca myuros*)	–	Moderate
Italian ryegrass (*Festuca perennis*)	–	Moderate
Edible fig (*Ficus carica*)	–	Moderate
Fennel (*Foeniculum vulgare*)	–	High
Cutleaf geranium (*Geranium dissectum*)	–	Limited
English ivy (*Hedera helix*)	–	High
Bristly ox-tongue (*Helminthotheca echioides*)	–	Limited
Foxtail barley (*Hordeum murinum* ssp. *leporinum*)	–	Moderate
Rough cat's-ear (*Hypochaeris radicata*)	–	Moderate
Perennial peppergrass (*Lepidium latifolium*)	B	High
Tree-tobacco (*Nicotiana glauca*)	–	Moderate
Sourgrass (*Oxalis pes-caprae*)	–	Moderate
English plantain (*Plantago lanceolata*)	–	Limited
Rabbitsfoot grass (*Polypogon monspeliensis*)	–	Limited
Wild radish (*Raphanus sativus*)	–	Limited
Black locust (*Robinia pseudoacacia*)	–	Limited
Himalayan blackberry (*Rubus armeniacus*)	–	High
Curly dock (*Rumex crispus*)	–	Limited
Red sesbania (*Sesbania punicea*)	B	High
Milk thistle (*Silybum marianum*)	–	Limited
London rocket (*Sisymbrium irio*)	–	Moderate
Johnson grass (*Sorghum halepense*)	C	–
Smilo grass (*Stipa miliacea*)	–	Limited
Puncturevine (*Tribulus terrestris*)	C	–
Rose clover (*Trifolium hirtum*)	–	Moderate
Periwinkle (*Vinca major*)	–	Moderate

Note: The California Department of Agriculture (CDFA) and California Invasive Plant Council (Cal-IPC) lists assign ratings that reflect the CDFA and Cal-IPC views of the statewide importance of the pest, likelihood that eradication or control efforts would be successful, and present distribution of the pest in the state. These ratings are guidelines that indicate the most appropriate action to take against a pest under general circumstances. The Cal-IPC species list is more inclusive than the CDFA list.

The CDFA categories indicated in the table are defined as follows:

B: Eradication, containment, control or other holding action at the discretion of the county agricultural commissioner.

C: State-endorsed holding action and eradication only when found in a nursery; action to retard spread outside nurseries at the discretion of the county agricultural commissioner.

The Cal-IPC categories indicated in the table are defined as follows:

High: Species with severe ecological impacts, high rates of dispersal and establishment, and usually widely distributed.

Moderate: Species with substantial and apparent ecological impacts, moderate to high rates of dispersal, establishment dependent on disturbance, and limited to widespread distribution.

Limited: Species with minor ecological impacts, low to moderate rates of invasion, limited distribution, and locally persistent and problematic.

Chapter 4 Results: Biological Resources, Discussion of Impacts and Mitigation

This chapter describes the effects of the proposed project on federally listed species under jurisdiction of USFWS. *Direct effects* are defined as the direct or immediate effects of a proposed action on a species or its habitat. Direct effects may result from the action and may include the effects of interrelated and interdependent actions. An *interrelated action* is an activity that is part of the proposed action and depends on the proposed action for its justification. An *interdependent action* is an activity that has no independent utility apart from the action under consultation (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998).

Indirect effects are caused by or result from the proposed action, are later in time, and are reasonably certain to occur. Indirect effects may occur outside the area directly affected by the action (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998).

Cumulative effects comprise the effects of future State, local, and private actions not involving a Federal action that are reasonably certain to occur within the action area under consideration (U.S. Fish and Wildlife Service and National Marine Fisheries Service 1998). Potential direct, indirect, and cumulative effects are discussed below.

4.1 Federally Listed or Proposed Plant Species

Based on the USFWS (2016) species list for the project vicinity (Appendix A), no federally listed plants are expected to occur in the BSA.

4.2 Federally Listed or Proposed Wildlife Species

Seven federally listed wildlife species appear on the USFWS species list (see Table 2-1). Based on professional knowledge, reconnaissance level field surveys, one federally listed species, VELB, has the potential to occur in the BSA and be affected by the proposed project. The project would have *no effect* on the remaining six federally listed wildlife species listed in Table 2-1 (vernal pool fairy shrimp, vernal pool tadpole shrimp, California tiger salamander, California red-legged frog, giant garter snake, and least Bell's vireo) based on the lack of suitable habitat for the species or because the BSA is outside the species' known range. No further evaluation is needed and there is no need for consultation on these species (50 CFR 402.12).

4.2.1 Valley Elderberry Longhorn Beetle

The VELB is federally listed as threatened. The current known range of the VELB extends from Tehama County in the north to Fresno County in the south of California's Central Valley and associated foothills from about the 3,000-foot contour on the east and the watershed of the Central Valley on the west (U.S. Fish and Wildlife Service 1999:1, 79 FR 5874-55917). The VELB is dependent on its host plant, elderberry, which is a common component of riparian corridors and adjacent upland areas in the Central Valley (Barr 1991:5).

The VELB has four stages of life: egg, larva, pupa, and adult. Females deposit eggs on or adjacent to the host elderberry. Egg production varies, and females have been observed to lay between 16 and 180 eggs. Eggs hatch within a few days of being deposited and larvae emerge. The larvae bore into the wood of the host plant and create a long feeding gallery in the pith of the elderberry stem. The larvae feed on the pith of the plant for 1–2 years. When a larva is ready to pupate, it chews an exit hole to the outside of the stem and then plugs it with wood shavings. The larva then retreats into the feeding gallery to an enlarged pupal chamber. The larvae metamorphose into pupae between December and April; the pupal stage is thought to last about a month. The adult remains in the chamber for several weeks after the pupal phase and then emerges from the chamber through the exit hole, which is typically 4–10 millimeters (mm) in diameter and circular to oval in shape. Adults emerge between mid-March and mid-June, the flowering season of the plant. Adults feed on elderberry leaves and mate within the elderberry canopy. (Talley et al. 2006a:7–9).

4.2.1.1 Survey Results

ICF wildlife biologist John Howe surveyed for and mapped elderberry shrubs in the BSA on April 8, 2015. Seven elderberry shrubs were identified within the BSA. Five shrubs are located on the West Sacramento side, and two are on the Sacramento side of the BSA (Figure 3-1). The results of the survey are summarized in Table 4-1. Shrub 1 was observed to be a re-sprout from an elderberry stump, which appeared to have been cut down. The stump was approximately 12 inches in diameter at ground level; multiple new stems were growing out of it and from the surrounding soil. Shrub 5 also was cut down at some point; it had two stumps greater than 5 inches in diameter with new stems growing out of them. Table 4-1 reports only those stems that currently provide habitat for VELB (i.e., the cut stumps themselves are not included). VELB has been documented approximately 0.5 mile north of the BSA along the west bank of the Sacramento River (California Department of Fish and Wildlife 2015).

Table 4-1. Elderberry Shrub Survey Results

Shrub Number	Stem Diameter Class at Ground Level in Inches			Shrub Height in Feet	Exit Holes Present?	Shrub in Riparian Habitat?
	≥1–≤3	>3–<5	≥ 5			
1	4	0	0	6	No	No
2	0	1	1	22	No	No
3	0	0	1	12	No	No
4	4	3	0	15	No	No
5	18	0	0	10	No	No
6	6	0	3	26	No	No
7	0	0	1	20	No	Yes
Total	**32**	**4**	**6**			

4.2.1.2 Critical Habitat

There is no critical habitat for VELB within the BSA.

4.2.1.3 Avoidance and Minimization Efforts

Implementation of the following measures would avoid and/or minimize direct and indirect impacts on VELB.

Measure 1: Install Orange Construction Fencing between the Construction Area and Adjacent Sensitive Biological Resources

The project proponent and/or their contractor will install orange construction fencing between the construction area and adjacent sensitive biological resource areas. Sensitive biological resources that occur adjacent to the construction area that could be directly affected by the project include natural communities of special concern; special-status wildlife habitats for VELB; nest sites of Swainson's hawk (*Buteo swainsoni*), purple martin (*Progne subis*), or other migratory birds; roosting bats; and protected trees to be avoided.

Barrier fencing around sensitive areas will be installed as one of the first orders of work and prior to equipment staging. Before construction begins, the construction contractor will work with the project engineer and a resource specialist to identify the locations for the orange construction fencing, and will place stakes around the sensitive resource sites to indicate these locations. The protected areas will be designated as environmentally sensitive areas and clearly identified on the construction plans and described in the specifications. To minimize the potential for snakes and other ground-dwelling animals from being caught in the orange construction fencing, the fencing will be placed with at least a 1-foot gap between the ground and the bottom of the orange construction fencing. The exception to this condition is where construction barrier fencing overlaps with

erosion control fencing and must be secured to prevent sediment runoff. Barrier fencing will be installed before construction activities are initiated, maintained throughout the construction period, and removed after completion of construction.

Measure 2: Conduct Environmental Awareness Training for Construction Employees

The project proponent will retain a qualified biologist to conduct environmental awareness training for construction crews before project implementation. The awareness training will be provided to all construction personnel and will brief them on the need to avoid effects on sensitive biological resources (e.g., native trees, natural communities of special concern, and special-status species habitats in and adjacent to the construction area). The education program will include a brief review of the special-status species with the potential to occur in the BSA (including their life history, habitat requirements, and photographs of the species). The training will identify the portions of the BSA in which the species may occur, as well as their legal status and protection. The program also will cover the restrictions and guidelines that must be followed by all construction personnel to reduce or avoid effects on these species during project implementation. This will include the steps to be taken if a sensitive species is found within the construction area (i.e., notifying the crew foreman, who will call a designated biologist). In addition, construction employees will be educated about the importance of controlling and preventing the spread of invasive plant infestations. An environmental awareness handout that describes and illustrates sensitive resources to be avoided during project construction and identifies all relevant permit conditions will be provided to each crew member. The crew foreman will be responsible for ensuring that crew members adhere to the guidelines and restrictions. Education programs will be conducted for appropriate new personnel as they are brought on the job during the construction period.

Measure 3: Conduct Periodic Biological Monitoring

The project proponent will retain a qualified biological monitor for the project who will visit the site a minimum of once per week to ensure that fencing around environmentally sensitive areas is intact and that activities are being conducted in accordance with the agreed upon project schedule and agency conditions of approval. The monitor will provide the project proponent with a monitoring log for each site visit.

Measure 4: Avoid and Minimize Impacts on Valley Elderberry Longhorn Beetle

The following measures will be implemented prior to and during construction to ensure that the proposed project does not adversely affect elderberry shrubs adjacent to the project footprint.

- Consistent with Measure 2, contractors will be briefed on the need to avoid damaging the elderberry plants and the possible penalties for not complying with these requirements. Crews also will be educated on the status of the VELB and the need to protect its habitat.
- All elderberry shrubs that are outside of the permanent project footprint or that can be avoided will be identified on construction drawings, with notes indicating that they are sensitive resources to be avoided.
- Consistent with Measure 1, orange construction barrier fencing will be placed at a minimum of 20 feet from each shrub's dripline [fencing around shrub 6 (construction will be within 20 feet) will be placed as far out from the dripline as possible]. No construction activities will be permitted within the buffer zone other than those activities necessary to erect the fencing. As specified in the Conservation Guidelines for the Valley Elderberry Longhorn Beetle (Guidelines) (U.S. Fish and Wildlife Service 1999), signs will be posted every 50 feet (at a minimum) along the perimeter of the buffer area fencing. The signs will contain the following information: *This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the Endangered Species Act of 1973, as amended. Violators are subject to prosecution, fines, and imprisonment*. The signs should be clearly readable from a distance of 20 feet and must be maintained for the duration of construction.
- Consistent with Measure 3, buffer area fences around the shrubs will be inspected weekly by a biological monitor during ground-disturbing activities and monthly after ground-disturbing activities until project construction is complete or until the fences are removed, as approved by the biological monitor. The biological monitor will check that the contractor is maintaining the buffer area fences around elderberry shrubs throughout construction. Biological inspection reports will be provided to USFWS and the project proponent.

Measure 5: Transplant Elderberry Shrubs That Cannot Be Avoided

Elderberry shrubs that cannot be avoided will be transplanted to a USFWS-approved conservation area in accordance with the Guidelines (U.S. Fish and Wildlife Service 1999). Transplanting will occur during the plant's dormant phase (approximately

November through the first 2 weeks of February, after they have lost their leaves). A qualified biologist that is familiar with elderberry shrub transplantation procedures will supervise the transplanting. The location of the conservation area transplantation site will be approved by USFWS before removal of the shrubs.

4.2.1.4 Project Effects

Direct Effects

Five of the seven shrubs (shrubs 1, 2, 3, 5, and 7) would be directly affected (removed or trimmed) by project construction. Shrubs 1, 2, 3, and 7 are within areas identified as temporarily impacted by project construction. Although these shrubs could be avoided, construction activities would likely be within 20 feet of the shrub driplines. Shrub 5 would be permanently impacted by a new access road.

Indirect Effects

Two elderberry shrubs (shrubs 4 and 6) could be indirectly affected by project construction (i.e., impacts between 20 and 100 feet from the shrub dripline). Shrub 4 is approximately 80 feet west of areas identified for temporary disturbance associated with the removal of the West Sacramento approach structure; shrub 6 is located immediately adjacent to the area identified as temporarily affected and less than 20 feet from areas of permanent impact. The USFWS typically considers project activities that result in a change in hydrology, fragmentation of habitat, drift of fertilizers or pesticides, increased pedestrian traffic, artificial lighting, and dust as potential indirect effects on the species. The project would not result in any of these effects on shrubs 4 and 6. Both shrubs are located in developed areas that are already subject to pedestrian traffic, artificial lighting, and the potential use of herbicides and pesticides from adjacent developed areas. The project construction that would occur within 100 feet of shrub 4 is limited to the removal of the approach structure on the West Sacramento side of the river, which would not result in an alternation of the hydrology in this area. Although work would occur within 20 feet of shrub 6, it is located on the embankment of I-5, which is above the current grade. Thus, construction activities at Bercut Drive and Railyards Boulevard are not likely to substantially alter the hydrology in the area around the shrub such that it would be adversely affected. Talley et al. (2006b:647) found that elderberry shrubs adjacent to paved surfaces were less stressed that those near dirt surfaces, possibly because increased runoff from paved surfaces benefitted the shrubs. Talley et al. also found that dust from low-traffic dirt roads trails and paved roads did not affect VELB presence in shrubs either directly or indirectly through changed elderberry condition (Talley et al. 2006b:647). Therefore, project dust is not expected to affect the VELB or its habitat associated with shrubs 4 and 6. Though shrubs 4 and 6 are located within 100 feet of project construction, construction activities and the operation of the project are not expected to result in a change in condition that could result in take of VELB.

Project construction is *likely to adversely affect* the federally threatened VELB through the loss of suitable habitat in accordance with the definition of take under the ESA.

4.2.1.5 Modifications to the Project to Mitigate Effects

Implementation of Measure 6 would compensate for direct impacts on VELB habitat.

Measure 6: Compensate for Impacts on Valley Elderberry Longhorn Beetle Habitat

Before construction begins, the project proponent will compensate for direct impacts (including transplanting) on all elderberry stems measuring 1 inch or more at ground level (i.e., habitat for VELB) that are located within 20 feet of proposed construction activities. Compensation will include planting replacement elderberry seedlings or cuttings and associated native plantings in a USFWS-approved conservation area, at a ratio between 1:1 and 8:1 (ratio = new plantings to affected stems), depending on the diameter of the stem at ground level, the presence or absence of exit holes, and whether the shrub is located in riparian habitat (U.S. Fish and Wildlife Service 1999).

Mitigation credits for VELB will be purchased at a USFWS-approved mitigation bank. There are three mitigation banks listed on the USFWS website that sell VELB credits and have service areas that overlap the BSA. These banks are: French Camp Conservation Bank, Laguna Creek Conservation Bank, and River Ranch Conservation Bank.

Table 4-2 summarizes the compensation required for direct effects on five elderberry shrubs (shrubs 1, 2, 3, 5, and 7) that provide VELB habitat. Based on stem counts listed in Table 4-1 for these five shrubs and in accordance with the Guidelines, 34 elderberry seedlings and 34 associated native plants will be planted in a USFWS-approved conservation area.

Table 4-2. Required Compensation for Directly Affected Elderberry Shrubs

Habitat	Stem Diameter	Number of Stems	Exit Holes?	Seedling Ratio	Native Plant Ratio	Total Seedling	Total Native Plants
Riparian	Stems >1" to <3"	0	No	2:1	1:1	0	0
	Stems >1" to <3"	0	Yes	4:1	2:1	0	0
	Stems >3" to <5"	0	No	3:1	1:1	0	0
	Stems >3" to <5"	0	Yes	6:1	2:1	0	0
	Stems >5"	1	No	4:1	1:1	4	4
	Stems >5"	0	Yes	8:1	2:1	0	0
Nonriparian	Stems >1" to <3"	22	No	1:1	1:1	22	22
	Stems >1" to <3"	0	Yes	2:1	2:1	0	0
	Stems >3" to <5"	1	No	2:1	1:1	2	2
	Stems >3" to <5"	0	Yes	4:1	2:1	0	0
	Stems >5"	2	No	3:1	1:1	6	6
	Stems >5"	0	Yes	6:1	2:1	0	0
Total		**26**				**34**	**34**

4.2.1.6 Cumulative Effects

Under the ESA, cumulative effects are "those effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area of the federal action subject to consultation" (50 CFR 402.2). Future federal actions that are unrelated to the proposed action are not considered in this assessment because they require separate consultation pursuant to Section 7 of the ESA.

Caltrans is not aware of any future state or private activities that are reasonably certain to affect VELB within the area potentially affected by the proposed project.

4.3 Federally Listed or Proposed Fish Species

Federally listed fish species that could occur in the action area, including the Sacramento River portion of the BSA, were identified based on a review of existing information and the USFWS (2015a; 2016) species list for the project vicinity (Appendix A). One federally listed fish species under USFWS jurisdiction, delta smelt, has the potential to occur in the action area and be affected by the proposed project (Table 2-1). As discussed in Chapter 2, four other federally listed fish species (Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, Central Valley steelhead, and North American green sturgeon) occur in the action area; however, because these species fall under the jurisdiction of NMFS, project impacts on these species are being evaluated in a separate BA.

4.3.1 Delta Smelt

Status and Distribution

Delta smelt was federally listed as threatened on March 5, 1993 (58 FR 12854–12863), and critical habitat was designated on December 19, 1994 (59 FR 65256–65278). In response to several lawsuits, USFWS conducted a 5-year status review for delta smelt. USFWS concluded on March 31, 2004, that delta smelt abundance remained relatively low compared to historical levels and that many of the threats to the species identified at the time of listing were still in existence, precluding de-listing of the species (U.S. Fish and Wildlife Service 2004). Subsequent indices of delta smelt abundance based on results of CDFW fishery sampling have shown that the abundance of delta smelt continued to decline to record low numbers.

In March 2006, several environmental groups filed an emergency petition with USFWS, requesting that the status of delta smelt be elevated from threatened to endangered under ESA (Center for Biological Diversity et al. 2006). The emergency petition was not approved by USFWS; however, on July 10, 2008, USFWS announced in a 90-day finding that consideration for reclassification of delta smelt was warranted and that a status review would be initiated (73 FR 39639). On April 7, 2010, USFWS ruled that the change in the status of delta smelt from threatened to endangered was warranted but was precluded by other higher priority listing actions (75 FR 17667).

Delta smelt was listed as a threatened species under CESA on December 9, 1993. In February 2007, an emergency petition was filed with the California Fish and Game Commission to elevate the status of delta smelt from threatened to endangered under CESA (The Bay Institute et al. 2007). On March 4, 2009, the California Fish and Game Commission elevated the status of delta smelt to endangered under CESA.

Historically, delta smelt populations have fluctuated greatly in response to their 1-year life cycle and ever-changing environmental conditions. In the last 30 years, delta smelt populations have shown a long-term decline in the upper estuary (the Delta and Suisun Bay), beginning with an abrupt decline in 1982 (Kimmerer 2002) and extremely low abundance in recent years as part of the pelagic organism decline (POD) (Sommer et al. 2007; Baxter et al. 2010). The low abundance of delta smelt since the early 1980s is attributed to a number of interacting factors. The principal factors contributing to the decline in delta smelt abundance include reductions in outflows and entrainment losses to water diversions, especially by the SWP and CVP pumping facilities located in the south Delta; extremely high river outflows that flush delta smelt and zooplankton out of the system; changes in prey abundance and composition caused by introduced species; predation by non-native species; toxic substances, including agricultural

pesticides, heavy metals, and other compounds; disease; and loss of genetic integrity through interbreeding with the introduced Wagasaki smelt (Moyle 2002; Bennett 2005).

The geographic distribution of delta smelt occurs primarily downstream of Isleton on the Sacramento River, in the Cache Slough subregion (Cache Slough–Liberty Island and the Deep Water Ship Channel [DWSC]), downstream of Mossdale on the San Joaquin River, and Suisun Bay and Suisun Marsh (Moyle 2002). Delta smelt also have been collected in the Petaluma and Napa Rivers (Bennett 2005); the Sacramento River above Rio Vista; and Cache, Lindsey, Georgiana, Prospect, Beaver, Hog, Sycamore, and Barker Sloughs (U.S. Fish and Wildlife Service 1996). Delta smelt have been observed in the Sacramento River as far upstream as the mouth of the Feather River and in the DWSC as far upstream as West Sacramento (Merz et al. 2011). Over the last 2 decades, the center of adult delta smelt abundance in fall (September through December) has been the West Delta and Suisun Bay subregions (Sommer et al. 2011). There is evidence that a life-history contingent of delta smelt may remain in the Cache Slough subregion throughout their lives (Nobriga et al. 2008; Sommer et al. 2011).

Life History

Delta smelt are endemic to the Sacramento–San Joaquin estuary and are found seasonally in Suisun Bay and Suisun Marsh (Moyle 2002). They typically are found in shallow water (<10 feet) where salinity ranges from 2 to 7 parts per thousand (ppt), although they have been observed at salinities between 0 and 18.4 ppt (Moyle 2002). Delta smelt have relatively low fecundity and most live for 1 year (Moyle 2002). They feed on planktonic copepods, cladocerans, amphipods, and insect larva (Moyle 2002).

Delta smelt are semi-anadromous. During their spawning migration, adults move into the freshwater channels and sloughs of the Delta between December and January (Moyle 2002). Spawning occurs between January and July, with peak spawning from April through mid-May (Moyle 2002). Spawning locations in the Delta have not been identified and are inferred from larval catches (Bennett 2005). Larval fish have been observed in Montezuma Slough (Wang 1986); Suisun Slough in Suisun Marsh (Moyle 2002); the Napa River estuary (Stillwater Sciences 2006); the Sacramento River above Rio Vista; and Cache, Lindsey, Georgiana, Prospect, Beaver, Hog, Sycamore, and Barker Sloughs (U.S. Fish and Wildlife Service 1996). Spawning also was detected in the Sacramento River up to Garcia Bend (RM 51) during drought conditions as a result of increased saltwater intrusion that moved delta smelt spawning and rearing farther inland (Wang and Brown 1993). Laboratory experiments have found eggs to be adhesive, demersal, and usually attached to substrate composed of gravel, sand, or other submerged material (Moyle 2002; Wang 1991). Hatching takes approximately 9 to 13 days, and larvae begin feeding 4 to 5 days later (Moyle 2002). Newly hatched larvae contain a large oil

globule that makes them semi-buoyant and allows them to stay near the bottom (Moyle 2002). As their fins and swim bladder develop, they move higher into the water column and are transported downstream to the open waters of the estuary (Moyle 2002).

Factors Affecting Abundance

Diversions and Delta inflow and outflow may affect survival of delta smelt. Estimates of delta smelt entrainment at the CVP and SWP South Delta export facilities suggest a population decline in the early 1980s, mirroring the decline indicated by mid-water trawl, summer tow-net, Kodiak trawl, and beach seine data (Bennett 2005). Diversions and upstream storage, including operation of the CVP and SWP, control Delta inflow and outflow during most months. Reduced Delta flow may inhibit or slow movement of larvae and juveniles to estuarine rearing habitat, increasing their residence in the deeper and narrower channels of the Delta and exposure to lower prey availability and increased predation (Moyle 2002). Reduced Delta flow also may increase entrainment in diversions, including entrainment at the CVP and SWP export pumps (Moyle 2002). Additional factors affecting delta smelt abundance include extremely high river outflow that increases entrainment at export facilities, changes in prey abundance and composition, predation by non-native species, toxic substances, disease, and loss of genetic integrity through interbreeding with the introduced Wagasaki smelt (Moyle 2002; Bennett 2005).

4.3.1.1 Survey Results

Focused surveys for delta smelt were not conducted. However, it is well documented that delta smelt occur in the Sacramento River in the action area. Spawning locations in the Delta have not been identified and are inferred from the location of gravid females and larval catches (Bennett 2005).

The temporal occurrence and relative abundance of adult delta smelt in the vicinity of the action area can be inferred based on the weekly trawl surveys of the Sacramento River at Sherwood Harbor (RM 55) as part of the Delta Juvenile Fish Monitoring Program (DJFMP) (U.S. Fish and Wildlife Service 2015b). In addition to collecting data on the relative number and timing of occurrence of delta smelt, USFWS collects information on the maturation status of adult smelt (i.e., individuals are physically examined at the time of capture to determine their readiness to spawn based on whether eggs or milt can be manually expressed from the individual). Maturation status provides information on the potential timing of spawning and, therefore, the potential occurrence of the species' eggs and larvae in the river. The occurrence of mature adults in the trawl samples suggests that delta smelt may spawn in this part of the Sacramento River, including action area.

From January 2005 through March 2015, adult delta smelt (some in spawning condition) were detected in the trawls from February through May, although most were detected in the trawls in

March (Table 4-3). Because of the proximity of the action area to Sherwood Harbor, it was assumed that the timing of occurrence of delta smelt in the action area is similar to that observed at Sherwood Harbor.

Table 4-3. Number of Delta Smelt Captured by Trawl at Sherwood Harbor (RM 55) by Month (January 2005 through March 2015)

4.3.1.2 Critical Habitat

Critical habitat includes those physical and biological features of the habitat that are essential to the conservation of the species and that may require special management consideration or protection. Critical habitat for delta smelt consists of all water and all submerged lands below OHWM and the entire water column bounded by and contained in Suisun Bay (including the contiguous Grizzly and Honker bays); the length of Goodyear, Suisun, Cutoff, First Mallard (Spring Branch), and Montezuma Sloughs; and the contiguous waters of the legal Delta (59 FR 65256; December 19, 1994). Therefore, the Sacramento River upstream of the existing I Street Bridge (upstream boundary of the legal Delta) is not designated as critical habitat for delta smelt as it does not lie within the boundaries of the legal Delta (59 FR 65256; December 19, 1994). Consequently, only that portion of the action area (defined in Chapter 3) that occurs downstream of the existing I Street Bridge is designated as critical habitat for delta smelt. Primary constituent elements of critical habitat determined to be essential to the conservation of delta smelt are physical habitat, water, river flow, and salinity concentrations required to maintain delta smelt habitat for spawning, larval and juvenile transport, rearing, and adult migration (U.S. Fish and Wildlife Service 2006).

4.3.1.3 Avoidance and Minimization Efforts

Implementation of the following measures would avoid and/or minimize direct and indirect effects on delta smelt and designated critical habitat.

Measure 1: Install Orange Construction Fencing between the Construction Area and Adjacent Sensitive Biological Resources

Please refer to the discussion of Measure 1 in Section 4.2.1.3.

Measure 2: Conduct Environmental Awareness Training for Construction Employees

Please refer to the discussion of Measure 2 in Section 4.2.1.3.

Measure 3: Conduct Periodic Biological Monitoring

Please refer to the discussion of Measure 3 in Section 4.2.1.3.

Measure 7: Conduct All In-Water Construction Activities between May 1 and November 30 and during Daylight Hours Only

The project proponents will conduct all in-water construction work and pile driving (in-water and shore-based within 250 feet of the Sacramento River), installation of cofferdams, removal of temporary sheet piles, and placement of rock revetment between May 1 and November 30 to avoid or minimize causing disturbance and injury to, or mortality of, special-status fish species in the affected reaches of the Sacramento River. In addition, in-water work will be conducted during daylight hours only to provide fish in the affected reaches of the Sacramento River with an extended quiet period during nighttime hours for feeding and unobstructed passage.

Limiting in-water construction to the May 1–November 30 period would achieve the following two goals.

In-water construction activities with the potential to generate harmful levels of underwater noise (e.g., driving piles with an impact hammer) would avoid the primary migration periods of adults and juveniles of special-status fish species.

The length of the in-water construction period would be maximized, thereby limiting the number of construction seasons that in-water construction would be needed and the number of year classes of fish species that potentially would be exposed to in-water construction effects.

Measure 8: Implement Measures to Minimize Exceedance of Interim Threshold Sound Levels during Pile Driving

The project proponents will require the contractor to implement the following measures, developed in coordination with project design engineers, to minimize the exposure of listed fish species to potentially harmful underwater sounds.

The contractor will vibrate all piles to the maximum depth possible before using an impact hammer.

No more than 20 piles will be driven per day, and pile driving with an impact hammer will occur on no more than 75 individual days total during construction.

During impact driving, the contractor will limit the number of strikes per day to the minimum necessary to complete the work and will limit the total number of hammer strikes to 16,000 strikes per day (i.e., 800 hammer strikes per pile, per day) for piles for the bridge piers and temporary trestles, and 20,000 strikes per day (i.e., 1,000 hammer strikes per pile, per day) for the piles for the bridge fender system.

The smallest pile driver and minimum force necessary will be used to complete the work.

During impact driving, the project proponents will require the contractor to use a bubble curtain or similar device to minimize the extent to which the interim peak and cumulative SEL thresholds are exceeded (see Section 4.4.1.3, “Project Impacts”).

No pile driving activity will occur at night, thereby providing fish with an extended quiet period during nighttime hours on days pile driving is being conducted for feeding and unobstructed passage.

Measure 9: Develop and Implement a Hydroacoustic Monitoring Plan

The project proponents and/or their construction contractor will develop and implement a hydroacoustic monitoring plan. The monitoring plan will be submitted to the resource agencies (CDFW, NMFS, and USFWS) for approval at least 60 days before the start of project activities. The plan will include the following requirements.

The project proponent and/or its construction contractor will monitor underwater noise levels during all impact pile driving activities on land and in water to ensure that peak and cumulative SELs do not exceed estimated values (Table 4-7).

The monitoring plan will describe the methods and equipment that will be used to document the extent of underwater sounds produced by pile driving, including the number, location, distances, and depths of the hydrophones and associated monitoring equipment.

The monitoring plan will include a reporting schedule for daily summaries of the hydroacoustic monitoring results and for more comprehensive reports to be provided to the resource agencies on a monthly basis during the pile driving season.

The daily reports will include the number of piles installed per day; the number of strikes per pile; the interval between strikes; the peak SPL, SEL, and RMS per strike; and the accumulated SEL per day at each monitoring station.

The project proponent or its contractors will ensure that a qualified fish biologist is on site during impact pile driving to document any occurrences of stressed, injured, or dead fish. If stressed, injured, or dead fish are observed during pile driving, the project proponent and/or its construction contractor will reduce the number of strikes per day to ensure that fish are no longer showing signs of stress, injury, or mortality.

Measure 10: Protect Water Quality and Prevent Erosion and Sedimentation in Drainages and Wetlands

The project proponents and/or their construction contractor will comply with all construction site BMPs specified in the Water Quality Assessment Report prepared for the project (ICF 2015) and the final SWPPP that will be developed for the project, as well as any other permit conditions to minimize introduction of construction-related contaminants and mobilization of sediment in the Sacramento River and the riparian forest/shrub wetland. Broadly, these BMPs will address soil stabilization, sediment control, wind erosion control, vehicle tracking control, non-storm water management, and waste management practices. The BMPs will be based on the best conventional and best available technology.

The proposed project is subject to storm water quality regulations established under the NPDES, described in Section 402 of the federal CWA. In California, the NPDES program requires that any construction activity disturbing 1 or more acres comply with the statewide General Permit, as authorized by the State Water Board. The General Permit requires elimination or minimization of non-storm water discharges from construction sites and development and implementation of a SWPPP for the site. The primary elements of the SWPPP include the following.

- Description of site characteristics—including runoff and streamflow characteristics and soil erosion hazard—and construction procedures
- Guidelines for proper application of erosion and sediment control BMPs
- Description of measures to prevent and control toxic materials spills
- Description of construction site housekeeping practices

In addition to these primary elements, the SWPPP specifies that the extent of soil and vegetative disturbance would be minimized by control fencing or other means and that the extent of soil disturbed at any given time would be minimized. The SWPPP must be retained at the construction site.

The BMPs will be selected to achieve maximum sediment removal and represent the best available technology that is economically achievable; they are subject to review and approval by the project proponent. The project proponent will perform routine inspections of the construction area to verify that the BMPs are properly implemented and maintained. The project proponent will notify contractors immediately of a noncompliance issue and will require compliance.

The BMPs will include, but are not limited to, the following.

- All earthwork or foundation activities involving wetlands or the intermittent vegetated stream will occur in the dry season (between May 1 and October 31). All in-water work within the Sacramento River will be conducted between May 1 and November 30 to minimize or avoid potential impacts on sensitive life stages (migration, spawning, egg and embryo incubation, and rearing) of special-status fish species.
- Equipment used in and around drainages and wetlands will be in good working order and free of dripping or leaking engine fluids. All vehicle maintenance will be performed at least 300 feet from all streams. Any necessary equipment washing will be carried out where the water cannot flow into drainages or wetlands.
- Develop a hazardous material spill prevention control and countermeasure plan before construction begins. The plan will include strict onsite handling rules to keep construction and maintenance materials from entering the river, including procedures related to refueling, operating, storing, and staging construction equipment and to preventing and responding to spills. The plan also will identify the parties responsible for monitoring a spill response. During construction, any spills will be cleaned up immediately according to the spill prevention control and countermeasure plan. The project proponent will review and approve the contractors' spill prevention control and countermeasure plan before allowing construction to begin.
- Prohibit the following types of materials from being rinsed or washed into the streets, shoulder areas, or gutters: concrete, solvents and adhesives, thinners, paints, fuels, sawdust, dirt, gasoline, asphalt and concrete saw slurry, and heavily chlorinated water.
- Take any surplus concrete rubble, asphalt, or other rubble from construction to a local landfill.
- Prepare and implement an erosion and sediment control plan for the proposed project that will include the following provisions and protocols. The SWPPP for

the project will detail the applications and type of measures and the allowable exposure of unprotected soils.

- Discharge from dewatering operations, if needed, and runoff from disturbed areas will be made to conform to the water quality requirements of the waste discharge permit issued by the RWQCB.
- Apply temporary erosion control measures, such as sandbagged silt fences, throughout construction of the proposed project and remove them after the working area is stabilized or as directed by the engineer. Soil exposure will be minimized through use of temporary BMPs, groundcover, and stabilization measures. Exposed dust-producing surfaces will be sprinkled daily, if necessary, until wet; this measure will be controlled to avoid producing runoff. Paved roads will be swept daily following construction activities.
- The contractor will conduct periodic maintenance of erosion and sediment control measures.
- Plant an appropriate seed mix of native species on disturbed areas upon completion of construction.
- Cover or apply nontoxic soil stabilizers to inactive construction areas (previously graded areas inactive for 10 days or more) that could contribute sediment to waterways.
- Enclose and cover exposed stockpiles of dirt or other loose, granular construction materials that could contribute sediment to waterways. Material stockpiles will be located in non-traffic areas only. Side slopes will not be steeper than 2:1. All stockpile areas will be surrounded by a filter fabric fence and interceptor dike.
- Contain soil and filter runoff from disturbed areas by berms, vegetated filters, silt fencing, straw wattle, plastic sheeting, catch basins, or other means necessary to prevent the escape of sediment from the disturbed area.
- Use other temporary erosion control measures (such as silt fences, staked straw bales/wattles, silt/sediment basins and traps, check dams, geofabric, sandbag dikes, and temporary revegetation or other ground cover) to control erosion from disturbed areas as necessary.
- Avoid earth or organic material from being deposited or placed where it may be directly carried into the channel.

The project proponents also will obtain a 401 Water Quality Certification from the Central Valley RWQCB, which may contain additional BMPs and water quality measures to ensure the protection of water quality.

Measure 11: Monitor Turbidity in the Sacramento River

The project proponents will require the construction contractor to monitor turbidity levels in the Sacramento River during in-water construction activities (e.g., pile driving, extraction of temporary sheet piles used for cofferdams, placement of RSP). Turbidity will be measured using standard techniques upstream and downstream of the construction area to determine whether changes in ambient turbidity levels exceed 20%, the threshold derived from the Sacramento and San Joaquin Rivers Basins Plan (Central Valley Regional Water Quality Control Board 2011). If it is determined that turbidity levels exceed the 20% threshold, then the project proponent and/or its contractors will adjust work to ensure that turbidity levels do not exceed the 20% threshold.

Measure 12: Implement Cofferdam Restrictions

The following restrictions will be implemented during installation of the cofferdams and cofferdam dewatering.

The extent of cofferdam footprints will be limited to the minimum necessary to support construction activities.

Sheet piles used for cofferdams will be installed and removed using a vibratory pile driver.

Cofferdams will be installed and removed only during the proposed in-water work window (between May 1 and November 30).

Cofferdams will not be left in place over winter where they could be overtopped by winter/spring flows and when juveniles of listed species are most likely to be present in the construction area.

All pumps used during dewatering of cofferdams will be screened according to CDFW and NMFS guidelines for screens.

Cofferdam dewatering and fish rescue/relocation from within cofferdams will commence immediately following cofferdam closure.

Measure 13: Prepare and Implement a Fish Rescue and Relocation Plan

The project proponents and/or their construction contractor will develop and implement a fish rescue and relocation plan to recover any fish trapped in cofferdams. The fish rescue and relocation plan will be submitted to the resource agencies (CDFW, NMFS, and USFWS) for approval at least 60 days before initiating activities to install cofferdams. At a minimum, the plan will include the following.

A requirement that fish rescue and relocation activities will commence immediately after cofferdam closure and that dewatering has sufficiently lowered water levels inside cofferdams to make it feasible to rescue fish.

A description of the methods and equipment proposed to collect, transfer, and release all fish trapped within cofferdams. Capture methods may include seining, dip netting, and/or electrofishing as approved by CDFW, NMFS, and USFWS. The precise methods and equipment to be used will be developed cooperatively by CDFW, NMFS, USFWS, and the project proponent and/or contractor.

A requirement that only CDFW-, NMFS-, and USFWS-approved fish biologists will conduct the fish rescue and relocation.

A requirement that fish biologists will contact CDFW, NMFS, and USFWS immediately if any listed species are found dead or injured.

A requirement that a fish rescue and relocation report be prepared and submitted to CDFW, NMFS, and USFWS within 5 business days following completion of the fish relocation. Data will be provided in tabular form and at a minimum will include the species and number rescued and relocated, approximate size of each fish (or alternatively, approximate size range if large number of individuals are encountered), date and time of their capture, and general condition of all live fish (e.g., good–active with no injuries; fair–reduced activity with some superficial injuries; poor–difficulty swimming/orienting with major injuries). For dead fish, additional data will include fork length and description of injuries and/or possible cause of mortality if it can be determined.

Measure 14: Prevent the Spread or Introduction of Aquatic Invasive Species

The project proponents or their contractor will implement the following actions to prevent the potential spread or introduction of AIS associated with the operation of barges and other in-water construction activities. Species of concern related to the operation of barges and other equipment in the lower Sacramento River include invasive mussels (e.g., quagga mussels [*Dreissena bugensis*] and zebra mussels [*Dreissena polymorpha*]) and aquatic plants (e.g., Brazilian waterweed [*Egeria densa*] and hydrilla [*Hydrilla verticillata*]) (California Department of Fish and Game 2008).

The project proponents or their contractors will coordinate with the CDFW's Invasive Species Program to ensure that the appropriate BMPs are implemented to prevent the spread or introduction of AIS.

Educate construction supervisors and managers about the importance of controlling and preventing the spread of AIS.

Train vessel and equipment operators and maintenance personnel in the recognition and proper prevention, treatment, and disposal of AIS.

To the extent feasible, prior to departure of vessels from their place of origin and before in-water construction equipment is allowed to operate within the waters of the Sacramento River, thoroughly inspect and remove and dispose of all dirt, mud, plant matter, and animals from all surfaces that are submerged or may become submerged, or places where water can be held and transferred to the surrounding water.

Measure 15: Minimize or Avoid Temporary Construction Lighting and Permanent Bridge Lighting from Directly Radiating on Water Surfaces of the Sacramento River

The project proponents will minimize or avoid the effects of nighttime lighting on special-status fish species by implementing the following actions.

Temporary Construction Lighting

- Avoiding construction activities at night, to the maximum extent practicable.
- Using the minimal amount of lighting necessary to safely and effectively illuminate the work areas.
- Shielding and focusing lights on work areas and away from the water surface of the Sacramento River, to the maximum extent practicable.

Permanent Bridge Lighting

- Minimizing nighttime lighting of the bridge structure for aesthetic purposes.
- Using the minimal amount of lighting necessary to safely and effectively illuminate vehicular, bicycle, and pedestrian areas on the bridge.
- Shielding and focusing lights on vehicular, bicycle, and pedestrian areas and away from the water surface of the Sacramento River, to the maximum extent practicable.

4.3.1.4 Project Impacts

The following assessment addresses potential direct and indirect effects of the proposed project on delta smelt and designated critical habitat (where applicable). Potential project effects on delta smelt and critical habitat include both short-term and long-term effects. Short-term effects include temporary construction-related impacts on fish and aquatic habitat that may last from a few hours to days (e.g., suspended sediment and turbidity, construction noise, artificial lighting). Long-term effects (addition of overwater structure, loss of aquatic habitat [substrate and water column], loss of SRA cover habitat) typically would last months or years, or would be permanent. These effects are generally due to physical alteration of important habitat attributes of the channel, shoreline, and adjacent bank. Short-term effects on delta smelt were evaluated qualitatively based on general knowledge of the impact mechanisms and the anticipated responses by delta smelt to construction actions. Long-term effects were measured in terms of

the area and/or linear feet of artificial shade created by the new bridge, and the area and/or linear feet of aquatic habitat and SRA cover habitat affected by the proposed project.

Direct Effects

Pile Driving Noise

Impact pile driving is of particular concern because of the intensity of sounds and known occurrences of fish kills associated with impact pile driving (Popper and Hastings 2009). The effects of pile driving noise on fish may include behavioral responses, physiological stress, temporary and permanent hearing loss, tissue damage (auditory and non-auditory), and direct mortality (Popper and Hastings 2009). In general, factors that may influence the magnitude of effects include species, life stage, and size of fish; type and size of pile and hammer; frequency and duration of pile driving; site characteristics (e.g., water depth); and distance of fish from the source of the underwater sound.

The primary source of underwater noise associated with the project would be driving the 200 16-inch piles with an impact hammer for the two in-water piers (i.e., piers 2 and 5) and two in-levee abutments (i.e., abutments 1 and 6) for the new bridge, the 160 16-inch piles for the temporary trestle and work platforms, the 60 16-inch piles for the bridge fender system, and the eight 16-inch spud piles for the barges (Figure 1-3). Additional sources of underwater noise associated with the project would occur during installation of the eight 108-inch steel casings for the two in-water piers (i.e., piers 3 and 4) for the lift span with a vibratory hammer and/or hydraulic-driven oscillator/rotator system, and installation and removal of temporary sheet piles with a vibratory hammer for the temporary cofferdams used to isolate the in-water construction areas for bridge piers 2 and 5. Only driving of piles with an impact hammer is expected to produce sound levels that could result in injury to fish.

Table 4-4 presents a summary of the pile driving assumptions used in the analysis, including assumptions related to pile location (e.g., structure location, land, in-water, in de-watered cofferdam), pile size and type (e.g., steel pipe, steel H pile, concrete), the number of piles to be installed (e.g., total and number per day), type of driver to be used (e.g., impact, vibratory, hydraulic driven oscillator/rotator system), estimated total pile strikes (e.g., per pile and day), sound attenuation (e.g., bubble curtain, dewatered cofferdam, none), and underwater sound level assumptions. Because a specific pile type has not been determined, Table 4-4 presents pile driving assumptions for all possible pile driving scenarios, including with and without sound attenuation (i.e., bubble curtain).

The assessment of underwater noise impacts on delta smelt is based on the overlap of construction activities (timing, location, duration) (Figure 1-4; Table 4-4) with the expected

occurrence of delta smelt in the action area (Table 4-3), as well as the expected fish behavior if encountering underwater noise. An important measure for reducing the potential exposure of delta smelt to pile driving noise is the restriction of in-water impact pile driving activities to May 1 through November 30, a period when the abundance of delta smelt in the construction area is reduced (see Measure 7).

To further minimize direct effects on fish, the project proponents propose to use vibratory driving to drive all piles to the maximum depth possible before using an impact driver to complete the installation and to use sound attenuation measures—including cofferdam dewatering and bubble curtains—and hydroacoustic monitoring to minimize the exposure of special-status fish species to potentially harmful pile driving sounds (Measures 8 and 9). During in-water pile driving activities, the use of an impact driver will be limited to driving only the 16-inch piles that are needed for the piers and abutments of the new bridge, the temporary trestles, and the barges. All of the 108-inch steel casings will be installed with a vibratory hammer and/or hydraulic-driven oscillator/rotator system, and all of the temporary sheet piles for the cofferdams will be installed and extracted using a vibratory driver. Use of a vibratory driver and/or hydraulic-driven oscillator/rotator system to install the 108-inch steel casings and the vibratory driver to install and remove the temporary sheet piles for coffer dams is not expected to produce sound levels that result in injury to fish. Vibratory pile driving is a preferred method for minimizing the exposure of fish to potentially harmful pile driving sounds (National Marine Fisheries Service 2009). Therefore, the following assessment focuses on the potential for injury to fish based on predicted noise levels associated with impact pile driving.

Because geotechnical information is not yet available, it is unknown how far piles would be advanced with a vibratory hammer before impact driving would be needed to complete the installation. Therefore, the following results are based on the estimated maximum number of strikes that would be needed with an impact hammer to fully install each pile and represent a worst-case scenario for underwater sound levels. However, actual underwater sound levels from driving piles would likely be less than those levels reported here because some portion of the pile installation is expected to be accomplished with a vibratory hammer, thereby reducing the total number of strikes needed with an impact hammer to install each pile.

Table 4-4. I Street Bridge Hydroacoustic Analysis. 7-13-15

Pile Location	Pile Diameter/ Type	Driver	Total Number of Piles to be Installed	Land or Water Installation	Piles per Day	Engineer's Estimate of Strikes per Pile	Total Strikes per Day	Attenuation (dB)	Underwater Sound Level Assumptions					Cumulative SEL at Reference Distance	Transmission Loss Constant	Distance (m) to Threshold			
																Onset of Physical Injury			Behavior
																Peak	Cumulative SEL dB		RMS
																dB	Fish ≥ 2 g	Fish < 2 g	dB
									Peak	SEL	RMS	Reference Distance (m)	Source for Sound Level Assumptions			206 dB	187 dB	183 dB	150 dB

Piers 3 and 4	108-in steel casings	Vibratory hammer and/or hydraulic driven oscillator/ rotator system	8	Water	2 weeks/ pile	NA	NA	NA	Vibratory pile driving is not known to cause injury to fish and is therefore not evaluated here.										
									Hydraulic oscillator/rotator systems slowly rotate pile into place and do not generate high underwater noise levels.										

Note 1. Cofferdam sheet piles will be driven with a vibratory driver. Vibratory pile driving is not known to cause injury to fish and is therefore not evaluated.
Note 2. There is limited data available for concrete piles driven on land. Data taken from measurements at the Port of Oakland is used. In this case piles driven on land resulted in higher underwater sound levels than piles driven in water.
Note 3. Pile driving energy does not accumulate once the single strike SEL drops to 150 dB (i.e. "effective quiet"). The distance to the onset of physical injury therefore cannot extend beyond the distance to "effective quiet." Once the daily number of strikes exceeds 5,000 strikes per day the distance to the onset of injury does not increase.
For this reason the distances to the 183 dB and 187 dB thresholds are the same.

Injury Thresholds for Pile Driving Noise

The ability to predict impacts of pile driving noise on listed fish species is currently limited by a lack of information on the key variables and mechanisms linking pile driving sounds with the biological responses of the species of concern (Popper and Hastings 2009). Beginning in 2004, Caltrans—in coordination with the FHWA, Oregon Department of Transportation, and Washington Department of Transportation—established a Fisheries Hydroacoustic Working Group (FHWG) to coordinate and improve information related to the assessment of underwater noise impacts on fish from pile driving. Other member agencies include NMFS (West Coast Region [formerly Northwest and Southwest Regions]), USFWS, and CDFW.

The following assessment is based on application of interim noise criteria established by the FHWG in 2008 (Table 4-5). These criteria, based on recommendations developed by Popper at al. (2006) and revised by Carlson et al. (2007), are considered preliminary thresholds for assessing the potential for injury to listed fish species. The peak sound pressure level (SPL) is considered the maximum SPL a fish can receive from a single strike without injury. The cumulative sound exposure level (SEL) is considered the total amount of acoustic energy that a fish can receive from a single or multiple strikes without injury. Insufficient data are currently available to support the establishment of a noise threshold for behavioral effects (Popper et al. 2006); however, NMFS generally assumes that a noise level of 150 decibels root mean square (dB RMS) is an appropriate threshold for behavioral effects; therefore, this criterion is also being used to assess potential project effects on delta smelt behavior. Technical guidance on the application of these criteria to pile driving projects is presented by ICF Jones & Stokes and Illingworth and Rodkin (2009).

Table 4-5. Interim Criteria for Injury to Fish from Pile Driving Activities

Interim Criteria	Agreement in Principle
Peak sound pressure level (SPL)	206 dB re 1µPa (for all sizes of fish)
Cumulative sound exposure level (SEL)	187 dB re 1µPa^2-sec—for fish size ≥ 2 grams 183 dB re 1µPa^2-sec—for fish size < 2 grams
Behavioral (RMS)	150 dB re 1µPa (for all sizes of fish)

dB = decibel(s)
dB re 1µPa = dB referenced to a pressure of 1 microPascal
dB re 1µPa^2-sec = dB referenced to a pressure of 1 microPascal squared per second
RMS = root mean square

The potential for physical injury to fish from exposure to pile driving sounds was evaluated using the "NMFS Pile Driving Calculator," a spreadsheet model developed by NMFS to calculate the distances from the pile that sound attenuates to the peak or cumulative criteria. These distances define the area in which the criteria are expected to be exceeded as a result of impact pile driving (potential impact area). The NMFS spreadsheet calculates these distances based on estimates of the single-strike sound levels for each pile type (measured at 10 meters

[32.8 feet] from the pile) and the rate at which sound attenuates with distance. To account for the exposure of fish to multiple pile driving strikes, the model computes a cumulative SEL for multiple strikes based on the single-strike SEL and the number of strikes per day or pile driving event. Estimated single-strike sound levels were based on measured sound levels produced by similar piles (California Department of Transportation 2009). The standard sound attenuation rate of 4.5 dB per doubling of distance was used in the absence of other data. The estimated number of pile strikes per day was provided by the project engineers. Because delta smelt in the project area could be smaller than 2 grams, the cumulative SEL threshold of 183 dB (i.e., the more protective threshold) is used in this analysis. It should be noted, however, that because the estimated daily number of strikes per day exceeds 5,000 strikes, the distance to the onset of physical injury does not increase because pile driving energy does not accumulate once the single strike SEL drops to 150 dB (i.e., "effective quiet"); therefore, the distance to the 183 dB and 187 dB thresholds are the same (see "Note 3" at bottom of Table 4-4).

16-Inch Piles for Temporary Trestles

A total of 160 (80 per trestle) 16-inch piles would be installed to support trestles for the work platforms during construction. The trestles would be installed over a 3 week period in May in the first year of construction and would remain in place throughout the duration of bridge construction (Figure 1-4). It was assumed that up to 20 piles (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-4). The piles for the temporary trestles would be removed during October of the second construction season once bridge construction is completed. Two pile types are being considered: 16-inch-diameter steel and 16-inch H piles. Both pile types have been evaluated separately for noise impacts.

16-Inch-Diameter Steel Piles for Temporary Trestles

Impact driving of 16-inch-diameter steel piles is expected to produce a single-strike peak SPL of 208 dB and a single-strike SEL of 176 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4); the single-strike peak SPL exceeds the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend 14 meters (46 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile, with two pile drivers operating), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 541 meters (1,775 feet) away from the source pile. The project proponents propose to use a bubble curtain to reduce this distance to an estimated 251 meters (824 feet) (Table 4-4).

16-Inch H Piles for Temporary Trestles

Impact driving of 16-inch H piles is expected to produce a single-strike peak SPL of 195 dB and a single-strike SEL of 170 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile, with two pile drivers operating), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 215 meters (705 feet) away from the source pile. The project proponents propose to use a bubble curtain to reduce this distance to an estimated 100 meters (328 feet) (Table 4-4).

16-Inch Piles for Piers 2 and 5

A total of 100 (50 per pier) 16-inch piles would be installed to construct piers 2 and 5 for the two fixed-span approach structures that would tie into the Sacramento and West Sacramento banks of the river (Figure 1-3). The 16-inch piles for piers 2 and 5 would be installed inside dewatered cofferdams that would be constructed to isolate the construction site from the Sacramento River. The piles would be driven over a 1 week period in May in the first construction season (Figure 1-4). It was assumed that up to 20 piles (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-4). Two pile types are being considered: 16-inch-diameter steel and 16-inch-square precast concrete piles. Both pile types have been evaluated separately for noise impacts.

16-Inch-Diameter Steel Piles for Piers 2 and 5

Impact driving of 16-inch H piles for piers 2 and 5 in the dewatered cofferdams is expected to produce a single-strike peak SPL of 203 dB and a single-strike SEL of 171 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4).The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 251 meters (824 feet) away from the source pile. Because the piles would be driven in dewatered cofferdams, there are no opportunities to further attenuate noise levels.

16-Inch-Square Precast Concrete Piles for Piers 2 and 5

Impact driving of 16-inch-square concrete piles for piers 2 and 5 in the dewatered cofferdams is expected to produce a single-strike peak SPL of 183 dB and a single-strike SEL of 161 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4).The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim

threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 54 meters (177 feet) away from the source pile. Because the piles would be driven in dewatered cofferdams, there are no opportunities to further attenuate noise levels.

16-Inch Piles for Abutments 1 and 6

A total of 100 (50 per abutment) 16-inch piles would be installed to construct abutments 1 and 6 on the West Sacramento and Sacramento banks of the river, respectively (Figure 1-3). The piles would be installed over a 1 week period in May of the second construction season (Figure 1-4). It was assumed that up to 20 piles (4–10 per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 16,000 strikes with the impact hammer to drive and test each pile (Table 4-4). Two pile types are being considered: 16-inch-diameter steel and 16-inch-square precast concrete. Both pile types have been evaluated separately for noise impacts because of their proximity to the river.

16-Inch-Diameter Steel Piles for Abutments 1 and 6

Impact driving of 16-inch-diameter piles for abutments 1 and 6 is expected to produce a single-strike peak SPL of 198 dB and a single-strike SEL of 171 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 251 meters (824 feet) away from the source pile. Because the piles would be driven on land, there are no opportunities to attenuate noise levels.

16-Inch-Square Precast Concrete Piles for Abutments 1 and 6

Impact driving of 16-inch-square precast concrete piles for abutments 1 and 6 is expected to produce a single-strike peak SPL of 192 dB and a single-strike SEL of 174 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 16,000 strikes per day (20 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 398 meters (1,306 feet) away from the source pile. Because the piles would be driven on land, there are no opportunities to attenuate noise levels.

16-Inch-Diameter Concrete Piles for Bridge Fender System

A total of 60 (30 per pier) 16-inch-diameter concrete piles would be installed at piers 3 and 4 to construct the bridge fender system for the two movable span piers (Figure 3-1). The fender system would protect the piers from errant watercraft navigating the river. The piles would be installed over a 2 week period in October of the second construction season (Figure 1-4). It was assumed that up to 20 piles per day (4–10 piles per day per pile driver, with two pile drivers operating) would be driven in a day, requiring up to 20,000 strikes with an impact hammer to drive and test each pile (Table 4-4).

Impact driving of 16-inch-diameter concrete piles for the bridge fender system is expected to produce a single-strike peak SPL of 188 dB and a single-strike SEL of 166 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4). The single-strike peak SPL and single-strike SEL would not exceed the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend less than 10 meters (32.8 feet) from the source pile. Based on an assumed maximum rate of 20,000 strikes per day (20 piles per day at 1,000 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 117 meters (384 feet) away from the source pile. The project proponents propose to use a bubble curtain to reduce this distance to an estimated 54 meters (177 feet) (Table 4-4).

16-Inch-Diameter Steel Piles for Barge Installation

A total of 8 16-inch-diameter steel piles (spud piles) would be installed to anchor each barge to provide a floating work platform during bridge construction. One to two barges would be used during construction and would be installed over a 1 week period in May of the first and second construction season. The barges would be in use for approximately 24 months and would be moved approximately 4–6 times during anytime of the year. It was assumed that up to 8 piles per day would be driven on the days a barge would be moved, requiring up to 6,400 strikes with an impact hammer to drive each pile (Table 4-4).

Impact driving of 16-inch-diameter steel (spud) piles for the barges is expected to produce a single-strike peak SPL of 208 dB and a single-strike SEL of 176 dB (measured at 10 meters [32.8 feet] from the pile) (Table 4-4); the single-strike peak SPL exceeds the interim criteria (Table 4-5). Peak SPLs above the interim threshold (206 dB) would extend 14 meters (46 feet) from the source pile. Based on an assumed maximum rate of 6,400 strikes per day (8 piles per day at 800 strikes per pile), cumulative SELs exceeding the interim threshold (183 dB for fish ≤ 2 grams) would occur out to 541 meters (1,775 feet) away from the source pile. The project

proponents propose to use a bubble curtain to reduce this distance to an estimated 251 meters (824 feet) (Table 4-4).

108-Inch Steel Casings for Piers 3 and 4

A total of 8 (4 per pier) 108-inch steel casings would be installed to construct piers 3 and 4 for the tower foundations (Figure 1-3). The 108-inch steel casings for piers 3 and 4 would be installed with a vibratory pile driver and/or hydraulic-driven oscillator/rotator system; therefore, this method of installation would not generate high underwater noise levels (Table 4-4). It was assumed that it will take approximately 7 weeks to install both 108-inch steel casings. The 108-inch steel casings would be installed from late May through early July in the first construction season (Figure 1-4).

Sheet Piles for Temporary Cofferdams

Two cofferdams would be installed to construct piers 2 and 5 (Figure 1-3). The sheet piles for the cofferdams would be installed and removed with a vibratory pile driver; therefore, this method of installation and removal would not generate high underwater noise levels (Table 4-4). The sheet piles for the two cofferdams would be installed at the same time over a 2 week period in May of the first construction season (Figure 1-4).

Effects of Pile Driving Noise on Fish

The proposed timing of pile driving activities, use of a vibratory hammer to first drive the piles to the maximum depth possible before using an impact driver to complete the installation, and use of sound attenuation measures are expected to minimize the exposure of delta smelt to potentially harmful pile driving sounds. Generally, the potential for injury or mortality of delta smelt would be greatest for the 16-inch-square precast concrete piles for abutments 1 and 6 and would be the lowest for the 16-inch-square precast concrete piles for piers 2 and 5 driven in dewatered cofferdams and 16-inch-diameter concrete piles driven in water (with attenuation) for the bridge fender system. For the 16-inch-square precast concrete piles for abutments 1 and 6, the potential for injury and mortality would exist within areas of less than 10 meters (32.8 feet) for single-strike exposures and within areas of up to 398 meters (1,306 feet) of the source piles for multiple-strike exposures to impact pile driving sounds. By comparison, for 16-inch-square precast concrete piles for piers 2 and 5 driven in dewatered cofferdams and 16-inch-diameter concrete piles driven in water (with attenuation) for the bridge fender system, the potential for injury and mortality would still exist within areas of less than 10 meters (32.8 feet) of the source piles for single-strike exposures and within areas of up to 54 meters (177 feet) of the source piles for multiple-strike exposures to impact pile driving sounds.

Several factors that could influence the potential exposure and susceptibility of delta smelt to injury from pile driving sounds include the size, mobility, and likely response of the life stages of

concern (adults, eggs, and larvae). Actively migrating adults are expected to be capable of avoiding or migrating through the areas where potential injury or mortality may occur. By contrast, eggs and larvae are not capable of avoiding areas where potential injury or mortality may occur. In addition, because of their larger size (i.e., greater than 2 grams), adult delta smelt would be expected to tolerate higher sound pressures than the levels associated with the onset of injury in smaller fish (Table 4-5), such as larvae or small juveniles (if they occur in the project area). At a minimum, any adults encountering pile driving noise may exhibit some form of behavioral response, including an avoidance response that could disrupt or delay their movement or feeding. Evidence suggests that some fish species avoid or disperse from areas subject to pile driving or other human-generated noises (Popper and Hastings 2009).

Installation of the temporary trestle piles and piles for piers 2 and 5 in May of the first year of construction presents the greatest concern for the potential of injury and mortality of delta smelt from pile driving noise because of the relatively large number of piles (i.e., approximately 160 total piles) that would be installed, the relatively large channel area that would be subject to cumulative sound levels exceeding the injury thresholds (Table 4-4), and potential for adults, eggs, and larvae to be present. In addition, relocation of the construction barges is of concern if impact driving is required to install the spud piles to anchor the barges during primary periods of species and life stage occurrence. However, unlike pile driving associated with the temporary trestles and bridge piers, pile driving associated with relocation of the barges would be infrequent (4–6 times over the course of construction) and would require that only 8 piles be driven over the course of one day, per event.

Delta smelt may spawn within or in the vicinity of the action area; therefore, their eggs and larvae may be exposed to underwater noise from pile driving activities. In addition, pile driving activities would overlap with delta smelt adults at the end of the migration and spawning season in May and June, and with larvae and possibly juveniles in May through early July. Pile driving associated with relocating the construction barges outside of May 1 to November 30 could potentially overlap peak migration and spawning periods for delta smelt; however, because it is not known when barges would have to be moved it is not possible to identify which species and life stages potentially would be affected. However, these pile driving activities would be infrequent and last for less than one day per event.

Based on the predicted levels of underwater noise, pile driving activities could lead to injury and/or direct and indirect mortality if individuals are within the range of noise levels that could cause physical harm or behavioral effects that lead to mortality (e.g., from predation). However, only a small proportion of the delta smelt population is likely to be at risk, based on the extent of overlap of pile driving activities with migration timing and the distribution of delta smelt in the

Sacramento River (the action area is located at the northern [upstream] boundary of the species' range).

Although pile driving would occur over many days per season, pile driving would not be continuous and would be limited to daylight hours only, resulting in extended overnight periods each day for migrating fish to pass the construction site undisturbed. In addition, the project proponents propose to drive piles for in-water piers 2 and 5 in dewatered cofferdams and to install the 108-inch-diameter steel casings for in-water piers 3 and 4 using a vibratory hammer and/or hydraulic driven oscillator/rotator system, which would not generate the same underwater noise levels had these piles been driven in water with an impact hammer. Finally, the project proponents will require the contractor to employ sound attenuation devices (e.g., bubble curtains) during in-water pile driving.

Insufficient data are currently available to support the establishment of a noise threshold for behavioral effects (Popper et al. 2006). NMFS generally assumes that a noise level of 150 dB RMS is an appropriate threshold for behavioral effects. During in-water (with attenuation) impact driving of the 16-inch diameter steel piles for abutments 1 and 6, the spreadsheet calculations indicate that underwater sounds exceeding 150 dB RMS would extend 1,585 meters (approximately 1 mile) from the source piles (Table 4-4). However, these calculations assume an unimpeded open water propagation path over this distance, which is not the case for the Sacramento River. The Sacramento River has major river channel bends within about 1,280 meters (4,200 feet) upstream and 1,830 meters (6,000 feet) downstream from the proposed bridge crossing that will result in diffraction and attenuation of sound waves. Thus, the distance within which 150 dB RMS is exceeded likely would be less than indicated in Table 4-4.

Based on the area of disturbance and timing of pile driving operations, some disturbance to the movement and feeding of special-status fish is anticipated. In addition, pile driving activities would not be continuous but would start and stop during the course of each day of pile driving (including cessation of pile driving activities at night), providing opportunities for fish to continue with their movements and feeding without substantial delays. In addition, general construction noise may act to disperse fish away from the construction area before impact driving is initiated.

Increased Exposure to Contaminants

Disturbance and resuspension of river bottom sediments during in-water construction pose a risk to delta smelt because of potential increases in the exposure to contaminated sediments.

Sand, silt, and gravel characterize bottom substrate in the BSA. Non-soluble contaminants with a tendency to adsorb[1] to sediments (as opposed to soluble contaminants which have the tendency to be readily diluted in water) can accumulate in the substrate over time. Non-soluble contaminants that are known to be present in the Sacramento River include polychlorinated biphenyls (PCBs), mercury, pesticides and insecticides (i.e., dieldrin, chlorodane, DDT), and other unknown toxicities (State Water Resources Control Board 2011). Resuspension of sediments with adsorbed metals during in-water construction potentially could lead to degradation of water quality and food resources in the action area. In addition, resuspended particulate material could be transported to other locations in the Sacramento River as a result of transport by river currents, thus leading to potential degradation of water quality and food resources in the action area. Although delta smelt may be present in the action area during May and June, restricting in-water construction to the May 1–November 30 window will reduce the exposure of delta smelt to contaminants because delta smelt occur less frequently than other months, or not at all, during this time of year.

In-water construction would be limited to pile driving, installation and removal of sheet piles for cofferdams, and RSP placement. In addition, in-water construction would be limited to daylight hours each day. Thus, disturbance of channel substrate and the potential for increased contaminants would be temporary and localized. Assuming that mobilization of sediment is also an indication of contaminant mobilization, the proposed in-water construction methods and construction BMPs should minimize the increase in contaminants in the river.

Given the relatively short exposure time and the restricted area of in-water construction relative to the distribution and temporal occurrence of adult and juvenile delta smelt between May 1 and November 30, the effect of contaminants mobilized by in-water construction is not expected to result in measurable effects on the survival and growth of delta smelt.

Contaminant Spills

Construction activities that occur in or near the Sacramento River channel can result in the discharge of contaminants that are potentially lethal to fish, including delta smelt. The operation of heavy equipment, cranes, pile drivers, drilling rigs, tug boats, and other construction equipment during bridge construction can result in spills and leakage of fuel, lubricants, hydraulic fluids, and coolants. Other sources of potential contamination include asphalt, wet concrete, and other materials that may come into direct contact with surface water during construction activities. For example, concrete that is being poured for the bridge decking could

[1] *Adsorption* is the adhesion of atoms, ions, or molecules from a gas, liquid, or dissolved solid to a surface—in this case, a sediment particle.

be discharged accidentally to the river, thereby contaminating the river with uncured concrete (which can raise pH) and related compounds.

The potential magnitude of biological effects resulting from contaminants depends on a number of factors, including the proximity of spills to the river; the type, volume, concentration, and solubility of the contaminant; and the timing and duration of the spill or release of the contaminant into the water column. Contaminants can affect survival, growth, and reproductive success of fish and other aquatic organisms. The level of effect depends on the species, life stage sensitivity, duration of exposure, condition or health of exposed individuals, and the physical and chemical properties of the water (e.g., temperature, pH, dissolved oxygen, and other factors).

Implementation of Measure 10 would eliminate or minimize the risk of contaminant spills and the potential effects of any spills on fish, including delta smelt, and other aquatic organisms.

Erosion and Mobilization of Sediment

Site clearing, earthwork, driving of permanent piles, driving and removal of piles for the temporary trestles, and vibrating and removal of sheet piles for cofferdams will result in disturbance of soil and riverbed sediments, resulting in temporary increases in turbidity and suspended sediments in the Sacramento River. In addition, dewatering and soil removal from the inside of the cofferdams could result in temporary increases in turbidity and suspended sediments in the river, if water (and associated spoils) from within the cofferdams is not properly disposed of or contained and treated before being discharged back to the river.

The potential for disturbance of riverbed sediments and associated increases in sedimentation and turbidity in the Sacramento River are anticipated to be greatest during activities to extract the piles used for the temporary trestles and cofferdams. These activities would result in greater disturbance to riverbed sediments than would occur during pile driving for piers and the bridge fender system; these piles would be driven only and not extracted.

In addition to increasing exposure to contaminants as discussed previously, elevated levels of suspended sediments have the potential to result in physiological, behavioral, and habitat effects related to increased sediment concentrations in the water column. The severity of these effects depends on the sediment concentration, duration of exposure, and sensitivity of the affected life stage. Short-term increases in turbidity and suspended sediment may disrupt normal behavior patterns of fish, potentially affecting foraging, rearing, and migration. The level of disturbance may also cause juveniles to abandon protective habitat or reduce their ability to detect predators, potentially increasing their vulnerability to predators (e.g., striped bass and largemouth bass). Previous studies have documented these effects. For example, juvenile salmonids have been observed to avoid streams that are chronically turbid (Lloyd et al. 1987) or move laterally or

downstream to avoid turbidity plumes (Sigler et al. 1984). Bisson and Bilby (1982) reported that juvenile coho salmon avoid turbidities exceeding 70 nephelometric turbidity units (NTUs). Chronic exposure to high turbidity and suspended sediment may affect growth and survival by impairing respiratory function, reducing tolerance to disease and contaminants, and causing physiological stress (Waters 1995). Sigler et al. (1984) found that prolonged exposure to turbidities between 25 and 50 NTUs resulted in reduced growth and increased emigration rates of juvenile coho salmon and steelhead compared to controls. Increased sediment delivery can also smother aquatic invertebrates (a fish food item), degrade forage habitat, and reduce cover for juvenile fish.

Delta smelt eggs may be at higher risk of exposure to construction-related impacts than other life stages because their benthic nature may make them more likely to encounter sediment plumes that may be more concentrated near the river bottom.

Implementation of Measure 10 would eliminate or minimize the potential for mobilization of sediment and increased sedimentation and turbidity in the Sacramento River. Some harassment of adult and juvenile fish may occur due to temporary, localized plumes of sediment during pile driving and installation and removal of temporary piles and sheet piles. Turbidity would be monitored throughout in-water construction (Measure 11).

Temporary and Permanent Loss of Aquatic Habitat

The proposed project would include the placement of temporary and permanent fill (bridge piers and RSP) below the OHWM and would result in the permanent and temporary loss of aquatic habitat area and volume, including spawning, larval and juvenile transport, rearing, and adult migration habitat for delta smelt. A total of up to 1.85 acres of permanent impacts on perennial stream and delta smelt habitat in the Sacramento River would result from the following bridge components and RSP to be placed below the OHWM (see Table 4-6 below).

- The two fixed-span approach structures for the new bridge would be constructed on center piers (Piers 2 and 5) with foundations each consisting of 50 driven or CIDH piles. The piles would be covered by pile caps and RSP. The footprint for Piers 2 and 5 on the river bottom would total 8,500 square feet (0.20 acre).
- The movable span section of the bridge would be constructed on a foundation of four 9-foot diameter CISS piles in the river bed. The CISS piles, consisting of hollow steel shells, would be driven into the channel bottom using drivers and cranes on the temporary trestle or mounted on barges to temporarily place the steel shells at the desired location for each pile. Once the steel shells are in place, the soil inside the shell would be drilled out, and concrete would be poured into the dewatered hollow shells. The piles would be covered by pile caps

and RSP. The footprint for r Piers 3 and 4 on the river bottom would total 1,864 square feet (0.04 acre).

- A bridge fender system would be constructed around the movable span piers that would include approximately 30 driven piles around each pier. The footprint of the bridge fender system on the river bottom would total 85 square feet (0.002 acre).
- RSP (1/4-ton, Method B) would be installed along 1,600 linear feet of shoreline (900 linear feet on City of Sacramento shoreline and 700 linear feet on City of West Sacramento shoreline) below the OHWM. The total volume and area of RSP that would be placed below the OHWM would be up to 2,000 cubic yards and 70,000 square feet (1.61 acres), respectively. In addition, a total of up to 2,000 cubic yards of RSP would be placed above the OHWM.

Table 4-6. Amount of Temporarily and Permanently Affected Aquatic Habitat in the Sacramento River Resulting from the Proposed Project

Feature/Habitat	Temporary Impact	Permanent Impact
Temporary Cofferdams		
Substrate Area (square feet [acre])	4,000 [0.09]	NA
Water Column Volume (cubic feet)	73,640	NA
Temporary Trestle Piles		
Substrate Area (square feet [acre])	197 [0.005]	NA
Water Column Volume (cubic feet)	3,573	NA
Piers 2 and 5		
Substrate Area (square feet [acre])	NA	8,500 [0.20][1]
Water Column Volume (cubic feet)	NA	12,250
Piers 3 and 4		
Substrate Area (square feet [acre])	NA	1,864 [0.04][2]
Water Column Volume (cubic feet)	NA	17,800
Piles for Bridge Fender System		
Substrate Area (square feet [acre])	NA	85 [0.002]
Water Column Volume (cubic feet)	NA	2,600
Shoreline Rock Revetment (RSP)		
Substrate Area (square feet [acre])	NA	70,000 [1.61]
Water Column Volume (cubic feet)	NA	NA
TOTALS		
Substrate Area (square feet [acre])	4,197 [0.095]	80,449 [1.85]
Water Column Volume (cubic feet)	77,213	32,650

NA = Not applicable
[1] 2,500 sf (pile caps) + 6,000 sf (RSP)
[2] 64 sf (piles) + 1,800 sf (RSP)

Temporary impacts on perennial stream and delta smelt habitat would also occur from temporary installation of two cofferdams and trestle piles during bridge construction. Installation of sheet pile cofferdams to isolate the in-water construction areas for piers 2 and 5 from the water column during pier construction would result in the temporary loss of aquatic habitat (substrate and water column) equal to the enclosed area and volume of the in-water cofferdams. The cofferdams would remain in place only during construction of the new bridge piers. The proposed

dimensions of each cofferdam are 25 feet by 80 feet, or 2,000 square feet. Together, the two cofferdams would result in a temporary loss of 4,000 square feet (0.09 acre) of substrate habitat and up to 73,640 cubic feet of water column habitat below the OHWM (based on a water surface elevation of +20 feet).

Approximately 141 16-inch-diameter pipe or H piles would be installed below the OHWM to support the temporary trestles, and would result in a temporary loss of 197 square feet (0.005 acre) of substrate habitat and up to 3,573 cubic feet of water column habitat below the OHWM. (Approximately 19 of the 160 piles for the temporary trestles would be installed above the OHWM). The temporary trestle piles would remain in place throughout the duration of construction.

Installation of these features may result in direct and indirect effects by inhibiting establishment of riparian vegetation; inhibiting recruitment and retention of sediment and woody debris; and eliminating shallow-water habitat.

Compensation for impacts on perennial stream, as described below, would offset the effects of temporary and permanent impacts on delta smelt habitat.

Temporary and Permanent Loss of Cottonwood Riparian Habitat (including SRA Cover Habitat)

Clearing of the existing cottonwood riparian forest vegetation within the proposed project footprint would result in the permanent loss of up to 1.44 acres and temporary loss of up to 1.52 acres of cottonwood riparian forest within the BSA, of which approximately 0.44 acre is below the OHWM and contributes to overhead (shade) and instream SRA cover (see additional discussion below regarding SRA cover). The permanent loss of existing cottonwood forest would result from activities related to construction of the two fixed-span bridge approach structures, the bikeway along Jibboom Street in the City of Sacramento, and the new residential access road connecting B Street and 3rd Street in the City of West Sacramento (Figure 3-1). The temporary loss of cottonwood riparian forest would occur from trimming riparian vegetation and removing additional trees and understory vegetation to provide equipment access. Portions of this affected riparian forest also provide SRA cover habitat that is an important component of anadromous fish habitat (see additional discussion below). Clearing of the existing cottonwood riparian forest that contributes to SRA cover would result in the temporary and permanent loss of up to 890 linear feet (i.e., up to 513 linear feet on the City of Sacramento side of the Sacramento River and up to 377 linear feet on the City of West Sacramento side of the Sacramento River) of overhead SRA cover (shade) along the summer (low-flow) shoreline of the Sacramento River.

Riparian vegetation is important in controlling stream bank erosion, contributing to instream structural diversity, and maintaining undercut banks. In addition, canopy cover (overhanging

vegetation [a form of SRA cover]) maintains shade that is necessary to reduce thermal input and provides an energy input to the aquatic habitats in the form of fallen leaves and insects (a food source for fish). SRA cover also provides fish with protection from predators in the form of undercut banks, branches, roots, and instream woody material (e.g., logs).

Without appropriate mitigation, removal of streamside vegetation is likely to degrade the quality of aquatic habitat in the Sacramento River. The amount of existing riparian and SRA cover habitat in the BSA and in the region is of variable quality because of past and ongoing impacts, including levee construction and bank protection activities (i.e., placement of rock revetment).

USFWS mitigation policy identifies California's riparian habitats, including SRA cover habitat, in Resource Category 2. The designation criteria for habitat in Resource Category 2 is "habitat to be impacted is of high quality for evaluation species and is relatively scarce or becoming scarce on a national basis or in the ecoregion section" (U.S. Fish and Wildlife Service 2015c), for which "no net loss of in-kind habitat value" is recommended (46 FR 7644, January 23, 1981). In addition, NMFS recommends re-vegetating onsite at a 3:1 ratio (3 units replaced for every 1 unit of affected habitat) with native riparian species to facilitate the development of SRA cover habitat (Rea pers. comm.).

Compensation for impacts on riparian habitat, including SRA cover habitat, as described below, would offset the effects of temporary and permanent loss of cottonwood riparian forest and SRA cover in the project area.

Fish Entrapment in Cofferdams

Cofferdams would be required in order to construct piers 2 and 5 for the new bridge. Cofferdams would be constructed of sheet piles; when installed, each cofferdam would be approximately 25 feet wide and 80 feet long. The potential exists for entrapment and mortality of delta smelt following closure and dewatering of the cofferdam. The proposed timing of cofferdam installation (May) would potentially overlap adult and juvenile occurrence in the river. Implementation of Measures 12 and 13 will minimize or avoid the risk of mortality for delta smelt potentially stranded during cofferdam installation, closure, and dewatering.

Increase in Direct Lighting on Sacramento River

Temporary lighting of work areas to facilitate nighttime construction, especially at construction sites adjacent to or over the Sacramento River, may result in increased nighttime light intensity on the water surface of the Sacramento River. Increases in direct lighting of the Sacramento River at night may affect the migratory behavior of fish; alter behavior of animals that prey on fish (e.g., piscivorous birds, mammals, and fish) in adjacent and affected habitats; or make juvenile fish more visible to predators, thereby leading to increased mortality of fish through

increased predation (Tabor et al. 2001). Implementation of Measure 15 would minimize the potential for effects of lighting on fish, including delta smelt, by requiring shielding and focusing of temporary lights on work areas to avoid and minimize the amount of nighttime lighting that directly radiates on to the Sacramento River, to the extent practicable.

Indirect Effects

Construction of the bridge would not promote or allow for urban or commercial development or expand boating or other recreational activities in the action area; therefore, no indirect effects related to additional development and use of the Sacramento River would occur.
Potential indirect effects on delta smelt and habitat include changes in impervious surface area and storm runoff, predator/competitor abundance or efficiency, and habitat suitability as a result of over-water structure (artificial shade). These indirect effects are discussed below.

Increases in Impervious Surface Area and Storm Water Runoff

The proposed project would result in added impervious surface which would have the potential to increase runoff volume in the Sacramento River. Increased traffic loads on the new bridge resulting from improved access could result in increased deposition of particulates onto the bridge deck that could then be transported to the Sacramento River with road runoff.

Heavy metals, oil, grease, and polycyclic aromatic hydrocarbons (PAHs) are common pollutants in road runoff. Some of these pollutants can accumulate in stream sediments with lethal and sublethal consequences for fish and other aquatic species, particularly during “first flush” rain events. PAHs are organic compounds—containing only carbon and hydrogen—that occur in motor vehicle exhaust, petroleum products, materials associated with asphalt, and various other municipal and industrial sources. PAHs are widely distributed in the environment and are important environmental pollutants because of their carcinogenicity and tendency to bioaccumulate. PAHs are readily absorbed by fish and other aquatic organisms and, depending on concentration, can lead to lethal and deleterious sublethal effects in these organisms (Tuvikene 1995). PAHs tend to adsorb to any particulate matter, including fine sediment; therefore, relative concentrations of PAHs in aquatic ecosystems are generally highest in sediments, followed by aquatic biota and the water column (Tuvikene 1995). There is evidence that urban runoff containing roadway sediment may be an important PAH input to aquatic habitats and that a significant contribution to the PAH content of roadway sediment comes from materials associated with asphalt (Wakeham et al. 1980).

Although the new bridge would represent added impervious surface area, the proposed project would not result in a substantial increase in impervious surface area in the BSA relative to existing conditions. The new bridge would replace the vehicle portion of the existing I Street Bridge, and existing traffic would be re-routed to the new bridge. In addition, storm water runoff

from the new bridge would be directed to the existing storm water collection systems. Therefore, it is not anticipated that a decrease in water quality from added impervious surface area would be an indirect effect of the proposed project.

Increase in Overwater Structure (Artificial Shade)

Overwater structures can alter underwater light conditions and provide potential holding conditions for juvenile and adult fish, including species that prey on juvenile fishes. Temporary shading attributable to the presence of the temporary trestles, work platforms, and barges during bridge construction and permanent shading from the new bridge potentially could reduce primary productivity of affected habitats. Temporary shading also could increase the number of predatory fishes (e.g., striped bass, largemouth bass) holding in the BSA and/or their ability to prey on delta smelt. Because the temporary trestles, work platforms, and barges would be present only during construction, effects of trestle, work platform, and barge shading would be temporary and localized.

Barge shading would occur year-round during construction of the new bridge. One to two barges, each approximately 60 feet wide and 190 feet long (11,400 square feet [0.26 acre]), would be present during construction and would provide a total of 11,400–22,800 square feet (0.26–0.52 acre) of temporary over-water structure (Table 4-7). Because the barges would be present only during construction and moved periodically as construction of the bridge progresses, effects of barge shading would be temporary and localized.

Table 4-7. Amount of Artificial Overwater Structure (Shade) on the Sacramento River under Existing and With-Project Conditions

Overwater Structure	Square Feet of Shaded Area		
	Existing Conditions	With-Project Conditions (Barge/Trestle/Bridge)	Change
Barge (Temporary)	0	11,400–22,800[a]	+11,400–22,800[a]
Trestle (Temporary)	0	30,000	+30,000
Bridge (Permanent)	0	55,000	+55,000
Net Change (Temporary)			+41,400–52,800a
Net Change (Permanent)			+55,000

NA = Not Applicable.
[a] 1 barge–2 barges.

Shading by the temporary trestles and work platforms would occur year-round during construction of the new bridge. Two trestles, approximately 30 feet wide and varying in length and configuration (Figure 1-3), would be present during construction and would provide a total of approximately 30,000 square feet (0.69 acre) of temporary over-water structure (Table 4-7). Because the trestles and work platforms would be present only during construction, effects of trestle shading would be temporary and localized. Together, the barges and temporary trestles

would create up to 52,800 square feet (1.21 acres) of temporary overwater structure (i.e., shade) (Table 4-7).

The new bridge would create approximately 55,000 square feet (1.26 acres) of permanent over-water structure where no over-water structure currently exists. The increased shading created by the new bridge could potentially affect predation rates on delta smelt by creating conditions favored by predatory species. Because of the height of the new bridge over the water, ambient light levels generally would be expected to penetrate into the water, thereby minimizing the effect of bridge shading on aquatic habitats in the Sacramento River. Compensation for the permanent loss of designated critical habitat for anadromous species, as described in the NMFS BA for the project, would offset the effects of bridge shading on aquatic habitats in the Sacramento River.

Introduction of Aquatic Invasive Species

During construction, the operation of barges and other in-water equipment originating from regions or areas outside the project area could result in the introduction and spread of aquatic invasive species (AIS), including the Asian overbite clam (*Corbula amurensis*), quagga mussel (*Dreissena bugensis*), zebra mussel (*Dreissena polymorpha*), hydrilla (*Hydrilla verticillata*), and Brazilian elodea (*Egeria densa*) (California Department of Fish and Game 2008). These species can adversely affect native fishes and other ecologically and economically important species through a number of mechanisms, including competition for resources, predation, parasitism, interbreeding, disease transmission, or changes in the physical or chemical attributes of aquatic habitat. The project proponent will address this impact by implementing Measure 14.

Increase in Direct Lighting on Sacramento River

Permanent lighting associated with the new bridge may result in increased nighttime light intensity on the water surface of the Sacramento River. Increases in direct lighting of the Sacramento River from permanently lighting may have the same effects on fish as described above for temporary lighting, except that the effects associated with permanent lighting of the new bridge could occur indefinitely. Implementation of Measure 15 would minimize the potential for effects of lighting on fish, including delta smelt, by requiring shielding and focusing of permanent bridge lighting on the bridge only to avoid and minimize the amount of nighttime lighting that directly radiates on to the Sacramento River, to the extent practicable.

Impacts on Delta Smelt Critical Habitat

As stated earlier, the Sacramento River upstream of the existing I Street Bridge (upstream boundary of the legal Delta) is not designated as critical habitat for delta smelt as it does not lie within the boundaries of the legal Delta (59 FR 65256; December 19, 1994); only that portion of the action area (defined in Chapter 3) that occurs downstream of the existing I Street Bridge,

which is downstream of the proposed crossing of the new bridge, is designated as critical habitat for delta smelt. Consequently, there would be no permanent effects on designated critical habitat for delta smelt from in-water construction of the new bridge. However, construction-related effects may extend far enough downstream to affect delta smelt critical habitat in the action area downstream of the existing I Street Bridge. Construction-related effects with potential to affect designated critical habitat for delta smelt include temporary effects on the water column (underwater noise and sound pressure, and water quality impacts). These impacts would be the same as those described above for delta smelt.

4.3.1.5 Modifications to the Project to Mitigate Effects

Implementation of Measure 16 would compensate for the permanent loss of perennial stream. Compensation for the permanent loss of perennial stream would also compensate for the loss of delta smelt habitat from the placement of permanent fill. In addition, compensation for the permanent loss of designated critical habitat for anadromous salmonids and green sturgeon, as described in the NMFS BA, would also benefit delta smelt. The project proponents will also comply with any regulatory requirements, including riparian habitat mitigation, determined as part of the Lake or Streambed Alteration Agreement (LSAA) for work that would affect the bed, channel, or bank of the Sacramento River. Consequently, Measure 17 would compensate for loss of riparian vegetation and SRA cover.

Measure 16: Compensate for Loss of Perennial Stream

The project proponents will comply with any regulatory requirements determined as part of the state (Section 401 Water Quality Certification or WDRs, LSAA) and federal (Section 404 and Section 10 permits) processes for the work that would occur in the Sacramento River. The project proponents will compensate for the permanent fill of up to 1.85 acres of other waters of the United States in the Sacramento River by purchasing mitigation bank credits, which can be in the form of preservation and/or creation credits using the following minimum ratios.

A minimum of 2:1 (2 acres of mitigation for each acre filled), for a total of up to 3.7 acres, if credits are for preservation of habitat; or,

A minimum of 1:1 (1 acre of mitigation for each acre filled), for a total of up to 1.85 acres, if credits are for creation of habitat.

The actual compensation ratios will be determined through coordination with the Central Valley RWQCB and USACE as part of the permitting process. The project proponents will compensate for permanent loss of perennial stream by implementing one or a combination of the following options.

Purchase credits for created riparian stream channel at a USACE- approved mitigation bank with a service area that encompasses the project area, such as the Cosumnes Floodplain Mitigation Bank, Fremont Landing Conservation Bank, or Elsie Gridley Mitigation Bank. The project proponents will provide written evidence to the resource agencies that compensation has been established through the purchase of mitigation credits.

Compensate out-of-kind for loss of perennial stream by implementing compensatory mitigation for cottonwood riparian forest impacts described in Measure 4. The acreage restored or created to compensate for loss of perennial stream will be added to the acreage restored or created for loss of riparian habitat.

Measure 17: Compensate for Temporary Effects to and Permanent Loss of Cottonwood Riparian Forest (including SRA Cover)

The project proponents will compensate for the permanent loss of up to 1.44 acres of riparian forest. In addition, any unavoidable temporary loss of riparian forest will be mitigated. The project proponents will implement onsite and, if necessary, offsite compensation measures and/or purchase mitigation bank credits to compensate for losses of cottonwood riparian forest on the waterside slope of the existing levees, including riparian forest supporting SRA cover habitat (as described above, portions of the cottonwood riparian forest in the BSA also provide SRA cover habitat for fish). Onsite compensation will be used to the maximum extent practicable. Compliance with the USACE levee vegetation policy (U.S. Army Corps of Engineers 2014), the ULDC (California Department of Water Resources 2012), or other engineering constraints may limit the ability to achieve full onsite compensation. Therefore, offsite compensation and/or purchase of mitigation bank credits may be needed to achieve no net loss of existing in-kind riparian and SRA cover habitat values. Each of these options is discussed below.

1. **Onsite and/or Offsite Restoration and/or Enhancement along the Sacramento River.** Riparian habitat restoration and/or enhancement onsite or offsite should occur in the same year construction is completed. For onsite or offsite replacement plantings, the project proponents will prepare a mitigation planting plan, including a species list and number of each species, planting locations, and maintenance requirements. Plantings will consist of cuttings taken from local plants or plants grown from local material. Planted species for the mitigation plantings will be similar to those removed from the project area and will include native species, such as Fremont cottonwood, valley oak, black walnut, Oregon ash, boxelder, and black willow. The final planting plan will be developed based on results of the arborist survey for species to be removed (see additional discussion below). All plantings will

be fitted with exclusion cages or other suitable protection from herbivory. Plantings will be irrigated for up to 3 years or until established. Plantings will be monitored annually for 3 years or as required in the project permits. If 75 percent of the plants survive at the end of the monitoring period, the re-vegetation will be considered successful. If the survival criterion is not met at the end of the monitoring period, planting and monitoring will be repeated after mortality causes have been identified and corrected.

2. **Mitigation Bank Credit Purchase.** If this option is chosen, the project proponents will provide written evidence to the resource agencies that compensation has been established through the purchase of mitigation credits. The amount to be paid will be the fee that is in effect at the time the fee is paid. The mitigation will be approved by CDFW and may be modified during the permitting process. Mitigation can be in the form of creation and/or preservation credits. If mitigation is in the form of restoration/creation credits, the mitigation will be at a minimum ratio of 1:1 (1 acre of restored or created riparian habitat for each acre of riparian habitat removed). If mitigation is in the form of preservation credits, the mitigation will be at a minimum ratio of 2:1 (2 acres of preserved riparian habitat for each acre of riparian habitat removed). The final compensation ratio will be approved by CDFW in order to result in no net loss of riparian habitat. The project proponent will purchase riparian habitat credits from an approved mitigation bank near the project, such as the Cosumnes Floodplain Mitigation Bank, Fremont Landing Conservation Bank, or Elsie Gridley Mitigation Bank. Replacement riparian forest habitat will include trees species that would support nesting Swainson's hawk (i.e., oak, cottonwood) and will occur within the range of nesting Swainson's hawk within the Sacramento Valley.

To provide a more accurate estimate of tree loss, an arborist survey will be conducted upon completion of 90% design plans for the project. In addition to a description of the tree, the arborist survey report will include the precise location of the trunk and size of the dripline for all trees whose trunk or canopy overlap with the project footprint. Riparian forest compensation will be consistent with the requirements of the City of West Sacramento and City of Sacramento tree ordinances to ensure compensation for losses of individual protected trees.

In addition to mitigating for the loss of riparian forest habitat, specific measures will be included to compensate for the loss of SRA cover (area and linear feet). However, the acreage will not be duplicated, such that the acreage of riparian forest habitat restored for

SRA cover mitigation will apply towards riparian forest habitat mitigation requirements. SRA cover mitigation will include the following riparian replacement requirements:

Replace the 890 linear feet and 0.44 acre of affected SRA cover vegetation (see "Temporary and Permanent Loss of Cottonwood Riparian Habitat (including SRA Cover Habitat") at a 3:1 replacement ratio (i.e., 3 linear feet replaced for every 1 foot affected and 3 acres replaced for every acre affected) by planting native riparian trees in temporary impact areas and along existing onsite or offsite unshaded banks along the Sacramento River.

Plant native riparian trees onsite to the maximum extent practicable, followed by planting on adjacent reaches of the Sacramento River to minimize the need for purchasing offsite mitigation bank credits.

Plant riparian trees that are intended to provide SRA cover along the water's edge at summer low flows up to the OHWM and at sufficient densities to provide shade along at least 85 percent of the bank's length when the trees reach maturity. This will ensure that riparian plantings intended for SRA cover mitigation will contribute to instream SRA cover when they are inundated during winter/spring flows and overhead cover (shade) during summer flows when they approach maturity.

Monitor and evaluate the re-vegetation success of riparian plantings intended for SRA cover mitigation as described above.

If mitigation for SRA cover is in the form of offsite mitigation bank credits, credits will need to be purchased from an approved mitigation bank within the approved service area for the project that provides riparian forest floodplain conservation credits as off-site compensation for impacts on state- and federally-listed fish species, designated critical habitat, and EFH for Pacific salmon.

4.3.1.6 Cumulative Effects

Under the ESA, cumulative effects are "those effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area of the federal action subject to consultation" (50 CFR 402.2). Future federal actions that are unrelated to the proposed action are not considered in this assessment because they require separate consultation pursuant to Section 7 of the ESA.

Caltrans is not aware of any future state or private activities that are reasonably certain to affect delta smelt or designated critical habitat within the area potentially affected by the proposed project.

4.4 Interrelated and Interdependent Actions

Caltrans does not anticipate any interrelated or interdependent actions associated with the proposed project.

Chapter 5 Conclusions and Determinations

5.1 Conclusions

5.1.1 Valley Elderberry Longhorn Beetle

Construction activities, which include the construction of the roads associated with the new I Street Bridge and the demolition of the existing approach structures, would result in direct impacts on five elderberry shrubs with a total of 26 stems greater than 1 inch in diameter and indirect effects on two elderberry shrubs. No VELB exit holes were observed on any of these shrubs.

Implementation of avoidance and minimization measures, described above under Section 4.2.1.3, prior to and during construction will minimize effects on the two shrubs outside of the construction footprint and provide for the transplantation of the five directly affected shrubs to a mitigation bank. These shrubs will also be compensated for by planting elderberry seedlings and associated natives at the mitigation bank, as described in Section 4.2.1.5.

5.1.2 Delta Smelt

Direct adverse effects of the proposed project on delta smelt are expected to occur largely from underwater noise levels generated by the proposed pile driving activities that are predicted to reach levels that can cause harassment, injury, and mortality of fish, depending on a number of factors that influence exposure levels of fish to pile driving noise. In addition, cofferdam construction and dewatering may cause injury and mortality of fish that become entrapped in cofferdams as they are being installed. Turbidity and suspended sediment levels during in-water construction activities (cofferdam installation and pile driving) are expected to reach levels that can cause harassment of delta smelt, potentially resulting in behavioral responses that could disrupt migration and spawning. Temporary construction lighting could alter the behavior and movements of delta smelt or attract predators to work areas, leading to increased predation. Direct effects on delta smelt may also result from the permanent and temporary loss of aquatic (substrate and water column) habitat associated with the new bridge piers and temporary piles, respectively, and from the permanent loss of SRA cover habitat associated with construction of the new bridge. Indirect adverse effects on delta smelt may occur from the increase in overwater structure (shade) and increased nighttime light intensity from permanent bridge lighting that may make predators more successful at preying on delta smelt.

The project proponents propose to implement a number of measures to avoid or minimize potential adverse effects on delta smelt. All in-water construction activities will be conducted between May 1 and November 30 to avoid or minimize construction effects on delta smelt.

Increased turbidity and suspended sediment would be limited to temporary, localized plumes of sediment during installation and removal of temporary trestle and sheet piles, during the installation of permanent 108-inch-diameter piles for piers 3 and 4 and the permanent piles for the bridge fender system, and during in-water placement of RSP. Because of the potential presence of delta smelt during proposed pile driving activities, the project proponents propose to implement a number of measures to minimize harassment and the risk of injury or mortality from elevated underwater sounds levels. Potential harassment, injury, and mortality of delta smelt from pile driving noise would be minimized by completing all pile driving activities within the proposed construction work window, using vibratory drivers to drive piles to the maximum possible depth , using a bubble ring or similar device to attenuate impact pile driving sounds to the maximum extent feasible, driving of piles for piers 2 and 5 in dewatered cofferdams, using a vibratory hammer and/or hydraulic driven oscillator/rotator system to install the 108-inch-diameter steel casings for piers 3 and 4, conducting pile driving during daylight hours only to provide a harassment-free period each day, and avoiding removing and re-installing the piles for the temporary trestles between the first and second construction seasons. To ensure that underwater sound levels do not exceed predicted values, the project proponents will develop and implement a NMFS-approved hydroacoustic monitoring plan to monitor underwater noise levels during impact pile driving activities (Table 4-4).

5.1.3 Delta Smelt Critical Habitat

Project effects on delta smelt critical habitat include temporary construction-related effects on water column habitat (underwater noise) and water quality (potential increase in turbidity and suspended sediment) downstream of construction. Because of the temporary nature of construction activities and minimal effect of the project on habitat structure and function downstream of the existing I Street Bridge, no long-term effects on the PCEs or conservation value of critical habitat in the region would be expected.

5.2 Determination

5.2.1 Valley Elderberry Longhorn Beetle

The proposed project is *likely to adversely affect* VELB based on the potential for “take” of VELB when elderberry shrubs are removed. To minimize indirect effects, the project proponents will implement avoidance and minimization measures described above under Section 4.2.1.3 prior to and during construction and will compensate for effects on VELB as described under Section 4.2.1.5.

5.2.2 Delta Smelt

The proposed project is *likely to adversely affect* delta smelt based on the potential for "take" of delta smelt during project construction. The greatest potential for take would occur during impact pile driving, which would generate underwater noise levels that are predicted to reach levels that can cause harassment, injury, and mortality of fish, and during the installation and dewatering of cofferdams to construct Piers 2 and 5, which could entrap individuals and result in mortality. In addition, temporary delays in movement or cessation of spawning activity may occur in response to increased turbidity, suspended sediment, or underwater noise. Any behavioral effects, however, would be temporary and are not expected to measurably affect growth, survival, or reproductive success. To minimize direct and indirect effects, the project proponents will implement avoidance and minimization measures described in Section 4.3.1.3 prior to and during construction, and will compensate for temporary effects on, and loss of habitat for, delta smelt as described under Section 4.3.1.5. With implementation of measures and proposed compensation, the project is not expected to reduce appreciably the survival and recovery of delta smelt in the Sacramento River or region.

5.2.3 Delta Smelt Critical Habitat

The project *is likely to adversely affect* delta smelt designated critical habitat. Although the BSA is not designated as critical habitat for delta smelt (designated critical habitat includes the Sacramento River as far upstream as the current I Street Bridge), project effects may extend far enough downstream to affect delta smelt critical habitat. Project effects with potential to affect designated critical habitat for delta smelt include temporary effects on the water column (underwater noise and sound pressure, and water quality impacts). These impacts would be the same as those described earlier in the "Sacramento River Winter-Run Chinook Salmon" impacts section); however, no long-term effects on the PCEs or conservation value of delta smelt critical habitat in the region would be expected.

6.2 Personal Communications

Rea, Maria. Assistant Regional Administrator, National Marine Fisheries Service. August 20, 2015—Letter to Ms. Sue Bauer, California Department of Transportation, regarding request for technical assistance for Caltrans' proposed project to replace the I-Street Bridge over the Sacramento River.

Appendix A Species List

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Sacramento Fish and Wildlife Office
FEDERAL BUILDING, 2800 COTTAGE WAY, ROOM W-2605
SACRAMENTO, CA 95825
PHONE: (916)414-6600 FAX: (916)414-6713

Consultation Code: 08ESMF00-2015-SLI-0340 April 17, 2015
Event Code: 08ESMF00-2015-E-01724
Project Name: I Street Bridge Replacement

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2)

of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

The table below outlines lead FWS field offices by county and land ownership/project type. Please refer to this table when you are ready to coordinate (including requests for section 7 consultation) with the field office corresponding to your project, and send any documentation regarding your project to that corresponding office. Therefore, the lead FWS field office may not be the office listed above in the letterhead. Please visit our office's website (http://www.fws.gov/sacramento) to view a map of office jurisdictions.

Lead FWS offices by County and Ownership/Program

County	Ownership/Program	Species	Office Lead*
Alameda	Tidal wetlands/marsh adjacent to Bays	Salt marsh species, delta smelt	BDFWO
Alameda	All ownerships but tidal/estuarine	All	SFWO
Alpine	Humboldt Toiyabe National Forest	All	RFWO
Alpine	Lake Tahoe Basin Management Unit	All	RFWO
Alpine	Stanislaus National Forest	All	SFWO
Alpine	El Dorado National Forest	All	SFWO
Colusa	Mendocino National Forest	All	AFWO
Colusa	Other	All	By jurisdiction (see map)
Contra Costa	Legal Delta (Excluding ECCHCP)	All	BDFWO
Contra Costa	Antioch Dunes NWR	All	BDFWO
Contra Costa	Tidal wetlands/marsh adjacent to Bays	Salt marsh species, delta smelt	BDFWO
Contra Costa	All ownerships but tidal/estuarine	All	SFWO

El Dorado	El Dorado National Forest	All	SFWO
El Dorado	LakeTahoe Basin Management Unit		RFWO
Glenn	Mendocino National Forest	All	AFWO
Glenn	Other	All	By jurisdiction (see map)
Lake	Mendocino National Forest	All	AFWO
Lake	Other	All	By jurisdiction (see map)
Lassen	Modoc National Forest	All	KFWO
Lassen	Lassen National Forest	All	SFWO
Lassen	Toiyabe National Forest	All	RFWO
Lassen	BLM Surprise and Eagle Lake Resource Areas	All	RFWO
Lassen	BLM Alturas Resource Area	All	KFWO
Lassen	Lassen Volcanic National Park	All (includes Eagle Lake trout on all ownerships)	SFWO
Lassen	All other ownerships	All	By jurisdiction (see map)

Marin	Tidal wetlands/marsh adjacent to Bays	Salt marsh species, delta smelt	BDFWO
Marin	All ownerships but tidal/estuarine	All	SFWO
Mendocino	Russian River watershed	All	SFWO
Mendocino	All except Russian River watershed	All	AFWO
Napa	All ownerships but tidal/estuarine	All	SFWO
Napa	Tidal wetlands/marsh adjacent to San Pablo Bay	Salt marsh species, delta smelt	BDFWO
Nevada	Humboldt Toiyabe National Forest	All	RFWO
Nevada	All other ownerships	All	By jurisdiction (See map)
Placer	Lake Tahoe Basin Management Unit	All	RFWO
Placer	All other ownerships	All	SFWO

Attachment

United States Department of Interior
Fish and Wildlife Service

Project name: I Street Bridge Replacement

Official Species List

Provided by:

Sacramento Fish and Wildlife Office
FEDERAL BUILDING
2800 COTTAGE WAY, ROOM W-2605
SACRAMENTO, CA 95825
(916) 414-6600

Non-participating U.S. Fish and Wildlife Service office(s):

The following office(s) have jurisdictions that overlap your project area, but do not provide automatically generated Species list documents. Please contact them directly to request a Species list document. Do this by visiting their website, if it is provided below. If a website is not provided, contact the office(s) by mail or phone.

San Francisco Bay-Delta Fish and Wildlife
650 CAPITOL MALL
SUITE 8-300
SACRAMENTO, CA 95814
(916) 930-5603

Consultation Code: 08ESMF00-2015-SLI-0340
Event Code: 08ESMF00-2015-E-01724

Project Type: Bridge Construction / Maintenance

Project Name: I Street Bridge Replacement
Project Description: Construct a new public crossing of the Sacramento River north of the Union Pacific Railroad-owned I Street Bridge and south of Richards Boulevard.

Please Note: The FWS office may have modified the Project Name and/or Project Description, so it may be different from what was submitted in your previous request. If the Consultation Code matches, the FWS considers this to be the same project. Contact the office in the 'Provided by' section of your previous Official Species list if you have any questions or concerns.

Endangered Species Act Species List

There are a total of 8 threatened or endangered species on your species list. Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Critical habitats listed under the **Has Critical Habitat** column may or may not lie within your project area. See the **Critical habitats within your project area** section further below for critical habitat that lies within your project. Please contact the designated FWS office if you have questions.

Amphibians	**Status**	**Has Critical Habitat**	**Condition(s)**
California Tiger Salamander *(Ambystoma californiense)* Population: U.S.A. (CA - Sonoma County)	Endangered	Final designated	
California red-legged frog *(Rana draytonii)* Population: Entire	Threatened	Final designated	
Crustaceans			
Vernal Pool fairy shrimp *(Branchinecta lynchi)* Population: Entire	Threatened	Final designated	
Vernal Pool tadpole shrimp *(Lepidurus packardi)* Population: Entire	Endangered	Final designated	
Fishes			
Delta smelt *(Hypomesus transpacificus)* Population: Entire	Threatened	Final designated	
steelhead *(Oncorhynchus (=salmo)*	Threatened	Final designated	

mykiss) Population: Northern California DPS			
Insects			
Valley Elderberry Longhorn beetle *(Desmocerus californicus dimorphus)* Population: Entire	Threatened	Final designated	
Reptiles			
Giant Garter snake *(Thamnophis gigas)* Population: Entire	Threatened		

Critical habitats that lie within your project area

There are no critical habitats within your project area.

Event Code: 08ESMF00-2016-E-01499
Project Name: I Street Bridge Replacement -- created on April 17, 2015 11:24

Subject: Updated list of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2)

of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Delta smelt *(Hypomesus transpacificus)* Population: Entire	Final designated

Appendix B Delineation of Waters of the United States for the I Street Bridge Replacement Project

May 3, 2016

Mr. Marc Fugler
U.S. Army Corps of Engineers
Sacramento District, Regulatory Division
1325 J Street, Room 1350
Sacramento, California 95814-2922

Subject: Request for preliminary jurisdictional determination of the delineation of the proposed I Street Bridge Project, Sacramento County and Yolo County, California

Dear Mr. Fugler:

On behalf of the City of Sacramento and the City of West Sacramento (Cities), ICF International is submitting a Request for Preliminary Jurisdictional Determination (PJD) for the Sacramento River at I Street Bridge project. The City of Sacramento, in cooperation with the City of West Sacramento and the California Department of Transportation, proposes to construct a new bridge over the Sacramento River to replace the existing vehicle crossing that is currently accommodated by the existing I Street Bridge in order to remove a series of functionally obsolete or structurally deficient bridges (i.e., approach structures). The new connection would also reduce future traffic congestion, improve operations and safety, serve multiple modes of transportation, and comply with current American Association of State Highway and Transportation Officials, Caltrans, and local agency design standards.

The Cities plan to submit a permit application for any work below OHWM or in the potential wetland. At this time, the Cities are requesting a PJD of the OHWM of the Sacramento River and the boundary of the potential wetland based on the discussion provided below and the attached delineation map (Exhibit A), photographs, and data forms.

Delineation Area

The delineation area comprises approximately 42 acres surrounding the proposed bridge and approaches (Exhibit A). The proposed bridge site is located over the Sacramento River between the Cities of Sacramento and West Sacramento, approximately 1,000 feet north of the existing I Street Bridge (Figure 1). The delineation area consists of the Sacramento River, riparian woodland, and open space with bike/pedestrian trails along the Sacramento River, local roads, elevated road (viaduct) and bridge approach structures, residential areas, and commercial

development. The delineation area has a relatively high level of historical and ongoing disturbance. Elevations in the delineation area range from -6 to 64 feet above mean sea level.

According to soil data from the Natural Resources Conservation Service, the delineation area contains the following five soil map units and water:

- Orthents-Urban land complex, 0 to 2 percent slopes (Sacramento County)
- Urban land (Sacramento County)
- Lang sandy loam (Yolo County)
- Lang sandy loam, deep (Yolo County)
- Sycamore silt loam (Yolo County)

Of these, Sycamore soils are hydric and inclusions within the map units of Orthents-Urban land and Lang sandy loam are hydric. The soil profile has been disturbed by development in West Sacramento and construction activity in the Sacramento Railyards Specific Plan area.

Methods

ICF wetland ecologist/botanist Lisa Webber conducted the field study on April 8, 2015 on behalf of the Cities in support of the proposed I Street Bridge project. The field study included investigations to identify areas that could be subject to jurisdiction by the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA) and the California Department of Fish and Wildlife (DFW) and to evaluate possible environmental constraints. The investigation consisted of walking through the delineation area, mapping the observed OHWM where accessible with a sub-meter accuracy global positioning system (GPS) unit, sampling potential wetland areas using the routine on-site determination method described in the 1987 *Corps of Engineers Wetlands Delineation Manual*, and implementing the supplemental procedures and wetland indicators described in the 2008 *Regional Supplement to the Corps of Engineers Wetland Delineation Manual for the Arid West Region*. The wetland ecologist/botanist identified the OHWM of the Sacramento River in the field using the guidance provided in Regulatory Guidance Letter 05-05. This boundary was confirmed using site-specific topographic mapping to identify the location of the 19-foot elevation, which has been identified as the OHWM for the Sacramento River at the existing I Street bridge. Aerial and ground-view photographs of the study area were reviewed prior to the field study.

A total of four data points were examined in the delineation area—two data points to establish the riparian wetland boundary (DP-1w and DP-2u) and two data points to record upland conditions (DP-3u and DP-4u). The data forms are attached.

Results

The delineation area in the City of Sacramento east of the levee is developed, graded, or landscaped. The delineation area in the City of West Sacramento west of the levee includes residences and other buildings with landscaping, as well as ruderal woodland, which supports few native trees and predominantly tree of heaven (*Ailanthus altissima*) [FACU]. One other waters (the Sacramento River) and one potential wetland were identified in the delineation area. These features are further described below.

Other Waters—Sacramento River

The location of the OHWM in the Sacramento River was based on the elevation of 19 feet NGVD that was previously determined by the USACE at the I Street Bridge. Observations in the field further confirmed this location based on the presence of shelving, silt deposition, and wracking. The average width of the Sacramento River at the OHWM is approximately 672 feet, and the delineation area encompasses 4.877 acres of the river (Photo 1). The channel bottom is a natural substrate, presumably sand and sediment, but water turbidity prevented visual confirmation of the composition. The river banks are mostly steeply sloped and support riparian forest vegetation, with riprap near the bottom of the slope.

The cottonwood riparian community on the Sacramento River banks is predominantly mature Fremont cottonwood (*Populus fremontii*) [FAC] trees associated with valley oak (*Quercus lobata*) [FACU] and black walnut (*Juglans californica* var. *hindsii*) [FAC]. Other riparian tree species observed include Oregon ash (*Fraxinus latifolia*) [FACW], boxelder (*Acer negundo* var. *californicum*) [FACW], and black willow (*Salix gooddingii*) [FACW]. The riparian understory on the waterside of the levee is primarily rip-rap with nonnative annual grasses and forbs, however, there are also patches of more typical riparian species, such as narrow-leaf willow (*Salix exigua*) [FACW], Himalayan blackberry (*Rubus armeniacus*) [FACU], and mugwort (*Artemisia douglasiana*) [FAC].

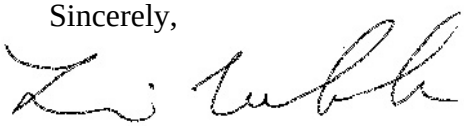
Riparian Wetland

A riparian forest/shrub wetland occurs in the delineation area within riparian habitat that meets all three federal wetland criteria (DP-1w). The riparian wetland is located in the northern portion of the delineation area on the east side of the Sacramento River within a basin (Photo 2). This basin appears to capture overflow from the Sacramento River during high flows. The vegetative composition of riparian forest/shrub wetlands is predominantly cottonwood, but also includes buttonwillow (*Cephalanthus occidentalis* var. *californicus*) [OBL], boxelder, and narrow-leaf willow. Hydric soils in the wetland met the redox depressions (F8) indicator. Wetland hydrology was indicated by observations of water marks (B1), sediment deposits (B2), and oxidized rhizospheres along living roots (C3).

The Cities request verification of the OHWM of the Sacramento River and the extent of the riparian wetland within the delineation area and a preliminary jurisdictional determination according to RGL 08-02. If you require additional information or have any questions regarding this request, please contact me at lisa.webber@icfi.com or Claire Bromund at claire.bromund@icfi.com or either of us by phone at (916) 737-3000.

Thank you for your assistance with this project.

Sincerely,



Lisa Webber
Wetland Ecologist

Saturation Present? (includes capillary fringe) Yes ___ No X Depth (inches): >14"

Wetland Hydrology Present? Yes X No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks: Area is in a basin that appears to capture overflow from the Sac. River

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: I Street Bridge City/County: Sacramento/Sac. West Sacramento/Yolo Sampling Date: 4-8-15

Applicant/Owner: City of Sacramento + City of West Sacramento State: CA Sampling Point: DP-24

Investigator(s): Webber, Howe Section, Township, Range: T9N, R4E, unnamed section

Landform (hillslope, terrace, etc.): floodplain Local relief (concave, convex, none): none Slope (%): 20

Subregion (LRR): CLRR Lat: Long: Datum:

Soil Map Unit Name: La (Lang Sandy loam) NWI classification:

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No X (If no, explain in Remarks.)

Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes X No ____

Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ____ No X	**Is the Sampled Area within a Wetland?** Yes ____ No X
Hydric Soil Present?	Yes ____ No X	
Wetland Hydrology Present?	Yes ____ No X	

Remarks: Extreme drought year, but .1" of rainfall in the previous 24 hours.

VEGETATION – Use scientific names of plants.
