- 28 USDA disaster declaration from 1982-2015, most associated with severe weather events
- WHAT ARE THE BIGGEST AG ISSUES?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: High
- Priority Hazard

Bird Strike

- The County of Sacramento operates five airports, which have a collective economic impact in excess of $3 billion annually (2008 dollars)
- The FAA data shows 2,812 bird strike incidents for Sacramento County since 1990
- ANY INPUT ON NOTABLE BIRD STRIKE INCIDENTS?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Climate Change

- The 2013 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state's infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and both snowmelt and rainwater running off sooner in the year. Climate Change has the potential to alter the nature and frequency of most hazards.
- ANY HMPC INPUT ON CLIMATE CHANGE ISSUES IN SACRAMENTO?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Dam failure

- There are 27 dams in Sacramento County constructed for flood control, storage, electrical generation, and recreational purposes. Of the 27 dams, 16 are rated as High Hazard, 5 as Significant Hazard, 5 as Low Hazard, and 1 was not rated.
- 8 high hazard dams located in neighboring counties also have the potential to impact the Sacramento County Planning Area

- A search of the National Performance of Dams database data shows two dam failure incidents for Sacramento County since 1994, both related to the Folsom Dam. However, these incidents were limited in scope and since the incidents occurred, improvements to the Folsom Dam system have been made.
- Likelihood of Future Occurrence: Jurisdictional Dams: Unlikely/Smaller, non-jurisdictional Dams: Occasional
- Vulnerability: Extremely High
- Priority Hazard

Drought and Water Shortage

- Historical drought data for the Sacramento County Planning Area and region indicate there have been 5 significant droughts in the last 84 years.
- Since 2012, snowpack levels in California have dropped dramatically, with an increase in 2015.
- 1 federal disaster declarations in 1977; 1 state disaster declaration in 2008; 1 drought State of Emergency in 2014
- HMPC – CAN YOU PROVIDE DAMAGES OR RESTRICTIONS THAT HAVE OCCURRED IN THE COUNTY RECENTLY DUE TO THE CURRENT DROUGHT. WHAT HAS BEEN IMPACTED THE MOST? WHAT IS THE PRIMARY SOURCE OF WATER AND HOW HAS WATER SUPPLY BEEN AFFECTED IN THE COUNTY?
- Likelihood of Future Occurrence: Likely
- Vulnerability: High
- Priority Hazard

Earthquake

- Geological literature indicates that no major active faults transect the County; however, there are several subsurface faults in the Delta.
- There have been two disaster declarations in Sacramento County: 1989 Loma Prieta; 2014 Napa
- There have been several felt occurrences in the County from area earthquakes, with limited damages to the County: USGS reports 13 earthquakes of 5.0 magnitude or greater within 90 miles of Sacramento County since 1975.
- WERE THERE ISSUES IN THE COUNTY FROM THE MORE RECENT EARTHQUAKES?
- Likelihood of Future Occurrence: Unlikely – large, damaging earthquake; Occasional – minor earthquake
- Vulnerability: High
- Priority Hazard

Earthquake: Liquifaction

- Sacramento County has two areas that have been suggested as posing potential liquefaction problems due to loose sandy soils and silt and presence of faults- the downtown area and the Delta.
- Although no historic examples of seismically induced levee failure are known in the Delta, the modern levee network has not been subjected to strong shaking.
- HAVE THERE BEEN ANY ISSUES IN THE COUNTY ASSOCIATED WITH LIQUEFACTION?
- Likelihood of Future Occurrence: Occasional
- Vulnerability: High
- Priority Hazard

Flood Hazards

100/200/500 year

- Historically, portions of Sacramento County have always been at risk to flooding because of its annual percentage of rainfall and the number of watercourses and miles of levees that traverse the County.
- Multiple state and federal disaster declarations related to heavy rains and flooding.
- Likelihood of Future Occurrence: 100-Occasional; 200-Unlikely; 500-Unlikely
- Vulnerability: High to Extremely High
- Priority Hazard

Localized/Stormwater flooding

- Significant localized flood history in the County – occurs annually
- Each jurisdiction is updating this information.
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium to High
- Priority Hazard

Landslides and Debris Flows

- The NCDC contains no records of landslides in the County. There have been no disaster declarations associated with landslides in Sacramento County.
- PAST OCCURRENCES?
- Likelihood of Future Occurrence: Occasional
- Vulnerability: Low
- Non-Priority Hazard

Levee Failure

- Many miles of levees throughout the County.
- There have been two federal disaster declarations in Sacramento County related to levee failure: 1980 Delta Levee Break and 1972 Andrus Island Levee Break.
- Although numerous documented levee breaks in the Delta area since 1900, most were prior to 1990 and do not reflect future failure potential due to extensive levee improvements in the area.
- All levees in the Sacramento Area have been decertified (although not reflected in current DFIRMs), but many are undergoing significant improvements to certify levees to the 200 year+ level of protection
- Likelihood of Future Occurrence: Occasional
- Vulnerability: Extremely High
- Priority Hazard

Severe weather

Extreme Temperatures: Cold and Freeze

- Annual occurrences of winter weather
- The NCDC data recorded 22 cold and freeze incidents for Sacramento County since 1993.

- No state or FEMA disaster declarations related to cold or freeze.
- ANY NOTABLE EXTREME COLD/FREEZE EVENTS SINCE 2011 PLAN?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Non-Priority Hazard

Extreme heat

- Annual occurrences – it gets hot every summer
- The NCDC data shows 32 extreme heat incidents for Sacramento County since 1993.
- ANY NOTABLE EXTREME HEAT EVENTS SINCE 2011? HOW MANY TIMES WERE COOLING CENTERS OPENED?
- Climate change might affect this hazard in the future
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium - High
- Priority Hazard

Fog and Freezing Fog

- Annual occurrences of fog events
- The NCDC data shows 6 fog incidents for Sacramento County since 1993
- ANY NOTABLE FOG EVENTS SINCE 2011?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Low
- Non-Priority Hazard

Heavy rains and storms (Thunderstorms, Hail, Lightning)

- Significant County history: annual occurrences
- Multiple state and federal disaster declarations associated with Heavy Rains and Storms
- The NCDC data shows 33 extreme heavy rains and storm events for Sacramento County since 1950.
- Severe storms/heavy rains are the primary cause of most major flooding
- ANY NOTABLE HEAVY RAINS/STORM EVENTS SINCE 2011?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: High
- Priority Hazard

Wind and Tornadoes

- Annual occurrences of wind events
- The NCDC data shows 52 high wind events for Sacramento County since 1993
- The NCDC data shows 18 tornado events (6 funnel clouds, 8 F0s, 3 F1s, 1 F2) for Sacramento County since 1993
- ANY NOTABLE HIGH WINDS OR TORNADO EVENTS SINCE 2011?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

River/Stream/Creek Bank Erosion

- Due to the high number of linear feet of levees and creek banks, erosion and deposition are occurring continually at varying rates over the planning area.
- USACE/DWR maintain an inventory program to identify and repair erosion sites. As areas are fixed, new areas are identified.
- ARE THERE ANY KEY AREAS THAT SHOULD BE A NOTED CONCERN?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Subsidence

- Subsidence in the Delta has been a historical problem, occurring on an annual basis. Areas with peat thickness over 10 feet have a great potential for continued subsidence.
- ANY NOTABLE AREAS OF CONCERN BOTH IN OUR OUTSIDE OF THE DELTA AREA?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Low
- Non-Priority Hazard

Volcano

- Of the approximately 20 volcanoes in the California, only a few are active and pose a threat. Of these, Long Valley Caldera and Lassen Peak are the closest to Sacramento County.
- According to the State Multi-Hazard Mitigation Plan, Sacramento County is not considered to be vulnerable to eruption and/or ash from these volcanoes.
- Likelihood of Future Occurrence: Unlikely
- Vulnerability: Extremely Low
- Non-Priority Hazard

Wildfire

- Wildfires occur on an annual basis in the Sacramento County Planning Area
- Any ignition has the potential to become an out of control wildfire.
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: High
- Priority Hazard

Sacramento County: Summary of Priority Hazards

Unincorporated Sacramento County

- Agricultural Hazards
- Bird Strike
- Climate Change
- Dam Failure
- Drought & Water Shortage
- Earthquake
- Earthquake Liquifaction
- Flood: 100/200/500–year
- Flood: Localized/Stormwater
- Levee Failure
- River/Stream/Creek Bank Erosion
- Severe Weather: Extreme Temperatures - Heat
- Severe Weather: Heavy rains and Storms
- Severe Weather: Winds/Tornadoes
- Wildfire: Burn Area/Smoke

Participating Jurisdictions: Data Needs

Review of Jurisdictional Participation Requests to date:

- Letter of Commitment
- Review, input, and update of existing Annexes (for 2011 plan participants)
- Hazard Identification Worksheet #1
- Historic Hazard Worksheet #2
- Mitigation Action Strategy Status Update (for 2011 plan participants)
- Electronic Logos
- Map of Jurisdictions (excluding County and incorporated communities)
- Photos – of past hazard events, areas, before and after (past mitigation projects)
- Vulnerability Worksheets #3 and Capability Tables

Future Jurisdictional Participation Needs:

- Review of Base Plan Chapter 4 and Draft Plan Document
- Review of Updated Jurisdictional Annexes
- New Mitigation Actions for all Jurisdictions and Priority Hazards

Mitigation Strategy: Goals

The most important element of the LHMP is the resulting mitigation strategy which serves as the long-term blueprint for reducing the potential losses identified in the risk assessment. The mitigation strategy is comprised of three components:

1. Mitigation Goals
2. Mitigation Actions
3. Action (Implementation) Plan

Mitigation Goals

Up to now, the HMPC has been involved in collecting and providing data for the Placer County Local Hazard Mitigation Plan Update. From this information, a Risk Assessment has been developed that describes the risk and vulnerability of the Placer County planning area to identified hazards and includes an assessment of the area's current capabilities for countering these threats through existing policies, regulations, programs, and projects.

This analysis identifies areas where improvements could or should be made. Formulating Goals will lead us to incorporating these improvements into the Mitigation Strategy portion of the plan. Our planning goals should provide direction for what loss reduction activities can be undertaken to make the planning area more disaster resistant.

Mitigation Goals are general guidelines that represent the community's vision for reducing or avoiding losses from identified hazards. Goals are stated without regard for achievement, that is, implementation cost, schedule, and means are not considered. Goals are public policy statements that:

- Represent basic desires of the jurisdiction;
- Encompass all aspects of planning area, public and private;
- Are nonspecific, in that they refer to the quality (not the quantity) of the outcome;
- Are future-oriented, in that they are achievable in the future; and
- Are time-independent, in that they are not scheduled events.

While goals are not specific (quantitative), they should not be so general as to be meaningless or unachievable.

Goals statements will form the basis for objectives. They should be stated in such a way as to develop one or more objectives related to each goal.

The key point in writing goals is to remember that they must deal with results, not the activities that produce those results.

Finally, before we formulate our goals, we should discuss other planning area goals from other regional/county/city programs and priorities. This keeps us from "reinventing the wheel," as well as being consistent with Multi-Objective Management --- or "MOM" --- where communities strive for efficiency by combining projects/needs that are similar in nature or location. Utilizing "MOM" effectively can result in

identifying multiple sources of funding that can be "packaged" and broadening the supporting constituency base by including "outcomes" desired by various stakeholder groups.

Types/Sources of other area mitigation plans and programs include:

- Emergency Operations Plans
- General Plans
- Stormwater Program and Plans
- Flood/Watershed Management Plans and Studies
- Drought Plans
- Community Wildfire Protection Plans
- Dam Failure Plans
- Other?

Sample Goals from other Plans

Goals from the 2013 California State Hazard Mitigation Plan

- Significantly reduce life loss and injuries
- Minimize damage to structures and property, as well as minimizing interruption of essential services and activities
- Protect the environment
- Promote hazard mitigation as an integrated public policy and as a standard business practice

Goals from the Sacramento County General Plan

AGRICULTURAL ELEMENT

Economic Viability of Agriculture

GOAL: Enhanced viability of Sacramento County's agricultural economy.

CONSERVATION ELEMENT

Water Resources

GOAL: Ensure that a safe, reliable water supply is available for existing and planned urban development and agriculture while protecting beneficial uses of Waters of the state of California, including important associated environmental resources.

Habitat Protection and Management

GOAL: Preserve and manage natural habitats and their ecological functions throughout Sacramento County.

Aquatic Resources

GOAL: Preserve, protect, and manage the health and integrity of aquatic resources in Sacramento County.

Rivers and Streams

GOAL: Preserve, protect, and enhance natural open space functions of riparian, stream and river corridors.

Vernal Pools

GOAL: Preserve and enhance self-sustaining vernal pool habitats.

SAFETY ELEMENT

Seismic and Geologic Hazards

GOAL: Minimize the loss of life, injury, and property damage due to seismic and geological hazards.

Flooding

GOAL: Minimize the loss of life, injury, and property damage due to flood hazards.

Fire Hazards

GOAL: Minimize the loss of life, injury, and property damage due to fire hazards.

Emergency Response

GOAL: An Emergency Preparedness System that can effectively respond in the event of a natural or manmade disaster.

Goals from the American River Community Wildfire Protection Plan

The overarching goal of this CWPP is to implement a comprehensive plan that results in the protection of human life and reduction of the loss of property, critical infrastructure, and natural resources due to wildfire.

Goals from City of Sacramento General Plan, Public Health and Safety

- GOAL PHS 4.1 Response to Natural and Human-Made Disasters. Promote public safety through planning, preparedness, and emergency response to natural and human-made disasters.
- GOAL PHS 5.1 Human Services and Healthy Communities. Improve the provision of human services and promote public health and safety.

Goal Development

You will each be given 3 sticky notes. On each note you will write what you think the goals for this mitigation planning effort should be. To get you started, provided below are possible goals for this mitigation plan. You may reword these or develop your own. These goal statements should serve as examples. It is vital that our Hazard Mitigation Planning Committee establish its own goals. Use one note for each goal. The purpose of the goal development is to reach a consensus on plan goals.

- Minimize risk and vulnerability from natural hazards
- Increase communities' awareness of vulnerability to hazards
- Increase the use of shared resources
- Improve communities' capabilities to mitigate losses
- Maintain coordination of disaster plans with changing DHS/FEMA needs
- Maintain FEMA eligibility/position jurisdictions for grant funding
- Maintain/enhance the flood mitigation program to provide 200/500-year flood protection
- Maintain current service levels
- Provide protection for existing buildings from hazards
- Provide protection for future development from hazards
- Provide protection for natural and cultural resources from hazard impacts
- Provide protection for people's lives from hazards
- Provide protection for public health
- Provide protection for critical services (fire, police, etc.) from hazard impacts
- Provide protection for critical lifeline utilities from hazard impacts
- Reduce exposure to hazard related losses
- Reduce the number of emergency incidents
- Make better use of technology

When done, we will:

- Pin/tape them to the wall/easel-chart and arrange them by category
- Combine and reword them into 3-4 goals for the plan.

Risk Assessment and Mitigation Strategy Meetings
Day 2

Mitigation Strategy: Actions

Mitigation Actions are specific projects and activities that help achieve the goals and accomplish risk reduction in the community.

Categories of Mitigation Measures

PREVENTION: Preventive measures are designed to keep the problem from occurring or getting worse. Their objective is to ensure that future development is not exposed to damage and does not increase damage to other properties.

- Planning
- Zoning
- Open Space Preservation
- Land Development Regulations
  - ✓ Subdivision regulations
  - ✓ Building Codes
    - Fire-Wise Construction
  - ✓ Floodplain development regulations
  - ✓ Geologic Hazard Areas development regulations (for roads too!)
- Storm Water Management
- Fuels Management, Fire-Breaks

EMERGENCY SERVICES: protect people during and after a disaster. A good emergency services program addresses all hazards. Measures include:

- Warning (flooding, tornadoes, winter storms, geologic hazards, fire)
  - ✓ NOAA Weather Radio
  - ✓ Sirens
  - ✓ "Reverse 911" (Emergency Notification System)
- Emergency Response
  - ✓ Evacuation & Sheltering
  - ✓ Communications
  - ✓ Emergency Planning
    - Activating the EOC (emergency management)
    - Closing streets or bridges (police or public works)
    - Shutting off power to threatened areas (utility company)
    - Holding/releasing children at school (school district)
    - Passing out sand and sandbags (public works)
    - Ordering an evacuation (mayor)
    - Opening emergency shelters (Red Cross)
    - Monitoring water levels (engineering)
    - Security and other protection measures (police)
- Critical Facilities Protection (Buildings or locations vital to the response and recovery effort, such as police/fire stations, hospitals, sewage treatment plants/lift stations, power substations)

- ✓ Buildings or locations that, if damaged, would create secondary disasters, such as hazardous materials facilities and nursing homes
- ✓ Lifeline Utilities Protection

➢ Post-Disaster Mitigation

➢ Building Inspections
- ✓ ID mitigation opportunities & funding before reconstruction

PROPERTY PROTECTION: Property protection measures are used to modify buildings subject to damage rather than to keep the hazard away. A community may find these to be inexpensive measures because often they are implemented by or cost-shared with property owners. Many of the measures do not affect the appearance or use of a building, which makes them particularly appropriate for historical sites and landmarks.

➢ Retrofitting/disaster proofing
- ✓ Floods
  - Wet/Dry floodproofing (barriers, shields, backflow valves)
  - Relocation/Elevation
  - Acquisition
  - Retrofitting
- ✓ High Winds/Tornadoes
  - Safe Rooms
  - Securing roofs and foundations with fasteners and tie-downs
  - Strengthening garage doors and other large openings
- ✓ Winter Storms
  - Immediate snow/ice removal from roofs, tree limbs
  - "Living" snow fences
- ✓ Geologic Hazards (Landslides, earthquakes, sinkholes)
  - Anchoring, bracing, shear walls
  - Dewatering sites, agricultural practices
  - Catch basins
- ✓ Drought
  - Improve water supply (transport/storage/conservation)
  - Remove moisture competitive plants (Tamarisk/Salt Cedar)
  - Water Restrictions/Water Saver Sprinklers/Appliances
  - Grazing on CRP lands (no overgrazing-see Noxious Weeds)
  - Create incentives to consolidate/connect water services
  - Recycled wastewater on golf courses
- ✓ Wildfire, Grassfires
  - Replacing building components with fireproof materials
  - Roofing, screening
  - Create "Defensible Space"
  - Installing spark arrestors
  - Fuels Modification

- ✓ Noxious Weeds/Insects
  - Mowing
  - Spraying
  - Replacement planting
  - Stop overgrazing
  - Introduce natural predators
- Insurance

NATURAL RESOURCE PROTECTION: Natural resource protection activities are generally aimed at preserving (or in some cases restoring) natural areas. In so doing, these activities enable the naturally beneficial functions of floodplains and watersheds to be better realized. These natural and beneficial floodplain functions include the following:

- storage of floodwaters
- absorption of flood energy
- reduction in flood scour
- infiltration that absorbs overland flood flow
- groundwater recharge
- removal/filtering of excess nutrients, pollutants, and sediments from floodwaters
- habitat for flora and fauna
- recreational and aesthetic opportunities

Methods of protecting natural resources include:

- Wetlands Protection
- Riparian Area/Habitat Protection/Threatened-Endangered Species
- Erosion & Sediment Control
- Best Management Practices

Best management practices ("BMPs") are measures that reduce nonpoint source pollutants that enter the waterways. Nonpoint source pollutants come from non-specific locations. Examples of nonpoint source pollutants are lawn fertilizers, pesticides, and other farm chemicals, animal wastes, oils from street surfaces and industrial areas and sediment from agriculture, construction, mining and forestry. These pollutants are washed off the ground's surface by stormwater and flushed into receiving storm sewers, ditches and streams. BMPs can be implemented during construction and as part of a project's design to permanently address nonpoint source pollutants. There are three general categories of BMPs:

1. Avoidance: setting construction projects back from the stream.
2. Reduction: Preventing runoff that conveys sediment and other water-borne pollutants, such as planting proper vegetation and conservation tillage.
3. Cleanse: Stopping pollutants after they are en route to a stream, such as using grass drainageways that filter the water and retention and detention basins that let pollutants settle to the bottom before they are drained

- Dumping Regulations
- Set-back regulations/buffers

- Fuels Management
- Water Use Restrictions
- Landscape Management
- Weather Modification

STRUCTURAL: Projects that have traditionally been used by communities to control flows and water surface elevations. Structural projects keep flood waters away from an area. They are usually designed by engineers and managed or maintained by public works staff. These measures are popular with many because they "stop" flooding problems. However, structural projects have several important shortcomings that need to be kept in mind when considering them for flood hazard mitigation:

- They are expensive, sometimes requiring capital bond issues and/or cost sharing with Federal agencies, such as the U.S. Army Corps of Engineers or the Natural Resources Conservation Service.
- They disturb the land and disrupt natural water flows, often destroying habitats or requiring Environmental Assessments.
- They are built to a certain flood protection level that can be exceeded by a larger flood, causing extensive damage.
- They can create a false sense of security when people protected by a structure believe that no flood can ever reach them.
- They require regular maintenance to ensure that they continue to provide their design protection level.

Structural measures include:

- Detention/Retention structures
- Erosion and Sediment Control
- Basins/Low-head Weirs
- Channel Modifications
- Culvert resizing/replacement/Maintenance
- Levees and Floodwalls
- Anchoring, grading, debris basins (for landslides)
- Fencing (for snow, sand, wind)
- Drainage System Maintenance
- Reservoirs (for flood control, water storage, recreation, agriculture)
- Diversions
- Storm Sewers

PUBLIC INFORMATION: A successful hazard mitigation program involves both the public and private sectors. Public information activities advise property owners, renters, businesses, and local officials about hazards and ways to protect people and property from these hazards. These activities can motivate people to take protection

- Hazard Maps and Data
- Outreach Projects (mailings, media, web, speakers, displays)
- Library Resources
- Real Estate Disclosure
- Environmental Education

Sacramento County Mitigation Actions from 2011 Plan

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Multi-Hazard Mitigation Actions					
Enhance Public Awareness of the Affects of Natural Hazards and Public Understanding of Disaster Preparedness	Sacramento County		X		
CRS Public Information Pilot Program	Sacramento County, City of Sacramento	X (City)	X (County)		
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan	Sacramento County City of Citrus Heights City of Elk Grove City of Folsom City of Galt City of Rancho Cordova City of Sacramento	X (Sacramento County) X (City of Sacramento)			
Flood Insurance Promotion	Sacramento County		X		
Evaluation and Mitigation of Critical Facilities in Identified Hazard Areas	Sacramento County		X (Sacramento County) X (City of Sacramento)		
Finalize and Implement the Actions of the South Sacrament Habitat Conservation Plan	Sacramento County City of Elk Grove City of Galt City of Rancho Cordova Sacramento Regional County Sanitation District Sacramento County Water Agency, Southeastern Connector	X (Sacramento County)			
SAFELY OUT™ Evacuation Preparedness	Sacramento County Citizen Voice			X	
Public Education Program	City of Elk Grove				
Alerts and Warning System	City of Elk Grove				
Emergency Operation Center (EOC)	City of Elk Grove				
Critical Facilities Database Development and Data Maintenance Processes	City of Elk Grove				
Increase Redundancy/ Functionality of Water Wells and Sewer Lift Stations	City of Galt				
Increase Data Capacity of Emergency Frequencies	City of Galt				

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Evaluation and Mitigation of Critical Facilities in Identified Hazard Areas	City of Sacramento				
Data Center Disaster Recovery Improvement	Los Rios Community College District				
Community Emergency Response Training (CERT)	Los Rios Community College District				
Update the critical facilities identified during this DMA planning effort with the City's GIS technical group to support emergency management efforts.	City of Sacramento	X			
Bird Strike Mitigation Actions					
Wildlife Hazard Management Plan	Sacramento County Airport System	X			
Dam Failure Mitigation Actions					
Mather Dam Improvements	Sacramento County		X		
Alder Creek Miners Dam	Sacramento County			X	
Improved Flood Inundation and Evacuation Plan for Probable maximum flow from New Spillway at Folsom Dam	Sacramento County		X		
Folsom Dam Joint Federal Project	SAFCA				
Folsom Dam Raise	SAFCA				
Drought Mitigation Actions					
Drought Contingency Plan	Southgate Park & Recreation District				
Earthquake Mitigation Actions					
Hughes Stadium Renovation at Sacramento City College	Los Rios Community College District				
Flood Mitigation Actions					
Improve County ALERT (Automated Local Evaluation in Real Time) system of stream and rain gages	Sacramento County		X		
Elevation Projects to Mitigate Flood Risk	Sacramento County		X		
Arcade Creek Corridor Plan	Sacramento County		X		
Elevate up to Three Homes on Long Island (Grand Island Road, Sacramento River)	Sacramento County		X		
Mitigation Projects for Repetitive Loss Structures/Areas	Sacramento County		X		

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Improve Strawberry Creek Basins at East Stockton Blvd	Sacramento County	X	X		
Triangle Detention Basin	Sacramento County		X		
Unionhouse Detention Basin Upstream of East Stockton Blvd Partnering with Park District and SAFCA	Sacramento County		X		
Unionhouse Creek Joint Use Detention Basins – Park Active or Passive Joint Use	Sacramento County		X		
South Sacramento Stream Group Detention Basins	Sacramento County		X		
Elder and Gerber Creek	Sacramento County		X		
Florin Creek Basins –Florin Vineyard Drainage Master Plan	Sacramento County		X		
Joint Use Detention-Park Basins on Laguna Creek	Sacramento County	X	X		
Pasa Robles Drive - Concrete Channel Lining Rehabilitation	Sacramento County			X	
Chicken Ranch Slough - Concrete Channel Lining Rehabilitation	Sacramento County		X		
Morrison Creek - Concrete Channel Lining Rehabilitation	Sacramento County			X	
Mayhew Slough - Concrete Channel Lining Rehabilitation	Sacramento County			X	
Strong Ranch Slough - Concrete Channel Lining Rehabilitation	Sacramento County			X	
Keep Watershed Management Plan Current CRS Activity 450 (county and cities)	Sacramento County		X		
Woodside Condominiums Repetitive Flood Loss Property	Sacramento County			X	
Conversion to NAVD88 vertical datum (from NGVD29)	Sacramento County		X		
Mitigation projects to reduce flood risk to critical facilities.	Sacramento County		X		
Hydrologic and Hydraulic Modeling in Compliance with 2012 Central Valley Flood Protection Plan	Sacramento County		X		
Delta Area Fire Station Needs to be Elevated or Flood Proofed to Protect Against Levee Breach Flooding to Assure Function in that Disaster Event.	Sacramento County			X	

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Update and Adopt Floodplain Management Ordinance in Light of Levee De-accreditation	Sacramento County	X	X		
Mitigate Peak Flow on Dry Creek and Tributaries (including Sacramento County and City of Roseville)	Sacramento County		X		
Repetitive Loss Church Building on Dry Creek	Sacramento County		X		
Determine Cause and Mitigate Mercury and Methyl Mercury Coming from Tributaries of American River	Sacramento County		X		
Pump Stations	Sacramento County	X	X		
Public Outreach Mailers	Sacramento County		X		
Drainage improvements to reduce flooding on key evacuation routes	Sacramento County		X		
South Branch Arcade Creek – Gum Ranch Basin (with Fair Oaks Park District)	Sacramento County			X	
Dry Creek Flood Hazard Mitigation Acquisitions with County Park Dept	Sacramento County			X	
Arcade Creek at Evergreen Estates Floodwall improvements	Sacramento County		X		
Linda Creek Peak Flow Mitigation	Sacramento County		X		
Improve flood protection and/or Evacuation Planning for Mobile Home/RV Park at Manzanita/Auburn. Alternatively, the park Should Establish Flood Warning and Evacuation Procedures.	Sacramento County		X	X

Work with City/County/Water departments to create defensible spaces at sites where nearby creeks are prone to flooding. Build-up earthen berms (off-site) to shed water away from critically located schools.	Twin Rivers School District				
Update the Emergency Preparedness Plan and the Emergency Operations Plan so that in event of emergency or disastrous event, personnel and procedures are in place and streamlined. This will include purchase of new equipment not reliant on typical system power; including communications equipment, emergency housing and supplies.	Twin Rivers School District				
Working with the Department of the State Architect (DSA) on Earthquake Retrofit Plan on all sites.	Twin Rivers School District				
Revise and update district-wide Storm Water Prevention Plan	Twin Rivers School District				
Create email notification system for families for emergency situations.	Twin Rivers School District				
Incorporate new rules for M&O department to keep drains clear, trees trimmed and vegetation removed to minimize impact during heavy rains.	Twin Rivers School District				
Create defensible perimeter space – for fire areas. Trees trimmed and vegetation removed to minimize impact during fire season.	Twin Rivers School District				
Updating Evacuation Plans.	Twin Rivers School District				
Updating District Policy for new Construction.	Twin Rivers School District				
Updating Evacuation Plans for Excessive Heat	Twin Rivers School District				
Updating Evacuation Plans for Streambank Erosion	Twin Rivers School District				
Updating Evacuation Plans for Fog	Twin Rivers School District				

Mitigation Strategy: Action Plan

The mitigation action plan describes how the mitigation actions will be implemented, including how those actions will be prioritized, administered, and incorporated into the community's existing planning mechanism. Each participating jurisdiction must have a mitigation actions and an action plan specific to that jurisdiction and its priority hazards and vulnerabilities.

Mitigation Criteria

For use in selecting and prioritizing Proposed Mitigation Measures

1. STAPLEE

Social: Does the measure treat people fairly? (different groups, different generations)

- Community Acceptance
- Effect on Segment of Population
- Social Benefits

Technical: Will it work? (Does it solve the problem? Is it feasible?)

- Technical Feasibility
- Reduce Community Risk
- Long Tem Solution/Sustainable
- Secondary Impacts

Administrative: Do you have the capacity to implement & manage project?

- Staffing
- Funding Allocated
- Maintenance/Operations

Political: Who are the stakeholders? Did they get to participate? Is there public support? Is political leadership willing to support?

- Political Support
- Local Champion
- Public Support
- Achieves Multiple Objectives
- Supported by a broad array of Stakeholders

Legal: Does your organization have the authority to implement? Is it legal? Are there liability implications?

- Existing Local Authority
- State Authority
- Potential Legal Challenges

Economic: Is it cost-beneficial? Is there funding? Does it contribute to the local economy or economic development?

- Benefit of Action

- Cost of Action
- Cost Effective/Economic Benefits
- Economically Viable
- Outside Funding Required

Environmental: Does it comply with Environmental regulations?

- Effect on Land/Water
- Effect on Endangered Species
- Effect on Cultural Resources
- Effect on Hazmat sites
- Consistent with Community Environmental Goals
- Consistent with Environmental Laws
- Environmental Benefits

2. SUSTAINABLE DISASTER RECOVERY

- Quality of Life
- Social Equity
- Hazard Mitigation
- Economic Development
- Environmental Protection/Enhancement
- Community Participation

3. SMART GROWTH PRINCIPLES

- Infill versus Sprawl
- Efficient Use of Land Resources
- Full Use of Urban Resources
- Mixed Uses of Land
- Transportation Options
- Detailed, Human-Scale Design

4. OTHER

- Does measure address area with highest risk?
- Does measure protect …
  - ✓ The largest # of people exposed to risk?
  - ✓ The largest # of buildings?
  - ✓ The largest # of jobs?
  - ✓ The largest tax income?
  - ✓ The largest average annual loss potential?
  - ✓ The area impacted most frequently?
  - ✓ Critical Infrastructure (access, power, water, gas, telecommunications)
- Timing of Available funding
- Visibility of Project
- Community Credibility

Mitigation Action Prioritization Instructions

Our Team recommendations are listed on flip-chart paper around the room.

You each have 3 sets of colored dots:

- 3 red dots
- 3 blue dots
- 3 green dots

The red dots are for high priority (5 points each)

The blue dots are for medium priority (3 points each)

The green dots are for low priority (1 point each)

Place your dots on the recommendations, using the different colors to indicate your priority. You may use as many of your dots, of any color, on any recommendation --- or you may spread them out using as few of your dots as you wish. The dots will indicate the consensus of the team.

Use your list of criteria to help you make your determinations.

After the totals are counted, we will discuss them further to confirm or change any of the results as we see fit.

C.2 Categories of Mitigation Measures Considered

The following categories of mitigation measures are based on the Community Rating System.

- Prevention
- Property Protection
- Natural Resource Protection
- Emergency Services
- Structural Projects
- Public Information

C.3 Sacramento County Analysis of Alternative Mitigation Measures per Category

Note: This review of mitigation measures is in compliance with the FEMA's nationally accepted six mitigation categories and FEMA's CRS Program requirement to provide a comprehensive evaluation of the six mitigation categories with a specific requirement that Preventative Measures be thoroughly reviewed. This review leads to the projects incorporated into the mitigation strategy action plan. This Section specifically focuses on the mitigation measures and potential mitigation strategies specific to Sacramento County and City of Sacramento, the two CRS communities to this plan.

C.3.1. Preventive Measures

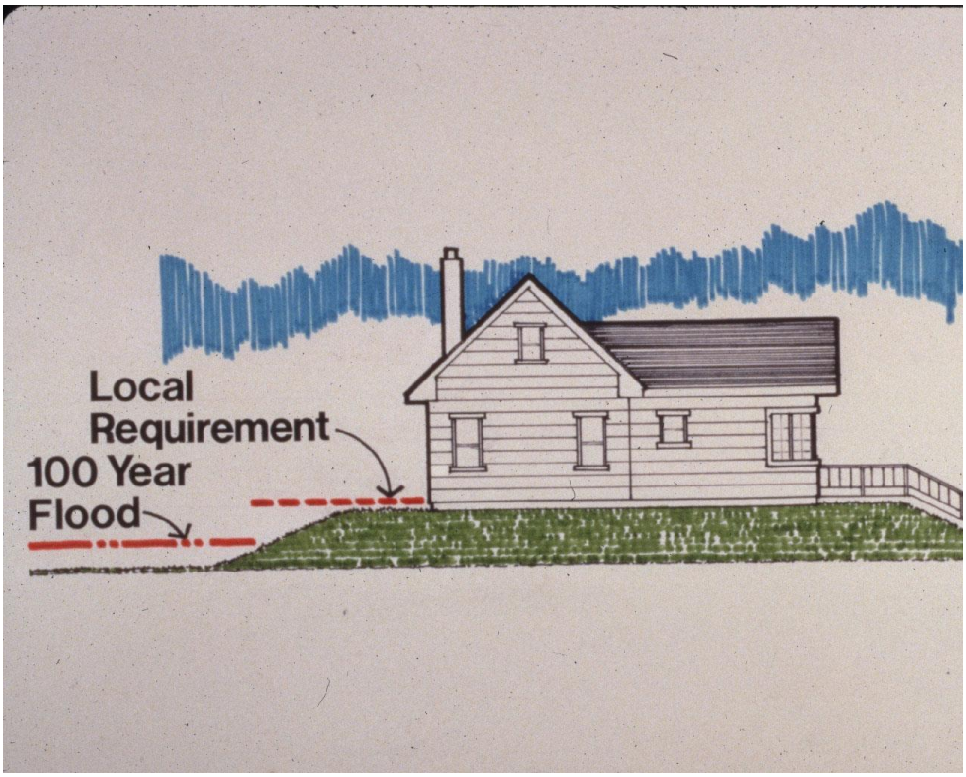
Preventive measures are designed to keep a problem - such as flooding - from occurring or from getting worse. The objective of preventive measures is to ensure that future development is not exposed to damage and does not cause an increase in damages to other properties. Building, zoning, planning and code enforcement offices usually administer preventive measures. Some examples of types of preventive measures include:

- Building codes and floodplain regulations
- Comprehensive land use planning, zoning, and open space preservation
- Stormwater management and subdivision regulations

Building Codes

Building codes provide one of the best methods of addressing natural hazards. When properly designed and constructed according to code, the average building can withstand many of the impacts of natural hazards. Hazard protection standards for all new and improved or repaired buildings can be incorporated into the local building code. Building codes can ensure that the first floors of new buildings are constructed to be higher than the elevation of the 100-year flood (the flood that is expected to have a one percent chance of occurring in any given year). This is shown in Figure C-1.

Figure C-1 Building Codes and Flood Elevations



Floodplain Regulations

Most communities with a flood problem participate in the National Flood Insurance Program (NFIP). The NFIP sets minimum requirements for the participating communities' standards for development, subdivision of land, construction of buildings, installation of mobile homes, and improvements and repairs to buildings. These are usually spelled out in a separate ordinance.

The NFIP minimum requirements are summarized below. It should be stressed that these are minimum requirements. Local conditions, such as high velocity flooding or the presence of a potential dam failure, may warrant higher local standards.

Enforcement

To ensure that communities are meeting the NFIP standards, FEMA periodically conducts a Community Assessment Visit. During this visit, the maps and ordinances are reviewed, permits are checked, and issues are discussed with staff. Failure to meet all of the requirements can result in one or more consequences:

- Reclassification under the Community Rating System to a higher class
- Probation, which entails a $50 surcharge on every flood insurance policy in the community, or
- Suspension from the NFIP.

Suspension is the most serious. It means that the community is out of the NFIP and the following sanctions are imposed:

- Flood insurance will not be available. No resident will be able to purchase a flood insurance policy.
- Existing flood insurance policies will not be renewed.
- No direct federal grants or loans for development may be made in identified flood hazard areas under programs administered by federal agencies, such as HUD, EPA, and the Small Business Administration.
- Federal disaster assistance will not be provided to repair insurable buildings located in identified flood hazard areas for damage caused by a flood.
- No federal mortgage insurance or loan guarantees may be provided in identified flood hazard areas. This includes policies written by FHA, VA, and others.
- Federally insured or regulated lending institutions, such as banks and credit unions, must notify applicants seeking loans for insurable buildings in flood hazard areas that there is a flood hazard and the property is not eligible for federal disaster relief.

These sanctions can be severe for any community with a substantial number of buildings in the floodplain. Most communities with a flood problem have joined the NFIP and are in full compliance with their regulatory obligations.

One way to assure good administration and enforcement is to have Certified Floodplain Managers on staff. The Association of State Floodplain Managers administers the national Certified Floodplain Manager (CFM®) program.

Minimum National Flood Insurance Program Regulatory Requirements

The National Flood Insurance Program (NFIP) is administered by the Federal Emergency Management Agency (FEMA). As a condition of making flood insurance available for their residents, communities that participate in the NFIP agree to regulate new construction in the area subject to inundation by the 100-year (base) flood. The floodplain subject to these requirements is shown as an A or V Zone on the Flood Insurance Rate Map (FIRM).

There are five major floodplain regulatory requirements. Additional floodplain regulatory requirements may be set by state and local laws.

1. All development in the 100-year floodplain must have a permit from the community. The NFIP regulations define "development" as any manmade change to improved or unimproved real estate, including but not limited to buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials.
2. Development along a river or other channel cannot obstruct flows so as to cause an increase in flooding on other properties. An analysis must be conducted to demonstrate that the cumulative effect of the proposed development, when combined with all other existing and anticipated development, will not increase the water surface elevation of the base flood more than one foot at any point within the community.
3. New buildings may be built in the floodplain, but they must be protected from damage from the base flood. In riverine floodplains, the lowest floor of residential buildings must be elevated to be at or above the base flood elevation (BFE). Nonresidential buildings must be either elevated or floodproofed.

4. Under the NFIP, a "substantially improved" building is treated as a new building. The NFIP regulations define "substantial improvement" as any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50% of the market value of the structure before the start of construction of the improvement. This requirement also applies to buildings that are substantially damaged.
5. Communities are encouraged to adopt local ordinances that are more comprehensive or provide more protection than the federal criteria. The NFIP's Community Rating System provides insurance premium credits to recognize the additional flood protection benefit of higher regulatory standards.

Local Implementation: Sacramento County and the City of Sacramento

Sacramento County and the City of Sacramento have adopted the 2013 California Building Code based on the 2012 International Building Code. Sacramento County has a Floodplain Management Ordinance (2014) that exceeds minimum NFIP standards and includes some higher regulatory standards. The County is in the process of updating their General Plan and Floodplain Management Ordinance to incorporate the 200-year flood standard of protection in urban or urbanizing areas (i.e., ULOP) as described in Chapter 4 of the Base plan. The City of Sacramento (2016) also has a Floodplain Management Ordinance that exceeds minimum NFIP standards and includes some higher regulatory standards. The City's ordinance was recently updated in March 2016 to incorporate the ULOP requirements of SB 5 as further described in Chapter 4 of the Base plan and in the City's Annex.

Just as important as having code standards is the enforcement of the code. Adequate inspections are needed during the course of construction to ensure that the builder understands the requirements and is following them. Making sure a structure is properly elevated and anchored requires site inspections at each step. Both Sacramento County and the City of Sacramento indicate that their Floodplain Management Ordinances are adequately enforced.

Reduce Future Flood Losses

Future flood losses should be reduced by enforcement of current floodplain regulations:

Sacramento County. For new residential construction or substantial improvements, Sacramento County requires that either the lowest finished floor be elevated at least 1.5 feet above the base flood elevation. For nonresidential construction or substantial improvements, Sacramento County requires that either the lowest finished floor be elevated at least 1.5 feet above the base flood elevation or that below the base flood level the structure is dry flood-proofed and watertight, with walls substantially impermeable to the passage of water and with structural components having the capability of resisting hydrostatic and hydrodynamic loads and effects of buoyancy.

City of Sacramento. For new residential construction or substantial improvements in Zones A, AH and AE, the City of Sacramento requires that either the lowest floor, including basement, be elevated at least 1 foot above the base flood elevation. For new residential construction, or substantial improvements in Zone AO, the City of Sacramento requires that either the lowest floor, including basement, be elevated above the highest grade to the depth number specified in feet on the FIRM or 2 feet above the highest adjacent grade if no depth number is specified. For nonresidential construction or substantial improvements, the City of

Sacramento requires that either the lowest floor, including basement be elevated in conformance with the residential standards described above, together with attendant utility and sanitary facilities or be dry floodproofed below the elevation required for the lowest floor so that the structure is watertight, with walls substantially impermeable to the passage of water and with structural components having the capability of resisting hydrostatic and hydrodynamic loads and effects of buoyancy.

Enacting and enforcing the current standards and/or adopting higher regulatory standards reduces future flood losses by regulating development within flood hazard areas.

Current Standards

As described above, Sacramento County and the City of Sacramento have Floodplain Management Ordinances that meet all of the NFIP's minimum floodplain regulatory requirements and exceed some of them such as establishing additional freeboard. Their regulations are designed to:

- Protect human life and health;
- Minimize expenditure of public money for costly flood control projects;
- Minimize the need for rescue and relief efforts associated with flooding;
- Minimize business interruptions;
- Minimize damage to public facilities, including streets, sewers, bridges, and utilities;

The County and City's regulations include methods and provisions for:

- Restricting or prohibiting development which are dangerous to health, safety, and property due to flood hazards, or which result in damaging increase in flood heights or velocities;
- Requiring that uses vulnerable to floods, including facilities which serve such uses, be protected against flood damage at the time of initial construction;
- Controlling the alteration of natural floodplains, stream channels, and natural protective barriers, which help accommodate or channel floodwaters;
- Controlling fill, grading, dredging, and other development which may increase flood damage; and
- Preventing or regulating the construction of flood barriers which will unnaturally divert floodwaters or which may increase flood hazards in other areas.

In addition, all new construction or substantial improvements shall be:

- Designed or modified and adequately anchored to prevent flotation, collapse or lateral movement of the structure resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy
- Constructed in ways that minimize flood damage
- Constructed with materials resistant to flood damage
- Constructed with electrical, heating, ventilation, plumbing, and air conditioning equipment and other service facilities designed or located so as to prevent water from entering or accumulating within components during flooding

Sacramento County and the City of Sacramento also have regulations that exceed minimum NFIP standards. These include:

- Floodways are delineated and certain requirements apply to construction within these floodways so as to not result in any increase in flood levels during the occurrence of the base flood discharge.

- Requiring new construction and substantial improvements to have the lowest flood, including basement, elevated a minimum of 1.5 feet (Sacramento County) above the base flood elevation.
- For the City, base flood elevations for new construction are required to be 1 foot above the FIRM flood depth for zones A, AH, and AE. In zones AO, the lowest floor will be elevated to one foot above the FIRM flood depth, or two feet above the highest adjacent grade if not depth number is specified.
- Restrictions and standards are included on the use of enclosures below elevated buildings.

In addition, Sacramento County's and the City of Sacramento's floodplain management programs are implemented by Certified Floodplain Managers on staff.

Manufactured Homes

Manufactured or mobile homes are usually not regulated by local building codes. They are built in a factory in another state and are shipped to a site. They do have to meet construction standards set by the U.S. Department of Housing and Urban Development. All mobile homes constructed after 1976 must comply with HUD's National Manufactured Home Construction and Safety Standards. These standards apply uniformly across the country and it is illegal for a local unit of government to require additional construction requirements. Local jurisdictions may regulate the location of these structures and their on-site installation.

Local Implementation

Both the Sacramento County and the City of Sacramento Floodplain Management Ordinances include specific requirements for the placement, installation, elevation, and anchoring of manufactured homes

CRS Credit

Building Codes: The CRS encourages strong building codes. It provides credit in two ways: points are awarded based on the community's BCEGS classification and points are awarded for adopting the International Code series. The CRS also has a prerequisite for a community to attain a Class 6 or better within the CRS program, the community must have a BCEGS class of 5/5 or better. To attain a Class 4 or better in the CRS program, the community must have a BCEGS class of 4/4 or better.

Sacramento County has a BCEGS classification of 3/3. Sacramento County has adopted the 2013 California Building Code which includes the International Code series with State enhancements.

The City of Sacramento's BCEGS classification is a 2/2. The City of Sacramento has also adopted the 2013 California Building Code which includes the International Code series with State enhancements.

The National Flood Insurance Program's (NFIP) Community Rating System (CRS) was implemented in 1990 as a program for recognizing and encouraging community floodplain management activities that exceed the minimum NFIP standards. The National Flood Insurance Reform Act of 1994 codified the Community Rating System in the NFIP.

- The CRS recognizes 18 creditable activities, organized under four categories numbered 300 through 600:
  - ✓ Public Information
  - ✓ Mapping and Regulations
  - ✓ Flood Damage Reduction

- ✓ Flood Preparedness

- Sacramento County and the City of Sacramento participate in the Community Rating System (CRS) of the National Flood Insurance Program.
- By implementing these floodplain management activities, the residents of Sacramento County and the City of Sacramento qualify for flood insurance premium rate reductions. When communities go beyond the minimum standards for floodplain management, the CRS can provide discounts up to 45% off flood insurance premiums.

Sacramento County is currently a Class 2 community, which provides a 40% discount on flood insurance to properties located in the Special Flood Hazard Area and up to a 10% discount for those properties located outside the special flood hazard zone.

The City of Sacramento is currently a Class 5 community, which provides a 25% discount on flood insurance to properties located in the Special Flood Hazard Area and up to a 10% discount for those properties located outside the special flood hazard zone.

Floodplain Management – Higher Regulatory Standards: There are many higher regulatory standards that warrant CRS credit. These standards include:

- Delineating a floodway, the area of higher hazard near the channel. This would allow development outside the floodway (called the "floodplain fringe") without engineering studies to determine their impact on others.
- Requiring all new construction to be elevated one or two feet above the base flood elevation to provide an extra level of protection from waves and higher floods. This extra protection is reflected in a distinct reduction in flood insurance rates.
- Having all developers (not just the larger ones) provide flood data where none are available.
- Specifications to protect foundations from erosion, scour and settling.
- Prohibiting critical facilities from all or parts of the floodplain.
- Prohibiting hazardous materials.
- Requiring buffers adjacent to streams or natural areas.
- Restrictions on use of enclosures below elevated buildings.
- Flood storage lost due to filling and construction must be compensated for by removal of an equal volume of storage.
- The CRS also provides credit for having trained staff and a higher credit if the staff members are Certified Floodplain Managers.

It should be noted that one of the prerequisites for participation in the CRS is that the community be in full compliance with the minimum requirements of the NFIP. A community with a number of "potential violations" risks being removed from the CRS entirely.

Manufactured homes: The NFIP allows communities to exempt mobile homes in existing mobile home parks from some of the flood protection requirements. The CRS provides up to 50 points if the community does not use this exemption.

Comprehensive Land Use Planning, Zoning, and Open Space Preservation

Building codes provide guidance on how to build in hazardous areas. Planning and zoning activities direct development away from these areas, particularly floodplains and wetlands. They do this by designating

land uses that are compatible with the natural conditions of land that is prone to flooding, such as open space or recreation. Planning and zoning activities can also provide benefits by simply allowing developers more flexibility in arranging improvements on a parcel of land through the planned development approach.

General and Comprehensive Plans

These plans are the primary tools used by communities to address future development. They can reduce future flood-related damages by indicating open space or low density development within floodplains and other hazardous areas. Unfortunately, natural hazards are not always emphasized or considered in the specific land use recommendations.

Generally, a plan has limited authority. It reflects what the community would like to see happen. Its utility is that it guides other local measures, such as capital improvement programs, zoning ordinances, and subdivision regulations.

Capital Improvement Plans

A capital improvement plan can guide a community's major public expenditures for a 5- to 20-year period. Capital expenditures may include acquisition of open space within the hazardous areas, extension of public services into hazardous areas, or retrofitting existing public structures to withstand a hazard.

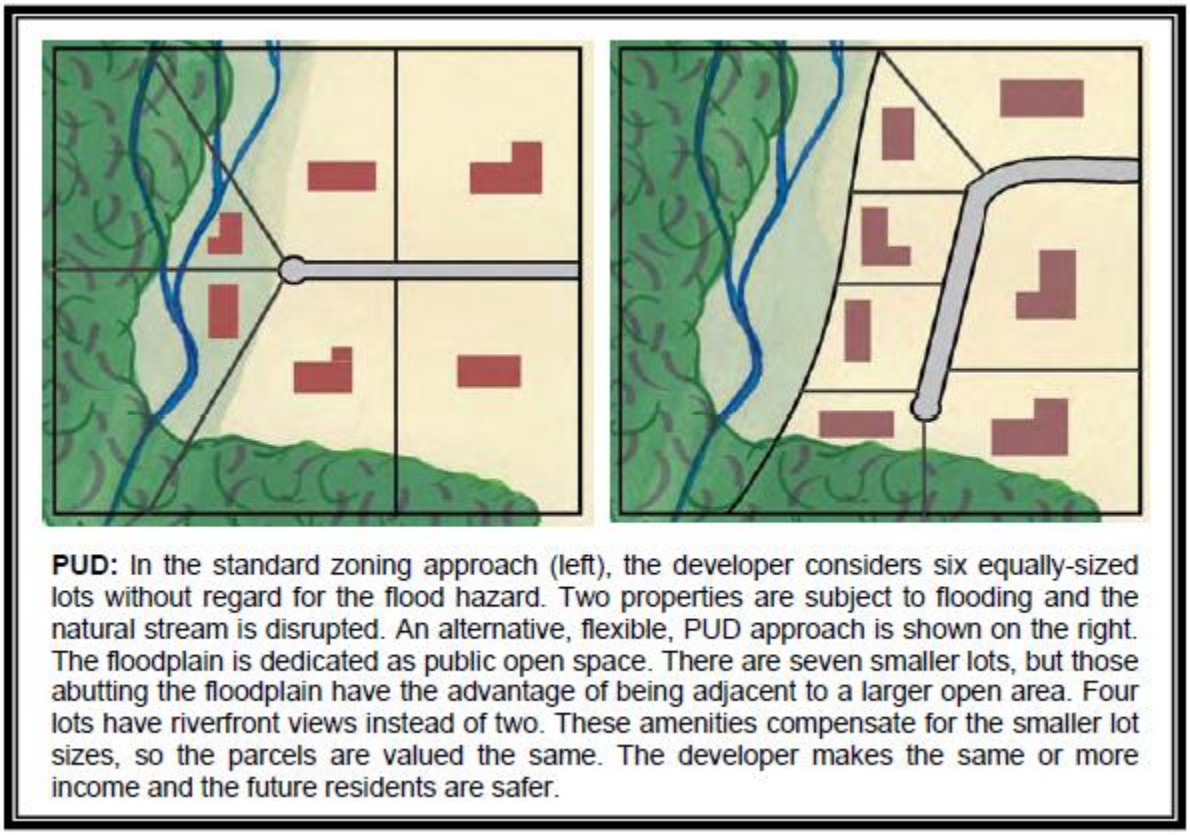
Zoning

A zoning ordinance regulates development by dividing a community into zones or districts and setting development criteria for each of those zones or districts. Zoning codes are considered the primary tool to implement a general/comprehensive plan's guidelines for how land should be developed.

Zoning ordinances can limit development in hazardous areas, such as reserving floodplain zones for agricultural uses. Often, developers will produce a standard grid layout. The ordinance and the community can allow flexibility in lot sizes and location so developers can avoid hazardous areas.

One way to encourage such flexibility is to use the planned unit development (PUD) approach or cluster development. The PUD and cluster approaches allow the developer to easily incorporate flood hazard mitigation measures into the project. Open space or floodplain preservation can be facilitated as site design standards and land use densities can be adjusted to fit the property's specific characteristics, as shown in Figure C-2.

Figure C-2 Zoning for Development in the Floodzone



PUD: In the standard zoning approach (left), the developer considers six equally-sized lots without regard for the flood hazard. Two properties are subject to flooding and the natural stream is disrupted. An alternative, flexible, PUD approach is shown on the right. The floodplain is dedicated as public open space. There are seven smaller lots, but those abutting the floodplain have the advantage of being adjacent to a larger open area. Four lots have riverfront views instead of two. These amenities compensate for the smaller lot sizes, so the parcels are valued the same. The developer makes the same or more income and the future residents are safer.

Open Space Preservation

Keeping the floodplain and other hazardous areas open and free from development is the best approach to preventing damage to new developments. Open space can be maintained in agricultural use or can serve as parks, greenway corridors and golf courses.

Comprehensive and capital improvement plans should identify areas to be preserved by acquisition and other means, such as purchasing an easement. With an easement, the owner is free to develop and use private property, but property taxes are reduced or a payment is made to the owner if the owner agrees to not build on the part set aside in the easement.

Although there are some federal programs that can help acquire or reserve open lands, open space lands and easements do not always have to be purchased. Developers can be encouraged to dedicate park land and required to dedicate easements for drainage and maintenance purposes. These are usually linear areas along property lines or channels. Maintenance easements also can be donated by streamside property owners in return for a community maintenance program.

Local Implementation

General Plan: Sacramento County's current General Plan was adopted in 2011. The County is in the process of finalizing updates to the 2011 General Plan to address new flood protections requirements that establish a 200-year state requirement for the ULOP. This is the primary policy change that will affect construction in urban or urbanizing areas that are in a SFHA or a Moderate Flood Zone. Areas not considered to be urbanizing will remain subject to the FEMA 0.1% standard of flood protection. Proposed amendments address: agency coordination, setbacks along levees, elevation and construction standards, flood map data, flood emergency response, floodway management, building design standards, and the process for making legal determinations and project approvals for development in flood hazard zones.

The City of Sacramento recently updated its General Plan in 2015 to include requirements for establishing 200-year state requirements for the ULOP to comply with Senate Bill (SB) 5 regarding floodplain management.

Zoning and Open Space Preservation: Sacramento County's General Plan, in coordination with the local Codes, protects current open space. As described above, the County is in the process of finalizing updates to the general plan which will also include updates to the County's Zoning Code.

The City of Sacramento's local codes in combination with the 2015 General Plan provides protection for and encourages open space preservation. The City's 2015 Floodplain Management Ordinance includes requirements for establishing 200-year state requirements for the ULOP to comply with Senate Bill (SB) 5 regarding floodplain management.

Reduce Future Flood Losses

Enacting the General Plans and the comprehensive zoning and future land uses contained in the County and City's General Plans will help to reduce future flood losses by managing development in hazardous areas and known floodplains.

Current Standards

Generally, Sacramento County's zoning ordinance separates hazardous land uses from sensitive land uses and addresses risks e.g. flood, erosion and traffic. The zoning ordinance contains a Flood (F) Combining Zoning District and Tributary Standards, and Natural Streams (NS) Combining Zoning District to reduce the impacts of flood hazards. Additionally, the ordinance contains a Parkway Corridor (PC) Combining Zoning District to ensure that bluff development does not create erosion or geologic instability.

Likewise, the City of Sacramento's zoning ordinance is an effective measure for reducing hazard impacts and is adequately administered and enforced. The City's ordinance includes a Flood Zone and an American River Parkway, Floodplain Zone (ARP-F). The Flood Zone is considered an Open Space Zone established to conditionally permit specified uses along the Sacramento and American Rivers and their tributaries. The ARP-F was established to prevent loss of life and property by prohibiting the erection of improvements or structures in a designated floodway, to protect the natural features of the American River floodplain, to prevent erosion and siltation, and to preserve valuable open space.

CRS Credit

The CRS provides flood insurance discounts to those communities that implement various floodplain management activities that meet certain criteria. Comparing local activities to those national criteria helps determine if local activities should be improved.

Credits are provided for regulations that encourage developers to preserve floodplains or other hazardous areas from development. There is no credit for a plan, only for the enforceable regulations that are adopted pursuant to a plan. Credits are also provided for setting aside floodplains for low density zoning, such as five acre lots or conservation

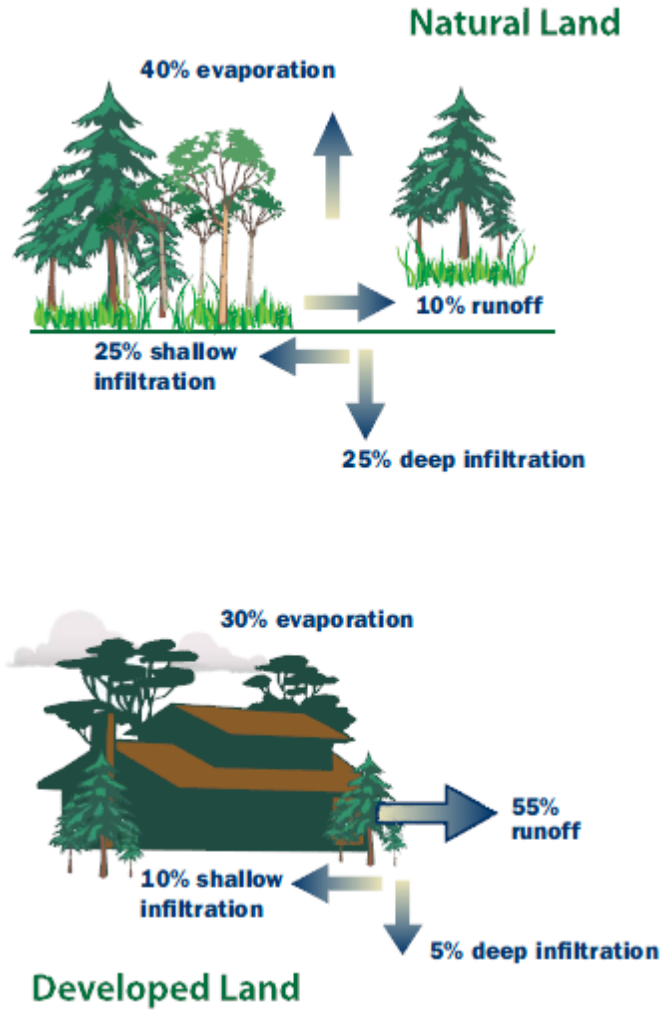
Preserving flood prone areas as open space is one of the highest priorities of the Community Rating System. Up to 1,450 points can be given, based on how much of the floodplain is in community public undeveloped properties, parks, wildlife refuges, golf courses, or other uses that can be depended on to stay open (Activity 420 - Open Space Preservation).

Stormwater Management and Subdivision Ordinance

Development in floodplains is development in harm's way. New construction in the floodplain increases the amount of development exposed to damage and can aggravate flooding on neighboring properties.

Development outside a floodplain can also contribute to flooding problems. Stormwater runoff is increased when natural ground cover is replaced by urban development (see Figure C-3). Development in the watershed that drains to a river can aggravate downstream flooding, overload the community's drainage system, cause erosion, and impair water quality.

Figure C-3 Runoff and Infiltration of Natural and Developed Land



There are three ways to prevent flooding problems caused by stormwater runoff:

- Regulating development in the floodplain to ensure that it will be protected from flooding and that it won't divert floodwaters onto other properties, and
- Regulating all development to ensure that the post-development peak runoff will not be greater than it was under pre-development conditions.
- Set construction standards so buildings are protected from shallow water.

Most communities participate in the NFIP, which sets minimum requirements for regulating development in the floodplain. All new buildings must be protected from the base or 100-year flood and no development can cause an increase in flood heights or velocities.

Stormwater runoff regulations require developers to build retention or detention basins to minimize the increases in the runoff rate caused by impervious surfaces and new drainage systems. Generally, each

development must not let stormwater leave at a rate higher than what existed under pre-development conditions.

Standards for drainage requirements are typical in subdivision regulations. Standards for storm sewers, ditches, culverts, etc., are best set when an area is laid out and developed. Traditionally, the national standard is to require that the local drainage system carry the 10-year storm. Recently, communities are finding that older estimates of the 10-year storm understated the true hazard, so they are addressing larger storms.

One problem with requiring the drainage system to carry water away is that runoff increases with urban development. The runoff equivalent of a 10-year storm occurs more frequently, and from smaller storms. The problem is just sent downstream onto someone else's property.

Accordingly, modern subdivision regulations require new developments to ensure that the post-development peak runoff will not be greater than it was under pre-development conditions. This is usually done by constructing retention or detention basins to hold the runoff for a few hours or days, until flows in the system have subsided and the downstream channels can accept the water without flooding.

If the storm sewers or roadside ditches cannot handle a heavy rain, the standard subdivision design uses the streets to carry excess runoff. If the flows exceed the streets' capacity, adjacent properties will flood. Therefore, the third approach to protecting from stormwater flooding is to make sure new buildings are elevated one or two feet above the street or above adjacent grade.

Local Implementation

Reduce Future Flood Losses

Current practices and tracking mechanisms are seeking to reduce flood risks. Future flood control and stormwater improvements in Sacramento County and the City of Sacramento will help reduce localized flood risks by improving flood control mechanisms and drainage. In order to reduce future flood losses, the County and City may consider revisiting their stormwater management ordinances.

Current Standards

Sacramento County and the City of Sacramento have stormwater management ordinances.

Sacramento County's Stormwater Management Ordinance authorizes the County to exercise its police power to protect and promote the public health, safety and general welfare. While stormwater runoff is one step in the natural cycle of water, human activities, including, but not limited to, agriculture, construction, manufacturing and the operation of an urban infrastructure, may result in undesirable discharges of pollutants and certain sediments. Such discharges may accumulate in local drainage channels and waterways and eventually may be deposited in the natural surface waters. The purpose of this chapter is to protect and enhance the watercourses within the unincorporated area of the County, by controlling the contribution of urban pollutants to stormwater runoff which enters the County storm drain system in a manner consistent with the Federal Clean Water Act, the Porter-Cologne Water Quality Control Act and Municipal discharge Permit No. CAS082597, and by controlling pollutants that are discharged directly to

natural surface waters. The County's Stormwater Program also uses its Land Grading and Erosion Control Ordinance to minimize damage to surrounding properties and public rights-of-way, the degradation of the water quality of watercourses, and the disruption of natural or County authorized drainage flows caused by the activities of clearing and grubbing, grading, filling and excavating of land, and sediment and pollutant runoff from other construction related activities, and to comply with the provisions of the County's National Pollutant Discharge Elimination System (NPDES) Permit Number, CA0082597, issued by the California Regional Water Quality Control Board (Regional Board). These goals will be achieved by establishing administrative procedures, minimum standards of review, and implementation and enforcement procedures for controlling erosion, sedimentation and other pollutant runoff, including construction debris and hazardous substances used on construction sites, and the disruption of existing drainage and related environmental damage caused by the aforementioned activities.

The City of Sacramento's Stormwater Management Ordinance is designed to protect and promote the health, safety and general welfare of the citizens of the City by controlling non-stormwater discharges to the stormwater conveyance system, by eliminating discharges to the stormwater conveyance system from spills, dumping, or disposal of materials other than stormwater, and by reducing pollutants in urban stormwater discharges to the maximum extent practicable. This chapter is intended to assist in the protection and enhancement of the water quality of watercourses, water bodies, and wetlands in a manner pursuant to and consistent with the Federal Water Pollution Control Act, Porter-Cologne Water Quality Control Act, and National Pollutant Discharge Elimination System (NPDES) Permit No. CAS082597, as such permit is amended and/or renewed.

Subdivision Regulations

In addition to controlling stormwater runoff as described above, subdivision regulations govern how land will be subdivided and they set construction standards. These standards generally address roads, sidewalks, utilities, storm sewers, and drainage ways. They can include the following flood protection standards:

- Requiring that the final plat show all hazardous areas
- Requiring that each lot be provided with a building site above the flood level
- Requiring that all roadways be no more than one foot below the flood elevation

Local Implementation

Sacramento County's subdivision ordinance regulates the design and improvement of land divisions and the dedication of public improvements needed in connection with land divisions. The subdivision ordinance does not address hazards.

The City of Sacramento's Subdivision Ordinance is designed to assist in the systematic implementation of the general plan, specific and community plans, the zoning ordinance, and other land use regulations, and to provide for public needs, health and safety, convenience, and general welfare. The City's subdivision requirements address floodplain management requirements. Specifically, the ordinance requires that the design of all subdivisions shall provide adequate drainage to reduce exposure to flood damage and shall in all respects conform to the requirements of Title 15.104 of this code, Floodplain Management Regulations, and the national flood insurance program regulations, set forth in Subchapter B of Title 44 of the Code of Federal Regulations Parts 59 and 60. All final subdivision improvement plans will provide the elevation of the proposed building site. If the site is filled above the base flood, the final pad elevation shall be

certified by a qualified registered professional engineer or surveyor and provided to the local administrator. All subdivision proposals shall be consistent with the need to minimize flood damage. All subdivision proposals shall have public utilities and facilities such as sewer, gas, electrical and water systems located and constructed to minimize flood damage.

CRS Credit

CRS credit is provided for both higher regulatory standards in the floodplain and stormwater management standards for new developments. Credit is based on how those standards exceed the minimum NFIP requirements.

Conclusions and Recommendations

- Sacramento County and the City of Sacramento have floodplain development ordinances that exceed minimum national and state standards and will be helpful in preventing flood problems from increasing.
- With ongoing improvements to the regions' flood control facilities, requirements mandated by SB 5, and any resulting changes in the FEMA DFIRMs, the floodplain regulations for the County and City should be revisited and revised accordingly.
- Sacramento County and the City of Sacramento should continue to implement CRS activities to align with the recent changes in the 2013 Coordinator's Manual. The County and City should evaluate their floodplain management ordinances for incorporating additional higher standards.
- The County and City should review their zoning and subdivision ordinances for floodplain management and other hazard specific enhancements.
- The County and City should continue to enforce stormwater management best management practices to control post development site runoff. Consideration of a unified countywide stormwater ordinance will provide consistent regulations between all communities within the Sacramento County planning area.
- Standards in subdivision regulations for public facilities should account for the hazards present at the site. New building sites, streets, and water systems should facilitate access and use by fire and emergency equipment.

C.3.2. Property Protection Measures

Property protection measures are used to modify buildings or property subject to damage. Property protection measures fall under three approaches:

- Modify the site to keep the hazard from reaching the building,
- Modify the building so it can withstand the impacts of the hazard, and
- Insure the property to provide financial relief after the damage occurs.

Property protection measures are normally implemented by the property owner, although in many cases technical and financial assistance can be provided by a government agency.

Keeping the Hazard Away

Generally, natural hazards do not damage vacant areas. As noted earlier, the major impact of hazards is to people and improved property. In some cases, properties can be modified so the hazard does not reach the damage-prone improvements. For example, a berm can be built to prevent floodwaters from reaching a house.

Flooding

There are five common methods to keep a flood from reaching and damaging a building:

- Erect a barrier between the building and the source of the flooding.
- Move the building out of the floodprone area.
- Elevate the building above the flood level.
- Demolish the building.
- Replace the building with a new one that is elevated above the flood level.

Barriers

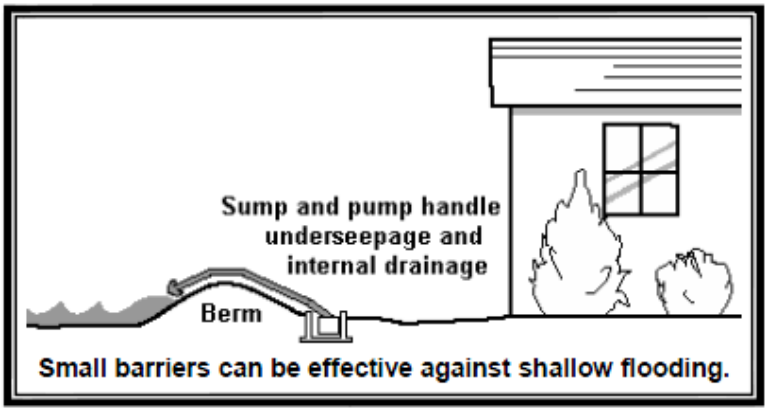
A flood protection barrier can be built of dirt or soil (a "berm") or concrete or steel (a "floodwall"). Careful design is needed so as not to create flooding or drainage problems on neighboring properties. Depending on how porous the ground is, if floodwaters will stay up for more than an hour or two, the design needs to account for leaks, seepage of water underneath, and rainwater that will fall inside the perimeter. This is usually done with a sump or drain to collect the internal groundwater and surface water and a pump and pipe to pump the internal drainage over the barrier.

Figure C-4 Types of Barriers

This low floodwall has landscaping to minimize the adverse impact on the property's appearance.

Small, wood frame buildings are the easiest to relocate

Source: Kennedy House Movers, Huntsville, AL



Small barriers can be effective against shallow flooding.

Barriers can only be built so high. They can be overtopped by a flood higher than expected. Barriers made of earth are susceptible to erosion from rain and floodwaters if not properly sloped, covered with grass, and

properly maintained. A berm can also settle over time, lowering its protection level. A floodwall can crack, weaken, and lose its watertight seal. Therefore, barriers need careful design and maintenance (and insurance on the building, in case of failure).

Relocation

Moving a building to higher ground is the surest and safest way to protect it from flooding. While almost any building can be moved, the cost increases for heavier structures, such as those with exterior brick and stone walls, and for large or irregularly shaped buildings.

In areas subject to flash flooding, deep waters, or other high hazard, relocation is often the only safe approach. Relocation is also preferred for large lots that include buildable areas outside the floodplain or where the owner has a new flood-free lot (or portion of the existing lot) available.

Building Elevation

Raising a building above the flood level can be almost as effective as moving it out of the floodplain. Water flows under the building, causing little or no damage to the structure or its contents. Raising a building above the flood level is cheaper than moving it and can be less disruptive to a neighborhood. Elevation has proven to be an acceptable and reasonable means of complying with floodplain regulations that require new, substantially improved, and substantially damaged buildings to be elevated above the base flood elevation.

One concern with elevation is that it may expose the structure to greater impacts from other hazards such as wind and groundshaking. If not braced and anchored properly, an elevated building may have less resistance to the shaking of an earthquake and the pressures of high winds.

Demolition

Some buildings, especially heavily damaged or repetitively flooded ones, are not worth the expense to protect them from future damages. It is cheaper to demolish them and either replace them with new, flood protected structures ("pilot reconstruction"), or relocate the occupants to a safer site. Demolition is also appropriate for buildings that are difficult to move - such as larger, slab foundation or masonry structures - and for dilapidated structures that are not worth protecting. Generally, demolition projects are undertaken by a government agency, so the cost is not borne by the property owner, and the land is converted to public open space use, like a park.

Figure C-5 Demolition of Flooded Home

Demolishing a repetitively flooded home

One problem that sometimes results from an acquisition and demolition project is a "checkerboard" pattern in which nonadjacent properties are acquired. This can occur when some owners, especially those who have and prefer a waterfront location, are reluctant to leave their homes. Creating such an acquisition pattern in a community simply adds to the maintenance costs that taxpayers must support.

Pilot Reconstruction

If a building is not in good shape, elevating it may not be worthwhile or it may even be dangerous. An alternative is to demolish the structure and build a new one on the site that meets or exceeds all flood and wind protection codes. This was formerly known as "demo/rebuild." FEMA funding programs refer to this approach as "pilot reconstruction." It is still a pilot program, and not a regularly funded option.

Certain rules must be followed to qualify for federal funds for pilot reconstruction:

- Pilot reconstruction is only possible after it has been shown that acquisition or elevation are not feasible, based on the program's criteria.
- Funds are only available to people who owned the property at the time of the event for which funding is authorized.
- It must be demonstrated that the benefits exceed the costs.
- The new building must be elevated to the advisory base flood elevation.
- The new building must not exceed more than 10% of the old building's square footage.
- The new building must meet all flood and wind protection codes.
- There must be a deed restriction that states the owner will buy and keep a flood insurance policy.
- The maximum federal grant is 75% of the cost, up to $150,000. FEMA is developing a detailed list of eligible costs to ensure that disaster funds are not used to upgrade homes.

Local Implementation

Within the Sacramento County planning area, which includes the unincorporated Sacramento County and the City of Sacramento, acquisition and elevation projects have occurred. Historically, Sacramento County has participated in programs to acquire and elevate flooddprone structures within the County. The County is currently pursuing a FEMA HMGP Grant to elevate another approximately 35 structures. The City of Sacramento has also participated in similar programs.

CRS Credit

The CRS provides the most credit points for acquisition and relocation, because this measure permanently removes insurable buildings from the floodplain. The CRS credits barriers and elevating existing buildings (Activity 530 - Flood Protection). Elevating a building above the flood level will also reduce the flood insurance premiums on that individual building. Because barriers are less secure than elevation, not as many points are provided. Higher scores are possible, but they are based on the number of buildings removed compared to the number remaining in the floodplain.

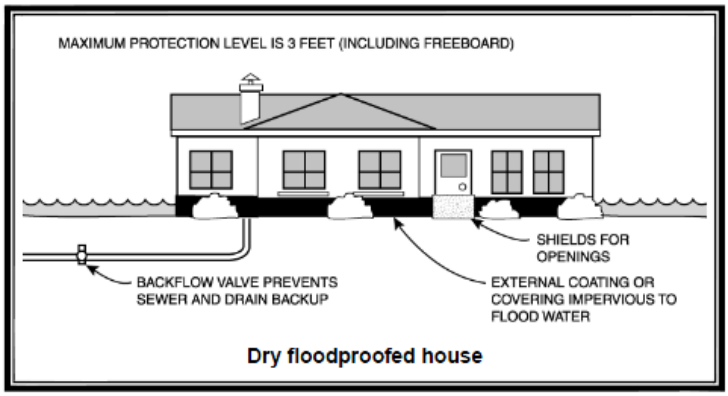
Retrofitting

An alternative to keeping the hazard away from a building is to modify or retrofit the site or building to minimize or prevent damage. There are a variety of techniques to do this, as described below.

Dry Floodproofing

Dry floodproofing means making all areas below the flood protection level watertight. Walls are coated with waterproofing compounds or plastic sheeting. Openings, such as doors, windows and vents, are closed, either permanently, with removable shields, or with sandbags. Dry floodproofing of new and existing nonresidential buildings in the regulatory floodplain is permitted under state, FEMA and local regulations. Dry floodproofing of existing residential buildings in the floodplain is also permitted as long as the building is not substantially damaged or being substantially improved. Owners of buildings located outside the regulatory floodplain can always use dry floodproofing techniques.

Figure C-6 Dry Floodproofing



Dry floodproofing is only effective for shallow flooding, such as repetitive drainage problems. It does not protect from the deep flooding along lakes and larger rivers caused by hurricanes or other storms.

Wet Floodproofing

The alternative to dry floodproofing is wet floodproofing: water is let in and everything that could be damaged by a flood is removed or elevated above the flood level. Structural components below the flood level are replaced with materials that are not subject to water damage. For example, concrete block walls are used instead of wooden studs and gypsum wallboard. The furnace, water heater and laundry facilities are permanently relocated to a higher floor. Where the flooding is not deep, these appliances can be raised on blocks or platforms.

Local Implementation

Area residents have utilized both dry and wet floodproofing techniques for construction of homes in floodprone areas. Floodproofing requirements for new or substantially improved structures are addressed in the communities' Floodplain Management Ordinances.

CRS Credit

Credit for dry and wet floodproofing and sewer backup protection is provided under Activity 530 - Retrofitting. Because these property protection measures are less secure than barriers and elevation, not as many points are provided.

Insurance

Technically, insurance does not mitigate damage caused by a natural hazard. However, it does help the owner repair, rebuild, and hopefully afford to incorporate some of the other property protection measures in the process. Insurance offers the advantage of protecting the property, as long as the policy is in force, without requiring human intervention for the measure to work.

Private Property

Although most homeowner's insurance policies do not cover a property for flood damage, an owner can insure a building for damage by surface flooding through the NFIP. Flood insurance coverage is provided for buildings and their contents damaged by a "general condition of surface flooding" in the area.

Figure C-7 Flood Insurance Coverage

Table 5-1 Example Flood Insurance Premiums	
Building Exposure	**Premium**
In the Special Flood Hazard Area (AE Zone)	
Pre-FIRM ("subsidized") rate	$1,689
Post-FIRM (actuarial) rates	
2 feet above the base flood elevation	$440
1 foot above the base flood elevation	$643
At the base flood elevation	$1,167
1 foot below the base flood elevation	$4,379
Outside the Special Flood Hazard Area	$1,029
Premiums are for $150,000 in building coverage and $75,000 in contents coverage for a one story house with no basement and a $500 deductible, using the October 2008 *Flood Insurance Manual*. Premiums include the 5% Community Rating System discount in unincorporated St. Tammany Parish. Premiums are higher in the municipalities, which are not in the CRS.	

Most people purchase flood insurance because it is required by the bank when they get a mortgage or home improvement loan. Usually these policies just cover the building's structure and not the contents. Contents coverage can be purchased separately. Renters can buy contents coverage, even if the owner does not buy structural coverage on the building. Most people don't realize that there is a 30-day waiting period to purchase a flood insurance policy and there are limits on coverage.

Public Property

Governments can purchase commercial insurance policies. Larger local governments often self-insure and absorb the cost of damage to one facility, but if many properties are exposed to damage, self-insurance can drain the government's budget. Communities cannot expect federal disaster assistance to make up the difference after a flood.

Under Section 406(d) of the Stafford Act:

> *"If an eligible insurable facility damaged by flooding is located in a [mapped floodplain] … and the facility is not covered (or is underinsured) by flood insurance on the date of such flooding, FEMA is required to reduce Federal disaster assistance by the maximum amount of insurance proceeds that would have been received had the buildings and contents been fully covered under a National Flood Insurance Program (NFIP) standard flood insurance policy. [Generally, the maximum amount of proceeds for a non-residential property is $500,000.]*

[Communities] Need to:

- Identify all insurable facilities, and the type and amount of coverage (including deductibles and policy limits) for each. The anticipated insurance proceeds will be deducted from the total eligible damages to the facilities.

- Identify all facilities that have previously received Federal disaster assistance for which insurance was required. Determine if insurance has been maintained. A failure to maintain the required insurance for the hazard that caused the disaster will render ineligible for Public Assistance funding…
- [Communities] must obtain and maintain insurance to cover [their] facility - buildings, equipment, contents and vehicles - for the hazard that caused the damage in order to receive Public Assistance funding. Such coverage must, at a minimum, be in the amount of the eligible project costs. FEMA will not provide assistance for that facility in future disasters if the requirement to purchase insurance is not met. - FEMA Response and Recovery Directorate Policy No. 9580.3, August 23, 2000

In other words, the law expects public agencies to be fully insured as a condition of receiving federal disaster assistance.

Local Implementation

Flood insurance is available in Sacramento County and the City of Sacramento.

Within Sacramento County, NFIP insurance data indicates that as of February 19, 2016, there were 10,468 policies in force in the unincorporated County, resulting in $2,939,536,100 of insurance in force. Of these, 9,698 are for residential properties; 770 are nonresidential. 3,171 of these are in A zones; 7,297 policies are for parcels in the B, C, & X zones. Of the 3,862 improved parcels within the 100-year floodplain, 3,171 (or 82.1 percent) of those parcels maintain flood insurance. Additional information on these policies for Sacramento County are described in Section 4.3.10 of the base plan.

Within the City of Sacramento, NFIP data indicates that as of February 19, 2016, there were 43,937 flood insurance policies in force in the City with $14,355,078,500 of coverage. Of the 43,937 policies, 42,827 were residential (single-family homes) and 1,110 were nonresidential; 2,153 of the policies were in A zones (the remaining 41,784 were in B, C, and X zones). The GIS parcel analysis detailed above identified 24,861 parcels in the 100-year flood zone. 2,153 policies for 24,861 parcels in the 100-year floodplain equates to insurance coverage of 28.8 percent. It should be noted, however, that many of the 24,861 parcels in the 100-yr floodplain are grandfathered into the X zone based on the date the structure was built. Additional information on these policies for the City of Sacramento are described in the City's Annex.

Both Sacramento County and the City of Sacramento make great efforts on flood insurance promotion. This includes public outreach efforts for flood insurance promotion under both of their CRS PPI programs as well as other outreach efforts as necessary to educate the public on this important mitigation program. More information on flood insurance, the County and City's PPI programs and other public outreach mechanisms regarding flood insurance promotion are included in Chapter 4 of the Base plan and the City's Annex.

CRS Credit

There is no credit for purchasing flood insurance, but the CRS does provide credit for local public information programs that explain flood insurance to property owners. The CRS also reduces the premiums for those people who do buy NFIP coverage.

The Government's Role

Property protection measures are usually considered the responsibility of the property owner. However, local governments should be involved in all strategies that can reduce flood losses, especially acquisition and conversion of a site to public open space. There are various roles a municipality can play in encouraging and supporting implementation of these measures.

One of the first duties of a local government is to protect its own facilities. Fire stations, water treatment plants and other critical facilities should be a high priority for retrofitting projects and insurance coverage. Often public agencies discover after the disaster that their "all-hazard" insurance policies do not cover the property for the type of damage incurred. Flood insurance is even more important as a mitigation measure because of certain Stafford Act provisions.

Providing basic information to property owners is the first step in supporting property protection measures. Owners need general information on what can be done. They need to see examples, preferably from nearby.

Communities can help owners by helping to pay for a retrofitting project. Financial assistance can range from full funding of a project to helping residents find money from other programs. Some communities assume responsibility for sewer backups, street flooding, and other problems that arise from an inadequate public sewer or public drainage system. Less expensive community programs include low interest loans, forgivable low interest loans and rebates. A forgivable loan is one that does not need to be repaid if the owner does not sell the house for a specified period, such as five years. These approaches don't fully fund the project, but they cost the community less and they increase the owner's commitment to the flood protection project. Often, small amounts of money act as a catalyst to pique the owner's interest to get a self-protection project moving.

The more common outside funding sources are listed below. Unfortunately, the last three are only available after a disaster, not before, when damage could be prevented.

Pre-disaster funding sources:

- FEMA's Pre-Disaster Mitigation (PDM) grants
- FEMA's Flood Mitigation Assistance (FMA) grants
- Community Development Block Grants
- Conservation organizations, although generally these organizations prefer to purchase vacant land in natural areas, not properties with buildings on them.

Post-disaster funding sources:

- Insurance claims
- The NFIP's Increased Cost of Compliance. This provision increases a flood insurance claim payment to help pay for a flood protection project required by code as a condition to rebuild the flooded building. It can also be used to help pay the non-federal cost-share of an elevation project.

Post-disaster funding sources, federal disaster declaration needed:

- FEMA's disaster assistance (for public properties). However, after a flood, the amount of assistance will be reduced by the amount of flood insurance that the public agency should be carrying on the property.
- Small Business Administration disaster loans (for non-governmental properties)
- FEMA's Hazard Mitigation Grant Program

Acquisition Agent

The community can be the focal point in an acquisition project. Most funding programs require a local public agency to sponsor the project. The local government could process the funding application, work with the owners, and provide some, or all, of the local share. In some cases, the local government would be the ultimate owner of the property, but in other cases another public agency could assume ownership and the attendant maintenance responsibilities.

Mandates

Mandates are considered a last resort if information and incentives are insufficient to convince a property owner to take protective actions. An example of a retrofitting mandate is the requirement that communities have to disconnect downspouts from the sanitary sewer line.

There is a mandate for improvements or repairs made to a building in the mapped floodplain. If the project equals or exceeds 50% of the value of the original building, it is considered a "substantial improvement." The building must then be elevated or otherwise brought up to current flood protection codes.

Another possible mandate is to require less expensive hazard protection steps as a condition of a building permit. For example, many communities require upgraded electrical service as a condition of a home improvement project. If a person were to apply for a permit for electrical work, the community could require that the service box be moved above the base flood elevation or the installation of a separate ground fault interrupter circuits in the basement.

Local Implementation

As previously described, both Sacramento County and the City of Sacramento have participated in programs to acquire and/or elevate structures in floodprone areas.

CRS Credit

Except for public information programs, the CRS does not provide credit for efforts to fund, provide incentives, or mandate property protection measures. CRS credits are provided for the actual projects after they are completed. However, to participate in CRS, a community must certify that it has adequate flood insurance on all properties that have been required to be insured. The minimum requirement is to insure those properties in the mapped floodplain that have received federal aid, as specified by the Flood Disaster Protection Act of 1973.

Repetitive Loss Properties and Analysis

Repetitive loss properties deserve special attention because they are more prone to damage by natural hazards than any other properties in the County planning area. Further, protecting repetitive loss buildings is a priority with FEMA mitigation funding programs.

According to FEMA's records and an analysis in Sacramento County Department of Water Resources' July 2015 Repetitive Loss Area Analysis (RLAA) Report, there are 101 Repetitive Loss Properties within Sacramento County. Several more properties within Sacramento County may have reached the damage threshold for Repetitive Loss Properties, but not all properties are covered by flood insurance and flood insurance claims are not submitted for all flood damage sustained. There are 11 severe repetitive loss properties. Much more information and analysis of the County's RL properties can be found in Section 4.3.10 of the Base plan and the County's RLAA 2015 Report, included as an appendix to this LHMP.

City of Sacramento: NFIP data further indicates that there are 21 repetitive loss (RL) buildings, with 5 RL buildings being insured. There have been a total of 49 RL losses, with 10 insured RL losses. None of the insured RL buildings has incurred 4 or more losses. 18 of the properties are located in the A zone, and 3 RL buildings are located outside of the 100- and 500-year floodplain in the B, C, or X zones. The RL properties are located throughout the city. Repetitive flooding is generally a result of a combination of poor drainage and homes below the street elevation. Drainage improvements in the area have alleviated some of the flooding issues to these RL structures over the years. Citizens are required to have flood insurance in an A zone if they have a federally backed mortgage. Repetitive loss properties are shown in **Error! Reference source not found.** and detailed in **Error! Reference source not found.**. A more detailed repetitive loss area analyses of the City's repetitive loss properties is located in the City's Annex to this LHMP and in their most recent RLAA Report, also included as an Appendix to this LHMP.

Conclusions and Recommendations

- There are several ways to protect individual properties from damage by natural hazards. The advantages and disadvantages of each should be examined for each situation.
- Property protection measures can protect some of the most damage-prone buildings in the Sacramento County planning area including repetitive loss properties.
- Flood insurance promotion has been effective within both Sacramento County and the City of Sacramento as evidenced by the numbers of flood insurance policies.
- Property owners can implement some property protection measures at little cost, especially for sites in areas of low hazards (e.g., shallow flooding, sewer backup, and thunderstorms). For other measures, such as relocation and elevation, the owners may need financial assistance.
- Local government agencies can promote and support property protection measures through several activities, ranging from public information to financial incentives to full funding.
- Government properties, including critical facilities, should be evaluated to determine the extent to which they are protected from flooding.
- Because properties in floodplains are likely to be damaged at some point, efforts should continue to provide information and advice to floodplain property owners. Special attention should be given to repetitive loss and high hazard areas.
- Public education materials can be developed/enhanced to explain property protection measures that can help owners reduce their exposure to damage by floods and the various types of insurance that are available.

- All property protection projects should be voluntary to be most effective. Other than state and federally mandated regulations, local incentives should be positive as much as possible, such as providing financial assistance.
- A FEMA Hazard Mitigation Assistance (HMA) Grant workshop focused on private firms and citizens could be conducted annually to showcase the assistance that FEMA (HMGP, PDM, FMA, RFC and SRL) provides and to encourage public participation.
- A standard checklist could be developed to evaluate a property's exposure to damage from floods. It should include a review of insurance coverage and identify where more information can be found on appropriate property protection measures. The checklist should be provided to each agency participating in this planning process and made available to the public.
- Sacramento County and the City of Sacramento should evaluate its own properties using the standard checklist. A priority should be placed on determining critical facilities' vulnerability to damage and whether public properties are adequately insured.
- Sacramento County and the City of Sacramento should protect their own publicly owned facilities with appropriate mitigation measures.

C.3.3. Natural Resource Protection

Resource protection activities are generally aimed at preserving (or in some cases restoring) natural areas. These activities enable the naturally beneficial functions of fields, floodplains, wetlands, and other natural lands to operate more effectively. Natural and beneficial functions of watersheds, floodplains and wetlands include:

- Reduction in runoff from rainwater and snow melt in pervious areas
- Infiltration that absorbs overland flood flow
- Removal and filtering of excess nutrients, pollutants and sediments
- Storage of floodwaters
- Absorption of flood energy and reduction in flood scour
- Water quality improvement
- Groundwater recharge
- Habitat for flora and fauna
- Recreational and aesthetic opportunities

As development occurs, many of the above benefits can be achieved through regulatory steps for protecting natural areas or natural functions. The regulatory programs are discussed in Section 4.4, Capability Assessment, of the base plan. This Appendix C covers the resource protection programs and standards that can help mitigate the impact of natural hazards, while they improve the overall environment. Seven areas are reviewed:

- Wetland protection
- Erosion and sedimentation control
- River restoration
- Best management practices
- Dumping regulations
- Urban forestry
- Farmland protection

Wetland Protection

Wetlands are often found in floodplains and depressional areas of a watershed. Many wetlands receive and store floodwaters, thus slowing and reducing downstream flows. They also serve as a natural filter, which helps to improve water quality, and they provide habitat for many species of fish, wildlife and plants.

Wetlands that are determined to be part of the waters of the United States are regulated by the U.S. Army Corps of Engineers and the U.S. Environmental Protection Agency (US EPA) under Section 404 of the Clean Water Act. Before a "404" permit is issued, the plans are reviewed by several agencies, including the Corps and the U.S. Fish and Wildlife Service. Each of these agencies must sign off on individual permits.

There are also nationwide permits that allow small projects that meet certain criteria to proceed without individual permits. Wetlands not included in the Corps' jurisdiction or that are addressed by a nationwide permit may be regulated against by local authorities.

If a permit is issued by the Corps, County, or one of the cities, the impact of the development is typically required to be mitigated. Wetland mitigation can include creation, restoration, enhancement or preservation of wetlands elsewhere. Wetland mitigation is often accomplished within the development site, however, mitigation is allowed off-site and sometimes in another watershed. The appropriate type of mitigation is addressed in each permit.

Some developers and government agencies have accomplished the required mitigation by buying into a wetland bank. Wetland banks are large wetlands created for the purpose of mitigation. The banks accept money to reimburse the owner for setting the land aside from development.

When a wetland is mitigated at a separate site there are drawbacks to consider. First, it takes many years for a new wetland to approach the same quality as an existing one. Second, a new wetland in a different location (especially if it is in a different watershed) will not have the same flood damage reduction benefits as the original one did.

Local Implementation

Sacramento County and the City of Sacramento have ordinances that provide parameters for developing near wetlands. These include requirements for restricting grading and soil disturbances in wetlands, drainage ways, stream environment zones, or water bodies.

CRS Credit

The CRS focuses on activities that directly affect flood damage to insurable buildings. While there is no credit for relying on the Corps of Engineers' 404 regulations, there is credit for preserving open space in its natural condition or restored to a state approximating its natural condition. The credit is based on the percentage of the floodplain that can be documented as wetlands protected from development by ownership or local regulations. Likewise, there is credit for maintaining water quality buffers that protect streams, rivers, lakes and shorelines in their natural condition or restoring them to an approximate natural state. Credit is also available for an approved habitat conservation plan.

Erosion and Sedimentation Control

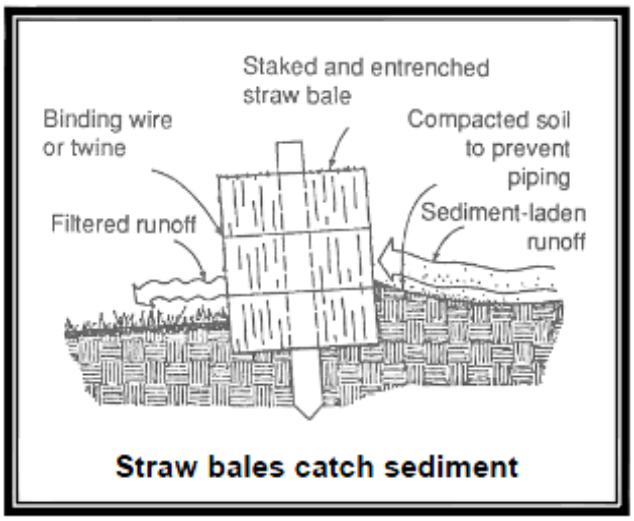
Farmlands and construction sites typically contain large areas of bare exposed soil. Surface water runoff can erode soil from these sites, sending sediment into downstream waterways. Erosion also occurs along stream banks and shorelines as the volume and velocity of flow or wave action destabilize and wash away the soil.

Sediment suspended in the water tends to settle out where flowing water slows down. This can clog storm drains, drain tiles, culverts and ditches and reduce the water transport and storage capacity of river and stream channels, lakes and wetlands. When channels are constricted and flooding cannot deposit sediment in the bottomlands, even more sediment is left in the channels. The result is either clogged streams or increased dredging costs.

Not only are the drainage channels less able to perform their job, but the sediment in the water reduces light, oxygen and water quality, and often carries chemicals, heavy metals and other pollutants. Sediment has been identified by the US EPA as the nation's number one nonpoint source pollutant for aquatic life.

There are two principal strategies to address these problems: minimize erosion and control sedimentation. Techniques to minimize erosion include phased construction, minimal land clearing, and stabilizing bare ground as soon as possible with vegetation and other soil stabilizing practices.

Figure C-8 Erosion Control



If erosion occurs, other measures are used to capture sediment before it leaves the site. Silt fences, sediment traps and vegetated filter strips are commonly used to control sediment transport. Runoff from the site can be slowed down by terraces, contour strip farming, no-till farm practices, hay or straw bales, constructed wetlands, and impoundments (e.g., sediment basins and farm ponds). Slowing surface water runoff on the way to a drainage channel increases infiltration into the soil and reduces the volume of topsoil eroded from the site.

Erosion and sedimentation control regulations mandate that these types of practices be incorporated into construction plans. The most common approach is to require applicants for permits to submit an erosion and sediment control plan for the construction project. This allows the applicant to determine the best practices for the site.

Local Implementation

Both Sacramento County and the City of Sacramento have comprehensive Stormwater Quality Programs and Erosion and Sediment Control Programs which include ordinances and practices for erosion and sedimentation control. In addition, the South Sacramento Habitat Conservation Plan is a regional approach to addressing issues related to urban development, habitat conservation and agricultural protection. The Plan is still in process and is estimated to be approved in Summer 2017.

CRS Credit

Local governments whose ordinances include erosion and sedimentation control provisions can qualify for up to 45 points for this measure.

River Restoration

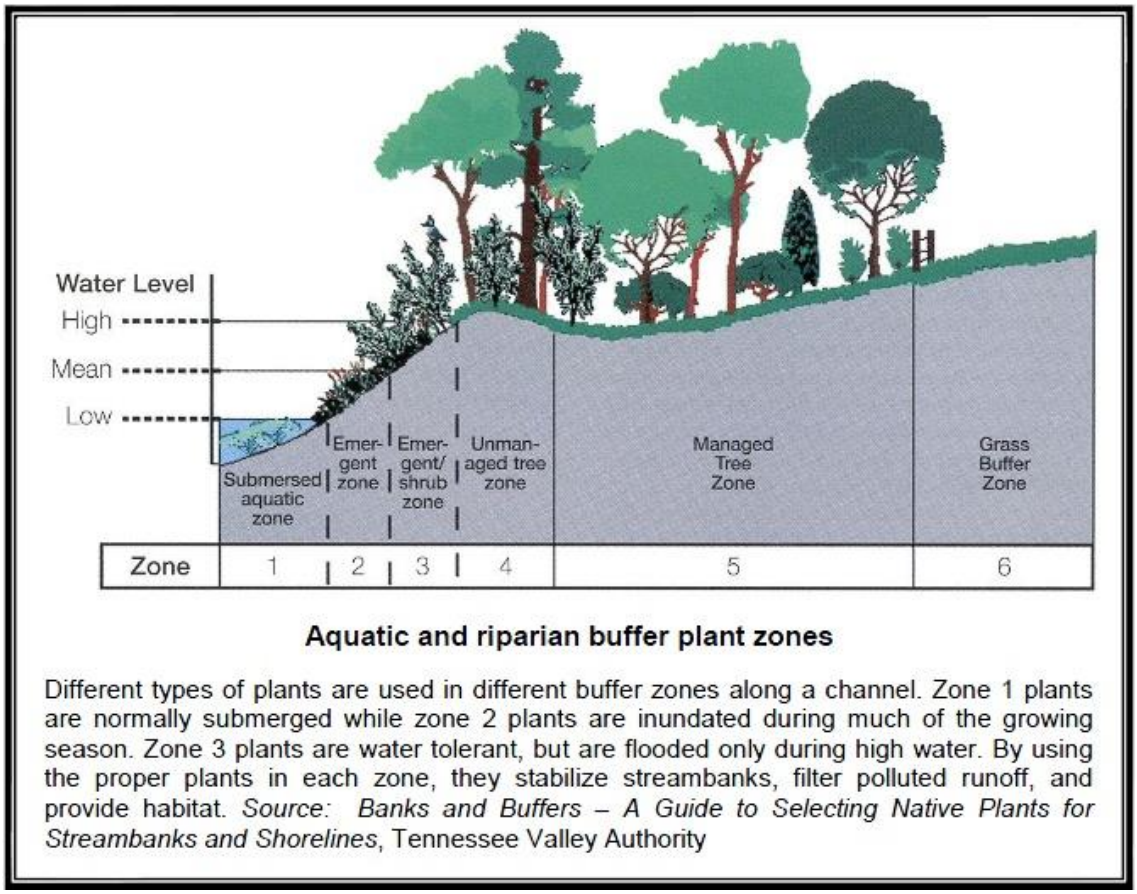
There is a growing movement that has several names, such as "stream conservation," "bioengineering," or "riparian corridor restoration." The objective of these approaches is to return streams, stream banks and adjacent land to a more natural condition, including the natural meanders. Another term is "ecological restoration," which restores native indigenous plants and animals to an area.

A key component of these efforts is to use appropriate native plantings along the banks that resist erosion. This may involve retrofitting the shoreline with willow cuttings, wetland plants, or rolls of landscape material covered with a natural fabric that decomposes after the banks are stabilized with plant roots.

In all, restoring the right vegetation to a stream has the following advantages:

- Reduces the amount of sediment and pollutants entering the water
- Enhances aquatic habitat by cooling water temperature
- Provides food and shelter for both aquatic and terrestrial wildlife
- Can reduce flood damage by slowing the velocity of water
- Increases the beauty of the land and its property value
- Prevents property loss due to erosion
- Provides recreational opportunities, such as hunting, fishing and bird watching
- Reduces long-term maintenance costs

Figure C-9 River Restoration Zones



Aquatic and riparian buffer plant zones

Different types of plants are used in different buffer zones along a channel. Zone 1 plants are normally submerged while zone 2 plants are inundated during much of the growing season. Zone 3 plants are water tolerant, but are flooded only during high water. By using the proper plants in each zone, they stabilize streambanks, filter polluted runoff, and provide habitat. *Source: Banks and Buffers – A Guide to Selecting Native Plants for Streambanks and Shorelines*, Tennessee Valley Authority

Local Implementation

Sacramento County and the City of Sacramento implement a variety of these activities for water quality and floodplain management purposes under many of their existing programs.

CRS Credit

The CRS provides credits for preserving open space in its natural condition or restored to a state approximating its natural condition. There are also credits for channel setbacks, buffers and protecting shorelines. Sacramento County and the City of Sacramento currently receive some credit for open space conservation. Credit is also provided for open space land that is deed restricted

Best Management Practices

Point source pollutants come from pipes such as the outfall of a municipal wastewater treatment plant. They are regulated by the US EPA and the California Department of Water Resources. Nonpoint source pollutants come from non-specific locations and harder to regulate. Examples of nonpoint source pollutants are lawn fertilizers, pesticides, other chemicals, animal wastes, oils from street surfaces and industrial areas,

and sediment from agriculture, construction, mining and forestry. These pollutants are washed off the ground's surface by stormwater and flushed into receiving storm sewers, ditches and streams.

The term "best management practices" (BMPs) refers to design, construction and maintenance practices and criteria that minimize the impact of stormwater runoff rates and volumes, prevent erosion, protect natural resources and capture nonpoint source pollutants (including sediment). They can prevent increases in downstream flooding by attenuating runoff and enhancing infiltration of stormwater. They also minimize water quality degradation, preserve beneficial natural features onsite, maintain natural base flows, minimize habitat loss, and provide multiple usages of drainage and storage facilities.

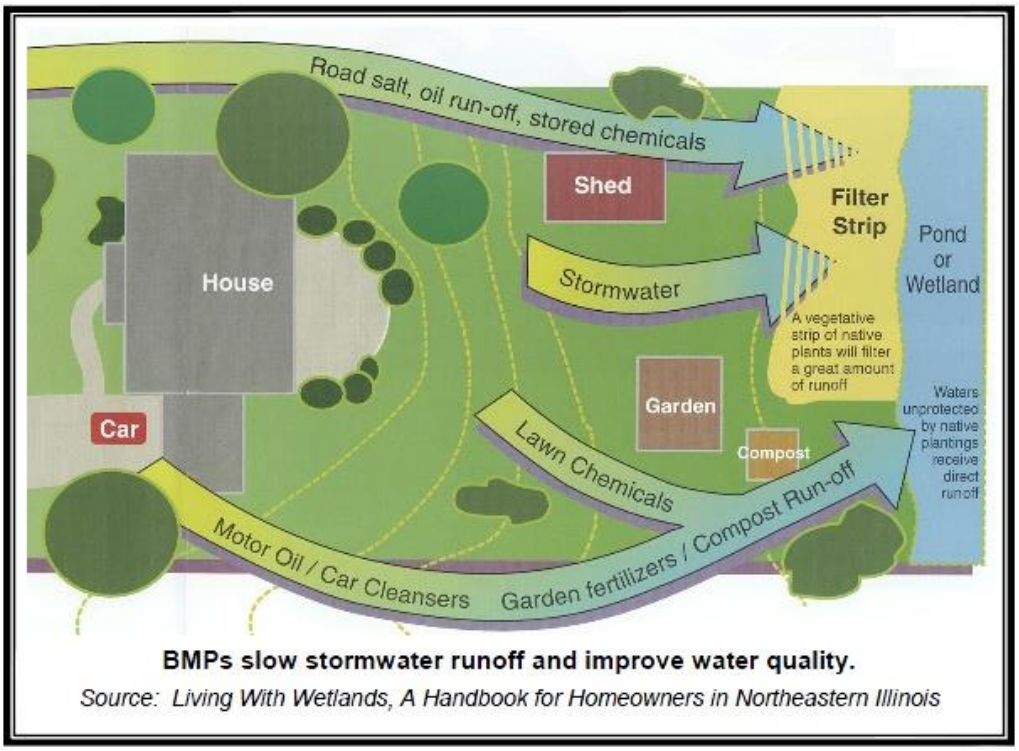
Local Implementation

Sacramento County and the City of Sacramento participate in the National Pollutant Discharge Elimination System permitting program and require BMPs to minimize stormwater impacts.

CRS Credit

A community can receive CRS points if regulations require new developments to include in the design of their permanent stormwater management facilities appropriate BMPs that will improve the quality of surface waters.

Figure C-10 Stormwater Best Management Practices



Dumping Regulations

BMPs usually address pollutants that are liquids or are suspended in water that are washed into a lake or stream. Dumping regulations address solid matter, such as shopping carts, appliances and landscape waste that can be accidentally or intentionally thrown into channels or wetlands. Such materials may not pollute the water, but they can obstruct even low flows and reduce the channels' and wetlands' abilities to convey or clean stormwater.

Many communities have nuisance ordinances that prohibit dumping garbage or other "objectionable waste" on public or private property. Waterway dumping regulations need to also apply to "non-objectionable" materials, such as grass clippings or tree branches, which can kill ground cover or cause obstructions in channels. Regular inspections to catch violations should be scheduled.

Many people do not realize the consequences of their actions. They may, for example, fill in the ditch in their front yard without realizing that is needed to drain street runoff. They may not understand how regarding their yard, filling a wetland, or discarding leaves or branches in a watercourse can cause a problem to themselves and others. Therefore, a dumping enforcement program should include public information materials that explain the reasons for the rules as well as the penalties.

Local Implementation

Sacramento County ordinances makes it unlawful for anyone to deposit waste, trash, or debris into a waterway. Ordinances also prohibits the placing of any obstruction in a floodway, including buildings, fill, or fencing. It is also illegal to dump or discharge hazardous materials, trash, or other pollutants into the storm drains. Even grass, leaves and yard clippings that are repeatedly swept into catch basins can clog the drain, causing flooding and the potential for becoming a breeding ground for rodents and insects. Additionally, when grass and leaves decompose they encourage excessive growth of algae which can deprive fish of adequate oxygen.

The City of Sacramento has regulations that make it illegal for anyone to accumulate, store, keep, throw, place, deposit, or dump refuse in any water or waterway, or upon the levees or banks adjacent thereto. The City also has regulations prohibiting the discharge of trash and pollutants into storm drains.

Both the City and County publicize this information on their local websites and through other outreach mechanisms.

CRS Credit

The CRS provides credit for enforcing and publicizing a regulation that prohibits dumping in the drainage system.

Farmland Protection

Farmland protection is quickly becoming an important piece of comprehensive planning and zoning throughout the United States. The purpose of farmland protection is to provide mechanisms for prime,

unique, or important agricultural land to remain as such, and to be protected from conversion to nonagricultural uses.

Frequently, farm owners sell their land to residential or commercial developers and the property is converted to non-agricultural land uses. With development comes more buildings, roads and other infrastructure. Urban sprawl occurs, which can lead to additional stormwater runoff and emergency management difficulties.

Figure C-11 Floodplain Damages to Farmland

Farms on the edge of cities are often appraised based on the price they could be sold for to urban developers. This may drive farmers to sell to developers because their marginal farm operations cannot afford to be taxed as urban land. The Farmland Protection Program in the United States Department of Agriculture's 2002 Farm Bill (Part 519) allows for funds to go to state, tribal, and local governments as well as nonprofit organizations to help purchase easements on agricultural land to protect against the development of the land. Eligible land includes cropland, rangeland, grassland, pastureland, or forest land that is part of an agricultural operation. Certain lands within historical or archaeological resources are also included.

The hazard mitigation benefits of farmland protection are similar to those of open space preservation:

- Farmland is preserved for future generations,
- Farmland in the floodplain keeps damageable structures out of harm's way,
- Farmland keeps more stormwater on site and lets less stormwater runoff downstream,
- Rural economic stability and development is sustained,
- Ecosystems are maintain, restored or enhanced, and
- The rural character and scenic beauty of the area is maintained.

Local Implementation

Sacramento County currently implements the Williamson Land Conservation Act. This Act was passed by the California legislature to preserve agricultural and other open space lands. It was originally drafted to slow the loss of prime agricultural land, regardless of soil quality. In addition, it now provides protection

for wild life habitats, marshlands, salt flats and certain scenic highways. The Act authorizes local governments and property owners to commit land to specified uses of twenty years or more under a binding contract. Once committed, the land is to be valued as open space land pursuant to open space valuation laws (Revenue & Taxation Code Sections 421, et seq.) enacted pursuant to the Open Space Amendment of the California Constitution.

The City of Sacramento has a similar Urban Agriculture Incentive Zone, intended to promote urban agriculture by providing property tax incentives.

CRS Credit

Credit is given for preserving open space in the floodplain, regardless of why it is being preserved. Credit is also provided for density zoning of floodprone areas.

Conclusions and Recommendations

- A hazard mitigation program can use resource protection programs to support protecting areas and natural features that can mitigate the impacts of natural hazards.
- Sacramento County and the City of Sacramento enforce regulations that prohibit illicit discharges into public sewers or onto public or private property.
- Preserving farmland in the floodplain will maintain open space and prevent damage to homes, businesses, and other development.
- The public and decision makers should be informed about the hazard mitigation benefits of restoring rivers, wetlands and other natural areas. Restoration and protection techniques should be explained.
- Sacramento County and the City of Sacramento may consider publicizing their illicit discharge rules more widely.
- Public outreach activities should include informing the public about the need to protect streams and wetlands from dumping and inappropriate development and the relevant codes and regulations.

C.3.4. Emergency Services Measures

Emergency services measures protect people during and after a disaster. A good emergency management program addresses all hazards, and it involves all local government departments. At the state level, emergency services programs are coordinated by the California Office of Emergency Services (Cal OES). Locally, emergency services are coordinated by the Sacramento County Office of Emergency Services and the City of Sacramento Office of Emergency Services.

This section reviews emergency services measures following a chronological order of responding to an emergency. It starts with identifying an impending problem (threat recognition) and continues through post-disaster activities.

Threat Recognition

The first step in responding to a flood, storm, or other natural hazard is to know when weather conditions are such that an event could occur. With a proper and timely threat recognition system, adequate warnings can be disseminated.

Routine Monitoring for Alerts, Watches and Warnings

Emergency officials constantly monitor events and the environment to identify specific threats that may affect their jurisdiction and increase awareness levels of emergency personnel and the community when a threat is approaching or imminent.

The National Weather Service (NWS) is the prime agency for detecting meteorological threats, such as tornadoes, thunderstorms and winter storms. Severe weather warnings are transmitted through NOAA's Weather Radio System. Federal agencies can only look at the large scale, e.g., whether conditions are appropriate for the formation of a thunderstorm. Local emergency managers can provide more site-specific and timely recognition by sending out NWS trained spotters to watch the skies when the Weather Service issues a watch or a warning. The NWS page for Sacramento County is accessible through the Sacramento County website and at the following: http://forecast.weather.gov/MapClick.php?zoneid=CAZ017.

A flood threat recognition system predicts the time and height of a flood crest. This can be done by measuring rainfall, soil moisture, and stream flows upstream of the community and calculating the subsequent flood levels.

On larger rivers, this measuring and calculating is performed by the NWS, a part of the U.S. Department of Commerce's National Oceanic and Atmospheric Administration (NOAA). Support for NOAA's efforts is provided by cooperating partners from state and local agencies. Forecasts of expected river stages are made through the Advanced Hydrologic Prediction Service (AHPS) of the National Weather Service. Flood threat predictions are disseminated on the NOAA Weather Wire or NOAA Weather Radio. NOAA Weather Radio is considered by the federal government as the official source for weather information.

On smaller rivers, locally established rainfall and river gauges are needed to establish a flood threat recognition system. The NWS may issue a "flash flood watch." This is issued to indicate current or developing hydrologic conditions that are favorable for flash flooding in and close to the watch area, but the occurrence is neither certain nor imminent. These events are so localized and so rapid that a "flash flood warning" may not be issued, especially if no remote threat recognition equipment is available. In the absence of a gauging system on small streams, the best threat recognition system is to have local personnel monitor rainfall and stream conditions. While specific flood crests and times will not be predicted, this approach will provide advance notice of potential local or flash flooding.

Local Implementation

Sacramento County and City of Sacramento Emergency Operations Plan's (EOP), include procedures for threat identification. The City and County work closely with the NWS for issuing an Emergency Alert System (EAS). Additional Sacramento County's threat identification mechanisms include:

California Data Exchange Center (CDEC). The CDEC provides information for flood forecasting information at http://cdec.water.ca.gov/. The CDEC installs, maintains, and operates an extensive hydrologic data collection network including automatic snow reporting gages for the Cooperative Snow Surveys Program and precipitation and river stage sensors for flood forecasting.

Automated Local Evaluation in Real Time (ALERT) System. ALERT was created by the NWS to provide continuous and automatic reports from river levels and rainfall gauges detect impending high water levels. ALERT information includes:

- Rainfall Summary
- Stage Summary
- Storm Ready
- Sandbag Information
- Detailed Forecast
- Quantitative Precipitation Forecasts (QPF)
- NWS River Forecasts

The Sacramento County's ALERT system consists of 2 base stations, and 50 gaging stations. The purpose of the County's ALERT website is to provide real time monitoring information to stage and rainfall information during storm events, which assist in informing the activation of additional warning and potential evacuation of affected areas. This information which can be accessed through the Sacramento County website includes information for: Stream Level Summaries and Maps; and Rainfall Summaries and Maps. See https://www.sacflood.org/home.php.

Dam Protocols. Should an event trigger the activation of an Emergency Action Plan (EAP) for a potential dam failure, County OES receives this information via direct phone calls from the originating source/agency or from PCSO Dispatch and/or Cal OES. County OES then follows the notification and evacuation procedures called for in the EAP.

Increased Readiness & Pre-Impact

Early threat identification and sufficient warning provides the opportunity for response agencies to increase readiness, which are actions designed to increase an agency's ability to effectively respond once the emergency occurs. This includes steps to brief key officials, disseminating information to the community, and through activation of EOCs, as necessary.

Community Preparedness and Awareness

Emergency public information is a priority during emergencies and disasters. County and City governments have a primary responsibility to provide accurate and timely information to the public regarding conditions, threats, and protective measures. Emergency information is best communicated when centralized and coordinated among all involved jurisdictions, agencies, and organizations.

The public's response to any emergency is based on an understanding of the nature of the emergency, the potential hazards, the likely response of emergency services, and knowledge of what individuals and groups should do to increase their chances of survival and recovery. Effective public awareness and education prior to an emergency or a disaster will directly affect the Sacramento County/City's emergency operations response and recovery efforts.

CRS Credit

Credit can be received for using river flood stage predictions for the NWS's gages. The actual score is based on how much of the community's floodplain is affected by these systems. Potential CRS credit is possible under Activity 610 - Flood Warning Program and Response.

Notifications and Warning Systems

Once a disaster is imminent, action is taken to control the situation, save lives, protect property, and minimize the effects of the disaster. During this phase, warning systems are activated; resources and first responders notified and mobilized; and evacuations begin.

After a threat recognition system tells the emergency services office that a flood, severe weather or other hazard is coming, the next step is to notify the public and staff of other agencies and critical facilities. Providing adequate and timely notification to the public is the greatest challenge, especially with sudden or no-notice events. The earlier and more specific the warning, the greater the number of people that can implement protection measures.

As previously described, the NWS issues notices to the public using two levels of notification:

- **Watch.** Conditions are right for flooding, thunderstorms, or other hazard event.
- **Warning**. A flood or other event has started or been observed.

A more specific warning may be disseminated by the community in a variety of ways. The following are the more common methods:

- Commercial or public radio or TV stations
- The Weather Channel
- Cable TV emergency news inserts
- Telephone trees/mass telephone notification
- NOAA Weather Radio
- Tone activated receivers in key facilities
- Outdoor warning sirens
- Sirens on public safety vehicles
- Door-to-door contact
- Mobile public address systems
- Email notifications

Multiple or redundant systems are most effective - if people do not hear one warning, they may still get the message from another part of the system. Each has advantages and disadvantages:

- Radio and television provide a lot of information, but people have to know when to turn them on. They are most appropriate for hazards that that develop over more than a day, such as a tropical storm, hurricane, or winter storm.
- NOAA Weather Radio can provide short messages of any impending weather hazard or emergency and advise people to turn on their televisions for more information, but not everyone has a Weather Radio.
- Outdoor warning sirens can reach many people quickly as long as they are outdoors. They do not reach people in tightly-insulated buildings or those around loud noise, such as at a factory, during a

thunderstorm, or in air conditioned homes. They do not explain what hazard is coming, but people should know to turn on a radio or television when they hear the siren.

- Automated telephone notification services are also fast, but can be expensive and do not work when phone lines are down. Nor do they work for unlisted numbers, call screening services, or cellular service, unless people sign up for notifications.
- Where a threat has a longer lead time, going door-to-door and manual telephone trees can be effective.

Just as important as issuing a warning is telling people what to do in case of an emergency. A warning program should have a public information aspect. Citizens should know the difference between a tornado warning (when they should seek shelter in a low spot), a flood warning (when they should stay out of low areas), and other appropriate warnings and responses.

StormReady

The National Weather Service established the StormReady program to help local governments improve the timeliness and effectiveness of hazardous weather related warnings for the public. To be officially StormReady, a community must:

- Establish a 24-hour warning point and emergency operations center,
- Have more than one way to receive severe weather warnings and forecasts and to alert the public,
- Create a system that monitors weather conditions locally,
- Promote the importance of public readiness through community seminars, and
- Develop a formal hazardous weather plan, which includes training severe weather spotters and holding emergency exercises.

Being designated a StormReady community by the National Weather Service is a good measure of a community's emergency warning program for weather hazards. It is also credited by the CRS.

Local Implementation

In coordination with established public safety warning protocols, the activated EOCs for Sacramento County and the City of Sacramento will manage the dissemination of timely and adequate warnings to threatened populations in the most direct and effective means possible. Depending upon the threat and time availability, the County and City EOCs will initiate alerts and warnings utilizing any of the following methods:

- Activation of the Emergency Alert System (EAS)
- Activation of the Telephonic Alert and Warning System (Everbridge and Reverse 911)
- Activation of the Emergency Digital Information System (EDIS)
- Activation of the California Law Enforcement Mutual Aid Radio System (CLEMARS)
- Media broadcast alerts.
- Commercial or public radio or TV stations
  - ✓ Radio: KFBK 1530 am, KSTE 650, KGBY, 92.5 FM
  - ✓ TV: KCRA Channel 3, www.KCRA.com; KXTV Channel 10; KOVR Channel 13; KTXL Channel 40
- NOAA Weather Radio
- www.saccounty.net; SacramentoReady.org websites
- 211/311 Sacramento

- CalTrans 511
- Telephone trees/mass telephone notifications
- Tone activated receivers in key facilities
- Fire and Law enforcement loudspeakers
- Outdoor warning sirens
- Mobile public address sirens/systems
- Door-to-door contact
- Vulnerable population databases
- Email notifications

Sacramento ALERT

The Sacramento County OES, in partnership with Yolo and Placer emergency agencies, use a state-of-the-art emergency alert system known as Sacramento Alert. The system provides information to residents about emergency events quickly and through a variety of communication methods.

The alert system currently includes all listed and unlisted landline telephone numbers in Yolo, Placer, and Sacramento counties that are serviced by AT&T and Verizon.

To ensure emergency notices are received quickly both at work and home, residents are encouraged to log onto the Sacramento Alert Self- Registration Portal and provide phone numbers for both home and work, including land and cell phone numbers, email addresses, TTY device information and instant messaging information.

Residents will only receive alerts that are critical and time-sensitive, including: flooding, levee failures, severe weather, disaster events, unexpected road closures, missing persons, and evacuations of buildings or neighborhoods in specific geographic locations.

The system, which uses Everbridge Alert and Notifications System, was made possible for all three counties by a grant from CAL OES and supported by CA Department of Water Resources, Flood Operations Center through the Sacramento County OES.

In addition, both Sacramento County and the City of Sacramento are StormReady certified.

CRS Credit

Community Rating System points are based on the number and types of warning media that can reach the community's flood prone population. Depending on the location, communities can receive credit for the telephone calling system and more points if there are additional measures, like telephone trees. Being designated as a StormReady community can provide additional points. These credits are in Activity 610 - Flood Warning Program and Response.

Response

The protection of life and property is the most important task of emergency responders. Concurrent with threat recognition and issuing warnings, a community should respond with actions that can prevent or reduce damage and injuries. Typical actions and responding parties include the following:

- Activating the emergency operations center (emergency preparedness),
- Closing streets or bridges (police or public works),
- Shutting off power to threatened areas (utility company),
- Passing out sand and sandbags (public works),
- Holding children at school or releasing children from school (school superintendent),
- Opening evacuation shelters (the American Red Cross),
- Monitoring water levels (public works), and
- Establishing security and other protection measures (police).

An emergency action plan ensures that all bases are covered and that the response activities are appropriate for the expected threat. These plans are developed in coordination with the agencies or offices that are given various responsibilities.

A flood stage forecast map shows areas that will be under water at various flood stages. Different flood levels are shown as color coded areas, so the emergency manager can quickly see what will be affected. Emergency management staff can identify the number of properties flooded, which roads will be under water, which critical facilities will be affected, and who to warn. With this information, an advance plan can be prepared that shows problem sites and determines what resources will be needed to respond to the predicted flood level.

Emergency response plans should be updated annually to keep contact names and telephone numbers current and to ensure that supplies and equipment that will be needed are still available. They should be critiqued and revised after disasters and exercises to take advantage of the lessons learned and of changing conditions. The end result is a coordinated effort implemented by people who have experience working together so that available resources will be used in the most efficient manner possible.

Local Implementation

Sacramento County and City of Sacramento OES have established response protocols to be followed for any given event. Response is provided cooperation with the County Sherriff, city police, and fire departments. The County and City EOPs address the planned response to emergency situations associated with natural disasters and emergencies in or affecting the area. The EOPs are intended to facilitate multi-agency and multi-jurisdictional coordination in emergency operations. They seek to mitigate the effects of hazards, prepare for measures to be taken which will preserve life and minimize damage, enhance response during emergencies and provide necessary assistance, and establish a recovery system to return the County the local jurisdictions to their normal state of affairs.

CRS Credit

The CRS program provides credit under Activity 610- Flood Warning for a warning system that effectively notifies residents of a flood and has procedures for testing and monitoring the system.

Evacuation and Shelter

According to Emergency Management: Principles and Practice, the principle of evacuation is to move citizens from a place of relative danger to a place of relative safety, via a route that does not pose significant danger. There are six key components to a successful evacuation:

- Adequate warning
- Adequate routes
- Proper timing to ensure the routes are clear
- Traffic control
- Knowledgeable travelers
- Care for special populations (e.g., the handicapped, prisoners, hospital patients, and schoolchildren)

Those who cannot get out of harm's way need shelter. Typically, the American Red Cross will staff a shelter and ensure that there is adequate food, bedding, and wash facilities. Shelter management is a specialized skill. Managers must deal with problems like scared children, families that want to bring in their pets, and the potential for an overcrowded facility.

Local Implementation

The County and City both maintain Evacuation Plans that outline strategies and protocols for medium to high-level (catastrophic) evacuation events in the County. These plans also include procedures for sheltering to provide people affected by a disaster with a safe, temporary place to be housed during or immediately after a disaster until they can either return to their homes or be relocated to other housing facilities. Highlights of these County/City plans are detailed below.

Sacramento County

Sacramento County's Evacuation Plan, 2008, is an annex to the County EOP. An update to the 2008 Evacuation Plan is scheduled for 2016. The purpose of the Evacuation Plan is to document agreed upon strategy for the County's response to emergencies that involve the evacuation of persons from an impacted area to a safe area. This involves coordination and support for the safe and effective evacuation of the general population and for those who need additional support to evacuate, such as health care facilities and schools. This plan also includes considerations for shelter-in-place options, in circumstances where evacuation may be a higher risk option. All evacuation and sheltering-in-place for medium and high level catastrophic incidents will be coordinated through Sacramento County EOC. Low level incidents will be handled at a more local level, such as through local fire departments. Care and sheltering of evacuees will be handled through Sacramento County's Department of Human Assistance (DHA), with support from Red Cross. The County's Evacuation Plan identifies criteria and triggers for determining what level of evacuation is warranted; information on transportation and evacuation movement control; and roles and responsibilities of agencies/organizations supporting the evacuation.

City of Sacramento

The City EOP identifies roles and responsibilities for coordinating evacuation in the City. Evacuation routes are established for 20 areas within the City. The City Law Enforcement Branch has the responsibility to coordinate area evacuations. Wide-spread evacuations are coordinated with County OES and other local and regional agencies.

Rescue and Evacuation Planning

The City has also established guidelines that focus on public safety during a flood event as an amendment (Appendix K) to its floodplain ordinance. This includes City guidelines for public refuge areas and evacuation locations for rescue areas are based on potential flood depths from the time of levee failure.

Rescue and evacuation planning analysis and maps have been developed based on several levee break scenarios and are being used to support these public safety measures during a levee failure event and include development guidelines to address:

- Refuge and staging locations with exits (e.g., second floor areas with windows or balconies
- Exit locations when the way out is in an extraordinary location for persons with disabilities (e.g., a roof hatch)
- Evacuation points/routes for transport to safety

CRS Credit

Because it is primarily concerned with protecting insurable buildings, the CRS does not provide any special credit for evacuation or sheltering of people (minimal credit is given in Activity 510 - Floodplain Management for evacuation policies and procedures). It is assumed that the emergency response plan would include all necessary actions in response to a flood.

Post-Disaster Recovery and Mitigation

After a disaster, communities should undertake activities to protect public health and safety and facilitate recovery. Appropriate measures include:

- Patrolling evacuated areas to prevent looting,
- Providing safe drinking water,
- Monitoring for diseases,
- Vaccinating residents for tetanus and other diseases,
- Clearing streets, and
- Cleaning up debris and garbage.

Throughout the recovery phase, everyone wants to get "back to normal." The problem is that "normal" means the way they were before the disaster, exposed to repeated damage from future disasters. There should be an effort to help prepare people and property for the next disaster. Such an effort would include:

- Public information activities to advise residents about mitigation measures they can incorporate into their reconstruction work,
- Evaluating damaged public facilities to identify mitigation measures that can be included during repairs,
- Identifying other mitigation measures that can lessen the impact of the next disaster,
- Acquiring substantially or repeatedly damaged properties from willing sellers,
- Planning for long-term mitigation activities, and
- Applying for post-disaster mitigation funds.

Regulating Reconstruction

Requiring permits for building repairs and conducting inspections are vital activities to ensure that damaged structures are safe for people to reenter and repair. There is a special requirement to do this in floodplains, regardless of the type of disaster or the cause of damage. The NFIP requires that local officials enforce the substantial damage regulations. These rules require that if the cost to repair a building in the mapped floodplain equals or exceeds 50% of the building's market value, the building must be retrofitted to meet the standards of a new building in the floodplain. In most cases, this means that a substantially damaged building must be elevated above the base flood elevation.

This requirement can be very difficult for understaffed and overworked offices following a disaster. However, if these activities are not carried out properly, not only does the community miss a tremendous opportunity to redevelop or clear out a hazardous area, it may be violating its obligations under the NFIP. In some areas, mutual aid agreements have been established so building inspectors from a community not affected by the disaster can work in the communities that were hit the hardest.

Local Implementation

Sacramento County and City of Sacramento EOPs hav post-disaster recovery policies in place for the communities. The EOPs are intended to facilitate multi-agency and multi-jurisdictional coordination during emergencies including hazard events. Through it policies and procedures it seeks to mitigate the effects of hazards, prepare for measures to be taken which will preserve life and minimize damage, enhance response during emergencies and provide necessary assistance, and establish a recovery system in order to return the community to their normal state of affairs. The County and City are in the process of updating their EOPs in 2016. Post disaster recovery procedures for all hazards, including flood, are addressed the EOPs and are detailed further in Section 4.4 of the base plan and the City's Annex to this LHMP.

CRS Credit

The CRS does credit post-disaster mitigation procedures if the policies and procedures are incorporated into a flood mitigation or multi-hazard plan through Activity 510 - Floodplain Management Planning.

Conclusions and Recommendations

- There are several threat recognitions systems that can provide the County and City with advance notice of an impending emergency.
- Sacramento County and the City of Sacramento depend on local media outlets, sirens, telephones and door-to-door notices to warn residents. These media should reach most people who need to know of a threat. Consideration should be given to reach special populations that may require additional or different methods.
- Emergency management guidance could be very helpful when things happen quickly and for hazards that have predictable impacts, such as flooding.
- Sacramento County and the City of Sacramento should update and exercise their EOPs on a regular basis.
- Sacramento County, the City of Sacramento, and County jurisdictions should continue to work together to protect people before and after a disaster including an outreach program to promote each community's warning system.

C.3.5. Flood Control Measures

Four general types of flood control projects are reviewed here: levees, reservoirs, diversions, and dredging. These projects have three advantages not provided by other mitigation measures:

- They can stop most flooding, protecting streets and landscaping in addition to buildings,
- Many projects can be built without disrupting citizens' homes and businesses, and
- They are constructed and maintained by a government agency, a more dependable long-term management arrangement than depending on many individual private property owners.

However, as shown below, structural measures can have shortcomings. The appropriateness of using flood control depends on individual project area circumstances.

Pros and Cons of Structural Flood Control Projects

- Advantages
  - ✓ They may provide the greatest amount of protection for land area used.
  - ✓ Because of land limitations, they may be the only practical solution in some circumstances.
  - ✓ They can incorporate other benefits into structural project design, such as water supply and recreational uses.
  - ✓ Regional detention may be more cost-efficient and effective than requiring numerous small detention basins.

- Disadvantages
  - ✓ They can disturb the land and disrupt the natural water flows, often destroying wildlife habitat.
  - ✓ They require regular maintenance, which if neglected can have disastrous consequences.
  - ✓ They are built to a certain flood protection level that can be exceeded by larger floods, causing extensive damage.
  - ✓ They can create a false sense of security, as people protected by a project often believe no flood can ever reach them.
  - ✓ Although it may be unintended, in many circumstances they promote more intensive land use and development in the floodplain.

Levees and Floodwalls

Probably the best known flood control measure is a barrier of earth (levee) or concrete (floodwall) erected between the watercourse and the property to be protected. Levees and floodwalls confine water to the stream channel by raising its banks. They must be well designed to account for large floods, underground seepage, pumping of internal drainage, and erosion and scour. Key considerations when evaluating the use of a levee include:

- Design and permitting costs,
- Right of way acquisition,
- Removal of fill to compensate for the floodwater storage that will be displaced by the levee,
- Internal drainage of surface flows from the area inside the levee,
- Cost of construction,
- Cost of maintenance,

- Mitigation of adverse impacts to wetlands and other habitats,
- Loss of river access and views, and
- Creating a false sense of security, because while levees may reduce flood damage for smaller more frequent rain events, they may also overtop or breach in extreme flood events and subsequently create more flood damage than would have occurred without the levee.

Levees placed along the river or stream edge can degrade the aquatic habitat and water quality of the stream. They also are more likely to push floodwater onto other properties upstream or downstream. To reduce environmental impacts and provide multiple use benefits, a setback levee is often the best project design. The area inside a setback levee can provide open space for recreational purposes and provide access sites to the river or stream.

Floodwalls perform like levees except they are vertical-sided structures that require less surface area for construction. Floodwalls are constructed of steel sheet pile or reinforced concrete, which makes the expense of installation cost prohibitive in many circumstances. Floodwalls also can degrade adjacent habitat and can displace erosive energy to unprotected areas of shoreline downstream.

Reservoirs and Detention

Reservoirs reduce flooding by temporarily storing flood waters behind dams or in storage or detention basins. Reservoirs lower flood heights by holding back, or detaining, runoff before it can flow downstream. Flood waters are detained until the flood has subsided, and then the water in the reservoir or detention basin is released or pumped out slowly at a rate that the river can accommodate downstream.

Reservoirs can be dry and remain idle until a large rain event occurs. Or they may be designed so that a lake or pond is created. The lake may provide recreational benefits or water supply (which could also help mitigate a drought).

Flood control reservoirs are most commonly built for one of two purposes. Large reservoirs are constructed to protect property from existing flood problems. Smaller reservoirs, or detention basins, are built to protect property from the stormwater runoff impacts of new development.

Figure C-12 Retention Pond

Retention pond

Regardless of size, reservoirs protect the development that is downstream from the reservoir site. Unlike levees and channel modifications, they do not have to be built close to or disrupt the area to be protected. Reservoirs are most efficient in deeper valleys where there is more room to store water, or on smaller rivers where there is less water to be stored.

In urban areas, some reservoirs are simply manmade holes, excavated to store floodwaters. Reservoirs in urban areas are typically constructed adjacent to streams (though usually outside of the floodplain). When built in the ground, there is no dam for these retention and detention basins and no dam failure hazard. Wet or dry basins can also serve multiple uses by doubling as parks or other open space uses.

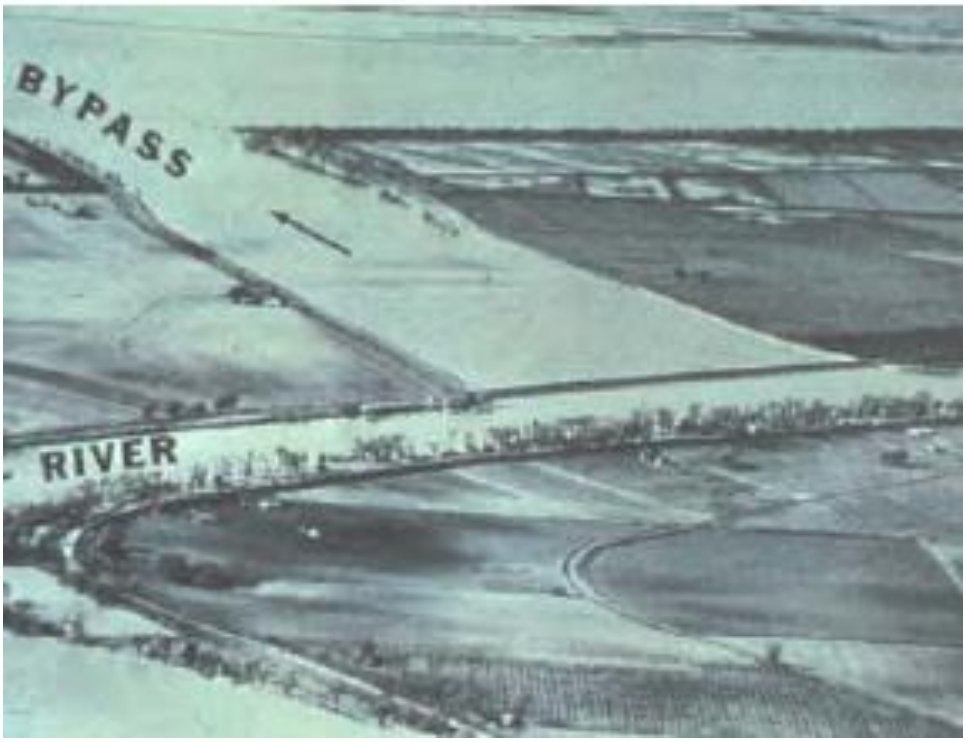
There are several considerations when evaluating the use of reservoirs and detention:

- There is the threat of flooding the protected area should the reservoir's dam fail,
- There is a constant expense for the management and maintenance of the facility,
- They may fail to prevent floods that exceed their design levels,
- Sediment deposition may occur and reduce the storage capacity over time,
- They can impact water quality as they are known to affect temperature, dissolved oxygen and nitrogen, and nutrient levels, and
- If not designed correctly, in-stream reservoirs may cause backwater flooding problems upstream

Diversion

A diversion is a new channel that sends floodwaters to a different location, thereby reducing flooding along an existing watercourse. Diversions can be surface channels, overflow weirs, or tunnels. During normal flows, the water stays in the old channel. During floods, the floodwaters spill over to the diversion channel or tunnel, which carries the excess water to a receiving lake or river.

Figure C-13 Diversion



Diversions are limited by topography; they will not work in some areas. Unless the receiving water body is relatively close to the floodprone stream and the land in between is low and vacant, the cost of creating a diversion can be prohibitive.

Dredging

Dredging is often viewed as a form of conveyance improvement. However, it has the following problems:

- Given the large volume of water that comes downstream during a flood, removing a foot or two from the bottom of the channel will have little effect on flood heights.
- Dredging is often cost prohibitive because the dredged material must be disposed of somewhere.
- Unless in-stream or tributary erosion is corrected upstream, the dredged areas usually fill back in within a few years, and the process and the expense have to be repeated.
- If the channel has not been disturbed for many years, dredging will destroy the habitat that has developed.

Figure C-14 Dredging Activity

To protect the natural values of the stream, federal law requires a U.S. Army Corps of Engineers permit before dredging can proceed. This can be a lengthy process that requires a lot of advance planning and many safeguards to protect habitats, which adds to the cost of the project.

CRS Credit

Structural flood control projects that provide 100-year flood protection and that result in revisions to the Flood Insurance Rate Map are not credited by the CRS in order to avoid duplicating the larger premium reduction provided by removing properties from the mapped floodplain.

The CRS credits smaller flood control projects that meet the following criteria:

- They must provide protection to at least the 25-year flood,
- They must meet certain environmental protection criteria,
- They must meet federal, state and local regulations, such as the Corps of Engineers' 404 permit and California Division of Dam Safety for dam safety rules, and
- They must meet certain maintenance requirements.

These criteria ensure that credited projects are well-planned and permitted. Any of the measures reviewed in this section would be recognized under Activity 530 - Flood Protection, although it would be very hard to qualify a dredging project. Credit points are based on the type of project, how many buildings are protected, and the level of flood protection provided.

Local Implementation

Much of the City of Sacramento and areas of Sacramento County are dependent on levees and other flood control structures to prevent flooding as previously described in this LHMP. In the aftermath of the 1986

floods, several flood control projects were identified to address the flood risks in the Sacramento area. Some of these projects were designed to correct structural deficiencies observed during the flood, while other projects were added once the water had receded and revealed levee conditions. The 1997 flood event also highlighted additional deficiencies that are now being corrected to increase the level of community flood protection.

Conclusions and Recommendations

- In coordination with California Department of Water Resources and the Sacramento Area Flood Control District (SAFCA), flood control and drainage facilities are being brought to current standards of flood protection and prevention.
- Sacramento County, the City of Sacramento, other cities, and special districts should continue to evaluate and implement countywide flood control and drainage improvement projects to reduce the potential from future flooding.

C.3.6. Public Information Measures

A successful hazard mitigation program involves both the public and private sectors. Public information activities advise property owners, renters, and businesses about hazards and ways to protect people and property from these hazards. These activities can motivate people to take the steps necessary to protect themselves and others.

Information can bring about voluntary mitigation activities at little or no cost to the government. Property owners mitigated their flooding problems long before government funding programs existed. The typical approach to delivering information involves two levels of activity. The first is to broadcast a short and simple version of the message to everyone potentially affected. The second level provides more detailed information to those who respond and want to learn more.

This section starts with activities that reach out to people and tell them to be advised of the hazards and some of the things they can do. It then covers additional sources of information for those who want to learn more. It ends with a general public information strategy.

Outreach Projects

Outreach projects are the first step in the process of orienting property owners to the hazards they face and to the concept of property protection. They are designed to encourage people to seek out more information in order to take steps to protect themselves and their properties.

Research has shown that outreach projects work. However, awareness of the hazard is not enough; people need to be told what they can do about the hazard. Thus, projects should include information on safety, health and property protection measures. Research has also shown that a properly run local information program is more effective than national advertising or publicity campaigns. Therefore, outreach projects should be locally designed and tailored to meet local conditions.

Community newsletters/direct mailings: One of the more effective types of outreach projects include mailings or distributions to everyone in the community. In the case of floods, they may be sent only to floodplain property owners.

News media: Local newspapers can be strong allies in efforts to inform the public. Press releases and story ideas may be all that's needed to gain their interest. After a flood in another community, people and the media become interested in their flood hazard and how to protect themselves and their property. Local radio stations and cable TV channels can also help. These media offer interview formats and cable TV may be willing to broadcast videos on the hazards.

Other approaches: Examples of other outreach projects include:

- Presentations at meetings of neighborhood, civic or business groups,
- Displays in public buildings or shopping malls,
- Signs in parks, along trails and on waterfronts that explain the natural features (such as the river) and their relation to the hazards (such as floods),
- Social Media broadcasts,
- Brochures available in municipal buildings and libraries, and
- Special meetings, workshops and seminars.

Local Implementation

Sacramento County and the City of Sacramento maintain websites that provides in-depth flood protection information. The County and City also provide direct mailings annually to residents, with a focus on repetitive loss areas, which include flyers on flood protection and property protection measures. The County and City also provides direct mailings on flood protection information to insurance brokers and realtors located throughout the community. In addition, the County's water resources and stormwater groups and the City's utility department also conduct and participate in a variety of public community events throughout the year such as community fairs, river cleanups, etc. and provide information to the public on stormwater management and flood protection measures. The County and City also have a variety of flood materials placed in public locations.

In addition, both the County and City have established Programs for Public Information (PPI) that are being implemented and contain a variety of focused flood outreach efforts as described further in Section 4.4 of the Base plan and the City's Annex to this LHMP.

CRS Credit

The Community Rating System provides credit for outreach projects which cover six flood-related topics. Credit is also available for producing flood response materials. Another way to achieve credit for outreach is for producing a PPI. A 40% bonus is applied to outreach credits which are included in a PPI.

Real Estate Disclosure

Many times after a flood or other natural disaster, people say they would have taken steps to protect themselves if they had known they had purchased a property exposed to a hazard. There are some federal and state requirements about such disclosures, but they have their limits.

Federal law: Federally regulated lending institutions must advise applicants for a mortgage or other loan that is to be secured by an insurable building whether the property is in a floodplain as shown on the Flood Insurance Rate Map. If so, flood insurance is required for buildings located within the floodplain if the mortgage or loan is federally insured. However, because this requirement has to be met only 10 days before closing, the applicant is often already committed to purchasing the property when he or she first learns of the flood hazard.

State law: State laws set standards for real estate sales and licensing of agents and brokers.

Local Implementation

Sacramento County and the City of Sacramento receive credit for providing for the local real estate agents disclosure of flood hazards to prospective buyers. Credit is also provided for state and community regulations requiring disclosure of flood hazards.

CRS Credit

Communities in areas that have additional disclosure requirements are eligible for five points under the "Other disclosure requirements" as well as 10 points for the "Disclosure of other hazards."

Libraries and Websites

The two previous activities tell people that they are exposed to a hazard. The next step is to provide information to those who want to know more. The community library and local websites are obvious places for residents to seek information on hazards, hazard protection, and protecting natural resources.

Books and pamphlets on hazard mitigation can be given to libraries, and many of these can be obtained for free from state and federal agencies. Libraries also have their own public information campaigns with displays, lectures and other projects, which can augment the activities of the local government. Today, websites are commonly used as research tools. They provide fast access to a wealth of public and private sites for information. Through links to other websites, there is almost no limit to the amount of up to date information that can be accessed on the Internet.

In addition to online floodplain maps, websites can link to information for homeowners on how to retrofit for tornadoes and floods or a website about floods for children. The "FEMA for Kids" website teaches children how to protect their home and what to have in a family disaster kit.

Local Implementation

Sacramento County and the City of Sacramento provide a variety of flood materials placed in public locations, including public buildings and public libraries. The County also has an extensive flood protection websites at: http://www.waterresources.saccounty.net/stormready/Pages/default.aspx. The City maintains a similar website at: http://www.cityofsacramento.org/Utilities/Education/Flood-Ready/.

CRS Credit

The Community Rating System provides credit for having a variety of flood references in the local public library and additional credits for similar material included on municipal websites (Activity 350 - Flood Protection Information).

Technical Assistance

Hazard Information

Many benefits stem from providing map information to inquirers. Residents and business owners that are aware of the potential hazards can take steps to avoid problems or reduce their exposure to flooding. Real estate agents and house hunters can find out if a property is floodprone and whether flood insurance may be required.

Communities can easily provide map information from FEMA's DFIRMs and Flood Insurance Studies. They may also assist residents in submitting requests for map amendments and revisions when they are needed to show that a building is located outside the mapped floodplain.

Some communities supplement what is shown on the DFIRM with information on additional hazards, flooding outside mapped areas and zoning. When the map information is provided, community staff can explain insurance, property protection measures and mitigation options that are available to property owners. They should also remind inquirers that being outside the mapped floodplain is no guarantee that a property will never get wet.

Property Protection Assistance

While general information provided by outreach projects or the library is beneficial, most property owners do not feel ready to retrofit their buildings without more specific guidance. Local building department staffs are experts in construction. They can provide free advice, not necessarily to design a protection measure, but to steer the owner onto the right track:

- Building or public works department staffs can provide the following types of assistance:
- Visit properties and offer protection suggestions,
- Recommend or identify qualified or licensed contractors,
- Inspect homes for anchoring of roofing and the home to the foundation,
- Provide advice on protecting windows and garage doors from high winds, and
- Explain when building permits are needed for home improvements.

There is a concern that a local official might provide the wrong information and the community would be sued if a project failed. To counter this, there are guidelines for local programs and training on how to identify the right measures. FEMA conducts a free week-long course at its Emergency Management Institute on property protection measures for flooding. FEMA and the Corps of Engineers periodically conduct one- or two-day retrofitting workshops.

Local Implementation

FEMA floodplain maps are available on local websites for both Sacramento County and the City of Sacramento. The County and City also respond to requests on whether a property is located in a Special Flood Hazard Area. The County and City also maintain elevation certificates for many existing home within or near the SFHA.

CRS Credit

The Community Rating System provides points for providing map information to inquirers. Points are available for providing one-on-one flood protection assistance to residents and businesses and for making site visits. Both services must be publicized.

Public Information Program Strategy

A public information program strategy is a document that receives CRS credit. It is a review of local conditions, local public information needs, and a recommended plan of activities. A strategy consists of the following parts, which are incorporated into this plan:

- The local flood hazard (discussed in Chapter 4)
- The property protection measures appropriate for the flood hazard (discussed in Chapters 4 and 5)
- Flood safety measures appropriate for the local situation (discussed in Chapters 4 and 5)
- The public information activities currently being implemented within the community, including those being carried out by non-government agencies (discussed in Chapter 4 and jurisdictional annexes)
- Goals for the community's public information program (discussed in Chapters 4 and 5)
- The outreach projects that will be done each year to reach the goals (discussed in Chapters 4 and 5)
- The process that will be followed to monitor and evaluate the projects (discussed in Chapter 7)

Figure C-15 illustrates several flood safety tips that can be used in an outreach campaign to better inform the public of the hazards associated with flooding.

Figure C-15 Flood Safety Tips for Outreach Campaign

Flood Safety

Pay attention to evacuation orders. Listen to local radio or TV stations for forecasts and emergency warnings. Know about evacuation routes and nearby shelters and have plans for all family members on how to evacuate and where to meet if you're split up during an emergency.

Do not drive through a flooded area. During a flood, more people drown in their cars than anywhere else. Don't drive around road barriers; the road or bridge may be washed out.

Do not walk through flowing water. Flash flooding is the leading cause of weather-related deaths in the U.S. Currents can be deceptive; 6 inches of moving water can knock you off your feet in a strong current. If you walk in standing water, use a stick to help you locate the ground.

Stay away from power lines and electrical wires. Electrical currents can travel through water. Report downed power lines to the police or sheriff by calling 911.

Have the power company turn off your electricity. Some appliances, like TV sets, keep electrical charges even after they've been unplugged. Don't use appliances or motors that have gotten wet unless they have been taken apart, cleaned and dried.

Look before you step. After a flood, the ground and floors are covered with debris like broken bottles and nails. Floors and stairs that are covered with mud can also be slippery.

Be alert for gas leaks. Use a flashlight to inspect damage. Don't smoke or use candles, lanterns, or open flames unless you know the gas has been shut off and the area has been ventilated.

Look out for animals that may have been flooded out of their homes and who may seek shelter in yours. Use a pole or stick to turn things over and scare away small animals.

Look before you step. After a flood, the ground and floors are covered with debris. Floors and stairs that have been covered with mud will be very slippery.

Carbon monoxide exhaust kills. Use a generator or other gasoline-powered machine outdoors. The same goes for camping stoves. Charcoal fumes are especially deadly – cook with charcoal outdoors.

Clean everything that got wet in the flood. Floodwaters have picked up sewage and chemicals from roads, farms, factories, and storage buildings. Spoiled food, and flooded cosmetics and medicines can be health hazards. When in doubt, throw it out.

Take care of yourself. Recovering from a flood is a big job. It is tough on both the body and the spirit and the effects a disaster has on you and your family may last a long time.

CRS Credit

The CRS provides up to 350 points for a Program for Public Information (PPI).

Conclusions and Recommendations

- There are many ways that public information can be used so that people and businesses will be more aware of the hazards they face and how they can protect themselves.
- Libraries and websites are currently being used as public information tools in Sacramento County and the City of Sacramento.
- The most important topics to cover in public information activities are:
  - ✓ Safety precautions for all types of hazards, but especially floods, earthquakes, thunder storms, winter storms, wildfires, and tornadoes.
  - ✓ Knowing where emergency evacuation shelters are in town.

- ✓ Flood protection measures, including rules for new construction and insurance.
- ✓ Keeping drainage ways clear and protection from local drainage problems.
- ✓ Family and emergency preparedness measures.
- ✓ What the County and cities are doing and sources of assistance.
- ✓ Protecting water quality and wetlands and the benefits of open space.

- The most appropriate ways to spread this information are:
  - ✓ Websites and social media
  - ✓ Mailings to everyone, in utility bills or otherwise
  - ✓ News releases or newspaper articles
  - ✓ Newsletters
  - ✓ Displays, particularly at special events
  - ✓ Handouts, flyers and other materials, which can be distributed at special events and presentations
- County and City staff should continue to reach out to residents, civic organizations and other organizations to help spread the word about flood hazards, flood protection, and safety measures.

Sacramento County Local Hazard Mitigation Plan Update

Mitigation Strategy Meetings: Mitigation Actions v/1, July 12 & 13, 2016

Responsible Jurisdiction/Department	Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
County, Cities	Public outreach: Education and Preparedness for all Hazards and all populations	Multi-hazard	28
County, Cities (FM)	Incorporate LHMP Update by reference through board adoption into the safety element of the General Plan Update	Multi-hazard	N/A*
County, Cities	Business resiliency education and outreach	Multi-hazard	0
County, Cities	Update and maintain countywide Critical Facilities GIS layer	Emergency Services/Multi-hazard	N/A
County, Cities	Increase enrollment in Everbridge	Emergency Services/Multi-hazard	0
All	Backup Generators/pumps – Critical Facilities	Emergency Services/Multi-hazard	27
All	Critical Facility evaluation/mitigation	Emergency Services/Multi-hazard	11
All	Increased data capacity of emergency frequencies	Emergency Services/Multi-hazard	5
County, Cities	Conduct evacuation and shelter planning for all communities and populations (to include all critical hazards, at risk populations, medical, ADA, and an outreach component)	Emergency Services/Multi-hazard	11
County, Cities	Conduct emergency, multi-agency exercises	Emergency Services/Multi-hazard	10
All	Update, maintain, and enhance Emergency Operations Plans	Emergency Services/Multi-hazard	0
County, Cities	Storm Weather radio distribution	Emergency Services/Multi-hazard	3
County Ag Dept.	To be determined (flood, drought, pests)	Agricultural	N/A
County, Cities	Climate Action/Adaptation planning and adaptation strategy development (including new construction)	Climate Change	38
RDs	Levee Crown raising projects	Climate Change/Levee Failure	2
???	Dam O & M	Dam Failure	0

Responsible Jurisdiction/Department	Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
County/RD 800	Consumnes Dam	Dam Failure	0
County	Rancho Marietta improvements?	Dam Failure	0
County	Alder Dam stabilization/removal (mercury issues)	Dam Failure	1
All	Provide repairs/enhancements to water conveyance infrastructure	Drought & Water Supply	N/A
All	Maintain and enhance conservation measures	Drought & Water Supply	17
County, Cities	Develop/Implement metering and tiered rate structures	Drought & Water Supply	1
All	Drought contingency planning	Drought & Water Supply	1
County, Cities	Landscape and irrigation requirements and retrofits	Drought & Water Supply	5
County, Cities	Grey water use/recycled water programs	Drought & Water Supply	13
All	Water Quality studies	Drought & Water Supply	0
County, Cities	Surface and groundwater management planning/studies	Drought & Water Supply	0
All	Block the governor's tunnel project	Drought & Water Supply	8
County, Cities	Implement mandatory green building code	Drought & Water Supply	3
All	Inventory and evaluate options for vulnerable critical facilities (e.g., demolish, retrofit), including URMs	Earthquake	1
All	Bank and levee erosion projects	Erosion/Levee Failure	10
County and City of Sacramento	Continued enhancement of CRS Program	Flood	0
Other Cities	Consider joining CRS	Flood	0
County	RV Park mitigation (near Citrus Heights)	Flood	6
County/Cities	Stockpiling/locating flood fighting materials	Flood	10
County/Cities	Implement LID and hydromodification standards	Flood	7
County	Ring Levees	Flood	6
County, Cities	SB 5 compliance projects	Flood	31
County, Cities	Rep Loss property mitigation	Flood	8
County, Cities	Elevation projects	Flood	21
County, Cities	Acquisition projects	Flood	5
County, Cities	Floodproofing Projects	Flood	5
County, Cities	Insurance promotion	Flood	5

Responsible Jurisdiction/Department	Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
County, Cities	Well protection	Flood	0
All	Information technology and management improvements	Flood	10
All	Channel lining rehab projects	Flood	6
All	Develop/Implement localized stormwater plans/projects (including those to provide for 200-year level of protection)	Flood	21
All	Dry Wells	Flood	24
City of Sac	Implement projects from CFMP (1 worksheet/chap)	Flood	0
All	Utilize green infrastructure	Flood	10
All	Update depth grid data	Flood	5
All	Update and implement regional watershed management plan	Flood	8
County, Cities	FEMA risk map project	Flood	22
County Open Space and Parks	Flood Safety in American River Parkway (evac planning, pre-flood preparations, post-flood cleanup and repairs)	Flood	N/A
County DOT	Bridge replacement on Elk Grove-Florin Road at Elder Creek (will raise bridge several feet)	Flood	N/A
County DOT	Michigan Bar Bridge replacement at Consumnes River (will raise bridge about a foot)	Flood	N/A
County DOT	El Camino Avenue - Second phase road improvements (storm drain pipes and extended drain inlets)	Flood	N/A
All	Implement projects from the Regional Flood Management Plan – Lower Sacramento/Delta North	Flood/Levee Failure	N/A
County, Cities	Develop/update heat contingency plans	Heat	10
County, Cities	Evaluate systematic, multiagency, public-private approach to regional cooling centers	Heat	5
County, Cities	Increase tree planting/canopy preservation/enhancement	Heat/Climate Change	11
County, Cities	Cool Roofs (voluntary green code to mandatory)	Heat/Climate Change	10
County, Cities, RDs	Encroachment: outreach, education, enforcement	Levee Failure	18
County, Cities, RDs	Urban levee design criteria	Levee Failure	3
County, Cities, RDs	Levee Improvement Projects (200-year+, 100-year)	Levee Failure	16
County, Cities, RDs	Operations and Maintenance	Levee Failure	10
County, RDs	Relief cuts	Levee Failure	5
County, RDs	Implement security improvements to facilities	Levee Failure	3
County, Cities, RDs	Widen floodplain (levee setback)	Levee Failure	5
County	Construct weir between Consumnes and Deer Creek	Levee Failure	6
County	Small communities grant implementation	Levee Failure	12

Responsible Jurisdiction/Department	Mitigation Action Title	Hazards Addressed	Points/ Worksheet Status
RDs	Levee splash guards	Wind/Tornado	0
All	Undergrounding of utilities	Wind/Tornado	3
All	Tree trimming and debris removal	Wind/Tornado	2
All	Roofing projects (tie downs/foaming)	Wind/Tornado	0
Metro Fire	Update and maintain American River CWPP	Wildfire	N/A
Metro Fire	Implement Projects from CWPP -Fuels mitigation	Wildfire	5
Metro Fire	Implement Projects from CWPP -Defensible Space0	Wildfire	0
Metro Fire	Implement Projects from CWPP -Public Outreach	Wildfire	0
Metro Fire	Implement Projects from CWPP -Plant restoration and stabilization (native plants)	Wildfire	0
All fire	Develop additional CWPPs	Wildfire	1
All fire	Fuels mitigation	Wildfire	N/A
All fire	Defensible space	Wildfire	N/A
All fire	Public outreach	Wildfire	N/A
All fire	Plant restoration and stabilization (native plants)	Wildfire	N/A
All fire	Hazardous Vegetation Mitigation	Wildfire	0
All fire	Weed abatement code enforcement	Wildfire	2
All fire	WUI Fire code development and implementation	Wildfire	0
County Open Space and Parks	Fire hazard reduction in Parks/Open Space (hand crews, grazing, prescribed burns, mechanical removal, invasive species removal, County Ordinance/policy change to minimize fire ignition hazards)	Wildfire	N/A
County and Cities	Continue grazing programs	Wildfire	N/A
County Open Space and Parks	Wildfire fighting improvements (maintain clearance for fire access, signage for access routes, maintain fuel breaks, technology updates, training burns, maintain fire hydrants/access gates)	Wildfire	N/A

Appendix D Adoption Resolution

Note to Reviewers: When this plan has been reviewed and approved pending adoption by FEMA Region IX, the adoption resolutions will be signed by the participating jurisdictions and added to this appendix. Two model resolutions are provided below. The first resolution should be used by the County and all incorporated communities as it also includes language to adopt the 2016 LHMP Update into the Safety Element of the General Plan. The second resolution should be used by all participating Districts to this LHMP Update.

Sample Resolution for Sacramento County and Incorporated Communities

Resolution # _____

Adopting the Sacramento County Local Hazard Mitigation Plan

Whereas, (Name of Government/District/Organization seeking FEMA approval of hazard mitigation plan) recognizes the threat that natural hazards pose to people and property within our community; and

Whereas, undertaking hazard mitigation actions will reduce the potential for harm to people and property from future hazard occurrences; and

Whereas, the U.S. Congress passed the Disaster Mitigation Act of 2000 ("Disaster Mitigation Act") emphasizing the need for pre-disaster mitigation of potential hazards;

Whereas, the Disaster Mitigation Act made available hazard mitigation grants to state and local governments;

Whereas, an adopted Local Hazard Mitigation Plan is required as a condition of future funding for mitigation projects under multiple FEMA pre- and post-disaster mitigation grant programs; and

Whereas, (Name of Government/District/Organization) fully participated in the FEMA-prescribed mitigation planning process to prepare this local hazard mitigation plan; and

Whereas, the California Office of Emergency Services and Federal Emergency Management Agency, Region IX officials have reviewed the Sacramento County Local Hazard Mitigation Plan and approved it contingent upon this official adoption of the participating governing body;

Whereas, the (Name of Government/District/Organization) desires to comply with the requirements of the Disaster Mitigation Act and to augment its emergency planning efforts by formally adopting the Sacramento County Local Hazard Mitigation Plan;

Whereas, adoption by the governing body for the (Name of Government/District/Organization), demonstrates the jurisdiction's commitment to fulfilling the mitigation goals and objectives outlined in this Local Hazard Mitigation Plan.

Whereas, adoption of this legitimizes the plan and authorizes responsible agencies to carry out their responsibilities under the plan.

Now, therefore, be it resolved, that the (Name of Government/District/Organization) adopts the Sacramento County Local Hazard Mitigation Plan as an official plan; and

Be it resolved, that the (Name of Government/District/Organization) adopts the Sacramento County Local Hazard Mitigation Plan by reference into the safety element of their general plan in accordance with the requirements of AB 2140, and

Be it further resolved, (Name of Government/District/Organization) will submit this adoption resolution to the California Office of Emergency Services and FEMA Region IX officials to enable the plan's final approval in accordance with the requirements of the Disaster Mitigation Act of 2000 and to establish conformance with the requirements of AB 2140.

No	57.14%	12
I don't know	14.29%	3
Total		21

Appendix G Repetitive Loss Area Analysis Report

CITY OF SACRAMENTO
REPETITIVE LOSS AREA ANALYSIS SUMMARY

On May 3, 2016, the City's Repetitive Loss Area Analysis (RLAA) was adopted by City Council as part of the City of Sacramento's Comprehensive Flood Management Plan. The RLAA analyzed the cause of repetitive flooding for five regions within the city. It was found that the main cause of repetitive flooding was the undersized drainage conveyance system. GEI Consultants conducted further investigation of flooding for Region 5 properties and provided mitigation recommendations for three areas within the region. The updated RLAA (December 2016) has been incorporated into the 2016 Comprehensive Flood Management Plan. Below is a summary of the City of Sacramento's Repetitive Loss Area Analysis.

Region 1 – South Natomas

The greater Natomas basin is 55,000 acres in size and extends into the northwest portion of Sacramento County running south just north of downtown at the American River Parkway (3 miles from downtown). Within the City, the area of the Natomas basin is approximately 12,500 acres and is surrounded by levees. The area of the Natomas is identified within the SFHA and is at risk to internal drainage issues, riverine flooding and potential breach. The Natomas area is broken into North Natomas and South Natomas, with our focus in terms of the RLAA being on South Natomas. Within the South Natomas area, three repetitive loss areas were analyzed.

Region 1 Overview	
Number of Properties in the Defined Region	92
Number of NFIP Repetitive Loss Properties	3
Number of Claims	6
Dates of Flooding	January 1995, January 1997, February 1998, January 2000
Flood Zone	A99

Findings and Recommendations:
Area 1: The addition of fill to the repetitive loss property causes water to seep into a portion of the structure that is built below grade. *Recommendations:* Remove the landscaping fill from the property, sandbags, or elevate the portion of the structure that is built below grade.

Area 2: Flooding occurred during heavy winter storms. The source of the flooding was from an adjacent property built at a higher elevation. *Recommendations:* Grading on the property to redirect the flow of water, installation of drains to divert pooling water, or sandbags.

Area 3: Flooding was caused due to the failure of a floodproofing system on a building located on the river side of levee. *Recommendations:* Improvement or replacement of floodproofing system.

Region 2 – Downtown East

The three repetitive loss areas in Region 2 are located in or near the River Park Neighborhood. This neighborhood is located west of Sacramento State University and follows the American River. This area is vulnerable to overbank flooding and has other risks such as drainage issues from the combined sewer system.

Region 2 Overview	
Number of Properties in the Defined Region	74
Number of NFIP Repetitive Loss Properties	3
Number of Claims	7
Dates of Flooding	February 1986, June 1993, April 1995, January 1995, January 1997, February 1998
Flood Zone	Shaded-X Zone

Findings and Recommendations:
Area 4: During the flooding events, the industrial park was in a low-lying area near the American River with an undersized drainage conveyance system and with no onsite drainage. *Recommendations:* It is recommended that this area be removed from the Repetitive Loss List because of the completion of mitigation projects. Sump 31 has been enlarged and a new force main was constructed to the American River. Additionally, a detention basin has also been added to help mitigate flooding in the area.

Area 5: Flooding occurred during heavy storms that overwhelmed the undersized drainage system in the area. *Recommendations:* Based on the Basin 10 Drainage Master Plan, it is suggested that critical pipes in the system should be enlarged and a detention basin should be constructed to provide adequate flood protection for the basin. These improvements would mitigate the repetitive loss properties in Area 5.

Area 6: This area is located in the combined sewer system with an undersized drainage conveyance system. During large storms water pools in the streets and yards of the surrounding residents. Most flood loss was due to water seeping into garages and into doorways located at grade level. *Recommendations:* Improvement of drainage system, elevation of lower homes, sandbags, flood insurance, and outreach to express the importance of keeping storm drains clear of leaves and debris.

Region 3 – Downtown West

Region 3 of the City of Sacramento's RLAA is the western portion of Downtown Sacramento located just east of the Sacramento River. This area consists of several commercial buildings and high-rises as well as housing. The repetitive loss properties located in this region are all in the category of housing and the primary source of flooding in this area occurs due to the combined sewer systems that back up due to the undersized conveyance system.

Region 3 Overview	
Number of Properties in the Defined Region	234
Number of NFIP Repetitive Loss Properties	5
Number of Claims	13
Dates of Flooding	January 1995, March 1995, December 1995, January 1997, September 2004
Flood Zone	Shaded-X

Findings and Recommendations:
Areas 7-11: These areas are located in the combined sewer system with an undersized conveyance system. Flooding occurs when the system is overwhelmed due to a long duration storm. *Recommendations:* Improvement of drainage system, elevation of buildings, basements and garages, sandbags or floodgates, and flood insurance.

Region 4 – Southeast Sacramento

Region 4 of the RLAA is located near the Southeast portion of Sacramento's city limits. This entire region is comprised of residential properties located between 65th Avenue and Power Inn Road. There are 2 repetitive loss properties located in this region that have flooded due to uneven land. Water from higher adjacent properties flows into low lying areas cause some homes to flood.

Region 4 Overview	
Number of Properties in the Defined Region	79
Number of NFIP Repetitive Loss Properties	2
Number of Claims	6
Dates of Flooding	January 1995, December 1996, January 1997, December 2005
Flood Zone	Shaded-X

Findings and Recommendations:
Area 12: This area is in an undersized conveyance system which floods during heavy storms. *Recommendations:* Improvement of drainage system, elevation of buildings, sandbags or floodgates, and flood insurance.

Area 13: Flooding occurred during heavy winter storms. The source of the flooding was from open land adjacent to the property. *Recommendations:* Grading on the property to redirect the flow of water, installation of drains to divert water, or sandbags.

Region 5 – Sutterville/Meadowview

Region 5 of the RLAA stretches from Sutterville Road down south to Meadowview Road. The majority of this area is residential, however it does consist of a few shopping/corporate centers, Bing Maloney Gold Course, and the Sacramento Executive Airport. This entire region is classified by FEMA as a Shaded-X Zone with a low risk of flooding due to surrounding levees.

Region 5 Overview	
Number of Properties in the Defined Region	252
Number of NFIP Repetitive Loss Properties	8
Number of Claims	22
Dates of Flooding	March 1989, January 2000, February 2000, January 1993, January 1995, January 1996, February 1996, January 1997, February 2000, December 2005
Flood Zone	Shaded-X

Findings and Recommendations:

Area 14: Based on the investigation preformed by GEI Consultants it was discovered that flooding likely occurred due to undersized drainage system during long duration storm events. Discussions with the property owner confirmed this conclusion and acknowledge that water would enter the building through two doors that were at grade. *Recommendations:* Design and construct a low-lying floodwall in front of the two entrances, increase pipe size in drainage system, additional drainage and grading of the property, or elevation of the finished floor.

Area 15: This area is located in a low-lying area with an undersized drainage conveyance system. Flooding occurs during long duration storms. *Recommendations:* Construction of a detention basin at Land Park Golf Course, flood insurance, or possible elevation of structures.

Area 16: This area is located in a low-lying area with an undersized drainage conveyance system. Flooding occurs during long duration storms. *Recommendations:* Improvement of drainage system, elevation of buildings and garages, sandbags or floodgates, and flooding insurance.

Area 17: Based on GEI Consultants' investigation the most logical reason for flooding is unique to one structure within the area. It is believed that an addition of a patio structure in the back of the property reduced the ability of the property to drain properly. *Recommendations:* Place underground drains to allow the backyard to discharge on the main street, flood insurance, and sandbags.

Area 18: Based on GEI Consultants' investigation the flooding in this area is caused by undersized drain pipes that are overwhelmed during long duration storms. *Recommendations:* Drainage system improvements, flood preparedness education, flood insurance, and sandbags.

EXECUTIVE SUMMARY

The purpose of this Report is to assist home owners in reducing their flood risk by providing a broader understanding of the potential and existing flooding problems and identifying potential solutions. This is one component of Sacramento County's overall floodplain management program. Due to the number of properties in Sacramento County that meet the National Flood Insurance Program's (NFIP's) definition of Repetitive Loss properties, a Repetitive Loss Area Analysis (RLAA) is required for Sacramento County as a part of its participation in the Community Rating System (CRS) program. This Report contains all twenty-eight (28) designated Repetitive Loss Areas (RLAs) within Sacramento County.

The County followed a process prescribed by the CRS program. An area analyses must have been prepared and adopted for each repetitive loss area in the community. The analyses must meet the following criteria:

- The repetitive loss areas must be mapped.
- A five-step process must be followed. Although all five steps must be completed, steps 2–4 do not have to be done in the order listed. For example, staff may want to contact agencies and organizations to see if they have useful data (Step 2) after the site visit is conducted (Step 3).
- The repetitive loss area analysis report(s) must be submitted to the community's governing body and made available to the media and the public. If private or sensitive information is included in the report, then a summary report may be prepared for the media and the public. The complete repetitive loss area analysis report(s) must be adopted by the community's governing body or by an office that has been delegated approval authority by the community's governing body.
- An annual evaluation report must be done.
- The analysis must be updated in time for each CRS cycle verification visit.

Properties in the RLAs were notified of the analysis and data was collected from various sources to identify the hazard and capabilities to mitigate them.

Section 2 of this Report describes the specific steps, which include: implementing recommended flood hazard mitigation measures, obtaining funding assistance for these measures, and annually updating this Report.

1. BACKGROUND

1.1 Problem Statement

More than 370 square miles of Sacramento County is within the Special Flood Hazard Area. Additionally, the Department of Water Resources has identified many other areas that are subject to local flood hazards that are not shown on FEMA's maps. Flooding is a reoccurring problem for communities within Sacramento County, and neighborhood flooding events disrupt transportation, commerce, and lives. Property damage due to flooding is more than an inconvenience; it carries a significant price of both time and money.

Flooding is defined as a damaging overflow of water into a building or onto land that is dry most of the time. One type of flooding occurs when streams or rivers overflow into a floodplain, but flooding also occurs outside of floodplains when the rate of storm water runoff exceeds the capacity of the drainage system. Flooding in Sacramento County is due to the capacity of the drainage system and to overflowing rivers or streams.

The purpose of this Report is to help home owners reduce their flood risk by providing a broader understanding of the problems and identifying potential solutions. This is one component of Sacramento County's overall floodplain management program. Due to the number of properties in Sacramento County that meet the National Flood Insurance Program's (NFIP's) definition of repetitive loss properties, a Repetitive Loss Area Analysis (RLAA) is required for Sacramento County as a part of its participation in the Community Rating System (CRS) program.

1.2 National Flood Insurance Program (NFIP)

The NFIP is based on a cooperative agreement between the Federal Emergency Management Agency (FEMA) and local units of government. FEMA agrees to underwrite flood insurance policies within a community and the community agrees to regulate development in the floodplain. Participation in the NFIP is voluntary, but communities have incentive to join because Federally- backed flood insurance is not available in non-participating communities and a non-participating community will not receive Federal aid for damage to insurable buildings in the floodplain.

The three basic components of the NFIP are floodplain mapping, flood insurance, and floodplain management regulations. Floodplain mapping is provided by FEMA on a series of maps called Flood Insurance Rate Maps (FIRM), which designate areas of a community according to various levels of flood risk. Regardless of its risk level, any building in an NFIP participating community can be covered by a flood insurance policy, even buildings not located in a mapped floodplain. A flood insurance policy is only mandated for Federally-backed

mortgages on buildings in the floodplain. Any new buildings constructed in a floodplain, and any improvements or repair of existing buildings in a floodplain, is subject to the Sacramento County Floodplain Management Ordinance (Chapter 6).

1.3 Community Rating System (CRS)

The CRS is a voluntary program designed to reward a community for doing more than meeting the NFIP minimum requirements to reduce flood damages. Communities can be rewarded for activities such as: reducing flood damage to existing buildings, managing development in in areas not shown in the floodplain on the FIRMs, protecting new buildings from floods greater than the 100-year flood, helping insurance agents obtain flood data, and helping people obtain flood insurance. The reward for these activities comes in the form of reduced premiums for flood insurance policy holders.

Once a community has been accepted into the CRS, the community's floodplain management activities are rated according to the scoring system described in the CRS Coordinator's Manual. CRS communities are rated on a scale of 1-10. A Class 10 community receives no reduction in flood insurance premiums, but every class above 10 receives an additional 5% premium reduction. Class 1 requires the most credit points and provides a 45% premium reduction. Sacramento County is currently a Class 3.

1.4 Repetitive Loss Area (RLA)

The NFIP considers a property a Repetitive Loss Property if two or more flood insurance claims of more than $1,000 have been paid within any 10-year period since 1978. According to FEMA's records, there are 101 Repetitive Loss Properties within Sacramento County. Several more properties within Sacramento County may have reached the damage threshold for Repetitive Loss Properties, but not all properties are covered by flood insurance and flood insurance claims are not submitted for all flood damage sustained.

A Repetitive Loss Area (RLA) consists of Repetitive Loss Properties and the surrounding properties that experience the same or similar flooding conditions, whether or not the buildings on those surrounding properties have been damaged by flooding. Figure 1 shows the 26 RLAs in Sacramento County.

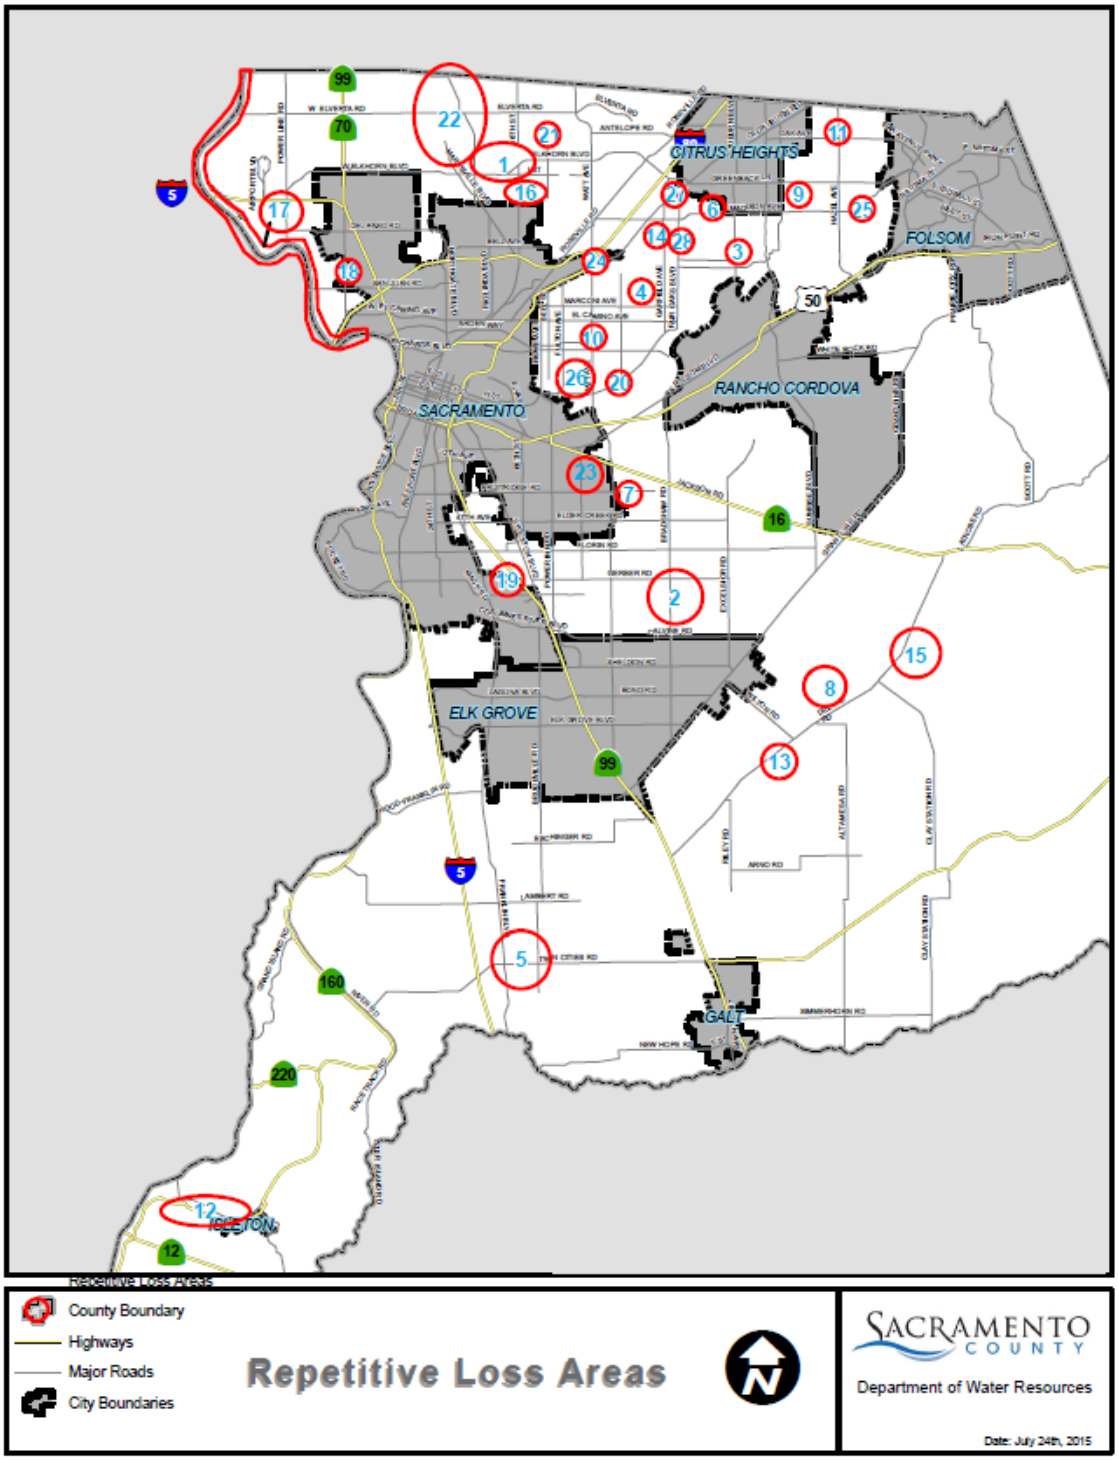
1.5 Sacramento County Floodplain Management Ordinance

The Floodplain Management Ordinance specifically describes what types of development activities are allowed and how proposed development may be permitted. The floodplain management is to realize the extent of flood hazards and to manage the flooding in a manner so

as to reduce damage to structures and infrastructure and to minimize the risk of human casualties.

FIGURE 1

Repetitive Loss Areas in Sacramento County



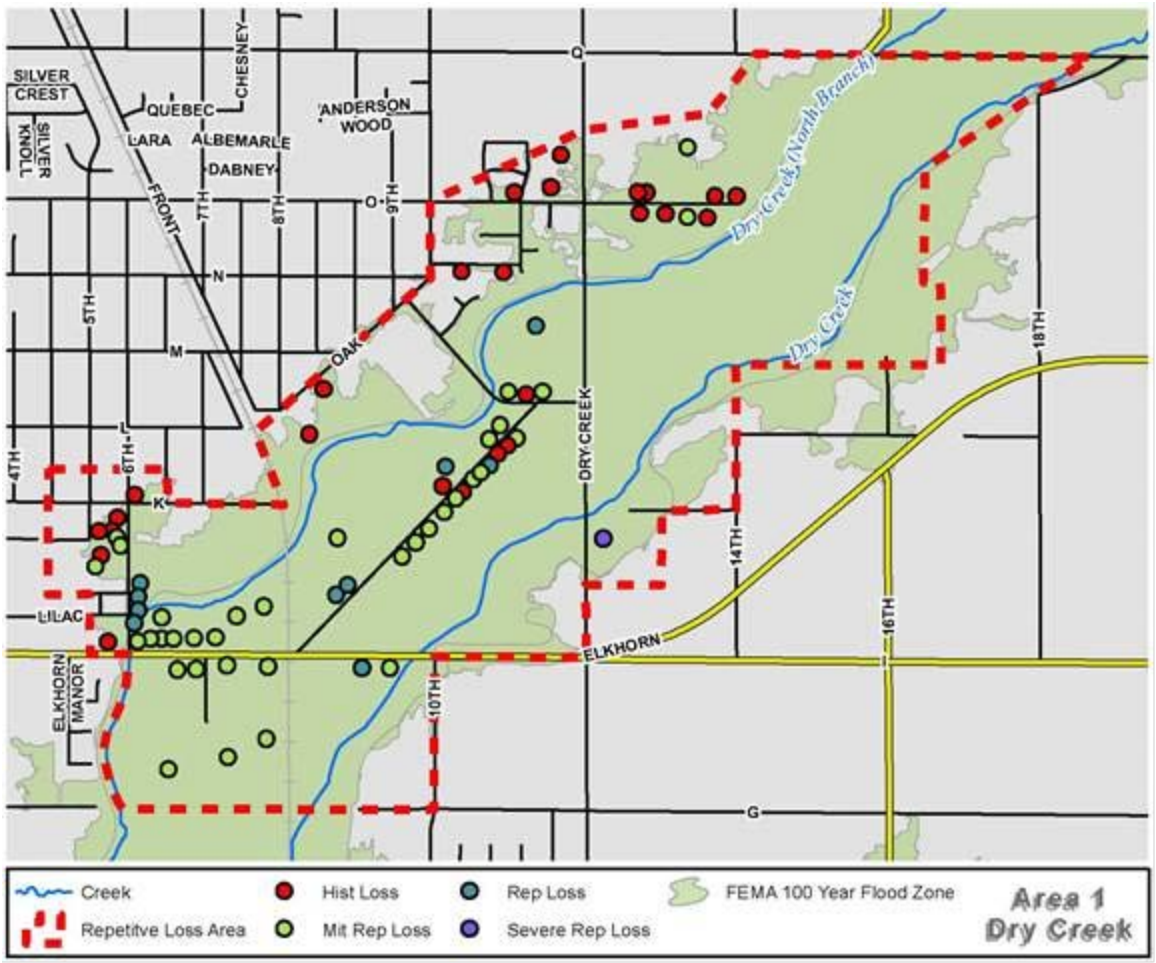
1.6 Repetitive Loss Area Analysis (RLAA)

A repetitive loss area analysis is a detailed mitigation plan for a repetitive loss area. It provides more specific guidance on how to reduce damage from repetitive flooding than the local hazard mitigation plan. The summary RLAA can be found in the Sacramento County Local Hazard Mitigation Plan.

As with a local hazard mitigation plan, CRS credit is dependent upon the community's following an appropriate process. The five steps for an area analysis are less involved than the 10-step local hazard mitigation planning process, but the analysis must evaluate each building in the repetitive loss area(s).

Figure 2 demonstrates a RLAA map with the typical information in the legend.

FIGURE 2
Repetitive Loss Area



2. REPETITIVE LOSS AREA ANALYSIS PROCESS

The process of developing a RLAA consists of five steps:

Step 1 – Advise all the properties in each Repetitive Loss Area (RLA) that the analysis will be conducted and request their input on the hazard and recommended actions.

Step 2 – Collect data from agencies or organizations that may have plans or studies that could affect the cause or impacts of the flooding.

Step 3 – Inspect each building in the RLA and collect basic data. Building entry is not necessary for this step since adequate information can be collected by observing the building from the street.

Step 4 – Review alternative approaches and determine whether any property protection measures or drainage improvements are feasible. The review must consider the full range of property protection measures for the types of buildings affected, including: preventative activities, property protection activities, natural resource protection activities, emergency services measures, structural projects, and public information activities.

Step 5 – Document the findings in a report. The report should include: a summary of the process that was followed and how property owners were involved in the process; a problem statement with a map of the affected area; a list or table showing basic information for each building in the affected area; the alternative approaches that were reviewed; and a list of action items identifying the responsible party, when the action should be completed, and how it will be funded.

2.1 Advise the Residents

Sacramento County sent Storm Ready letters and mailers to all residents informing them of the potential flooding they may experience during storm events. Annual outreach letters have been mailed to residents in RLAs since 1992. Further a website has been developed and communicated to residence for more information on measures to take in advance of the rainy season to prepare for inclement weather and possible flooding, www.stormready.org.

Sacramento County shall notify residents of the ongoing RLAA and requested their input. Upon completion of a draft of this Report, a letter and survey was sent out to residents in each of the RLAAs informing them of this Report, where and how they would be able to review it, and where and how they might submit comments regarding it. Both communication documents are shown in Figure 2A & 2B respectively.

FIGURE 2A
Repetitive Loss Area Report Letter

Robert B. Leonard
Chief Deputy County Executive

Department of Water Resources
Michael L. Peterson, Director

County of Sacramento

Bradley J. Hudson
County Executive

Dear Resident,

The Sacramento County Department of Water Resources is conducting a Repetitive Loss Area Analysis (RLAA) report. A Repetitive Loss Area (RLA) includes the properties on the repetitive loss list obtained from FEMA and all nearby properties with the same or similar flooding conditions. It is important to note that the only reason a property appears on FEMA's list is because the structure had flood insurance and received two or more claims of at least $1,000 during any given 10-year period. These properties are merely representative of the County's overall repetitive flooding problem.

You are receiving this letter because this property has been identified in a RLA. Sacramento County is looking for input from residents in these areas about their flooding experiences and for comments on our draft report. Please take a few minutes to complete the attached survey and return it by **DATE** to:

Sacramento County
Department of Water Resources
827 7th St. Suite 301
Sacramento, CA 95814
Attention: Floodplain Management

You may also fax your survey to (916)874-3789 or email it to floodj@saccounty.net. The survey is also available online survey at www.surveymonkey.com. At the end of the survey, you will have the opportunity to express your interest in commenting on our draft report or just to review it.

Thank you in advance for your assistance. If you have any further questions, please contact Sacramento County Department of Water Resources Floodplain Management at (916) 874-6851.

SACRAMENTO COUNTY

10. What caused the flooding? Check all that apply.

☐ Drainage from adjacent properties	☐ Storm system backup
☐ Storm surge from nearby waterways	☐ Clogged/undersized drainage ditch
☐ Overbank flooding from nearby ditch	☐ Other _____

11. Have you taken any measures to protect your property from flooding?

1.	☐ Installed drains or pipes to improve drainage	5.	☐ Installed a floodwall
2.	☐ Sandbagging	6.	☐ Water Proofed outside walls
3.	☐ Moved Utilities/content to a higher level	7.	☐ Elevated all or part of structure(s)
4.	☐ Regraded yard to keep water away	8.	☐ Other _____

12. Did any of the measures checked in item #11 work? ☐ YES ☐ NO

If YES, which ones? _____

If not, do you know why it didn't work? _____

13. Do you have Flood Insurance? ☐ YES ☐ NO

14. Are you interested in reviewing a copy of the Repetitive Loss Report

☐ YES ☐ NO

If yes, please refer to . . .

Would you like one of our technicians to visit your property to discuss mitigation measures? Call 874-#### to make an appointment.

Sacramento County Department of Water Resources | Drainage Development 2

2.2 Contact Agencies or Organizations

Agencies or organizations that were contacted that may have plans or studies that could affect the cause or impacts to flooding are:

- Sacramento County Department of Transportation
- Sacramento Area Flood Control District
- Sacramento County Planning and Environmental Review
- Department of Water Resources Drainage Maintenance Engineering

2.3 Visit RLAs and Collect Basic Building Data

On-site inspections of buildings in the RLA were performed. This inspection was performed from the public right-of-way by a County Certified Floodplain Manager (CFM). As such, the CFM did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations and information obtained, and when available from Elevation Certificates on file. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Garage location and relative elevation;
- Property grading;
- Neighborhood topography and flow routes.

A table will be used for each RLA property to summarize the findings.

Condition of Structure – These data are based on the level of repair required. Consultation with the local building official is highly recommended.

- **Good** (optional minor repair) – Select this option when only cosmetic type repairs are needed.
- **Fair** (needs minor repair) – Select this option when the following characteristics are observed:
  - Minor shrinkage cracks due to thermal expansion and contraction
  - Signs of rust on iron or steel members
  - Signs of corrosion of rebar
- **Poor** (needs significant repair) – Select this option when the following types of damage are observed:
  - Bowed brick veneer wall or parapet walls
  - Leaning of wall
  - Cracking of wall due to excessive settlement
  - Building settlement

- Large cracking around sills, eaves, chimneys, parapets, and iron or steel lintels
- Differential settlement of chimney
- Fungal and insect attack of wood
- Exposed rebar in concrete walls due to corrosion
- Fire damage

Foundation Type – The selection of a foundation type may require a close inspection of the structure. Consultation with the local building official is highly recommended (see Section 2.5).

2.4 Review Alternatives

Many types of flood hazard mitigation exist, and there is not one mitigation measure that fits every case. Nor is there even one application that fits most cases. Successful mitigation often requires multiple strategies. The CRS Coordinator's Manual breaks the primary types of mitigation down as displayed in Figure 3.

FIGURE 3
Categories of Floodplain Management Activities (FEMA FIA-15, 2013)

1. **Preventive** activities keep flood problems from getting worse. The use and development of flood-prone areas is limited through planning, land acquisition, or regulation. They are usually administered by building, zoning, planning, and/or code enforcement offices.
2. **Property Protection** activities are usually undertaken by property owners on a building-by- building or parcel basis.
3. **Natural Resource Protection** activities preserve or restore natural areas or the natural functions of floodplain and watershed areas. They are implemented by a variety of agencies, primarily parks, recreation, or conservation agencies or organizations.
4. **Emergency Services** measures are taken during an emergency to minimize its impact. These measures are usually the responsibility of city or county emergency management staff and the owners or operators of major or critical facilities.
5. **Structural Projects** keep flood waters away from an area with a levee, reservoir, or other flood control measure. They are usually designed by engineers and managed or maintained by public works staff.
6. **Public Information** activities advise property owners, potential property owners, and visitors about the hazards, ways to protect people and property from the hazards, and the natural and beneficial functions of local floodplains. They are usually implemented by a public information office.

2.4.1 Preventative

Sacramento County regulates residential and commercial development through its building code, planning and zoning requirements, stormwater management regulations and floodplain management ordinances. Any project located in a floodplain, regardless of its size, requires a

permit from Sacramento County, unless the project can be characterized as routine maintenance.

2.4.2 Property Protection

These measures are generally performed by the property owners or their agents. FEMA has published numerous manuals that help a property owner determine which property protection measures are appropriate for particular situations, several of which are listed below. The manuals listed below are available for review at FEMA website.

- FEMA 259, Engineering Principles and Practices of Retrofitting Floodprone Residential Structures
- FEMA 312, Homeowner's Guide to Retrofitting: Six Ways to Protect Your House from Flooding
- FEMA 551, Selecting Appropriate Mitigation Measures for Floodprone Structures
- FEMA 348, Protecting Building Utilities from Flood Damage
- FEMA 511, Reducing Damage from Localized Flooding
- FEMA 102, Floodproofing Non-Residential Structures
- FEMA 84, Answers to Questions about the NFIP
- FEMA 54, Elevated Residential Structures Book
- FEMA 268, Protecting Floodplain Resources: A Guidebook for Communities
- FEMA 347, Above the Flood: Elevating Your Floodprone House
- FEMA 85, Protecting Manufactured Homes from Floods and Other Hazards

For a complete guide to retrofitting your home for flood protection see *FEMA P-312, Homeowner's Guide to Retrofitting 3rd Edition (2014).* The primary methods of property protection in Sacramento County are:

1. Demolition/Relocation.
2. Elevation (structure or damage prone components such as furnace or AC unit)
3. Dry flood-proof (so water cannot get in).
4. Wet flood-proof portions of the building (so water won't cause damage).
5. Direct drainage away from the building.
6. Drainage maintenance.
7. Sewer Improvements.

Demolition

The only way to ensure a structure will not accumulate additional losses from future flood events is to demolish the structure completely. There are two options demolishing a structure.

- A government agency can purchase the property, demolish the structure, and convert the property to a park or other open space.
- The property owner may retain ownership, demolish the structure, and build a new structure in a manner that meets all local building and flood protection code requirements.

Home Elevation

Sometimes dry or wet floodproofing are not enough and greater measures must be taken. For example, if the floodwaters are too high for dry floodproofing and the inhabited area is too low for wet floodproofing, it may be necessary to raise the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, Sacramento County has utilized FEMA grant money for dozens of qualified elevation projects.

The structure in Figure 4 is an example of a home that is elevated above the 100-year flood elevation. The Sacramento County Floodplain Management Ordinance requires all substantially improved residential buildings have their lowest floor elevated 18 inches above the 100-year flood elevation. This may exclude a basement in the elevated building.

FIGURE 4
Elevated House

Dry Floodproofing

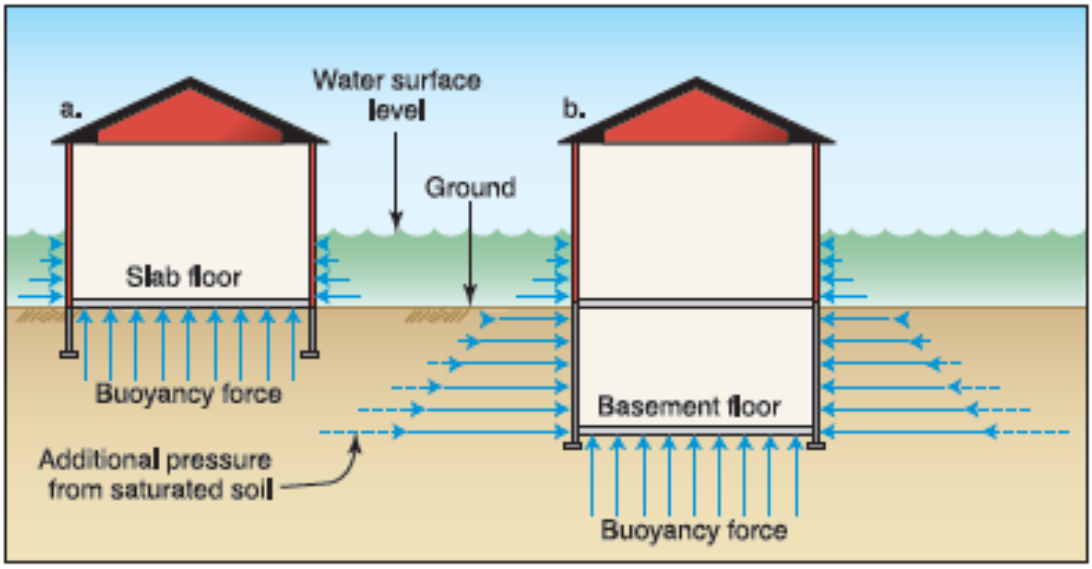
Dry floodproofing consists of completely sealing around the exterior of the building so that water cannot enter the building (see Figure 5). Dry floodproofing is not a good option for areas where floodwater is deep or flows quickly. The hydrostatic pressure and/or

hydrodynamic force can structurally damage the building by causing the walls to collapse or causing the entire structure to float. However, in areas that have minimal velocity and low depth, dry floodproofing can be a good option

Many flood hazards can be mitigated with various forms of dry flood proofing. Properties that do not have adequate protection of their low opening (window or basement door) can effectively raise the low opening height with a window well or a flood gate. The ultimate height of the low opening depends on several factors, such as: the level of flood protection desired, the appearance, and cost. The flood protection elevation could be set 1-foot higher than the existing low opening elevation, or it could be set to match the elevation of the lowest opening into a home that cannot be raised. This might be the elevation of the threshold of a door, for example.

The NFIP only allows dry floodproofing for residential retrofits that are not classified as a substantial improvement. A substantial improvement is any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50% of the market value of the structure before the "start of construction" of the improvement.

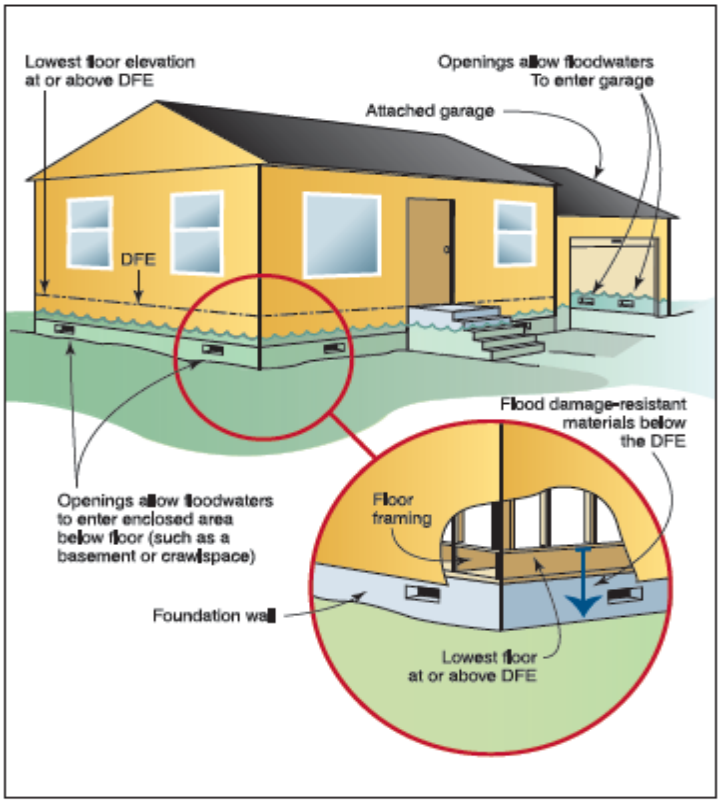
FIGURE 5
Dry Floodproofing Example (FEMA P-312, June 30, 2014)



Wet Floodproofing

Wet floodproofing consists of modifying uninhabited portions of a home, such as a crawl space, garage, or unfinished basement with flood-damage resistant materials, to allow floodwaters to enter the structure without causing damage (see Figure 6). Wet floodproofing requires portions of the building need to be cleared of valuable items and mechanical utilities. A key component of wet floodproofing is providing openings large enough for the water to flow through the structure such that the elevation of the water in the structure is equal to the elevation of the water outside of the structure. This equilibrium of floodwater prevents hydrostatic pressure from damaging structural walls.

FIGURE 6
Wet Floodproofing Example (FEMA P-312, June 30, 2014)



Direct Drainage Away From the Building

In some cases, there are things that the property owner can do on-site such as directing shallow floodwater away from a flood-prone structure. In other cases, there are drainage improvement projects that can be constructed by Water Resources staff.

Shallow flooding can often be kept away from a structure if some simple improvements are made to the yard. Sometimes structures are built at the bottom of a hill or in a natural

drainage way or storage area, so that water naturally flows toward them.

One solution is to regrade the yard. If water flows toward the building; a new swale or wall can direct the flow to the street or a drainage way. Filling and grading next to the building can also direct shallow flooding away. Although water may remain in the yard temporarily, it is kept away from the structure. When these types of drainage modifications are made, care must be taken not to adversely affect the drainage patterns of adjacent properties.

Over time, the swales along the lot lines or in the back yard may get filled in. Property owners build fences, garages, sheds, swimming pools, and other obstructions up to the lot line. These drainage problems can be fixed by removing the obstructions and restoring the swales so they will carry water away from the building

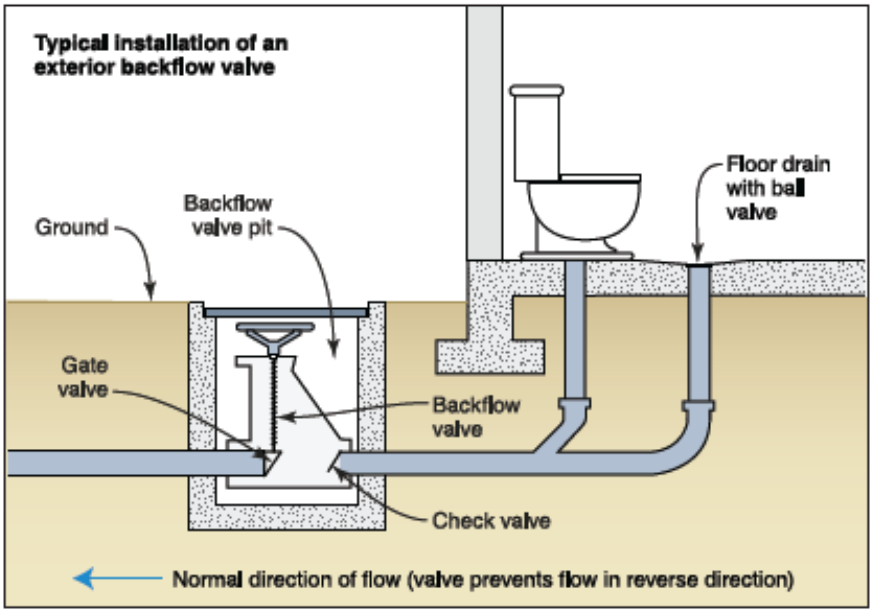
Drainage Maintenance

Rake leaves from inlets. If a nearby creek has fallen or collected debris, call 875-rain. The Stormwater Utility provides funds for systematic maintenance of the County's storm drain system, and allows for repair and construction projects that directly target local flooding problems. Do not dump or throw anything into drainage ditches, streams or storm drains. Dumping into our drainage system is a Sacramento County Code violation. Debris can accumulate and restrict the flow of stormwater which increases the potential of localized - flooding. To report flood problems or illegal dumping into the drainage system, please call (916) 875-RAIN (7246).

Sewer Improvements

Heavy rains can saturate the soil and infiltrate the sanitary sewer system through leaky joints or cracks in the pipes. The inflow of stormwater floods the sanitary sewer system causing water to back-up into the home through lower level plumbing fixtures. This occurrence can be prevented by installing a sewer backflow preventer (see Figure 7). A backflow preventer will allow the sanitary sewer water to flow freely from the home to the sewer, but restrict the reverse flow. Backflow preventers do require maintenance and can fail if debris in the sewer prevents the valve seating properly. An overhead sewer system pumps wastewater from basement level plumbing fixtures up to an elevation near the ground level, where it can drain by gravity into the sewer service line. This higher sewer makes it unlikely that water will back-up into the building.

FIGURE 7
Install Sewer Backflow Valves Example (FEMA P-312, June 30, 2014)



Temporary Barriers

Several types of temporary barriers are available to address typical flooding problems. They work with the same principles as permanent barriers, such as floodwalls or levees, but can be removed, stored, and reused in subsequent flood events (Figure 8).

FIGURE 8
Temporary Flood Barrier

2.4.3 Natural Resources Protection

Care should be taken to maintain the streams, wetlands and other natural resources within a floodplain. Removing debris from streams and channels prevents obstructions. Preserving and restoring natural areas provides flood protection, preserves water quality and provides natural habitat. Most of the natural resources within Sacramento County are in open spaces owned and maintained by the Sacramento County Park District or Sacramento County.

2.4.4 Emergency Services

Advance identification of an impending storm is only the first part of an effective Flood Warning and Response Plan. To truly realize the benefit of an early flood warning system, the warning must be disseminated quickly to floodplain occupants and critical facilities. Appropriate response activities must then be implemented, such as: road closures, directing evacuations, sandbagging, and moving building contents above flood levels. Finally, a community should take measures to protect public health and safety and facilitate recovery. These measures may include: cleaning up debris and garbage, clearing streets, and ensuring that that citizens have shelter, food, and safe drinking water.

2.4.5 Structural Projects

In response to the flood damage resulting from severe storm events, Sacramento County initiated several Flood Risk Reduction Assessments to determine what structural improvements could be made to mitigate flood damage from future storm events in the areas that have proven to be the most susceptible to flooding.

2.4.6 Public Information

One of the most important, and often overlooked, aspects of mitigation is public awareness. Awareness starts with recognition of the flood risk. FIRM panels, which designate areas of a community according to various levels of flood risk, can be viewed at www.FEMA.gov. Also, real estate transactions require disclosure of known flood hazards.

The next level of awareness is related to hazard mitigation measures. Often homeowners can greatly reduce their risks with mitigation efforts; they just do not know it. *For that reason, as part of this analysis, every resident in the RLA has been contacted and informed of the opportunity to review this Report.* In addition, Sacramento County sends out an annual outreach letter to every resident in each RLA.

2.5 Document the Findings

This report outlines the process that was followed and any relevant general background information. A separate analysis for each Repetitive Loss Area was done and is detailed in each respective area to this plan in the appendices. Each area analysis will include

- A summary of property owner responses, logged phone calls, survey results, etc.
- The problem statement with a map of the area affected.
- A table showing basic information for each building, such as address, foundation type, condition, and appropriate mitigation measures.
- Any alternative approaches that were reviewed.
- Action items that include:
  - ✓ Who is responsible for implementing the action,
  - ✓ When it will be done,
  - ✓ How it will be funded.

The summary report for Repetitive Loss Area Analysis is included in the Sacramento County Local Hazard Mitigation Plan 2011, approved December 6, 2011 by resolution number 2011-0886 and WA-2818. *This report is the complete repetitive loss area analysis and has been approved by the governing body of Sacramento County.*

An annual evaluation report will be completed in the fall of each year and submitted with the CRS annual recertification. The evaluation report will review each action item, describe what was implemented (or not implemented), and recommend changes to the action items as appropriate. The annual report will cover all the repetitive loss areas in the appendices and be made available to the media and public.

In time for each CRS cycle verification visit, the repetitive loss area analysis will be updated. The update will review the flooding and building conditions as well as any changes to FEMA's repetitive loss list, to determine whether the number of buildings on the list or other circumstances have changed, and revise the mapping and action items accordingly. The update may be a new report or an addendum to the existing report.

2.5.1 Data Collection

Sacramento County Plans and studies were utilized in this analysis. The sources listed below provided data related to the causes and impacts of flooding in the RLA.

- FEMA - NFIP Repetitive Loss Update CD that includes the repetitive loss properties. The mitigated and unmitigated properties are provided for reference purposes, and to assist in defining repetitive loss areas.

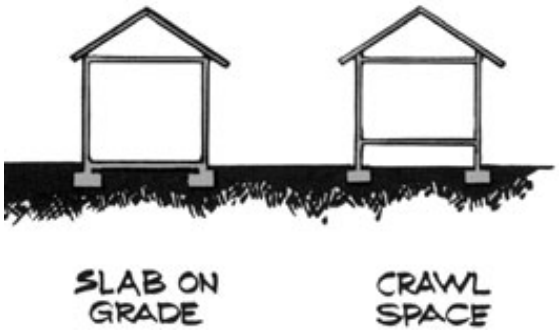
- Sacramento County Hazard Mitigation Grant Program (HMGP) - HMGP provided grants to Sacramento County residence to implement long-term hazard mitigation measures after a major disaster declaration. The purpose of the HMGP is to reduce the loss of life and property due to natural disasters and to enable mitigation measures to be implemented during the immediate recovery from a disaster. The HMGP is authorized under Section 404 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act.
- Local Floodplain Management Activities – Sacramento County has over the years collected base flood elevations related to actual surveyed ground elevation to determine the local flood hazard areas. The review of Elevation Certificates, Local Floodplain Mapping and general review of topography.
- GIS – Data for elevations, number of structures, location of structures, and other pertinent data to determine the potential risk of flooding.
- FIRM – Federal floodplain mapping, *Flood Insurance Study – Sacramento County, California and Incorporated Areas* (FEMA 06067C0062H and 06067C0054H August 2012)
- Drainage Maintenance and Engineering Section (DME) Service Request Tracking System provided storm event dates, customer problem descriptions, and specific address of affected flooding areas.

2.5.2 Types of Foundations

Within Sacramento County there are basically two types of foundations either slab on grade, crawl space (raised). Figure 12 shows the two common foundation types, which on the Elevation Certificate these are referenced as 1, 1A, 1B, or 8:

1. Crawl Space or raised foundation is a common type that you'll find in home construction. This foundation gets its name due to the fact that it's built above the ground, allowing for just enough room to crawl underneath. There are stem walls on the perimeters, pierced in-between and then a girder system and floor joists on top of that. The foundation is high enough to that you have at least 2' under there to crawl around to take care of the mechanical systems of the house.
2. Slab foundation is usually concrete poured directly onto the ground. This type of foundation is also different from other foundations in that it uses concrete, not wood, to help support the weight of the home.

FIGURE 12
Foundation Types



2.6 Funding Assistance

The most common hazard mitigation assistance programs are: the Hazard Mitigation Grant Program (HMGP), Pre-Disaster Mitigation (PDM), and Flood Mitigation Assistance (FMA). Each program has its own eligibility and funding criteria, but each can be used to fund property protection measures as shown in Figure 8 below, provided that the Benefit Cost Ratio exceeds 1.0. In general, these programs are funded when FEMA approves an application prepared jointly by a local government. In most cases, FEMA pays 75% of eligible expenses, but the federal share can reach 90% for Repetitive Loss Properties and 100% for Severe Repetitive Loss (SRL) properties.

APPENDICES

REPETITIVE LOSS REPORT

Appendix 1

REPETITIVE LOSS AREA 1

DRY CREEK

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 1
TABLE OF CONTENTS

A1.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 1, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 1 analysis includes properties on Cherry Lane, Dry Creek Road, O Street, Elkhorn Boulevard and 4th Street and is defined by **Figure A1**.

A1.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A1.3 PROBLEM STATEMENT

The location of Area 1 is generally Elkhorn Boulevard east of Rio Linda Boulevard. Floods in the Dry Creek watershed generally occur from October through April. The floods are usually caused by a combination of prolonged rainfall leading to saturated soils, and a short period of one to six hours of intense precipitation associated with frontal convection or severe thunderstorms. The source of flooding was primarily identified as the Dry Creek floodplain (North and South Branch) out of bank flooding in older residential areas constructed prior to NFIP requirements.

Dry Creek and its tributaries have an extensive record of flood conditions,. Damaging floods occurred in December 1955, April 1958, October 1962, December 1964, March 1983 and February 1986. The floods of 1983 and 1986 were the largest and most damaging on record before 1992. Hydrologic studies have shown that the recurrence interval of the March 1983 flood was approximately 10 years and the recurrence interval of the February 1986 flood was from 50 to 100 years, depending on the specific location in the Dry Creek watershed.6 Flood events also occurred in in January 1995, January 1997, February 1998, and December 2005, with the 1995 flood event causing extensive damage.

There are 272 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions. Twenty-two (22) properties were acquired and demolished as part of the Hazard Mitigation Grant Program and seven (7) properties were mitigated by elevation.

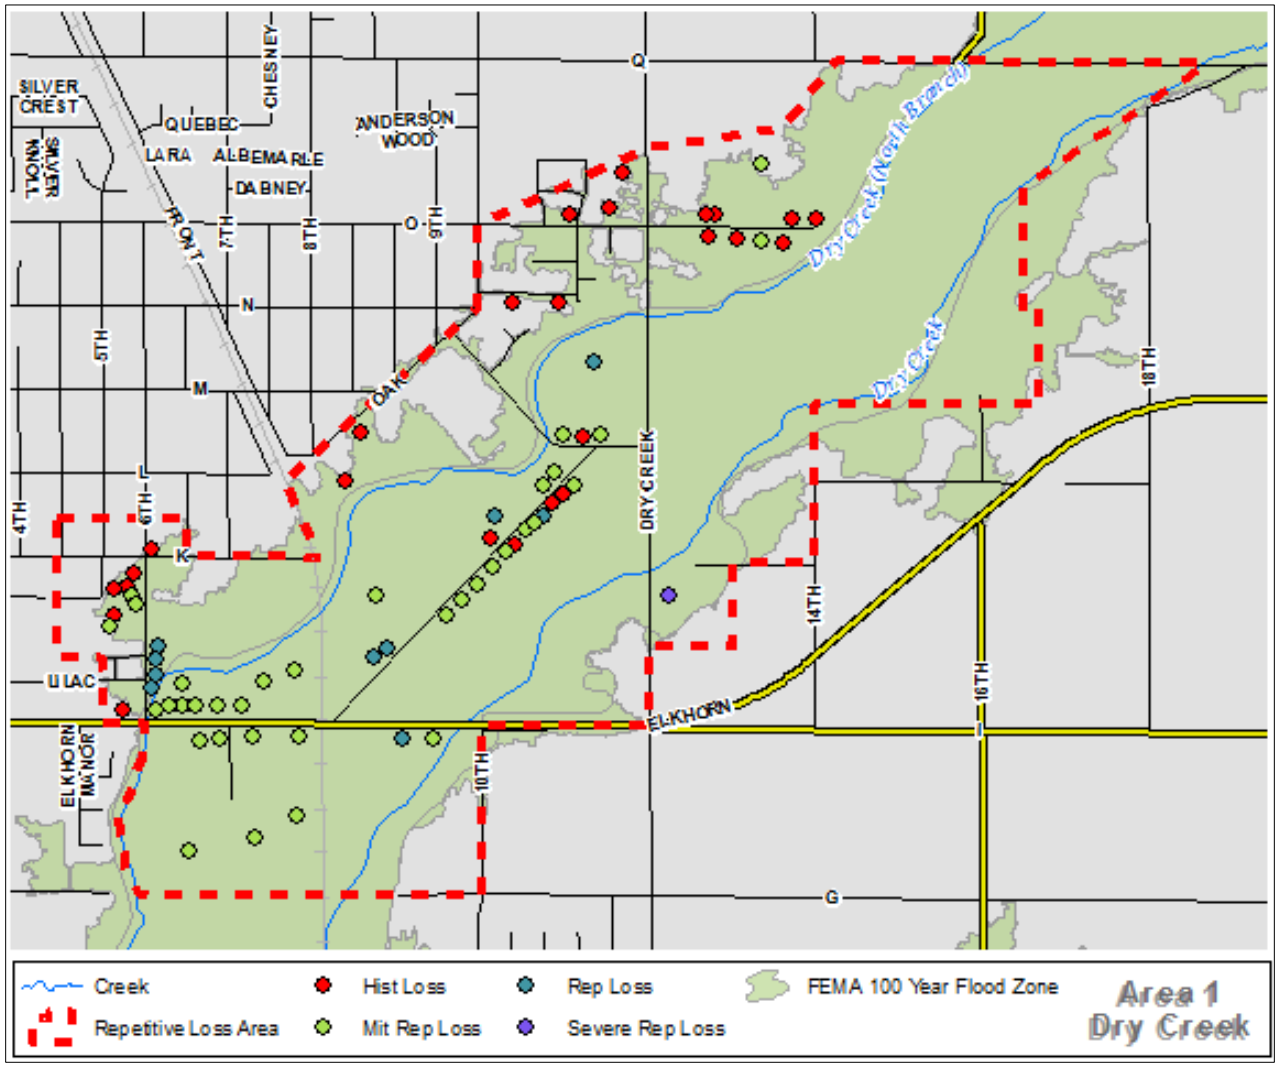
A1.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- Sacramento County Department of Transportation - Bikeway project 2009

The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

FIGURE A1
Repetitive Loss Area #1



A1.5 DATA COLLECTION

Sacramento County Plans and studies for the Dry Creek watershed were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- **Analysis of Dry Creek Alternatives to Detention** Prepared By Montgomery Watson May 26, 2000
- **The 1992 Dry Creek Watershed Flood Control Plan** (1992 Plan) and its Update; **Update to the Dry Creek Watershed Flood Control Plan** (2010)

A1.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) all properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when Dry Creek overflows into a floodplain. The Sacramento County Local Floodplain Map does not cover the Dry Creek Shed for this RLA,

A1.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that sixty-nine (69) of the overall 346 properties within the Dry Creek RLA had reported flooding.

A1.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in January 9, 1995, January 9 & 22, 1997, June 15, 1997, February 3, 1998, and June 15 & 16, 1998. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A1.5.4 Types of Foundations

The most common type of foundations within the Dry Creek RLA is slab on grade, which constitutes 79% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A1.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for acquisition of additional properties in Dry Creek Floodway for demolition to restores the natural floodplain. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

LAGUNA CREEK

(Inter-basin transfer)

GERBER CREEK

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 2

TABLE OF CONTENTS

A2.1 REPETITIVE LOSS AREA 2

This Report focuses on Area 2, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 2 analysis includes properties on Bar Du Lane, Bradshaw Road, Carmencita Avenue, Gerber Road, Wildhawk West Drive and Vineyard Road and is defined by **Figure 1**.

A2.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A2.3 PROBLEM STATEMENT

The location of Area 2 is generally Bradshaw Road west of Vineyard Road. The character of the Inter-basin Transfer flow in general, the flow leaving Laguna Creek remains on the east side of Bradshaw Road and ponds behind Bradshaw Road, overtopping the roadway at the lowest crown elevations just south of Gerber Road, once the capacity of smaller roadside ditches are exceeded. Once flow overtops the roadway, the majority of the spill would flow westward overland across the intersection of Gerber Road and across the properties south of Gerber Road. The inundation of properties just south of Gerber Road is significant, as they convey the majority of the Inter-basin Transfer. This Inter-basin transfer has an extensive record of flood conditions.

This RLAA consists of 103 properties which include buildings on FEMA's repetitive loss list and nearby buildings that may have the same or similar flooding conditions. The flood hazard in this area is Laguna Creek inter-basin transfer to Gerber Creek.

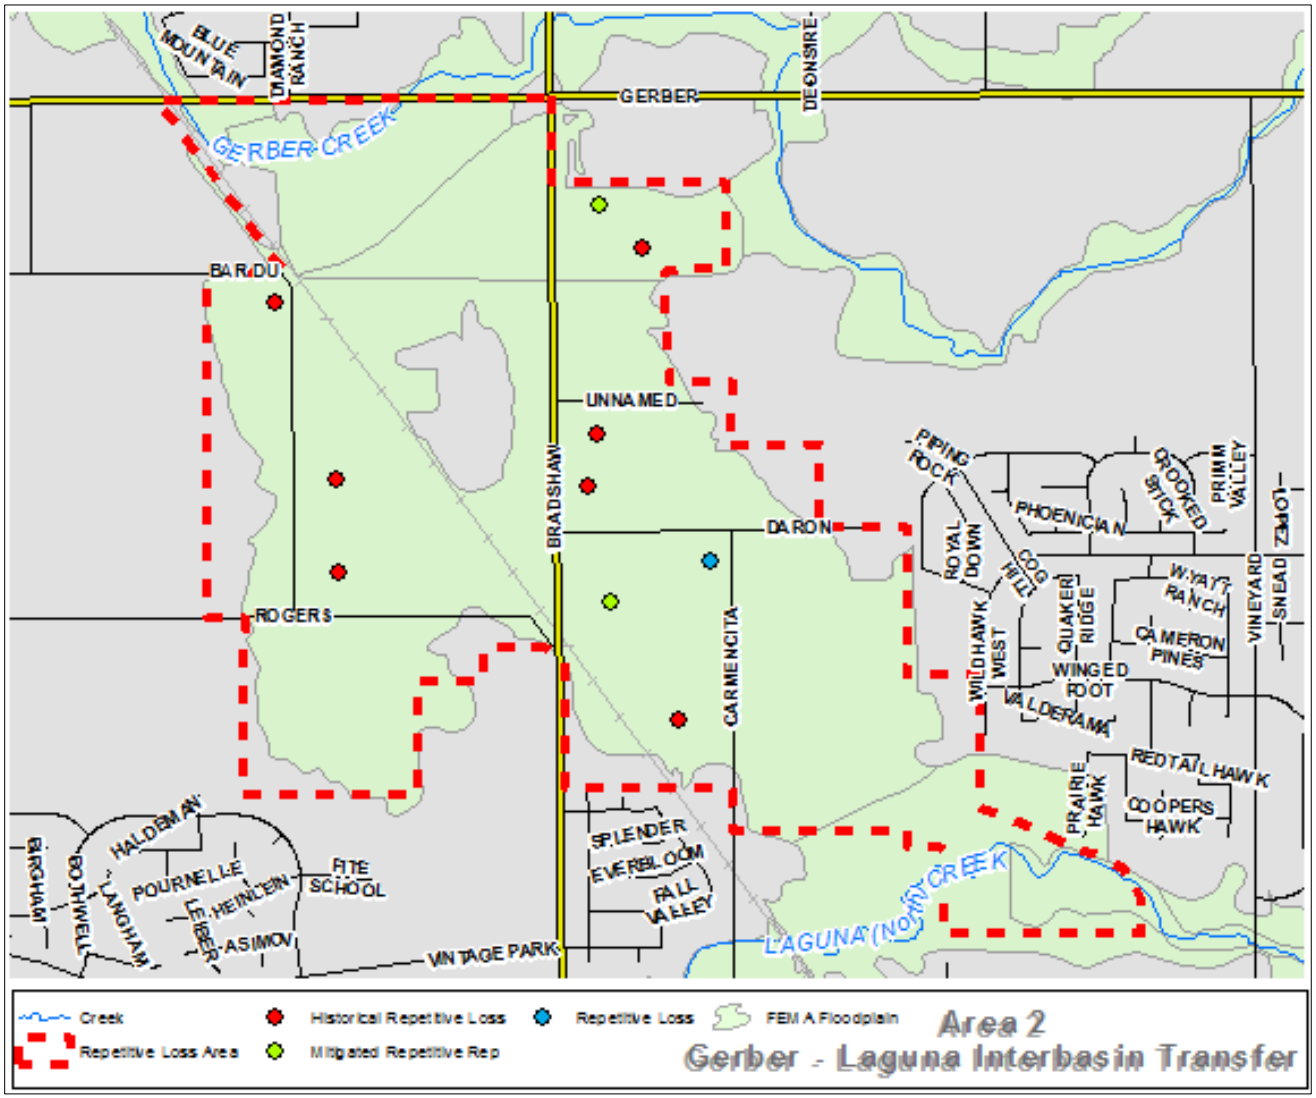
A2.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- The Upper Laguna Creek Drainage Improvement and Trail System (ULCDITS)
- Sacramento County Department of Water Resources' comprehensive drainage improvement plan from Vineyard Road to Calvine Road in southern Sacramento County.
- Southgate Recreation and Park District's construction of a pedestrian/bicycle/equestrian trail system along this portion of Laguna Creek.
- Multi-use flood control detention basin, and three water quality treatment basins
- Flood control detention basin at Triangle Rock's Vulcan pit, west of Folsom South Canal.
- Sacramento County is working on a flood control project (known as Triangle basin).

The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

FIGURE A2
Repetitive Loss Area #2



A2.5 DATA COLLECTION

Sacramento County Plans and studies for the Dry Creek watershed were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

A2.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) all properties within the RLA are within the 100-year FEMA floodplain. The flood hazard in this area is Laguna Creek inter-basin transfer to Gerber Creek. The Sacramento County Local Floodplain Map indicates this entire RLA falls within the Local Flood Plain with a flood elevation of 86.83' NGVD 29 or 89.13' NAVD 88,

A2.5.2 Flooding Experiences of Property Owners

Drainage Operation and Maintenance Service Request Tracking System (DOMS-SRTS) indicates that nine of the overall 103 properties within the Laguna Creek (Inter-Basin Transfer) RLA had reported flooding.

A2.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A2.5.4 Types of Foundations

The most common type of foundations within the Laguna Creek (Inter-Basin Transfer) RLA is raised foundations, which constitutes 74% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A2.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for acquisition of additional properties in Dry Creek Floodway for demolition to restores the natural floodplain. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

REPETITIVE LOSS AREA 3

LOCAL DRAINAGE

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 1

TABLE OF CONTENTS

A3.1 REPETITIVE LOSS AREA 3- Andrew Alan Lane

This Report focuses on Area 3, one of the twenty-eight (28) designated RLAs within the Sacramento County. The subject homes, constructed in 1990, flooded several times due to an unforeseen local shed jump and lack of overland release. Overland release was constructed in the mid1990's and the homes have not flooded since. See **Figure A3**.

A3.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the repetitive loss areas.

A3.3 PROBLEM STATEMENT

The location of Area 3 is Andrew Alan Lane north east of the intersection of San Juan Avenue and Winding Way. The small (two acre) subdivision was constructed in a low area with one storm drain inlet and no overland release. The homeowners filed flood insurance claims in 1995, 1996, and 1997 when the County was hit by a series of significant storms. Once the problem was recognized, an engineered solution was designed and constructed and the homes have not flooded since that time.

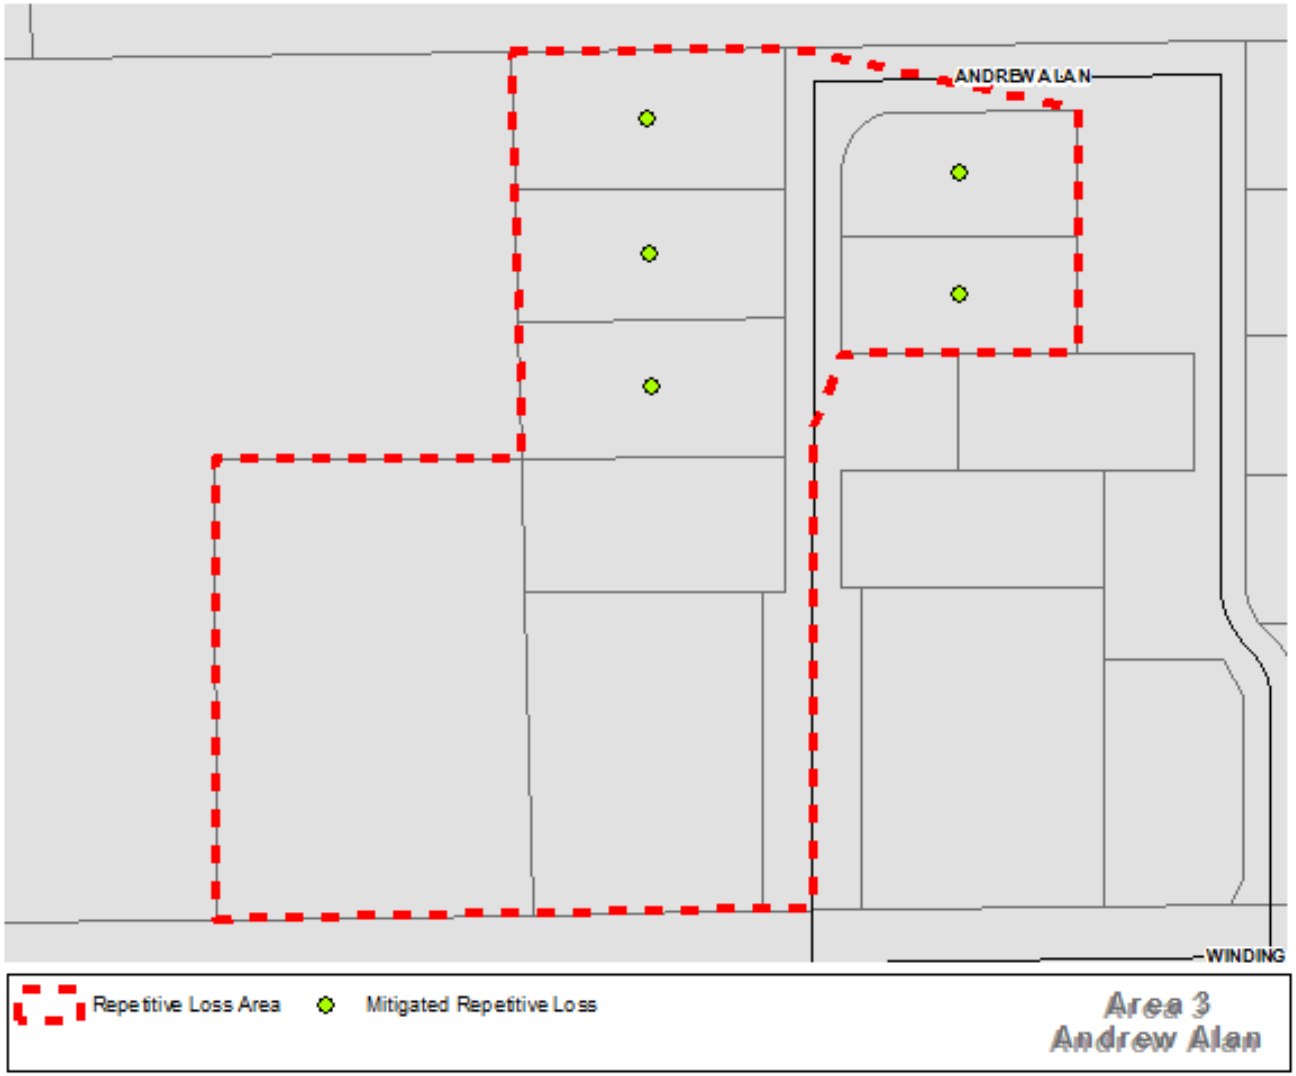
There are two properties included on FEMA's repetitive loss list, one other flood victim that is not listed on the repetitive loss list possibly due to not having flood insurance, and two other homes that would be in jeopardy had the engineered solution not been constructed.

A3.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

> This was a local drainage issue solved by the local agency. No state of federal agencies participated in the flood control solution.
>
> The primary method of property protection is overland release.

FIGURE A3
Repetitive Loss Area #3



A3.5 DATA COLLECTION

The issue was caused by an engineering oversight at the time of development. The error included a misunderstanding of the contributing watershed area. The solution included establishing an overland release path to assure storm water runoff from significant storm events, exceeding the capacity of the piped storm drain system, would safely release downstream. Sacramento County prepared the study and plans and assured construction was completed.

A3.5.1 Flood Insurance and Flood Event Data

Area 3 is in Zone X, on the FEMA Flood Insurance Rate Map 06067C0093H. The local flooding occurred in this area in 1993, 1995, 1996, and 1997. The repair was completed shortly after the 1997 storm event, and the area has not flooded since that time.

A3.5.2 Flooding Experiences of Property Owners

After flooding up to four times in a three year period with these homes were quite new, these property owners have enjoyed seventeen years without any flooding problems. Water Resources Service Request Tracking System (WR-SRTS) shows no complaints or questions after 1997.

A3.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in January 10, 1995. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A3.5.4 Types of Foundations

The most common type of foundations within the Andrew Alan Lane RLA is Slab on Grade which constitutes 100% of the two common foundations found in this RLA within Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types

mentioned).

A3.6 FUTURE MITIGATION MEASURES

The overland release must be inspected periodically and kept clear. The County does periodic outreach to ten properties in Area 3. The local flooding problem was mitigated by a project constructed under the direction of the County. There is no remaining construction action necessary. The overland release must be kept clear and functioning.

REPETITIVE LOSS AREA 4

NORTH AVENUE

East of Mission Avenue

Chicken Ranch Slough Floodplain

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 4
TABLE OF CONTENTS

A4.1 REPETITIVE LOSS AREA 4 North Ave (Chicken Ranch Slough)

This Report focuses on Area 4, one of the twenty-eight (28) designated RLAs within the Sacramento County. Repetitive loss area #4 has experienced flooding due to Chicken Ranch Slough and ponding water in the street caused by backwater from the high creek level. Two properties protected themselves with an on-site floodwall, one established sideyard overland release.

A4.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the repetitive loss area.

A4.3 PROBLEM STATEMENT

The location of Area 4 is Chicken Ranch Slough upstream of Mission Avenue. The measured water surface elevation in 1986 approximately matched the FEMA flood insurance base flood elevation and the 1995 high water was about 8 inches below the BFE. Flood insurance claims were filed in 1986, 1995, 1996, 1997, 2005; although, some only filed two claims, others filed three or four.

The problem is Chicken Ranch Slough and the fact that the PreFIRM homes were constructed too low.

A4.4 BASIC INFORMATION

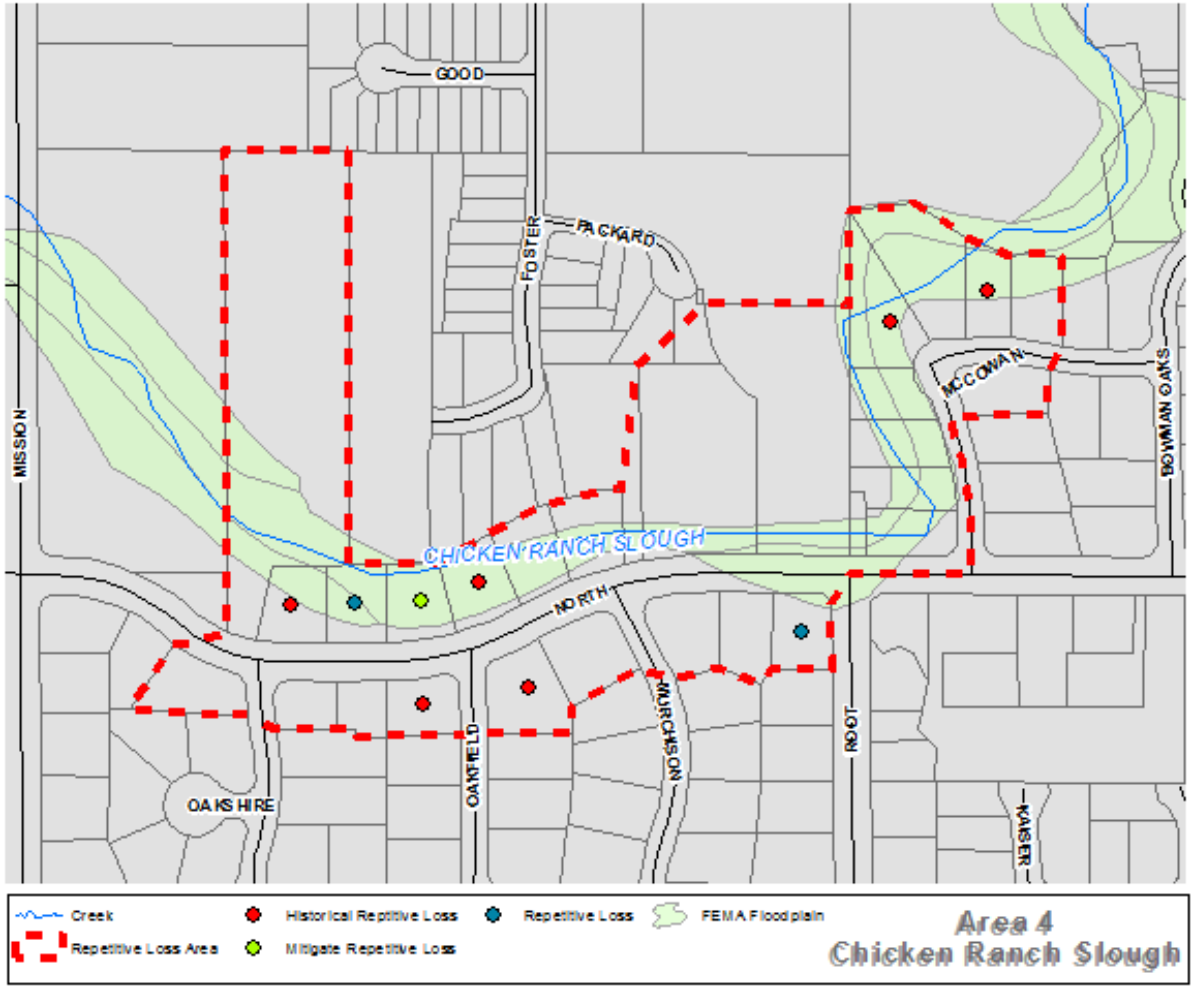
The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

A4.5 DATA COLLECTION

Sacramento County and FEMA flood insurance studies for Chicken Ranch Slough were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the repetitive loss area (RLA):

- FEMA Flood Insurance Rate Map
- Sacramento County 2006 hydrology and hydraulics model
- Sacramento County Drainage Engineering

FIGURE A4
Repetitive Loss Area #4



A4.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) the repetitive loss area properties are affected by the 100-year FEMA floodplain. The flooding occurs when the creek is high, and local storm drains cannot drain water from the street due to that tail-water condition.

A4.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that only a small handful of the overall properties within the Area 4 RLA had reported flooding.

A4.5.3 Structure Inspections

There have been numerous communications between the property owners in the subject area as shown on the SRTS map below. There are only a handful of properties who have filed flood insurance claims. The repetitive loss properties have experienced several floods, but local on-site mitigation may reduce the number of such claims.

FEMA hazard mitigation home elevation program benefit versus cost analyses would not support home elevation due to the depth of flooding. Consequently, it would seem that the on-site floodwalls and overland release are the best solution.

The County drainage engineering staff stands ready to assist property owners with on-site flood protection solutions.

A4.5.4 Types of Foundations

The homes in this area are a mix of slab on grade and raised foundation.

A4.6 FUTURE MITIGATION MEASURES

The most common type of foundations within the Dry Creek RLA is slab on grade, which constitutes 71% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

There does not appear to be an urgent project in Area 4.

- **Responsible Office:** Department of Water Resources through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** FEMA grant

REPETITIVE LOSS AREA 5

TWIN CITIES ROAD

LOWER COSUMNES RIVER / BEACH-STONE

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 5
TABLE OF CONTENTS

A5.1 REPETITIVE LOSS AREA 5

This Report focuses on Area 5, one of the twenty-eight (28) designated RLAs within the Sacramento County. Repetitive Loss Area 5 has experienced flooding due to the Cosumnes River and backwater Beach-Stone Lake floodplains as described on the FEMA Flood Insurance Rate Map. Area 5 analysis includes properties on Twin Cities Road and is defined by **Figure A5**.

A5.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the repetitive loss area.

A5.3 PROBLEM STATEMENT

This area is in a FEMA floodplain, the lot sizes and use are typically agricultural throughout this region of the County. The location of Area 5 is outside of the urban stormwater utility; however, the County floodplain management section stands ready to offer technical assistance and hazard mitigation as grant funds are available. Flooding was reported in this area January 1982, February 1986, January 1997.

Post-FIRM structures are constructed safely above the flood hazard elevation; however, some preFIRM structures were not elevated properly.

The one known repetitive loss home was elevated after it flooded in 1997, partially paid by HMGP grant funds.

A5.4 BASIC INFORMATION

See maps an table at the end of this document.

A5.5 DATA COLLECTION

Sacramento County and FEMA flood insurance studies, for the floodplain affecting the area, were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the repetitive loss area (RLA):

- FEMA Flood Insurance Rate Map
- County BFE analysis for unnumbered A-Zone

A5.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) the repetitive loss area properties are affected by the 100-year FEMA floodplain. The flooding occurs when the Cosumnes River breaches its uncertified rural levee system combined with Beach-Stone Lake floodwater and contributions from the Morrison Creek watershed.

FIGURE A5
Repetitive Loss Area #5

A5.5.1 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that only a small handful of the overall properties within the Area 5 RLA reported flooding.

A5.5.2 Structure Inspections

There have been numerous communications between the property owners in the subject area as shown on the SRTS map below. There are only a handful of properties who have filed flood insurance claims. The repetitive loss properties have experienced several floods, but local on-site mitigation may reduce the number of such claims.

FEMA hazard mitigation home elevation program benefit versus cost analyses would not support home elevation due to the depth of flooding. Consequently, it would seem that the on-site floodwalls and overland release are the best solution.

The County drainage engineering staff stands ready to assist property owners with on-site flood protection solutions.

A5.5.3 Types of Foundations

The homes in this area are a mix of slab on grade and raised foundation.

A5.6 FUTURE MITIGATION MEASURES

There is no project proposed.

There does not appear to be an urgent project in Area 4.

- **Responsible Office:** individual property owners must request mitigation
- **Timeline:** not urgent
- **Potential Funding:** FEMA grant

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the repetitive loss areas.

A6.3 PROBLEM STATEMENT

The location of Area 6 is along Coyle Creek, upstream of Madison Avenue.

The source of flooding was primarily identified as the residences being in low lying areas, in some instances adjacent to a creek that is over capacity, and most of the homes having slab-on-grade foundations.

There are 18 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

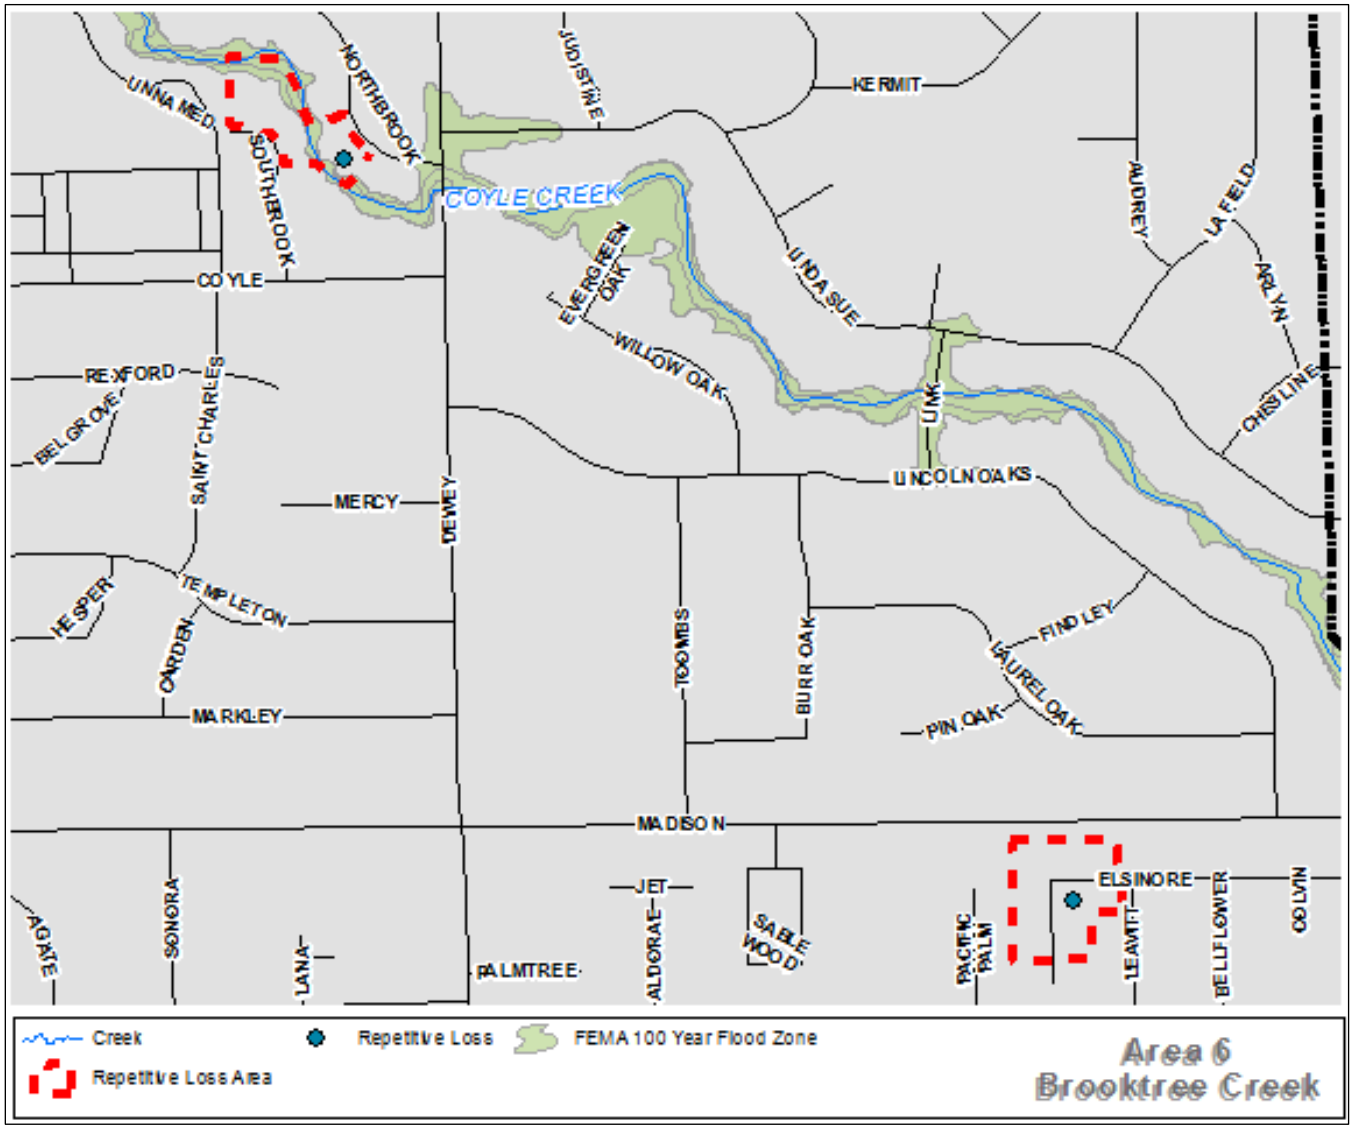
A6.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), plans or studies that could affect the cause or impacts to flooding were not available.

The primary methods of property protection are:

- Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.
- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.
- Home Removal – If necessary, it may be recommended that the County purchase the property and remove the home from the lot.

FIGURE A6
Repetitive Loss Area #6



A6.5 DATA COLLECTION

Sacramento County Plans and studies for Brooktree Creek were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- Improvement plans for 5334 Elsinore Way
- Palm Avenue Subdivision
- Orange Estates
- Pacific Palm Estates
- Oak Brook Park
- Oak Brook Park Unit 2
- Oak Brook Park Unit 3
- 6551 – 6599 Coyle Avenue

A6.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012), 7 properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs on Northbrook Way and Southbrook Way when flows exceed the capacity of Coyle Creek. The Sacramento County Local Floodplain on Elsinore Way for this RLA floods due to it being a low lying area.

A6.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 3 of the overall 18 properties within the Brooktree Creek RLA had reported flooding.

A6.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed on February 23, 2015. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.

- High-water marks and debris mark levels

A6.5.4 Types of Foundations

The most common type of foundations within the Dewey Drive RLA is slab-on-grade.

A6.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for future mitigation measures. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

MORRISON CREEK

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 7

TABLE OF CONTENTS

A7.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 7, one of the twenty-eight (28) designated RLAs within the Sacramento County. The Area 7 analysis includes a single property as seen in **Figure A7**.

A7.2 ADVICE FOR RESIDENTS

Resident have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A7.3 PROBLEM STATEMENT

The location of Area 7 is in a rural portion of the County with limit improvements. However, for the past two decades intense mining has occurred east of the concerned area, which has provided flood storage.

The source of flooding was primarily identified has high flood waters spreading out over a wide floodplain.

There is one property which includes a building on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions. None of the properties have been mitigated.

A7.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- West Jackson Highway – Master Drainage Study (Dated: 2012)

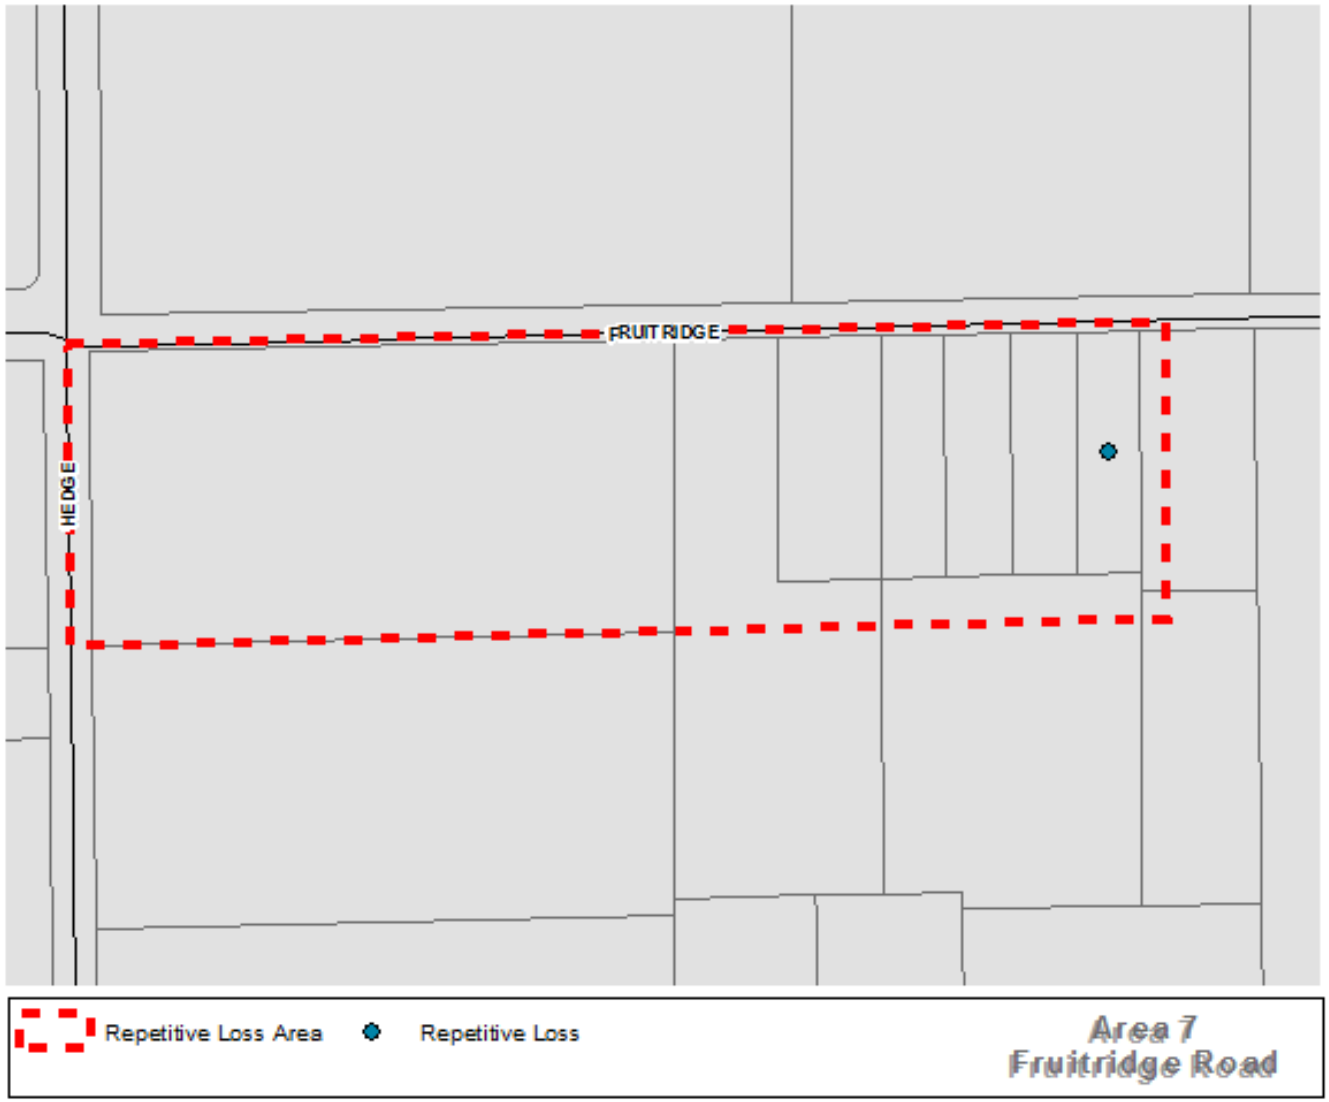
The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

A7.5 DATA COLLECTION

Sacramento County Plans and studies for Morrison Creek were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- West Jackson Highway – Master Drainage Study (2012)

FIGURE A7
Repetitive Loss Area #A7



A7.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) no properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when high stages experienced in Morrison Creek. The Sacramento County Local Floodplain identifies no properties from this RLA.

A7.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that one of the overall eight properties within the Morrison Creek RLA had reported flooding.

A7.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in May 2015. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A7.5.4 Types of Foundations

The most common type of foundations within Area 7 is a slab on grade foundation, which constitutes 100% of the 2 common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A7.6 FUTURE MITIGATION MEASURES

Based on the West Jackson Highway – Master Drainage Study, no further mitigation is required for Area 7.

REPETITIVE LOSS AREA 8
COSUMNES RIVER

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 8

TABLE OF CONTENTS

A8.1 REPETITIVE LOSS AREA 8

This Report focuses on Area 8, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 8 analyses include properties on Green Road and Jeffcott Road and are defined by **Figure A8**.

A8.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A8.3 PROBLEM STATEMENT

The location of Area 8 is generally area bounded by Wilton Road to the east, the Cosumnes River to the south, Green Road to the north and along the west side of Jeffcott Road. The source of flooding was primarily identified has been determined to be low lying areas around Cosumnes River. Out of bank flooding may occur in older residential areas constructed prior to NFIP requirements.

There are 33 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

A8.4 BASIC INFORMATION

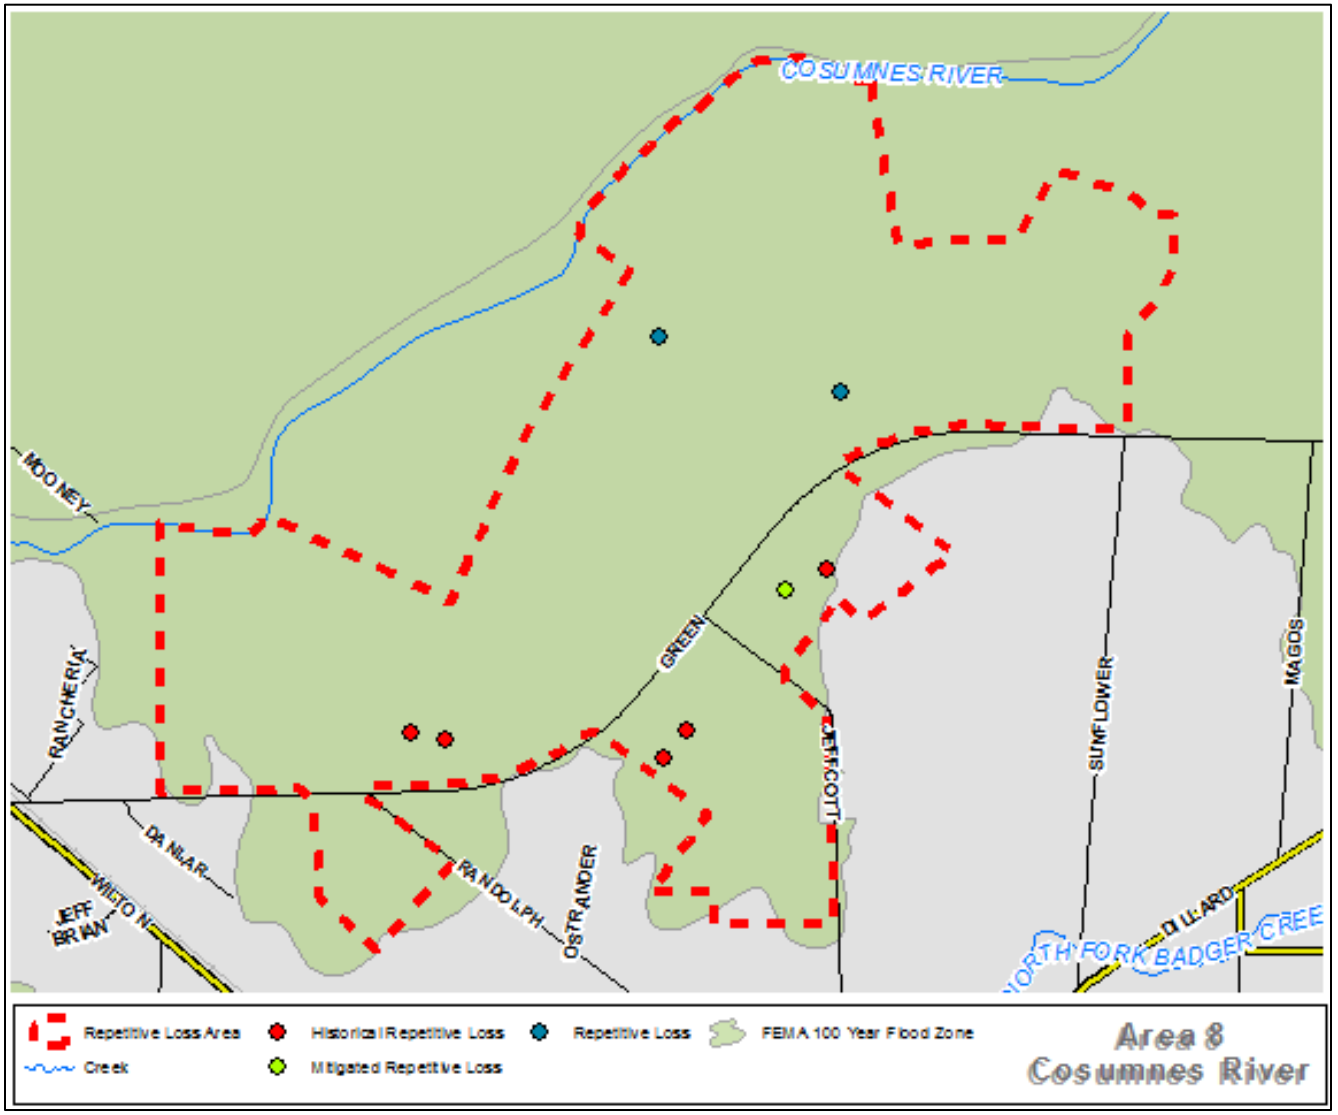
From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- 9500 Jeffcott Road – Rose's Engineering
- 11375 Green Road – Rose's Engineering

The primary methods of property protection are:

- Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.
- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.

FIGURE A8
Repetitive Loss Area #8



A8.5 DATA COLLECTION

- Sacramento County Plans and studies for Cosumnes River were utilized in this analysis.

A8.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) thirty-three (33) properties in the RLA are within the 100-year FEMA floodplain. The flooding occurs when low lying areas around Cosumnes River are inundated by out of bank flooding in the older residential areas.

A8.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 2 of the overall thirty-three (33) properties had reported flooding and seven (7) reported to FEMA for insurance purposes are within the Cosumnes River RLA.

A8.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in January 9, 1995, January 9 & 22, 1997. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A8.5.4 Types of Foundations

The most common type of foundations within the Cosumnes River RLA is both raised and slab on grade, which constitutes 71% of the known foundations found in this RLA in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A8.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for elevating homes. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP & FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

Appendix 9

REPETITIVE LOSS AREA 9

SOUTH BRANCH
OF
ARCADE CREEK

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 9

TABLE OF CONTENTS

A9.1 REPETITIVE LOSS AREA 9

This Report focuses on Area 9, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 9 analysis includes properties on Hoffman Lane, Long Acres Court and Manana Way defined by **Figure A9**.

A9.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A9.3 PROBLEM STATEMENT

The location of Area 9 is generally Hoffman Lane south of Greenback Lane.

The source of flooding has been determined to be South Branch of Arcade Creek in low lying area or low floors with a constrained drainage system. Out of bank flooding may occur in older residential areas constructed prior to NFIP requirements.

There are 21 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions. There was one property that was mitigated by elevation.

A9.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- South Branch Arcade Creek Drainage studies were performed as referenced in the approved environmental impact reports for the Gum Ranch and Sheltonham developments. Hydrologic models were developed to analyze development impacts and mitigation measures.

The primary methods of property protection are:

- Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.
- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.

FIGURE A9
Repetitive Loss Area #9

A9.5 DATA COLLECTION

Sacramento County Plans and studies for South Branch of Arcade Creek were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- Gum Ranch Drainage Study prepared by Morton & Pitalo, May 2005

A9.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) all properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when Out of bank flooding may occur in older residential areas. The Sacramento County Local Floodplain follows the FEMA floodplain for this RLA,

A9.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that seven of the overall 20 properties within the South Branch of Arcade Creek RLA had reported flooding.

A9.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in June 15 & 16, 1998.. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A9.5.4 Types of Foundations

The most common type of foundations within the South Branch of Arcade Creek RLA is Raised Foundation which constitutes 100% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A9.6 FUTURE MITIGATION MEASURES

The County continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 10

TABLE OF CONTENTS

A10.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 10, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 10 analyses include properties on Maple Glen Road, Kubel Circle, Lading Road, Rockwood Drive, Winding Creek Road and Riding Club Lane and are defined by **Figure A10**.

A10.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs.

A10.3 PROBLEM STATEMENT

The location of Area 10 is generally area bounded by Fulton Avenue to the east, Arden Way to the south, El Camino Avenue to the north and Eastern Avenue to the east. The source of flooding was primarily identified has been determined to be low lying areas around Strong Ranch Slough. Out of bank flooding may occur in older residential areas constructed prior to NFIP requirements.

There are 53 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

A10.4 BASIC INFORMATION

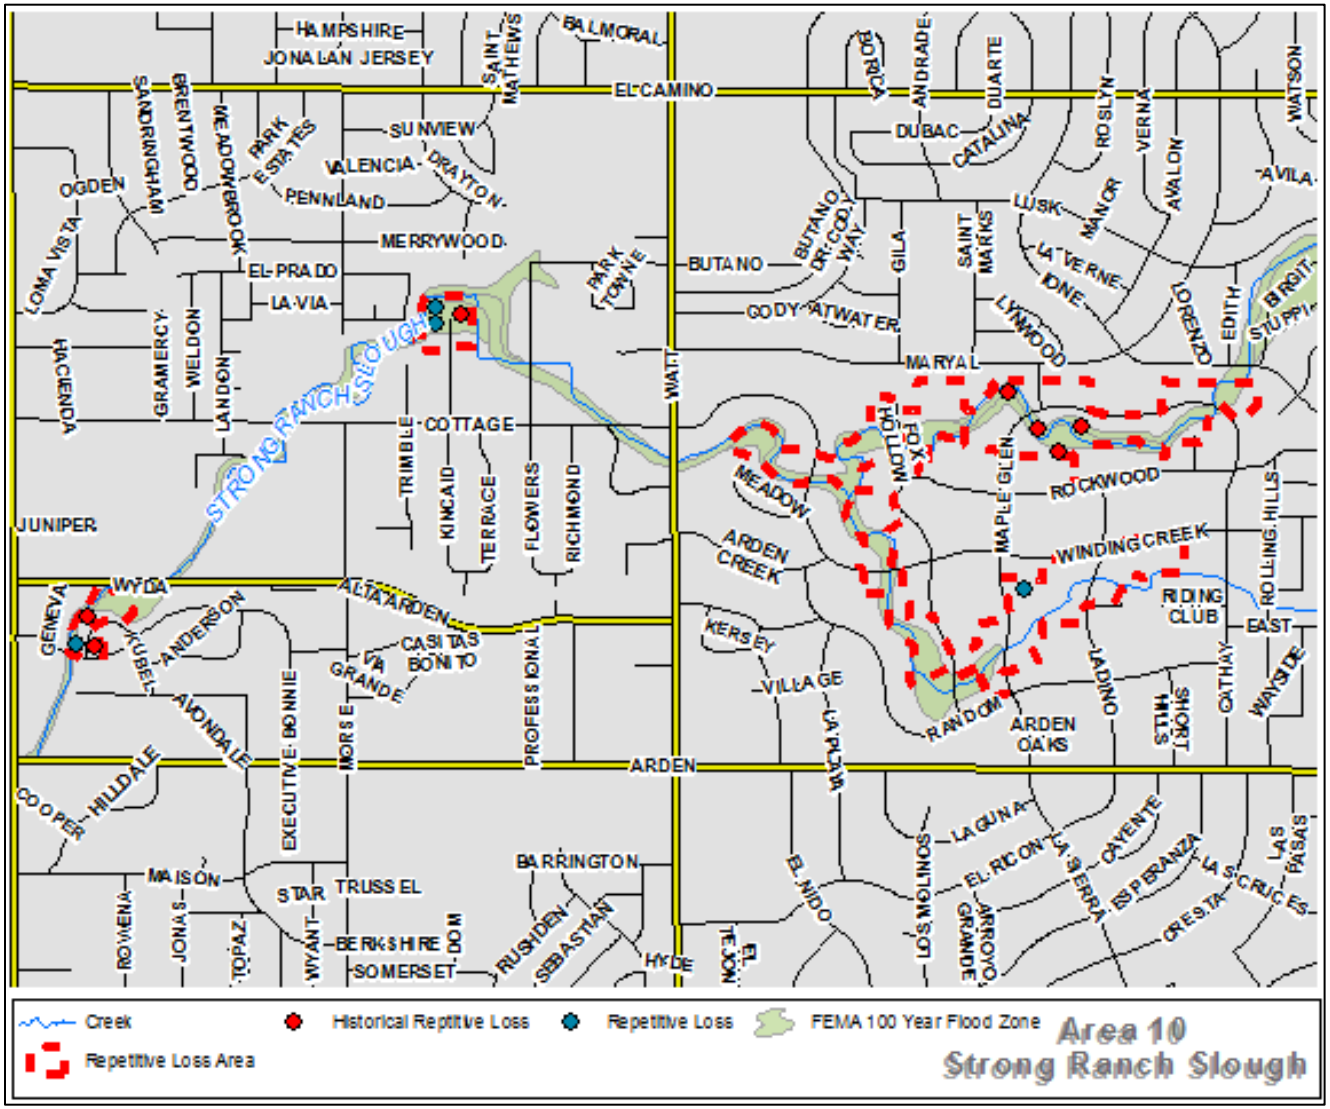
From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- Drainage study was developed by David Ford Engineers

The primary methods of property protection are:

- Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.
- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.

FIGURE A10
Repetitive Loss Area #10



A10.5 DATA COLLECTION

Sacramento County Plans and studies for Strong Ranch Slough were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- **Drainage study was developed by David Ford Engineers** for Water Resources in 2006 to analyze flood control alternatives. Staff expanded on the modeling in 2007 and developed a website and flood warning system for the area. The models are used by staff to analyze capital improvement projects.
- Sacramento County **Strong Ranch Slough Flood Prep 100 year Map Book**
- Kincaid Flood Wall Project by Sacramento County Water Resources (CIP).

A10.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) fifty-three (53) properties in the RLA are within the 100-year FEMA floodplain. The remaining twenty-six (26) properties are within the Local Flood Zone. The flooding occurs when low lying areas around Strong Ranch Slough are inundated by out of bank flooding in the older residential areas. The Sacramento County Local Floodplain Map shows the local flooding in Strong Ranch Creek for this RLA,

A10.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 12 of the overall seventy-nine (79) properties and 11 reported to FEMA for insurance purposes are within the Strong Ranch Creek RLA had reported flooding.

A10.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in January 9, 1995, January 9 & 22, 1997. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A10.5.4 Types of Foundations

The most common type of foundations within the Strong Ranch Slough RLA is raised, which constitutes 79.4% of the 79 common foundations found in this RLA in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A10.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for elevating homes . The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

Repetitive Loss Area 11

LINDA CREEK

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 11

TABLE OF CONTENTS

A11.1 REPETITIVE LOSS AREA 11

This Report focuses on Area 11, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 11 analysis includes properties on Hazel Avenue. Leever Lane, Nipawin Way, Creek Oaks Lane, Oak Avenue, Eden Oaks Avenue, and Oak Avenue defined by **Figure A11**.

A11.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A11.3 PROBLEM STATEMENT

The location of Area 11 is generally west of Granite Avenue and north of Oak Avenue. Floods in the Dry Creek watershed generally occur from October through April. The floods are usually caused by a combination of prolonged rainfall leading to saturated soils, and a short period of one to six hours of intense precipitation associated with frontal convection or severe thunderstorms. The source of flooding was primarily identified Linda Creek low lying areas around Linda Creek and a constrained drainage system. Out of bank flooding may occur in older residential areas constructed prior to NFIP requirements. There are 44 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

A11.4 DATA COLLECTION

Sacramento County Plans and studies for Linda Creek Remap were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- The Sacramento County Water Agency, and Placer County For Linda Creek Floodplain Mapping Agreement

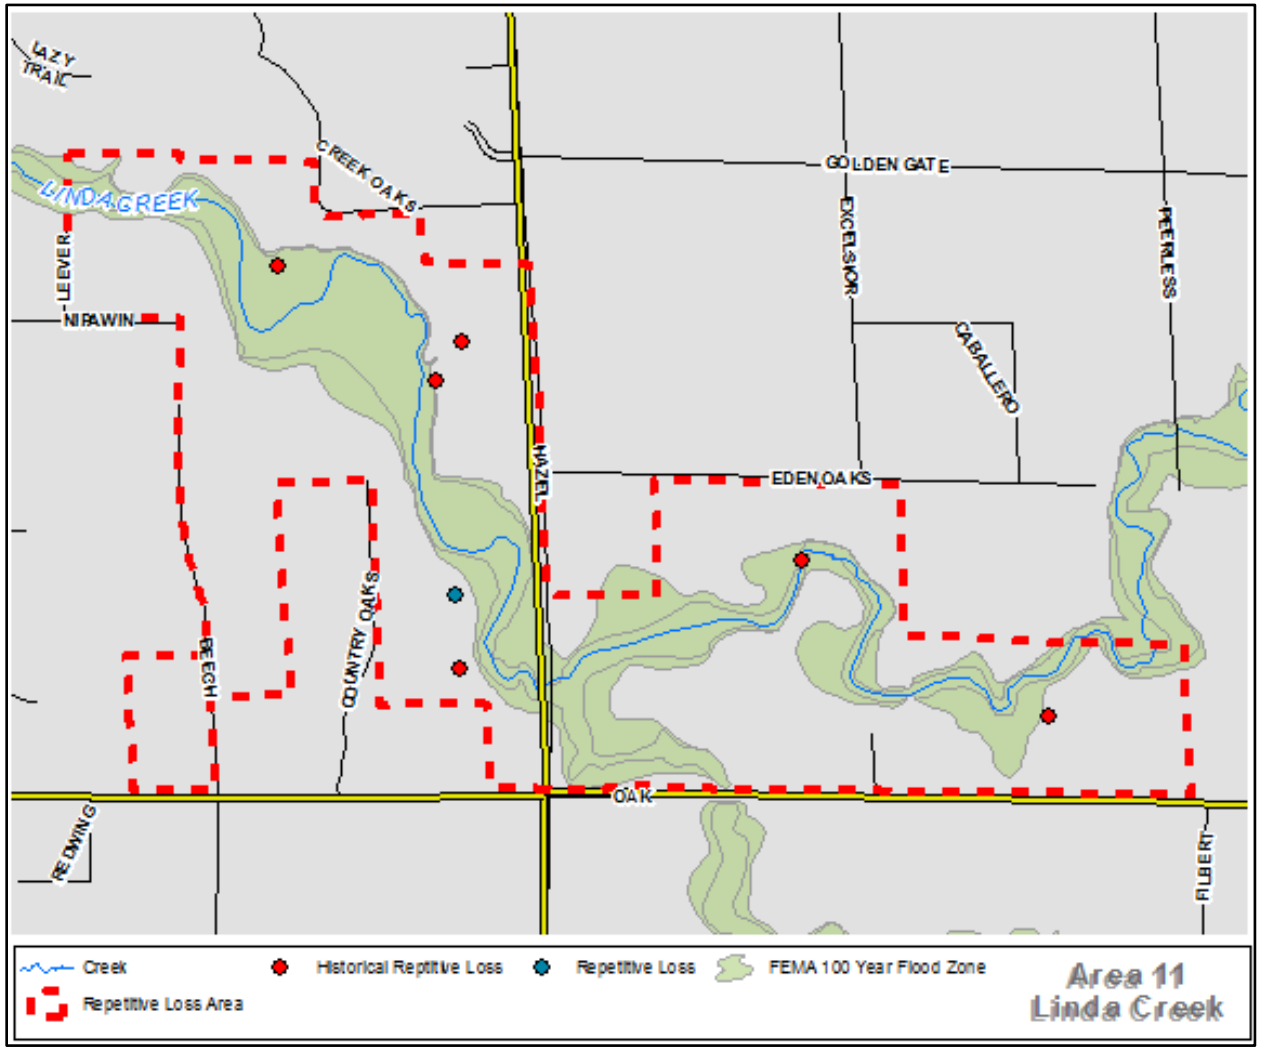
A11.4.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) 37 properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when Linda Creek overtops bank and the constrained drainage system in older residential areas. The Sacramento County Local Floodplain generally follows the existing FEMA floodplain for this RLA,

A11.4.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 4 of the overall 44 properties within the Linda Creek RLA had reported flooding.

FIGURE A11
Repetitive Loss Area #11



A11.4.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in January 9, 1995, April 1, 1996, and February 3, 1998. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A11.4.4 Types of Foundations

The most common type of foundations within the Linda Creek RLA is raised, which constitutes 74.5% of the common foundations found within Repetitive Loss Area 11 in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A11.5 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for elevating structures in this RLA. The County continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

&

VIEIRA'S RESORT

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 12

TABLE OF CONTENTS

A12.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 12, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 12 analysis includes properties on Long Island Road, Grand Island Road, and Vieira's resort as defined by **Figure A12**.

A12.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A12.3 PROBLEM STATEMENT

Area 12 is located in the southern portion of the County on the Sacramento River. The properties located in this area are on the water side of the levee prism. The source of flooding is caused by high stages in the Sacramento River. During 1986 storm event Area 12 experienced high stages from the Sacramento River.

There are 43 properties which include buildings on FEMA's repetitive loss list, historical loss properties or nearby buildings that may have the same or similar flooding conditions. Twenty-one (21) of the properties have Elevation Certificates on file and all but three (3) structures have been mitigated either through government assistance or private funding.

A12.4 BASIC INFORMATION

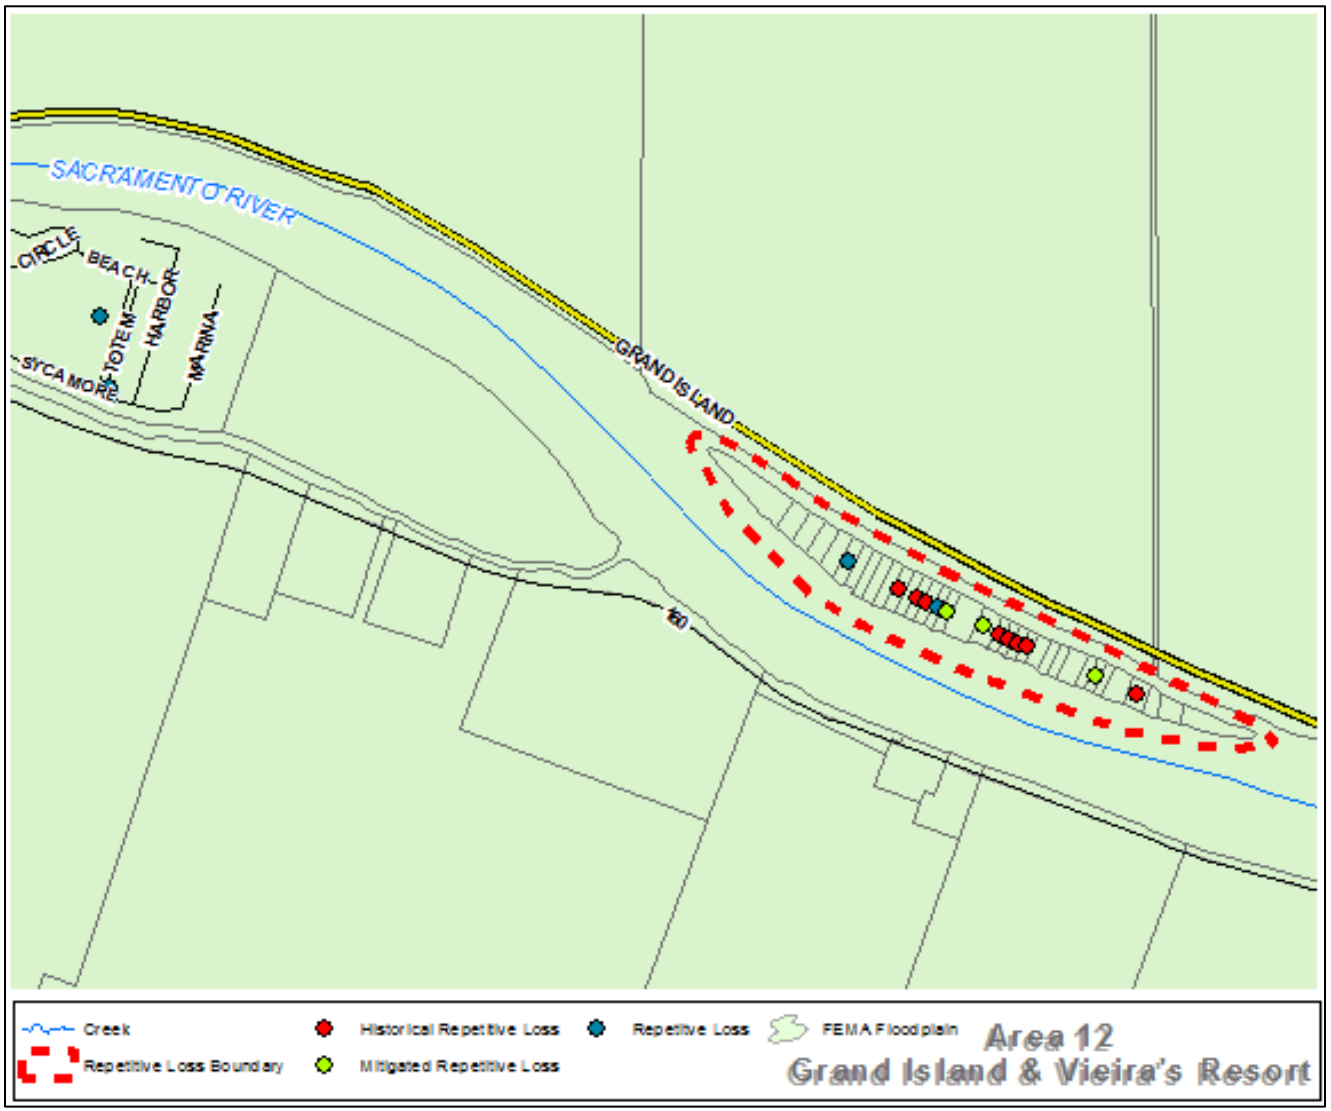
From the agencies or organizations that were contacted (Chapter 2.2), there are no studies or plans to further protect Area 12.

The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

A12.5 DATA COLLECTION

The Federal Emergency Management Agency (FEMA) – Flood Insurance Study for the Unincorporated County were utilized in this analysis to establish the base flood elevation.

FIGURE A12
Repetitive Loss Area #12



A12.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) all the properties within the RLA are within the 100-year FEMA floodplain. Area 12 is located between both levees of the Sacramento River and is inundated by the FEMA Effective floodplain.

A12.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that none of the overall 31 properties within the RLA had reported flooding. However, Area 12 is outside the Urban Services boundary and has limited resources to assist in flooding for this area.

A12.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed on February 6, 2015. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes

A12.5.4 Types of Foundations

The most common type of foundations within the RLA is raised foundation, which constitutes 100% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A12.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for home elevations. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

WILTON

LOCAL FLOODPLAIN

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 13

TABLE OF CONTENTS

A13.1 REPETITIVE LOSS AREA 13

This Report focuses on Area 13, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 13 includes properties in Wilton, California on Collings Road, Davis Road, Haggie Road, Mann Road, and Dillard Road as show on **Figure A13**.

A13.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs.

A13.3 PROBLEM STATEMENT

The location of Area 13 is within the Wilton area, south of Dillard Road generally between Collins Road and Davis Road, and north of Mann Road.

The source of flooding was primarily identified as poor drainage and flat terrain. The local floodplain tends from Dillard Road southeast across Mann Road toward the North Fork Badger Creek FEMA A-Zone floodplain. Damaging floods occurred in January of 1995 and January of 1997.

There are 33 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions. The lone repetitive loss property has not been mitigated.

A13.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding:

- none

The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

A13.5 DATA COLLECTION

The State of California – Department of Water Resources Central Valley Flood Evaluation and Delineation LiDAR (dated 2008) was utilized in this analysis.

A13.5.1 Flood Insurance and Flood Event Data

Area 13 is in Zone X, on the FEMA Flood Insurance Rate Map 06067C0345H. The flooding is associated with local drainage issues as a result of very flat terrain and limited drainage facilities. The flooding occurs when large storm events back up North Fork Badger Creek. Due to the extremely flat terrain, water ponds through the repetitive loss area.

FIGURE A13
Repetitive Loss Area #13

A13.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) has no record of any calls to report flooding from the properties identified in the repetitive loss area. The only repetitive loss property in the area filed flood claims in January of 1995 and January of 1997. The only historical loss property filed a flood claim in February of 1998.

A13.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed during the storm events causing repetitive flooding of January 1995 and January 1997. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the local flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location;
- Neighborhood topography and flow routes

In addition, visual inspections for each property were made in preparation of this Report.

A13.5.4 Types of Foundations

The most common type of foundations within the Badger Creek RLA is a raised foundation, which constitutes 73% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A13.6 FUTURE MITIGATION MEASURES

The County continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

A14.1 REPETITIVE LOSS AREA 14

This Report focuses on Area 14, one of the twenty eight (28) designated RLAs within the Sacramento County. Area 14 analyses include Manzanita Avenue, Peppermill Court, Sycamore Avenue, and Winding Way as defined by **Figure A14**.

A14.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAs.

A14.3 PROBLEM STATEMENT

The location of Area 14 is made up of six subareas. The area is bounded by Pasadena Avenue, Winding Way and College Oak Drive. The second subarea is generally bounded by Arcade Creek, Valhalla Drive, and Winding Way. The third subarea is adjacent to Brooktree Creek.

The source of flooding was primarily identified as the residences being in low lying areas, in some instances adjacent to a creek that is over capacity, and most of the homes having slab-on-grade foundations.

There are 47 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

A14.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following plans or studies that could affect the cause or impacts to flooding are:

- Drainage Study for 4950 Hackberry Lane

The primary methods of property protection are:

- Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.
- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.

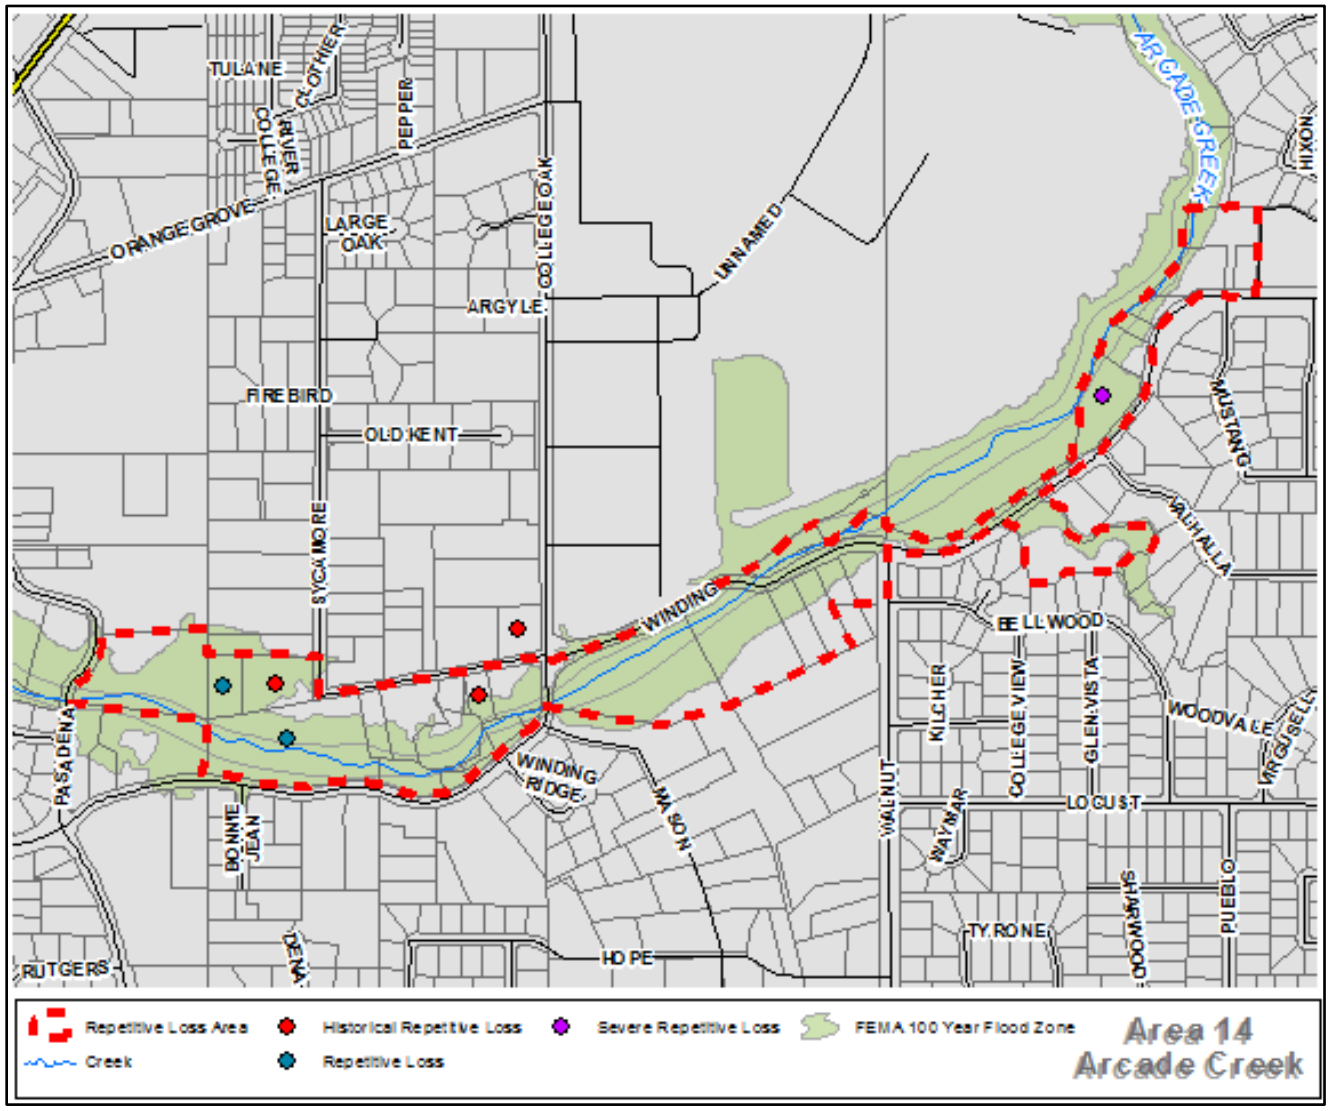
- Home Removal – If necessary, it may be recommended that the County purchase the property and remove the home from the lot.

A14.5 DATA COLLECTION

Sacramento County Plans and studies for Manzanita Avenue were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- Sycamore Avenue Drainage Project
- Del Paso Vale
- Oakvale No. 2
- Oakvale No. 3
- Oak Creek Estates Unit 2
- Hackberry Estates
- 5990 Devecchi Avenue

FIGURE A14
Repetitive Loss Area #14



A14.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) 26 properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when flows exceed the capacity of Arcade Creek, and Brooktree Creek. The Sacramento County Local Floodplain on Sycamore Avenue for this RLA floods due to it being a low lying area.

A14.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 8 of the overall 47 properties within the Arcade Creek RLA had reported flooding.

A14.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in March of 2015. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A14.5.4 Types of Foundations

The most common type of foundations within the Manzanita Avenue RLA is slab-on-grade.

A14.6 FUTURE MITIGATION MEASURES

The County continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

Wilton

Local Floodplain

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 15

TABLE OF CONTENTS

A15.1 REPETITIVE LOSS AREA 15

This Report focuses on Area 15, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 15 includes properties in Wilton, California on Apple Road, Berry Road, Cherry Road, Currant Road, Dillard Road, Early Times Road, Live Oak Road, and Orange Road as shown on **Figure A15**.

A15.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A15.3 PROBLEM STATEMENT

The location of Area 15 is within the Wilton area, east of Dillard Road generally between Apple Road and Orange Road, and east of Berry Road.

The source of flooding was primarily identified as backwater caused by the inverted siphon crossing at Folsom South Canal. During large storm events, the siphon is overwhelmed and backs up the unknown creek that runs north to south through the RLA. Damaging floods occurred in February of 1986, January of 1995, February of 1998, and February of 2000.

There are 40 properties which include buildings on FEMA's repetitive loss list, historical loss properties, and nearby buildings that may have the same or similar flooding conditions. One property contains two structures with different addresses, so there are a total of 41 structures within the RLA. None of the repetitive loss, severe repetitive loss, or historical repetitive loss properties have been mitigated.

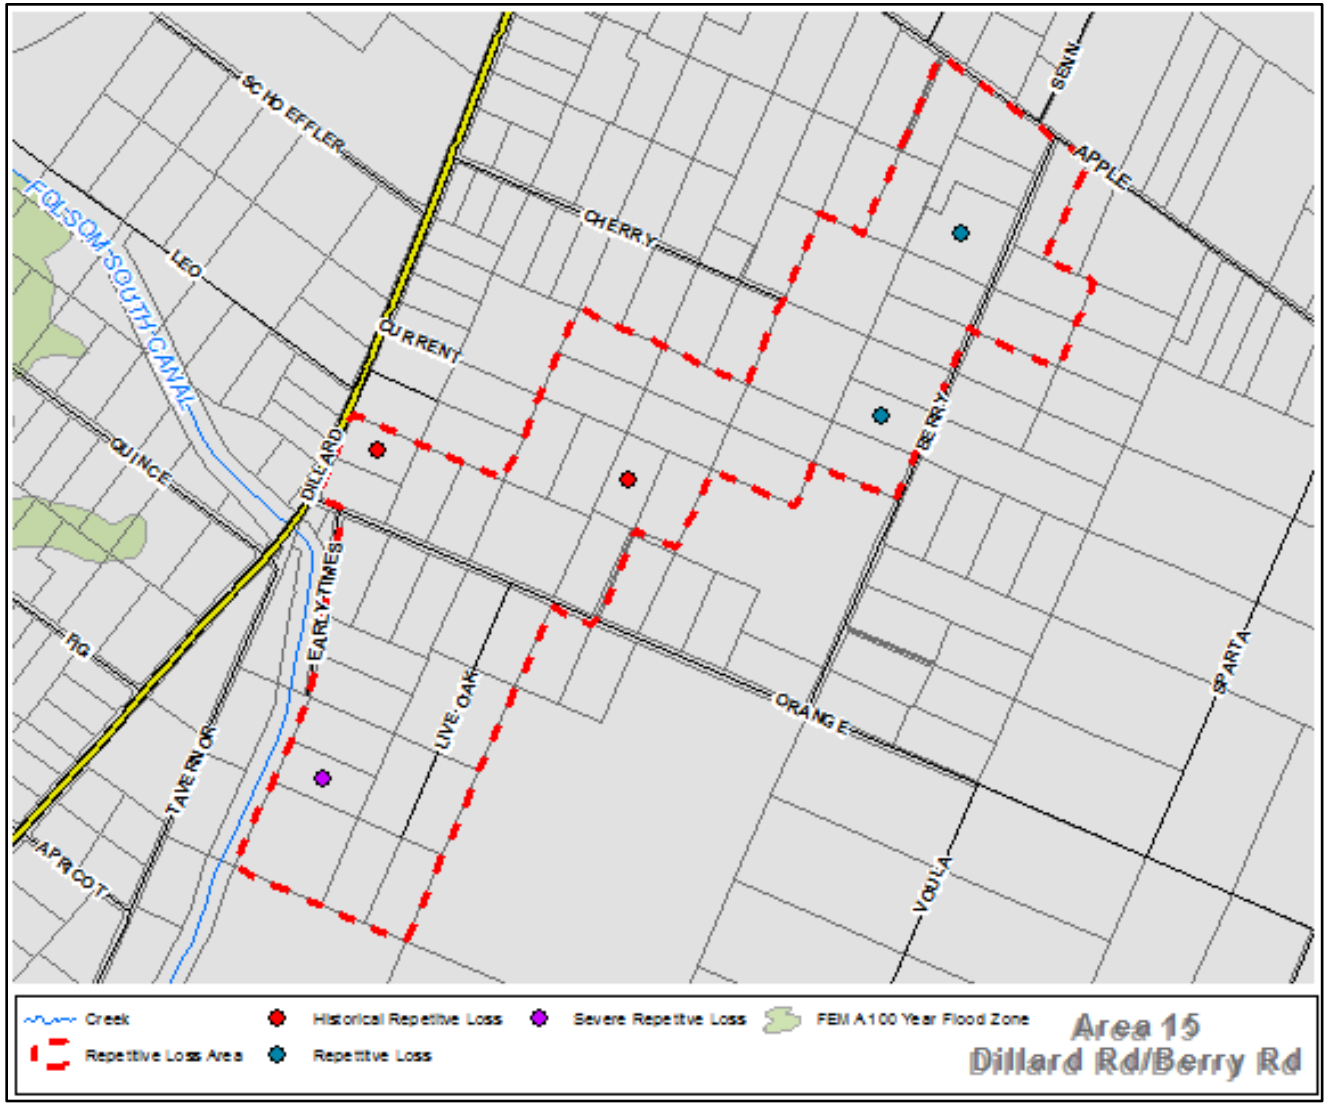
A15.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- **US Bureau of Reclamation Folsom South Canal Design Drawings – Reach 2**

The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

FIGURE A15
Repetitive Loss Area #15



A15.5 DATA COLLECTION

The State of California – Department of Water Resources Central Valley Flood Evaluation and Delineation LiDAR (dated 2008) was utilized in this analysis. In addition, the US Bureau of Reclamation Design Plans for Folsom South Canal were reviewed and used in the analysis.

A15.5.1 Flood Insurance and Flood Event Data

Area 15 is in Zone X, on the FEMA Flood Insurance Rate Map 06067C0375H. The flooding is associated with local drainage issues as a result of backwater created by the inverted siphon crossing at Folsom South Canal. The flooding occurs when large storm events overwhelm the capacity of the siphon. The unknown stream that crosses the Folsom South Canal runs north to south through the RLA. The properties located adjacent to the creek experience the localized flooding.

A15.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that five (5) of the overall 4 properties within the Dillard Rd/Berry Rd RLA had reported flooding. The severe repetitive loss property, repetitive loss properties, and historic loss properties in the area filed flood claims as indicated in the Data Analysis Summaries at the end of this Appendix.

A15.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed during the storm events causing repetitive flooding of February 1986, January 1995, February 1998, and February 2000. These inspections were performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the local flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location;
- Neighborhood topography and flow routes

In addition, visual inspections for each property were made in preparation of this Report.

A15.5.4 Types of Foundations

The most common type of foundations within the RLA is a raised foundation, which constitutes 66% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A15.6 FUTURE MITIGATION MEASURES

The County continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

In addition, the County could explore a regional improvement project to increase the capacity of the inverted siphon crossing at Folsom South Canal.

APPENDIX 16

TABLE OF CONTENTS

A16.1 REPETITIVE LOSS AREA 16

This Report focuses on Area 16, one of the twenty eight (28) designated RLAs within the Sacramento County. Area 16 analyses include properties on C Street, E Street, 16th Street, 20th Street, and 21st Street and are defined by **Figure A16**.

A16.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAs.

A16.3 PROBLEM STATEMENT

The location of Area 16 is generally bounded by Dry Creek Road, C Street, 22nd Street, and G Street.

The source of flooding was primarily identified as being due to capacity exceedance of Robla Creek and Rio Linda Creek.

There are 51 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

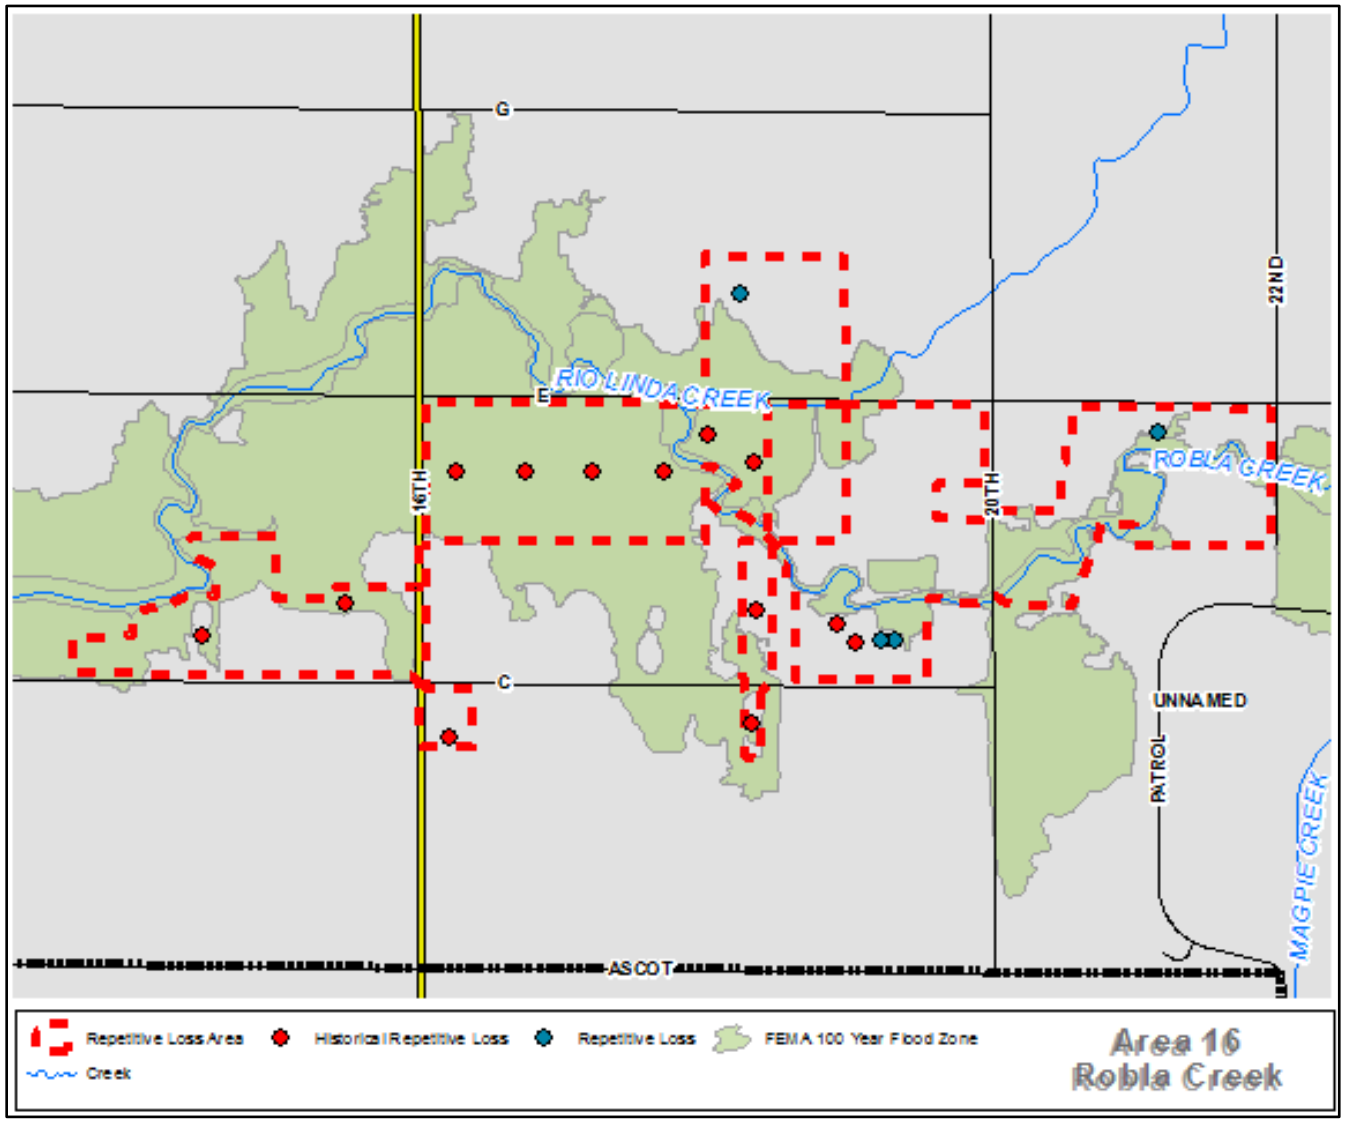
A16.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), plans or studies that could affect the cause or impacts to flooding were not available.

The primary methods of property protection are:

- Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.
- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.
- Home Removal – If necessary, it may be recommended that the County purchase the property and remove the home from the lot.

FIGURE A16
Repetitive Loss Area #16



A16.5 DATA COLLECTION

Sacramento County Plans and studies for Robla Creek were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- Rio Linda Subdivision No. 5

A16.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) 41 properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when flows exceed the capacity of Robla Creek and Rio Linda Creek. The Sacramento County Local Floodplain at the intersection of E Street and 20th Street for this RLA floods due to it being a flat and low lying area.

A16.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 7 of the overall 45 properties within the Dry Creek RLA had reported flooding.

A16.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in March of 2015. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A16.5.4 Types of Foundations

The most common type of foundation within the Robla Creek RLA is slab-on-grade.

A16.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for future mitigation measures. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 17

TABLE OF CONTENTS

A17.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 17, one of the twenty-seven designated RLAs within the Sacramento County. Area 17 analysis includes properties primarily along Garden Highway and is defined by **Figure 1**.

A17.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A17.3 PROBLEM STATEMENT

The location of Area 17 is located adjacent to the Sacramento River. According to information from the County of Sacramento – County Clerk Office, development of along the Sacramento River in Area 17 first began in the 1850's and is continuing to develop. The majority of homes was built prior to 1975 and is considered Pre-FIRM. These homes were built with no FEMA guidelines for proper construction in flood prone areas.

The Sacramento River Basin is approximately 27,000 square miles which drains the northern central valley into the Sacramento – San Joaquin Delta. Several hydrologic and hydraulic studies have been conducted on the Sacramento River system to understand the flooding potential at various locations. These models were calibrated to the large storm events that occurred in 1986, 1997, and 2005. Based on these models, Area 17 is susceptible to high flood stages in the Sacramento River. This is caused by tidal influences, American River, Feather River, Sacramento River, and Natomas Cross Canal converging around Area 17.

The source of flooding is caused by high stages in the Sacramento River. The FEMA Effective FIRM indicates that these parcels are inundated by the 100-year storm. Additionally, the U.S. Army Corps of Engineers (USACE) Common Features and the State of California Central Valley Flood Evaluation and Delineation hydraulic models confirmed this area is flood prone.

There are 300 properties which include buildings on FEMA's repetitive loss list, historical loss properties or nearby buildings that may have the same or similar flooding conditions. Of the total homes in Area 17, three (3) homes have been elevated and one (1) home was demolished.

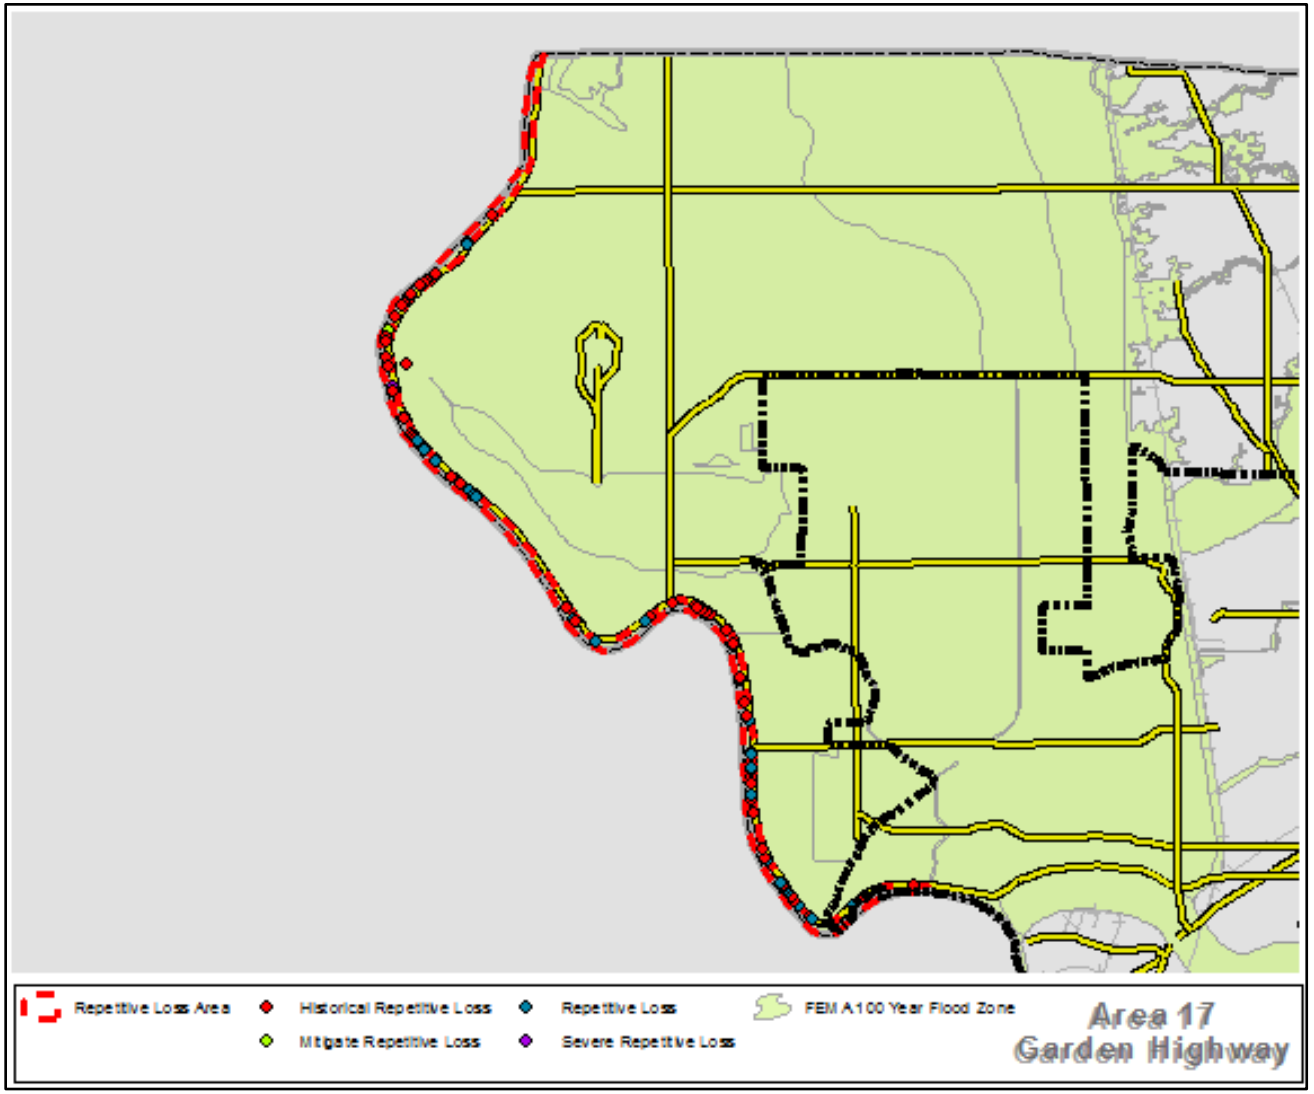
A17.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- SAFCA and USACE – Sacramento Levee Improvement Project
- USACE and Bureau of Reclamation – Folsom Dam Joint Federal Project (Completion 2017)
- State of California – Fremont Weir Expansion (Planning Stage)

The primary method of protection is to inform the public about flood risks of living in flood prone areas, especially for homes on the waterside of a levee. Additionally, all of the homes in Area 17 are identified in the County's building permit database. These homes are required to be in compliance with the local Floodplain Management Ordinance which describes how to safely build in areas that are within a FEMA Effective Floodplain and Local Floodplain.

FIGURE A17
Repetitive Loss Area #17



A17.5 DATA COLLECTION

Plans and studies have been conducted for the Sacramento River system and were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- FEMA Effective Flood Insurance Study
- SAFCA and USACE – Sacramento River Levee Improvement Project
- Central Valley Flood Evaluation and Delineation Project
- USACE and Bureau of Reclamation – Joint Federal Project
- State of California – Fremont Weir Expansion Project

A17.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) all properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when the Sacramento River reaches flood stages. Additionally, the Sacramento County Local Floodplain is included for the RLA.

A17.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that forty (40) of the overall 327 properties within the Sacramento River RLA had reported flooding.

A17.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed during large storm events which caused the Sacramento River to reach flood stages and for the purposes of preparing this document. These inspections were performed from both the public right-of-way, when staff was not allowed onto the property. As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- High-water marks and debris mark levels

A17.5.4 Types of Foundations

The most common type of foundations within the Sacramento River RLA are raised foundations, which constitutes 89% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A17.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for land acquisition and home elevations. The Federal and State governments have taken a strong interest in the Natomas area and have starting funding projects to strengthen and build setback levees protecting the area. Additionally, the Federal and State governments' area conducting off-site projects to decrease flood stages in the Sacramento River. Lastly, the County further continues to encourage home owners to raise their structures above the flood hazard.

- SAFCA and USACE – Sacramento River Levee Improvement Project
- Central Valley Flood Evaluation and Delineation Project
- USACE and Bureau of Reclamation – Joint Federal Project
- State of California – Fremont Weir Expansion Project
- County - Raise Home Elevations

REPETITIVE LOSS AREA 18
LEONA CIRCLE

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 18

TABLE OF CONTENTS

A18.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 18, one of the twenty-eight (28) designated RLAs within the Sacramento County. The Area 18 analysis includes properties on Leona Circle as defined by **Figure A18**.

A18.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A18.3 PROBLEM STATEMENT

The location of Area 18 is located is located Natomas off of El Centro between Arena Boulevard and San Juan Road. East of Leona Circle is West Drainage Canal which is designed to take local drainage to the Sacramento River. The topography is this area is relatively flat and is generally sloping east towards the canal. Additionally, Area 18 is located in a rural portion of the County which depends on ditches and culverts to provide positive drainage.

The source of flooding for Area 18 is caused by local drainage. Runoff from the adjacent areas collects in ditches and is conveyed toward the canal. During large storm events the ditches are overtopped and the drainage starts to sheet flow causing a wide floodplain. However, the floodplain is shallow.

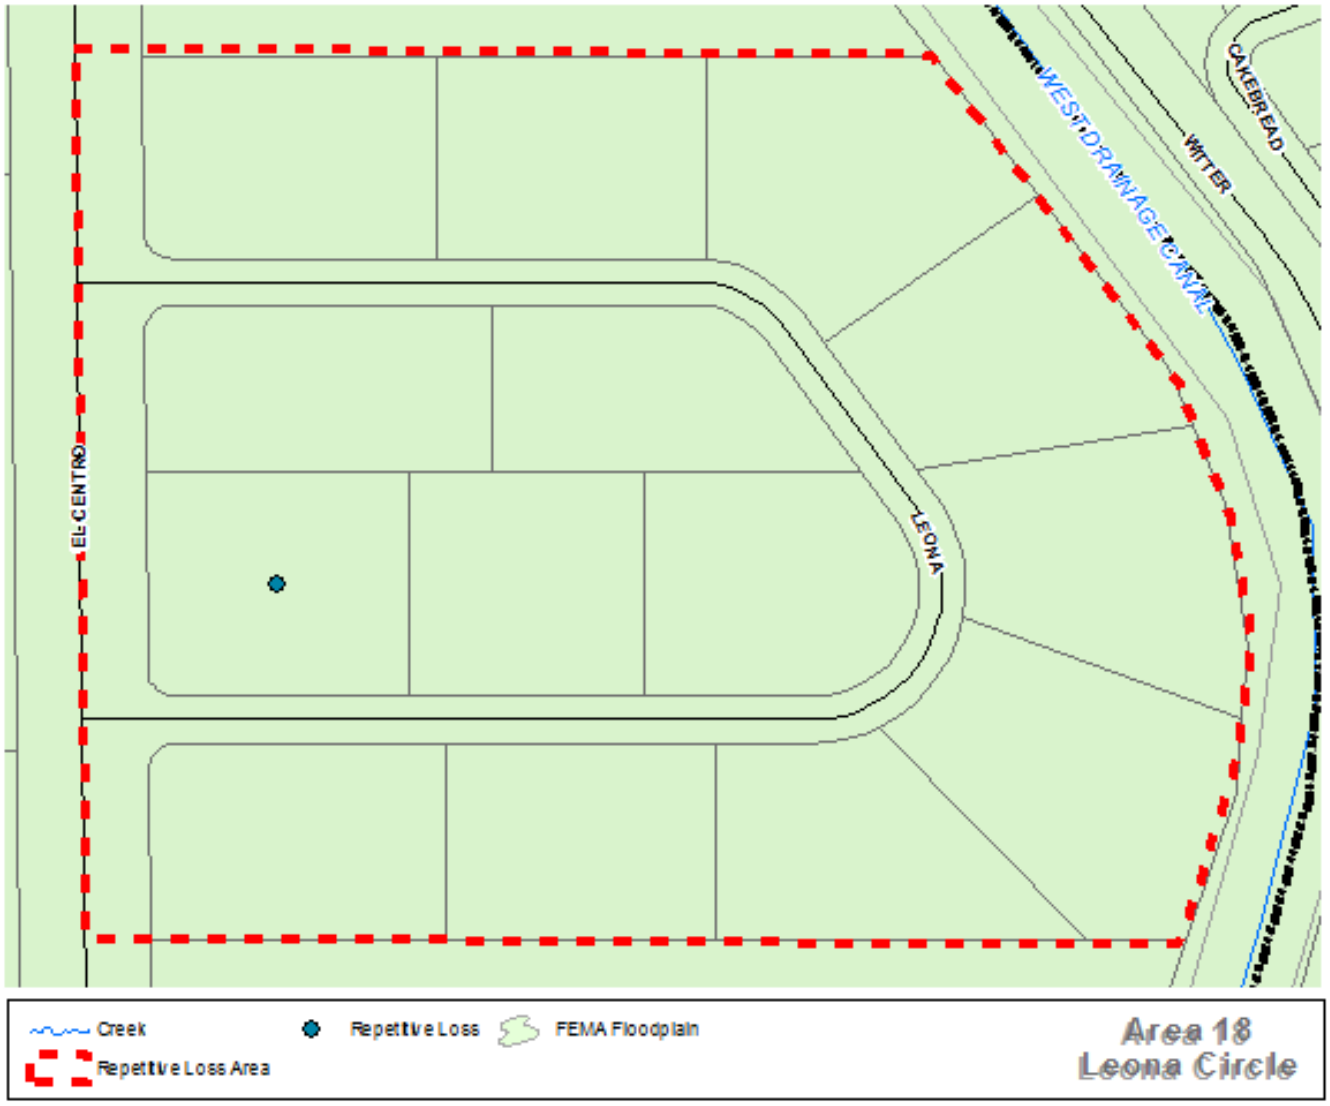
There are 14 properties which include buildings on FEMA's repetitive loss list, historical loss properties or nearby buildings that may have the same or similar flooding conditions. No properties have been acquired as part of the Hazard Mitigation Grant Program (HMGP).

A18.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), there are no projects to improve this area. However, private land developers have submitted a Planning Application seeking to redevelop this area.

The primary methods of property protection are to elevate structures above existing grades or damage prone components, dry flood proof, wet flood proof portions of the building, or acquire and demolish structures at grade.

FIGURE A18
Repetitive Loss Area #18



A18.5 DATA COLLECTION

The Sacramento County study for Repetitive Loss for Area 18 was utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- Sacramento County - Repetitive Loss documentation (2009)

A18.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) thirteen (13) properties are within the RLA are within the 100-year FEMA floodplain. The levees surrounding Natomas have been decertified by US Army Corps of Engineers (USACE) and de-accredited by FEMA. The resulting FEMA floodplain is the maximum stage in the Sacramento or American River project across Natomas. However, US Congress has authorized the USACE to improve the levees, which result in a FEMA floodplain zone change from Zone AE to Zone A99.

A18.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that none of the overall 13 properties within Leona Circle RLA had reported flooding.

A18.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed for the preparation of this report. This inspection was performed from public right-of-way. As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.

A18.5.4 Types of Foundations

The most common type of foundations within the Leona Circle RLA is slab on grade, which constitutes 80% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A18.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for acquisition of properties and further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources through FMA and property owners to elevate homes.
- **Timeline:** As opportunities and funding becomes available
- **Potential Funding:** State and/or Federal Grants

Appendix 19

REPETITIVE LOSS AREA 19
TANGERINE AVENUE

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 19

TABLE OF CONTENTS

A19.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 19, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 19 analysis includes properties on Persimmon Avenue and Tangerine Avenue as defined by **Figure A19**.

A19.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A19.3 PROBLEM STATEMENT

Area 19 is located in South Sacramento between Florin and Elder Creeks. Flooding in this area generally occurs between October and April during the rainy season. During large storm events the drainage system becomes overwhelmed and begins to discharge onto the streets, which eventually drains to the creek. However, according to the best available topographic data and staff observations, the parcels experiencing flooding are built lower than the roadway. Therefore, street flooding is spilling onto the parcels in the RLA.

There are three (3) properties which include buildings on FEMA's repetitive loss list, historical loss properties or nearby buildings that may have the same or similar flooding conditions. None of the properties in Area 19 have been mitigated for flooding.

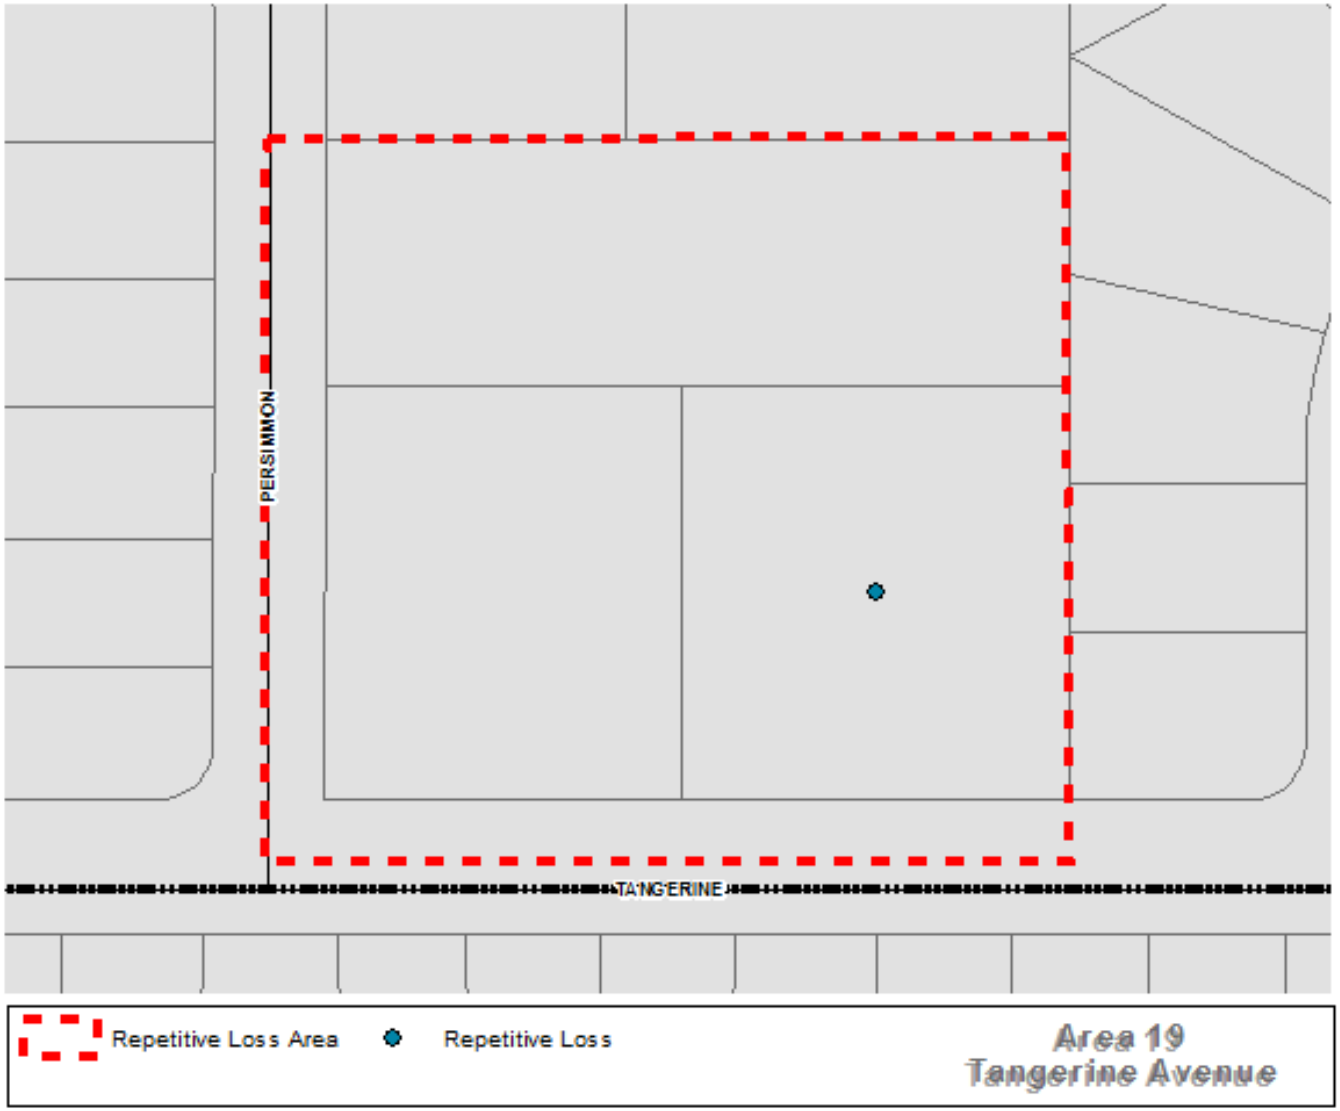
A19.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- SAFCA – Franklin-Boyce Detention Basin

The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

FIGURE A19
Repetitive Loss Area #19



A19.5 DATA COLLECTION

The State of California – Department of Water Resources Central Valley Flood Evaluation and Delineation LiDAR (dated 2008) was utilized in this analysis.

A19.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) none of the properties in Area 19 are within the 100-year FEMA floodplain.

A19.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that two (2) of the overall three (3) properties are within Area 19.

A19.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed by County staff. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A19.5.4 Types of Foundations

The most common type of foundations in Area 19 is a slab on grade foundation, which constitutes 100% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A19.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for acquisition of flood prone properties. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

Appendix 20

REPETITIVE LOSS AREA 20
TREEHOUSE LANE

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 20

TABLE OF CONTENTS

A20.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 20, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 20 analysis includes twelve (12) parcels as defined by **Figure A20**.

A20.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A20.3 PROBLEM STATEMENT

The location of Area 20 is located north of the American River between Eastern Avenue and Watt Avenues. The subdivisions built in this area occurred between the 1940's to the 1990's, with the majority of the development taking place around the 1950's. During this time, it was a very common practice to direct drainage to the natural flow path, which included drainage pipes between parcels, drainage pipes discharging overland and re-entering into drainage pipes, drainage pipes decreasing is size downstream to regulate flow, and variety of other unique schemes.

The source of flooding was primarily caused by large storm events that overwhelmed the drainage system and begins to discharge onto the surface, which eventually drains between parcels. The structures in Area 20 are adjacent to the overland release and are built low enough for potential flooding. Reported damages occurred in 1994 and 1995.

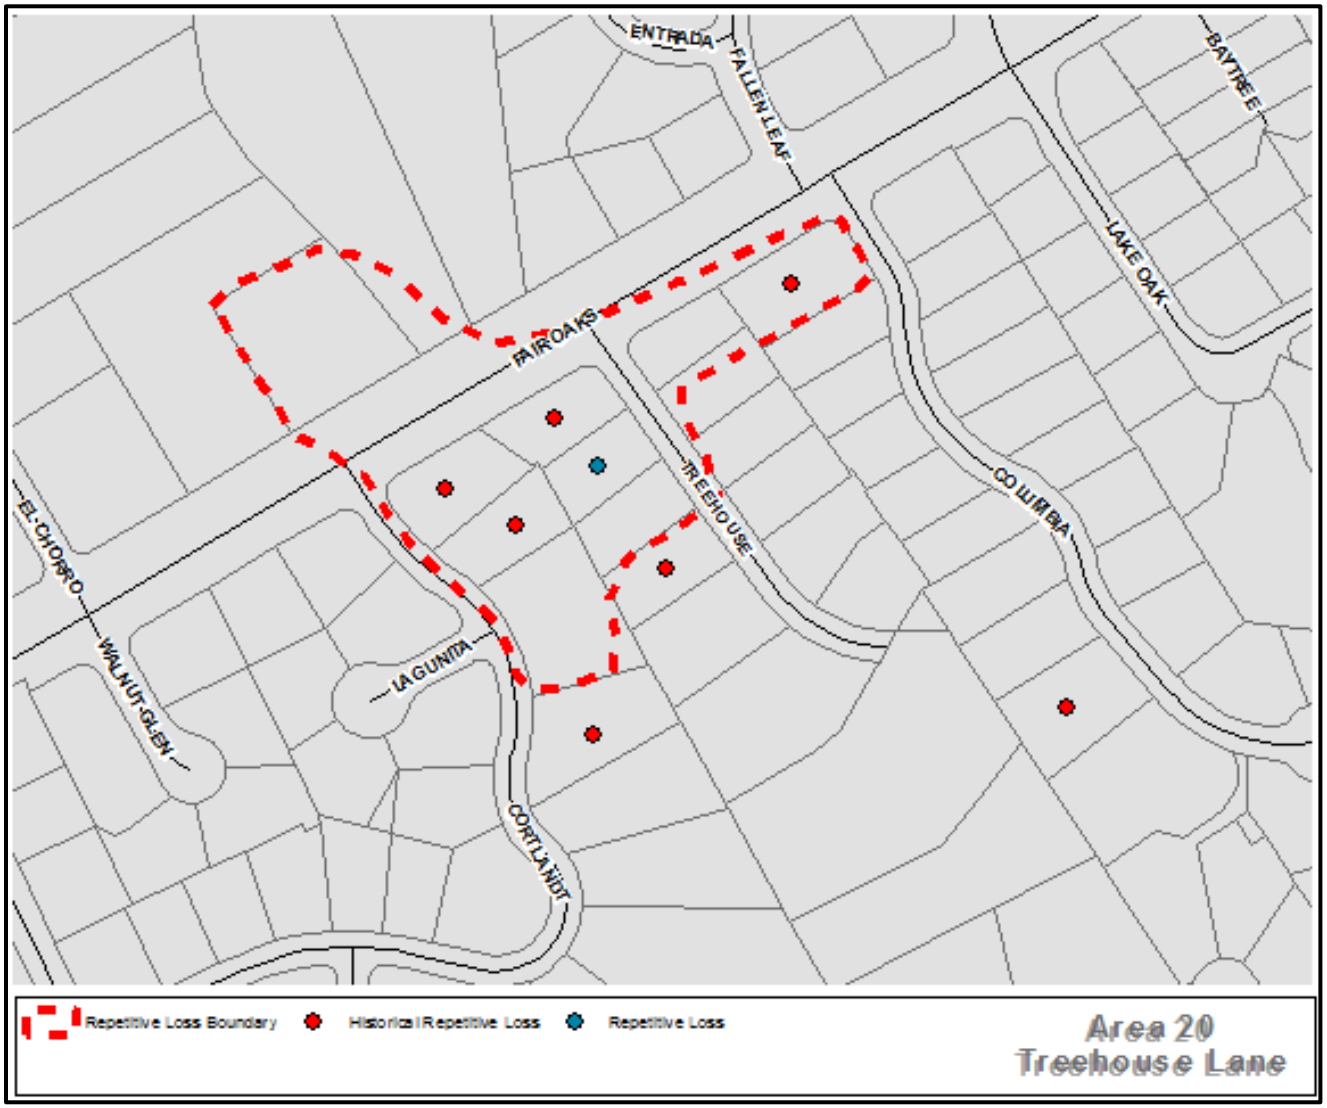
There are twelve (12) properties which include buildings on FEMA's repetitive loss list, historical loss properties or nearby buildings that may have the same or similar flooding conditions. No properties have been mitigated in Area 20.

A20.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), no projects are proposed that would impact flooding in Area 20.

The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

FIGURE A20
Repetitive Loss Area #20



A20.5 DATA COLLECTION

The State of California – Department of Water Resources Central Valley Flood Evaluation and Delineation LiDAR (dated 2008) was utilized in this analysis.

A20.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) none of the properties in Area 20 are within the 100-year FEMA floodplain.

A20.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that seven (8) of the overall twelve (12) properties within Area 20 have reported flooding.

A20.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in 1994 and 1995. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A20.5.4 Types of Foundations

The most common type of foundations within Area 20 is slab on grade, which constitutes of 100% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A20.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for acquisition of flood prone properties. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

Appendix 21

REPETITIVE LOSS AREA 21
RIO LINDA DRY CREEK

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 21

TABLE OF CONTENTS

A21.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 21, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 21 analysis includes properties on U Street and 24th Street in Rio Linda defined by **Figure A21**.

A21.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A21.3 PROBLEM STATEMENT

The location of Area 20 is generally south of U street and along 24th Street.

A strong frontal system moved from the Pacific Ocean through California from January 4 through 15. This storm caused damages throughout the state. It was particularly severe in Sacramento County where the slow, west to east movement of the frontal system temporarily stopped, positioning the front over and in line with the American River in Sacramento County. While the front stalled, the rain-producing flow along the front from the southwest continued to dump moisture in roughly the same area, resulting in extraordinary rainfall depths in the area.[1]

The source of flooding was primarily identified Dry Creek out of bank flooding in older residential areas constructed prior to NFIP requirements.

There are 19 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions. Three of the properties were mitigated by elevating the structures.

A21.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- Sacramento Area Flood Control Agency (SAFCA) Flood Control Program
- Dry Creek Parkway Project

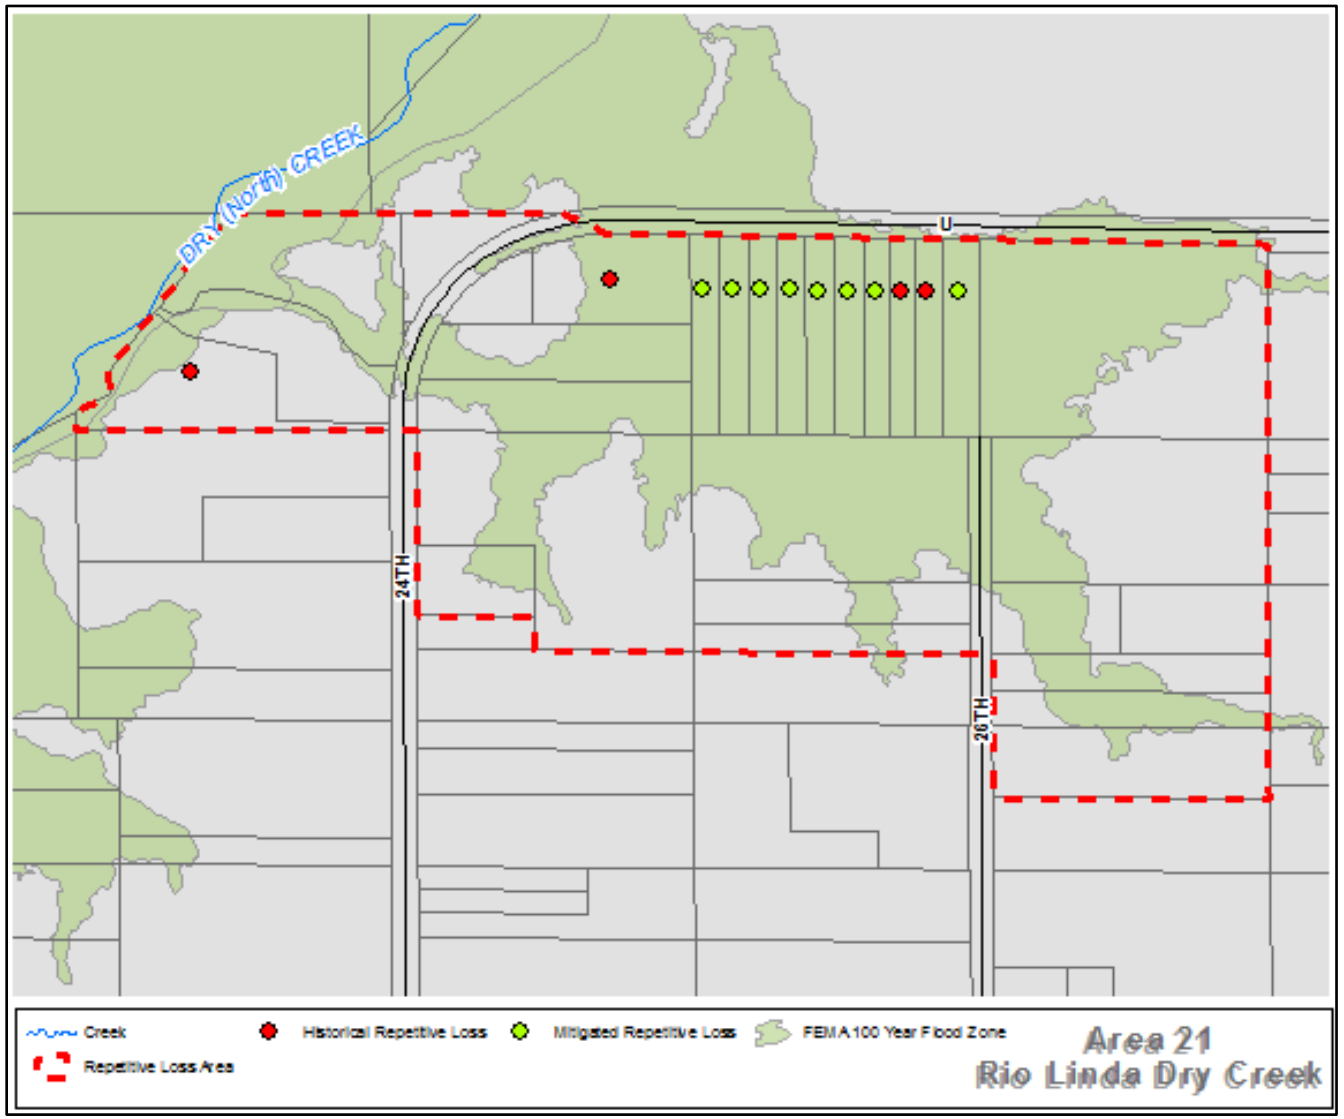
The primary methods of property protection are:

- Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.

[1] District Engineer, Placer County Flood Control and Water Conservation District, 11444 B Avenue, Auburn CA, 95603

- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.

FIGURE A21
Repetitive Loss Area #21



A21.5 DATA COLLECTION

Sacramento County Plans and studies for Dry Creek were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- 2003 Dry Creek Watershed Coordinated Resources Management Plan (DCC, HLA, Swanson, ECORP)
- Dry Creek Watershed Plan Update

A21.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) XXX properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when when Out of bank flooding may occur in older residential areas. The Sacramento County Local Floodplain does not cover this RLA,

A21.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 10 of the overall 19 properties within the Dry Creek RLA had reported flooding.

A21.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A21.5.4 Types of Foundations

The most common type of foundations within the Rio Linda Dry Creek RLA is raised, which constitutes 83% of the two common foundations found in this Sacramento County RLA (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A21.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for HMGP The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 22

TABLE OF CONTENTS

A22.1 REPETITIVE LOSS AREA 22

This Report focuses on Area 22, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 22 analyses includes properties on 2nd Street, 4th Street, 6th Street, Burr Avenue, E. Levee Road, El Modena Avenue, M Street, Marysville Boulevard, Q Street, Rio Linda Boulevard, Schandoney Avenue, Sorento Road, Straugh Road, and W Street as defined by **Figure A22**.

A22.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A22.3 PROBLEM STATEMENT

The location of Area 22 is located east of the Natomas East Main Drainage Canal (NEMDC) and north of Elkhorn Boulevard to the County boundary. Floods in this watershed generally occur from October through April. The floods are usually caused by a combination of prolonged rainfall leading to saturated soils, and a short period of one to six hours of intense precipitation associated with frontal convection or severe thunderstorms. The source of flooding was primarily identified as the North NEMDC Tributary floodplain are caused by high stages exceeding the channel banks and flooding older residential areas constructed prior to NFIP requirements.

NEMDC Tributary Canal has an extensive record of flood conditions. Damaging floods occurred in December 1955, April 1958, October 1962, December 1964, March 1983 and February 1986. The floods of 1983 and 1986 were the largest and most damaging on record before 1992. Hydrologic studies have shown that the recurrence interval of the March 1983 flood was approximately 10 years and the recurrence interval of the February 1986 flood was from 50 to 100 years, depending on the specific location in the watershed. Six flood events also occurred in in January 1995, January 1997, February 1998, and December 2005, with the 1995 flood event causing extensive damage.

There are 99 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions. One property has been elevated as part of the Hazard Mitigation Grant Program.

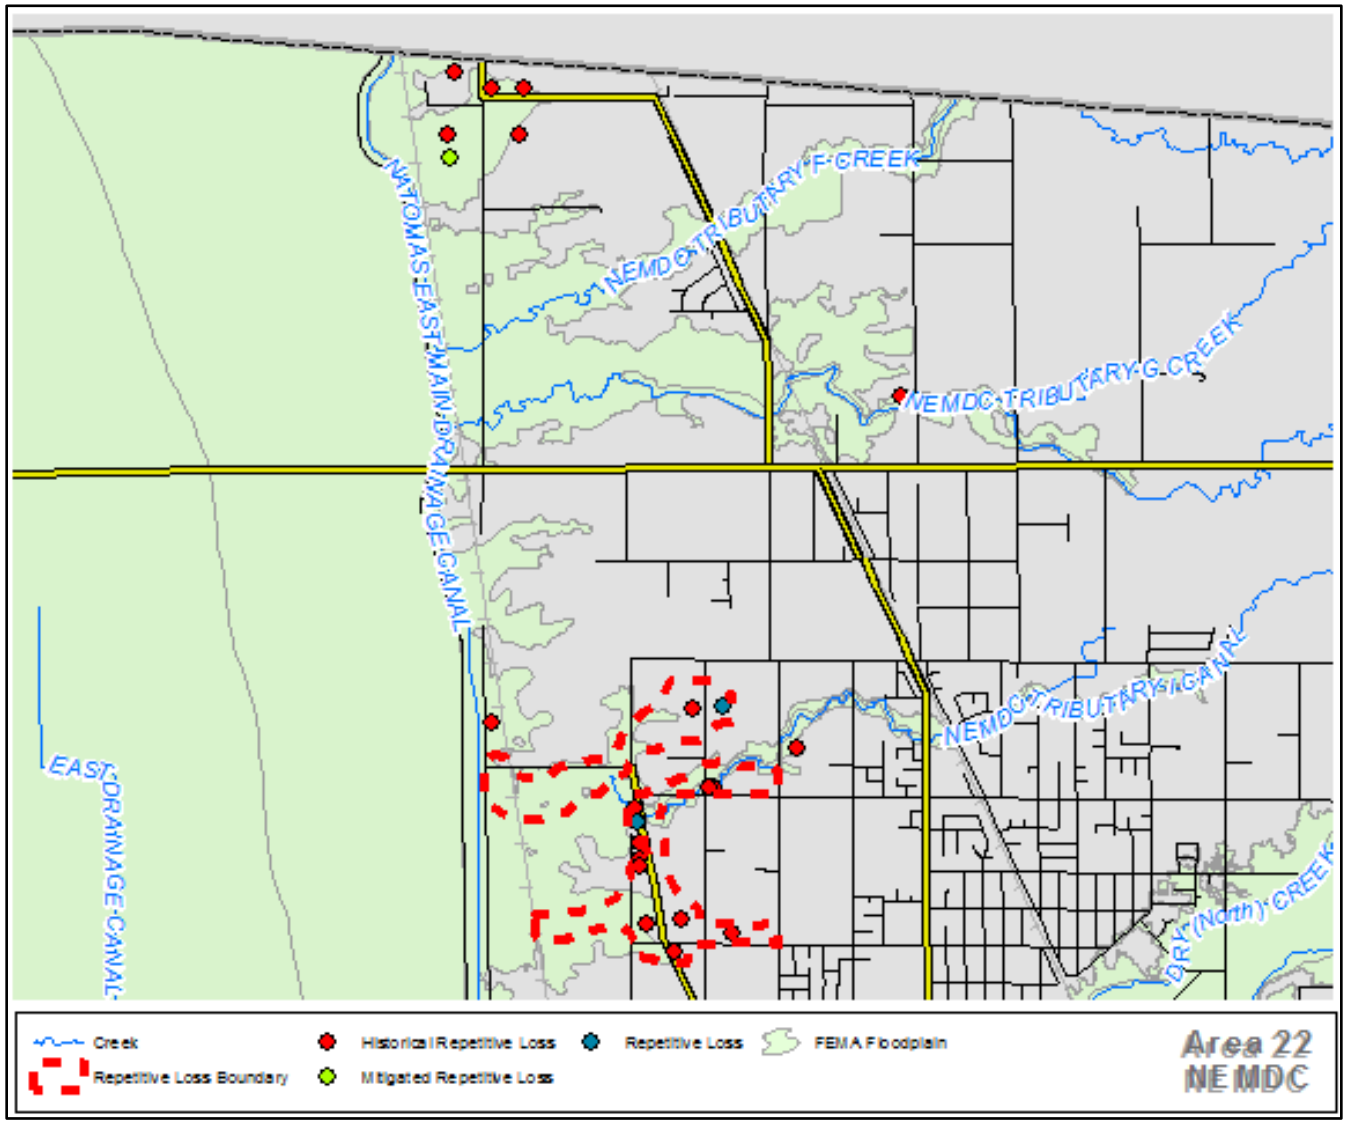
A22.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- SAFCA and USACE – Sacramento Levee Improvement Project
- USACE and Bureau of Reclamation – Folsom Dam Joint Federal Project (Completion 2017)
- State of California – Fremont Weir Expansion (Planning Stage)

The primary method of protection is to inform the public about flood risks of living in flood prone areas, especially for homes on the waterside of a levee. Additionally, all of the homes in Area 22 are identified in the County's building permit database. These homes are required to be in compliance with the local Floodplain Management Ordinance which describes how to safely build in areas that are within a FEMA Effective Floodplain and Local Floodplain.

FIGURE A22
Repetitive Loss Area #22



A22.5 DATA COLLECTION

Plans and studies have been conducted for the Sacramento River system and were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- FEMA Effective Flood Insurance Study
- SAFCA and USACE – Sacramento River Levee Improvement Project
- Central Valley Flood Evaluation and Delineation Project
- USACE and Bureau of Reclamation – Joint Federal Project
- State of California – Fremont Weir Expansion Project

A22.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) the majority of properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when the American River reaches flood stages and the NEMDC streams are under backwater conditions. Additionally, the Sacramento County Local Floodplain is included for the RLA.

A22.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 8 of the overall 98 properties within the North NEMDC Tributary RLA had reported flooding.

A22.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in January 9, 1995, January 9 & 22, 1997, June 15, 1997, February 3, 1998, and June 15 & 16, 1998. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A22.5.4 Types of Foundations

The most common type of foundations within the North NEMDC Tributary RLA is a raised foundation, which constitutes 41% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A22.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for acquisition of additional properties in North NEMDC floodplain for demolition to restores the natural floodplain. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

MORRISON CREEK

Sacramento

FEMA Floodplain

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 23

TABLE OF CONTENTS

A23.1 REPETITIVE LOSS AREA 23

This Report focuses on Area 23, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 23 includes properties in Sacramento, California on Bradshaw Road and Mayhew Road as shown on **Figure A23**.

A23.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs.

A23.3 PROBLEM STATEMENT

The location of Area 23 is just south of highway 16 on the west side of Bradshaw Road and east of Mayhew Road.

The source of flooding is the Morrison Creek floodplain that runs directly through the RLA. The 100-year floodplain escapes the banks of the creek and floods the adjacent properties in the area. Damaging floods occurred in January of 1995 and 1997.

There are 24 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions. Two (2) properties were purchased for purposes of mining by private owners and all structures were demolished as a part of the mining operations. Most of the properties located within the repetitive loss area are actively being mined. As such, the mining pits will be filled with flood water in the events where the creek banks are exceeded.

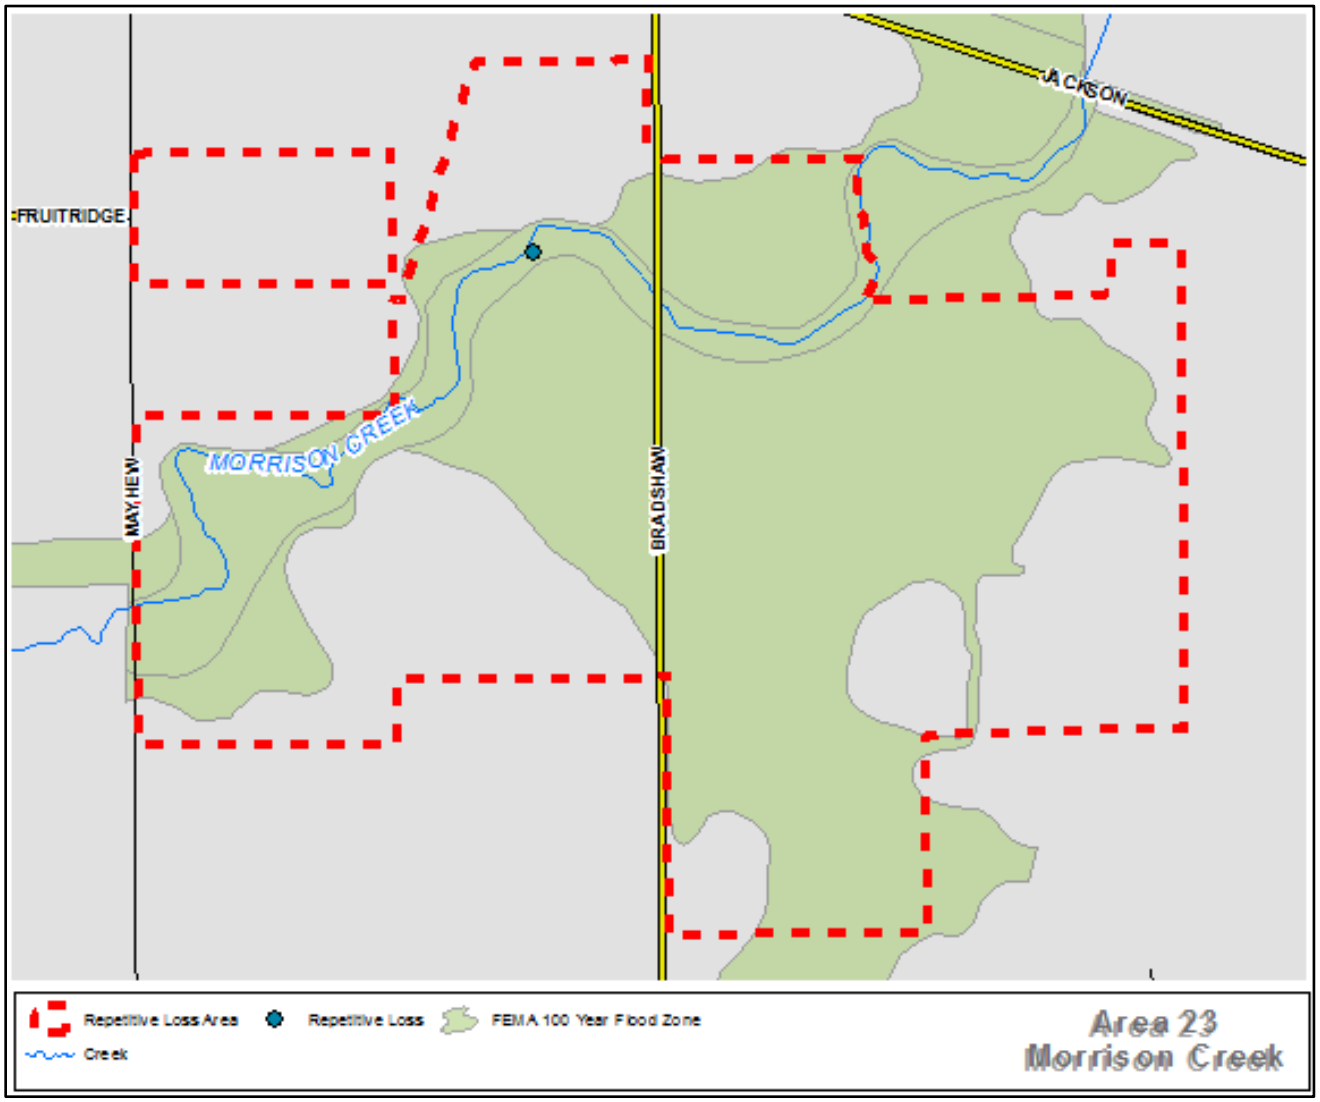
A23.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- West Jackson Highway – Master Drainage Study (Dated: 2012)

The primary methods of property protection are: demolition/relocation, elevate structure or damage prone components such as furnace or ac unit, dry flood-proof (so water cannot get in), wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

FIGURE A23
Repetitive Loss Area #23



A23.5 DATA COLLECTION

Sacramento County Plans and studies for Morrison Creek were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- West Jackson Highway – Master Drainage Study (2012)

The State of California – Department of Water Resources Central Valley Flood Evaluation and Delineation LiDAR (dated 2008) was also utilized in this analysis.

A23.5.1 Flood Insurance and Flood Event Data

Area 23 is in Zone AE, on the FEMA Flood Insurance Rate Map 06067C0215H (August 2012). Based on the FIRM all twenty-four (24) properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when low lying areas around Morrison Creek are inundated by out of bank flooding resulting from the large watershed contributing to Morrison Creek.

A23.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 2 of the overall 24 properties within the Morrison Creek RLA had reported flooding. Both of these properties no longer have structures on them.

A23.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed on January 9, 1995 and January 22, 1997 during record storm events. In addition inspections were conducted in May 2015. These inspections were performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location;
- Neighborhood topography and flow routes; and
- High-water marks and debris mark levels.

A23.5.4 Types of Foundations

The most common type of foundations within the Morrison Creek RLA is a raised foundation, which constitutes 71% of the two common foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A23.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for acquisition of additional properties in Morrison Creek floodplain for demolition to restores the natural floodplain. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

Further, a weir along Morrison Creek is planned to be constructed upstream of highway 16 at an aggregate mine that should control flooding and help reduce some of the structural flooding that has been experienced in the past. Flooding could still be experienced in existing and future mining areas that are below the flow line of the creek.

Appendix 24

REPETITIVE LOSS AREA 24

ARCADE CREEK
AT
PARK ROAD

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 24

TABLE OF CONTENTS

A24.1 REPETITIVE LOSS AREA 1

This Report focuses on Area 24, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 24 includes the floodplain associated with Arcade Creek in the vicinity of Park Road as shown in **Figure A24**.

A24.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A24.3 PROBLEM STATEMENT

The location of Area 24 is generally on Park Road, adjacent to Del Paso Park downstream of Auburn Boulevard. The source of flooding is due to Arcade Creek overtopping.

The five structures within Area 24 reside on FEMA's repetitive loss list, have experienced historical flooding, or are nearby buildings that may have the same or similar flooding conditions. Three of the five structures have been mitigated through elevation.

A24.4 BASIC INFORMATION

Due to the severity and nature of the flooding, the primary method of property protection in this area is home elevation.

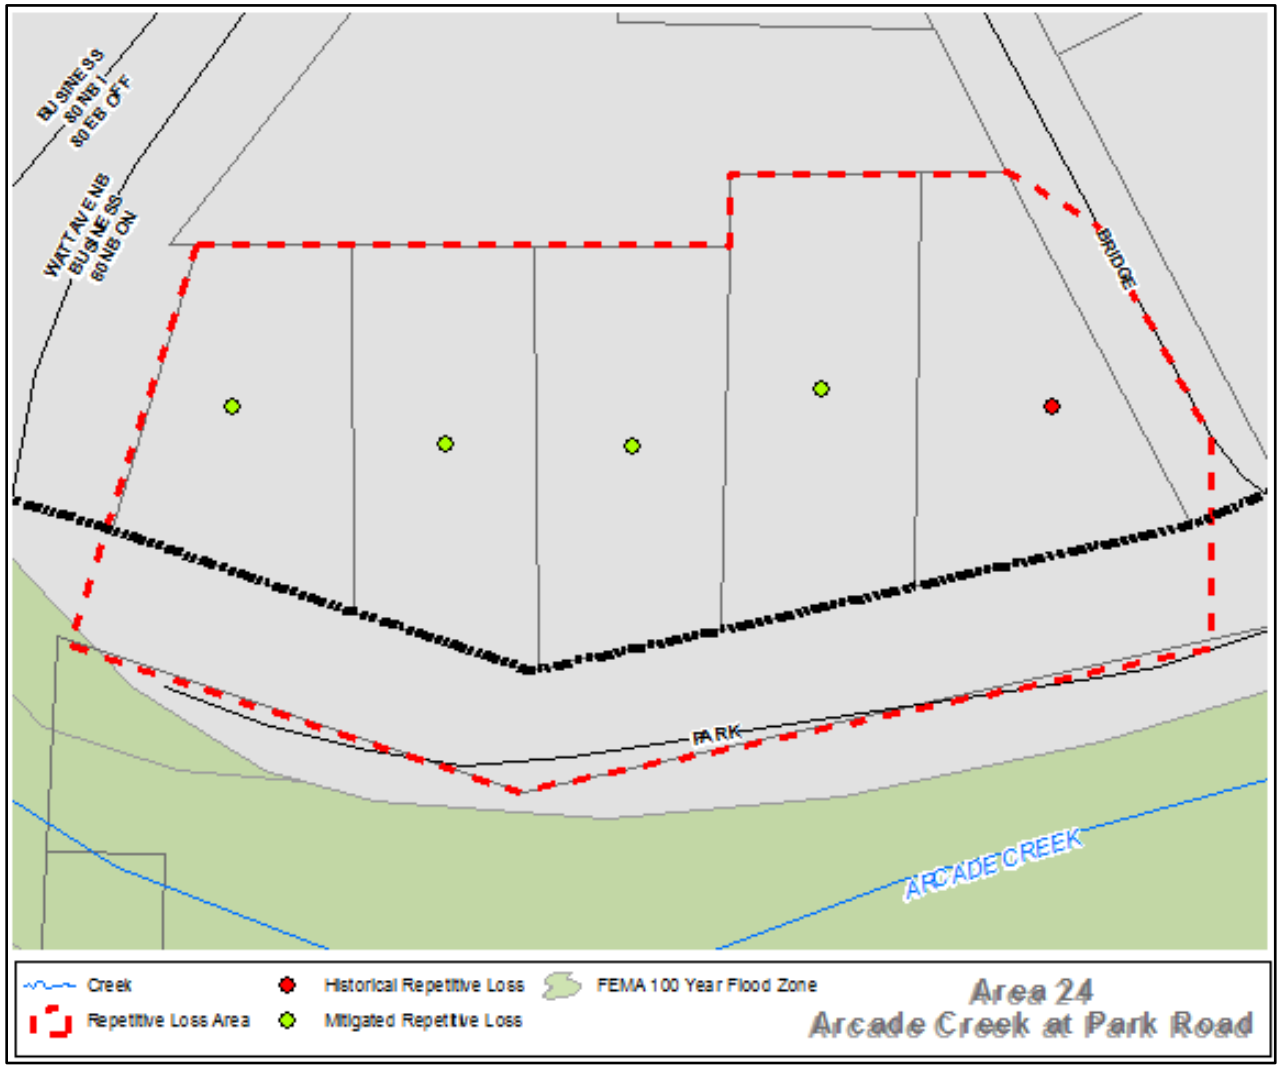
A24.5 DATA COLLECTION

Sacramento County Plans, high water information, homeowner testimony, and studies for the Arcade Creek watershed were utilized in this analysis. The structures located within this area were reviewed by DWR staff as part of the Hazard Mitigation Grant Program and Flood Mitigation Assistance Program.

A24.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) no properties within the RLA are within the 100-year FEMA floodplain although the flooding occurs when Arcade Creek overflows its banks. This is because Arcade Creek water surface elevations have exceeded those in the Flood Insurance Study, notably during the 1982, 1983, 1986, and 1995 storm events. Sacramento County DWR is currently in the process of having Arcade Creek remapped in this area to reflect a higher base flood elevation.

FIGURE A24
Repetitive Loss Area #24



A24.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that more than one of the five properties within the Area 24 RLA had reported flooding, but the records are to remain confidential by request of the homeowners.

A24.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed as part of the Hazard Mitigation Grant Program and the Flood Mitigation Assistance program. The inspections were performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A24.5.4 Types of Foundations

The most common type of foundations within the Area 24 RLA is raised foundations although one home has a slab foundation (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A24.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for home elevations. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Sacramento County Department of Water Resources
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

REPETITIVE LOSS AREA 25

MADISON AVENUE AT ROLLINGWOOD

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 25

TABLE OF CONTENTS

A25.1 REPETITIVE LOSS AREA 25

This Report focuses on Area 25, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 25 comprises the local floodplain area as shown in **Figure A25**.

A25.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A25.3 PROBLEM STATEMENT

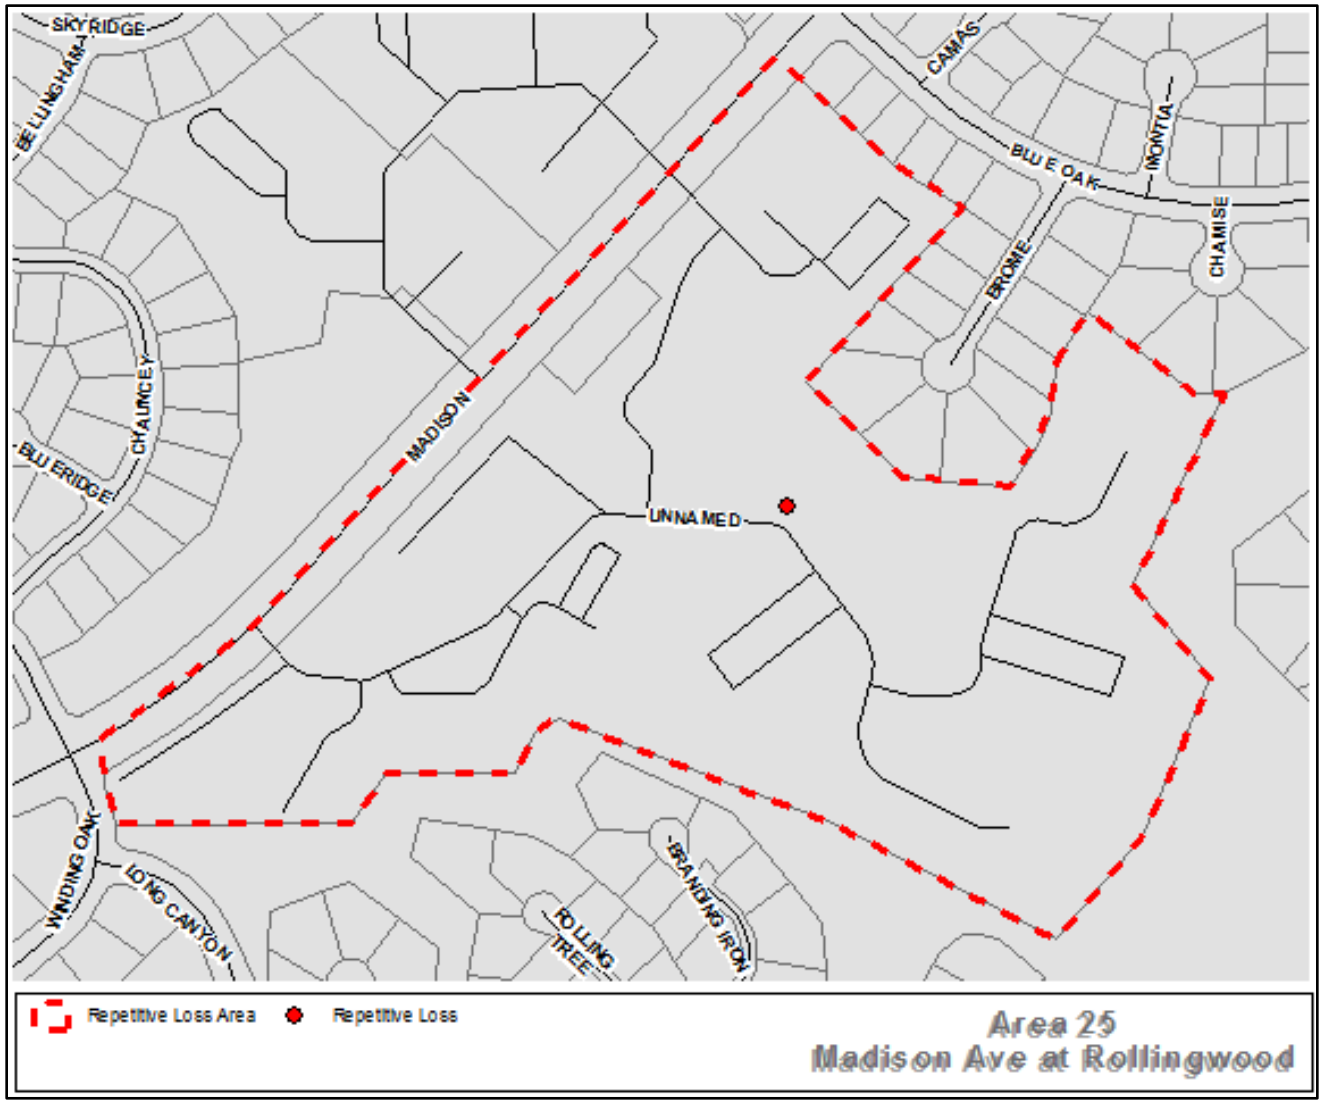
The location of Area 25 is generally the south side of Madison Avenue in the area of the Rollingwood development (east of the intersection of Madison and Hazel Avenue. The source of flooding is a unnamed stream system flowing southward to the American River.

There are 137 addresses which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions. The historic loss properties and repetitive loss properties are all located within the Rolling Wood condominium project. Eight of the condo units have repetitive losses and 17 others have a history of flooding but are not repetitive loss.

A25.4 BASIC INFORMATION

The primary methods of property protection would be to elevate affected structures or to construct a permanent floodwall around them if it could be designed to not cause impacts to any other structures in the area.

FIGURE A25
Repetitive Loss Area #25



A25.5 DATA COLLECTION

LIDAR topography, street level photography, and aerial photography were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

A25.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) none of the properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when the local floodplain associated with an unnamed stream overtops its banks during intense rainfall events.

A25.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that approximately 15 of the overall 137 addresses within the RLA had reported drainage related issues.

A25.5.3 Structure Inspections

The flood protection assessments in this Report are based upon visual observation of relative elevations. Each property within the RLA was reviewed and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A25.5.4 Types of Foundations

The most common type of foundations within the RLA is slab on grade, which constitutes a substantial portion of the foundations found in Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A25.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for home elevation projects. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Sacramento County Department of Water Resources
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

REPETITIVE LOSS AREA 26
STRONG RANCH SLOUGH

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 26

TABLE OF CONTENTS

A26.1 REPETITIVE LOSS AREA 26

This report focuses on Area 26, one of the twenty eight (28) designated RLAs within the Sacramento County. Area 26 analysis defined by **Figure A26**.

A26.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAs.

A26.3 PROBLEM STATEMENT

The location of Area 26 is generally bound by Howe Avenue to the west, Fulton Avenue/Munroe Street to the east, Imran Drive to the north and Fair Oaks Boulevard to the south. The Woodside properties are located at the confluence of Sierra Branch and Strong Ranch Slough in the south-west portion of the watershed. The Strong Ranch Slough and Chicken Ranch Slough (SRS / CRS) watershed is an urban watershed of approximately 15 square miles within Sacramento County, in northern California. Water levels in the lower portion of the Strong and Chicken Ranch Slough watershed are affected by the water level in the D05 pond, which, in turn, is related to water level in the lower American River.

Homes and community facilities in the Woodside condominium complex in the Arden-Arcade neighborhood of Sacramento County were flooded by local storm runoff in 1986, in 1997, and again on New Year's Eve of 2005. This complex is located in the Strong Ranch Slough watershed, adjacent to the Strong Ranch and Sierra Branch channels

The source of flooding was primarily identified as the residences being in low lying areas, in some instances adjacent to Strong Ranch Slough that is over capacity, and most of the homes having slab-on-grade foundations.

There are 69 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

A26.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following had plans or studies that could affect the cause or impacts to flooding are:

- USACE (1987). Hydrologic analysis of interior areas. EM 1110-2-1413. Office of the Chief of Engineers, Washington, D.C.
- Chicken Ranch Slough drainage master plan. Prepared for County of Sacramento, Department of Public Works, Water Resources Division, Sacramento, CA. Nolte and Associates – 1991
- Hydrologic study of Folsom Re-operation impacts on Sacramento County Drainage Facilities. Prepared by David Ford Consulting Engineers,
- How can Strong Ranch Slough and Chicken Ranch Slough flooding be reduced?

Prepared by David Ford Consulting Engineers, Sacramento, CA. – 1997

- Impact of Sacramento River stage on D05 pumping station exterior stage. Prepared by David Ford Consulting Engineers, Sacramento, CA. – 1997
- Use of weather radar data will improve forecasting in Sacramento County. Prepared by David Ford Consulting Engineers, Sacramento, CA.- 1997
- Economic efficiency of flood-damage-reduction plan for Arden-Arcade neighborhood of Sacramento County. Prepared by David Ford Consulting Engineers, Sacramento, CA. – 1997
- Federal Emergency Management Agency Flood insurance study: Sacramento, California, unincorporated areas. Washington, DC. - 1998
- USACE (1999). Reconnaissance study of Strong and Chicken Ranch Sloughs. WRDA 86, 905b Analysis. Sacramento, CA.
- USACE (2001). Strong and Chicken Ranch Sloughs, California – Feasibility report: Phase 1 studies. Prepared by David Ford Consulting Engineers, Sacramento, CA.

The primary methods of property protection are:

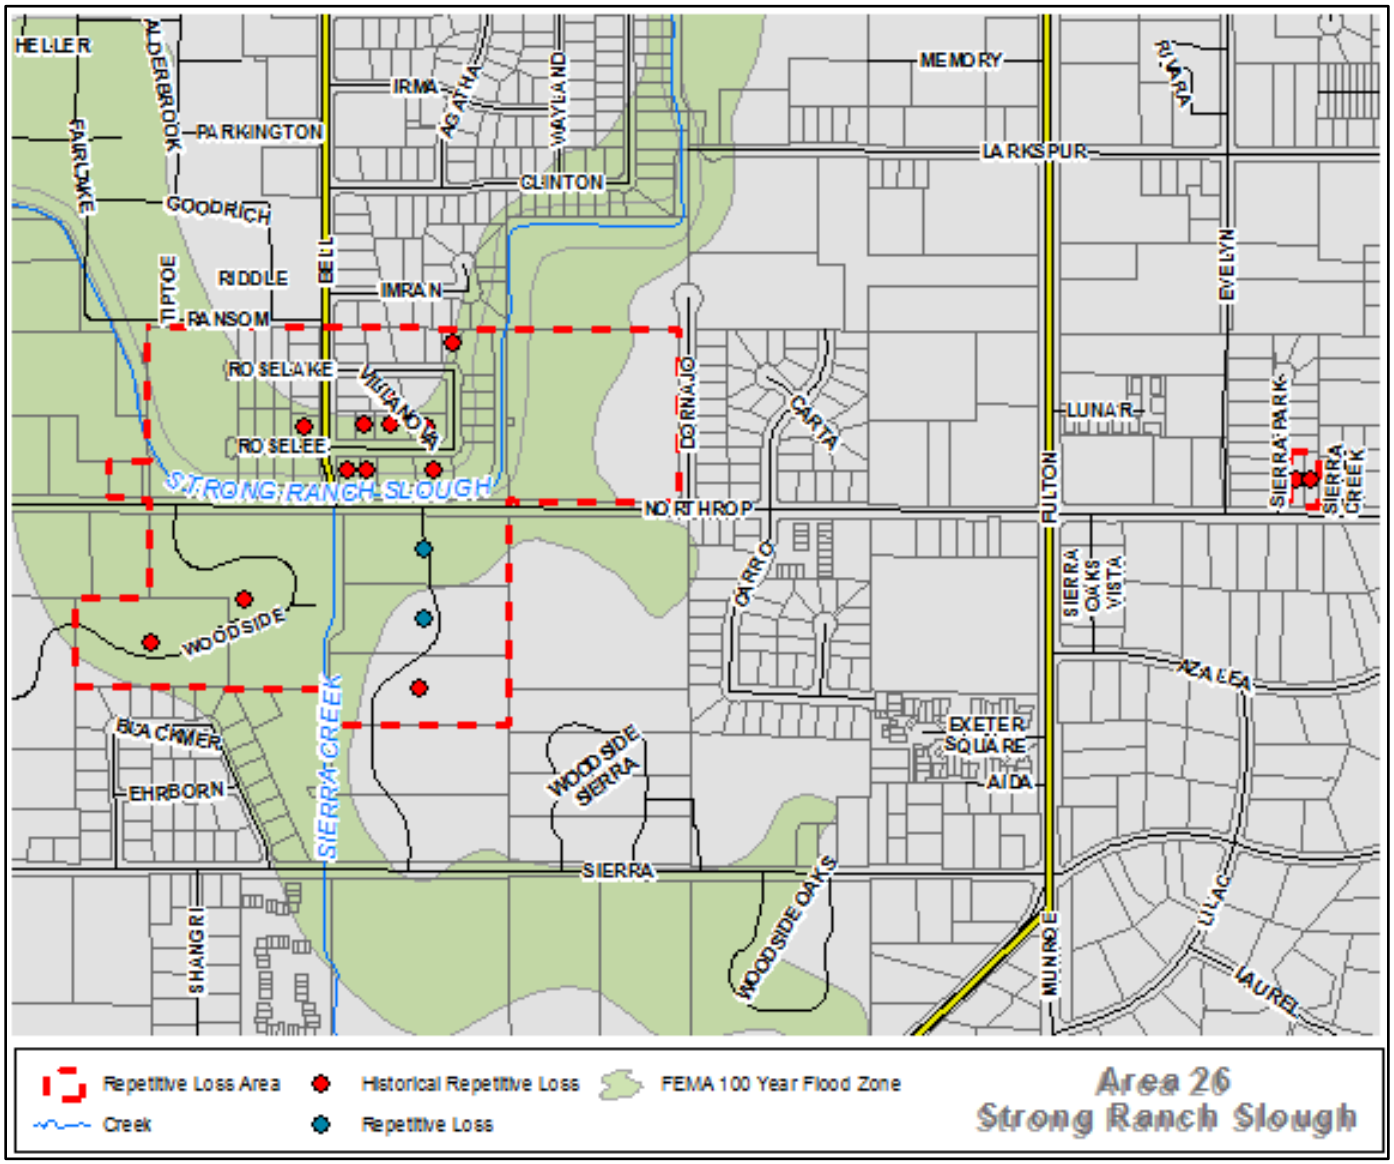
- The primary methods of property protection are: Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.
- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.
- Home Removal – If necessary, it may be recommended that the County purchase the property and remove the home from the lot

A26.5 DATA COLLECTION

Sacramento County Plans and studies for Strong Ranch Slough were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- Strong and Chicken Ranch Slough Watershed Alternative Analysis – 2006
- Sacramento County 5.1 Local Hazard Mitigation Plan Update - September 2011

FIGURE A26
Repetitive Loss Area #26



A26.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) 107 properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when flows exceed the capacity of Strong Ranch Slough and Sierra Creek. The Sacramento County Local Floodplain on Bell Street, Northrop Avenue, Woodside Lane and Sierra Boulevard for this RLA floods due to them being in low lying areas.

A26.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 187 of the overall 228 properties within the Strong Ranch Slough RLA had reported flooding.

A26.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in June of 2015. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A26.5.4 Types of Foundations

The most common type of foundations within the Strong Ranch Slough RLA is slab-on-grade.

A26.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for future mitigation measures. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

REPETITIVE LOSS AREA 27
BROOKTREE CREEK

SACRAMENTO COUNTY

Department of Water Resources
Repetitive Loss Area Analysis

APPENDIX 26

TABLE OF CONTENTS

A27.1 REPETITIVE LOSS AREA 27

This Report focuses on Area 27, one of the twenty-eight (28) designated RLAs within the Sacramento County. Area 27 analysis includes properties on Rosebud Lane as well as properties on Auburn Boulevard and is defined by **Figure A27**.

A27.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAAs

A27.3 PROBLEM STATEMENT

The location of Area 3 is generally northwest of Auburn Boulevard. The source of flooding was primarily identified as the back water flow from the confluence of Brooktree Creek and Arcade Creek.

There are sixteen (16) properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

A27.4 BASIC INFORMATION

The primary methods of property protection are: wet flood-proof portions of the building (so water won't cause damage), direct drainage away from the building, and drainage maintenance.

A27.5 DATA COLLECTION

Sacramento County Plans and studies for Brooktree Creek were not available to be utilized in this analysis.

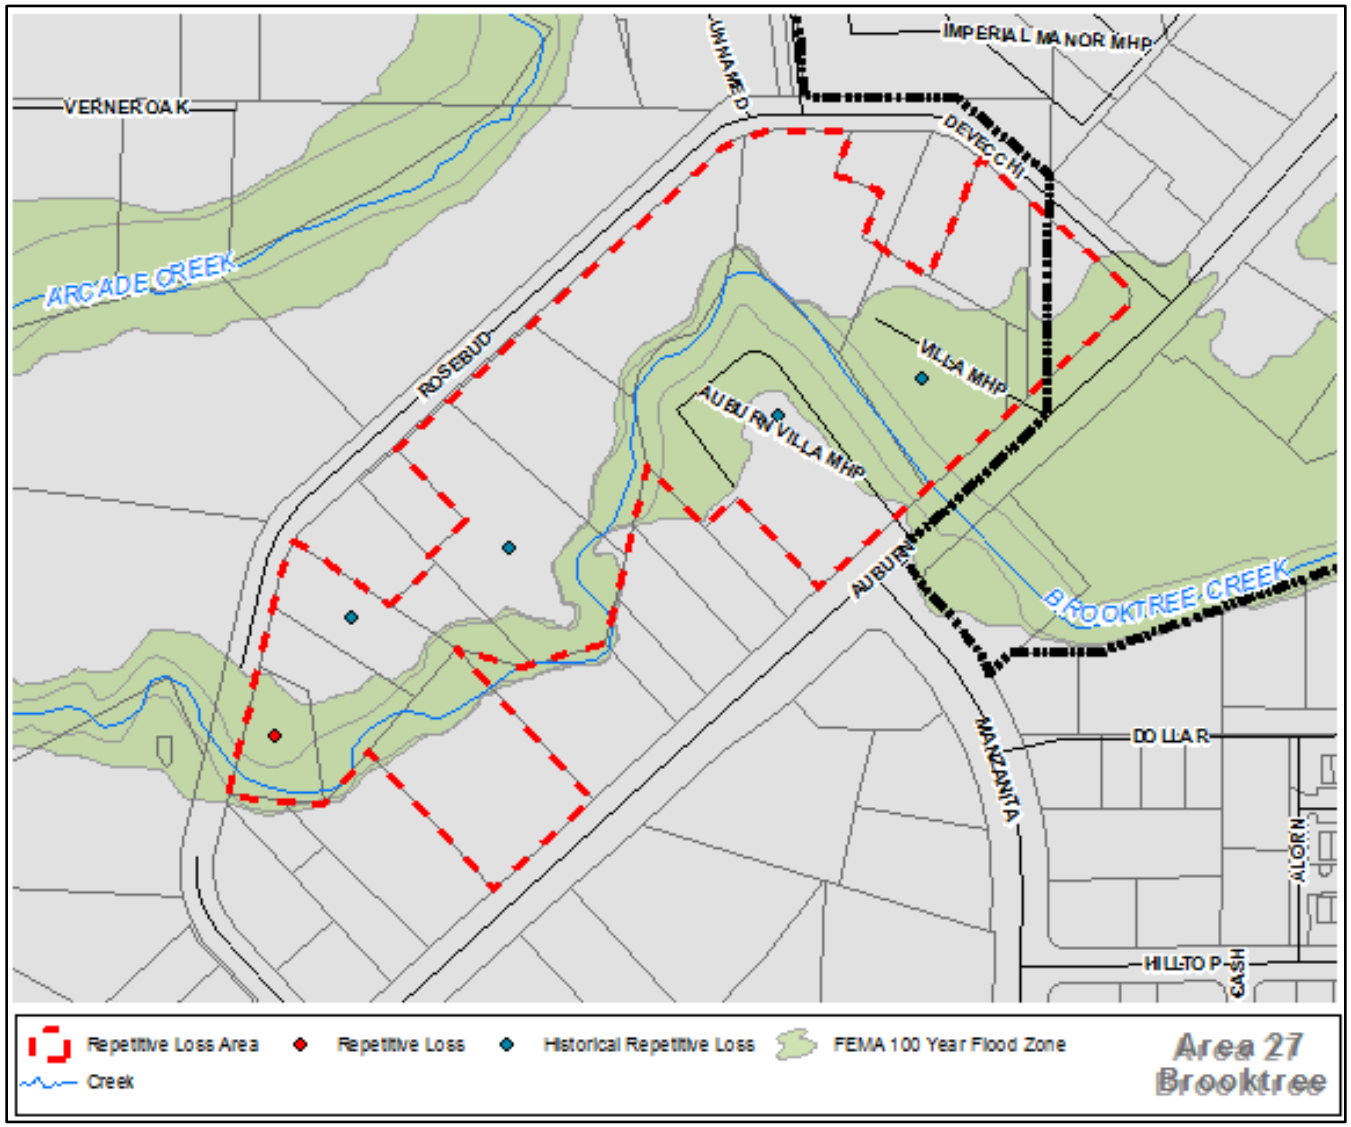
A27.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) 16 properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when Brooktree Creek overflows into a floodplain. The Sacramento County Local Floodplain Map does not cover the Dry Creek Shed for this RLA.

A27.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that three (3) of the overall 17 properties within the Brooktree Creek RLA had reported flooding.

FIGURE A27
Repetitive Loss Area #27



A27.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in January 1995 and December 1999. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A27.5.4 Types of Foundations

The most common type of foundations within the Brooktree Creek flood plain RLA is slab on grade, which constitutes 81.3% of the common foundations found in this RLA within Sacramento County (see Section 2.5.2 of this report for a detailed description of the foundation types mentioned).

A27.6 FUTURE MITIGATION MEASURES

The County continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Through HMGP & FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available.
- **Potential Funding:** State and/or Federal Grant

REPETITIVE LOSS AREA 28
VERDA CRUZ CREEK

SACRAMENTO COUNTY

Department of Water Resources

Repetitive Loss Area Analysis

APPENDIX 28

TABLE OF CONTENTS

A28.1 REPETITIVE LOSS AREA 28

This Report focuses on Area 28, one of the twenty eight designated RLAs within the Sacramento County. Area 14 analyses include Moraga Drive, Crestview Drive, Loma Linda Court, Hackberry Lane, and Verde Cruz Way as defined by **Figure A28**.

A28.2 ADVICE FOR RESIDENTS

Residents have been advised that their property is in or near a flood hazard area by a direct mailer that targeted properties in the RLAs.

A28.3 PROBLEM STATEMENT

The location of Area 14 is made up of six subareas. The first subarea is directly adjacent to Verda Cruz Creek and is generally bounded by Verde Cruz Creek crossing at the intersection of Hackberry Lane, Verde Cruz Way. The fourth section is located at the Verde Cruz Creek crossing near the intersection of Crestview Drive and Heathcliff Drive. The fifth subarea is adjacent to Brooktree Creek and is generally bounded by Auburn Boulevard, Rosebud Lane, and Devecchi Avenue. The sixth subarea is directly adjacent to Verde Cruz Creek near the intersection of Moraga Drive and Dewey Drive.

The source of flooding was primarily identified as the residences being in low lying areas, in some instances adjacent to a creek that is over capacity, and most of the homes having slab-on-grade foundations.

There are 22 properties which include buildings on FEMA's repetitive loss list, historical loss properties and nearby buildings that may have the same or similar flooding conditions.

A28.4 BASIC INFORMATION

From the agencies or organizations that were contacted (Chapter 2.2), the following plans or studies that could affect the cause or impacts to flooding are:

- Drainage Study for 4950 Hackberry Lane

The primary methods of property protection are:

- Home Elevation – Is your floor below the elevation of the floodplain? If so, it may be prudent to elevate the structure. Whenever the floor of a home is below the 100-year flood elevation, physically elevating the structure is often recommended as it is one of the most effective means to prevent flood damage. Financial assistance may be available to you. In the past, the County has utilized FEMA grant money for dozens of qualified elevation projects.

- Site Modification – Would a small wall, berm, or other site specific grading help keep water out of your house? Often, modification of the area around your home may be

appropriate to minimize flooding depending on the depth of floodwater and site specific constraints.

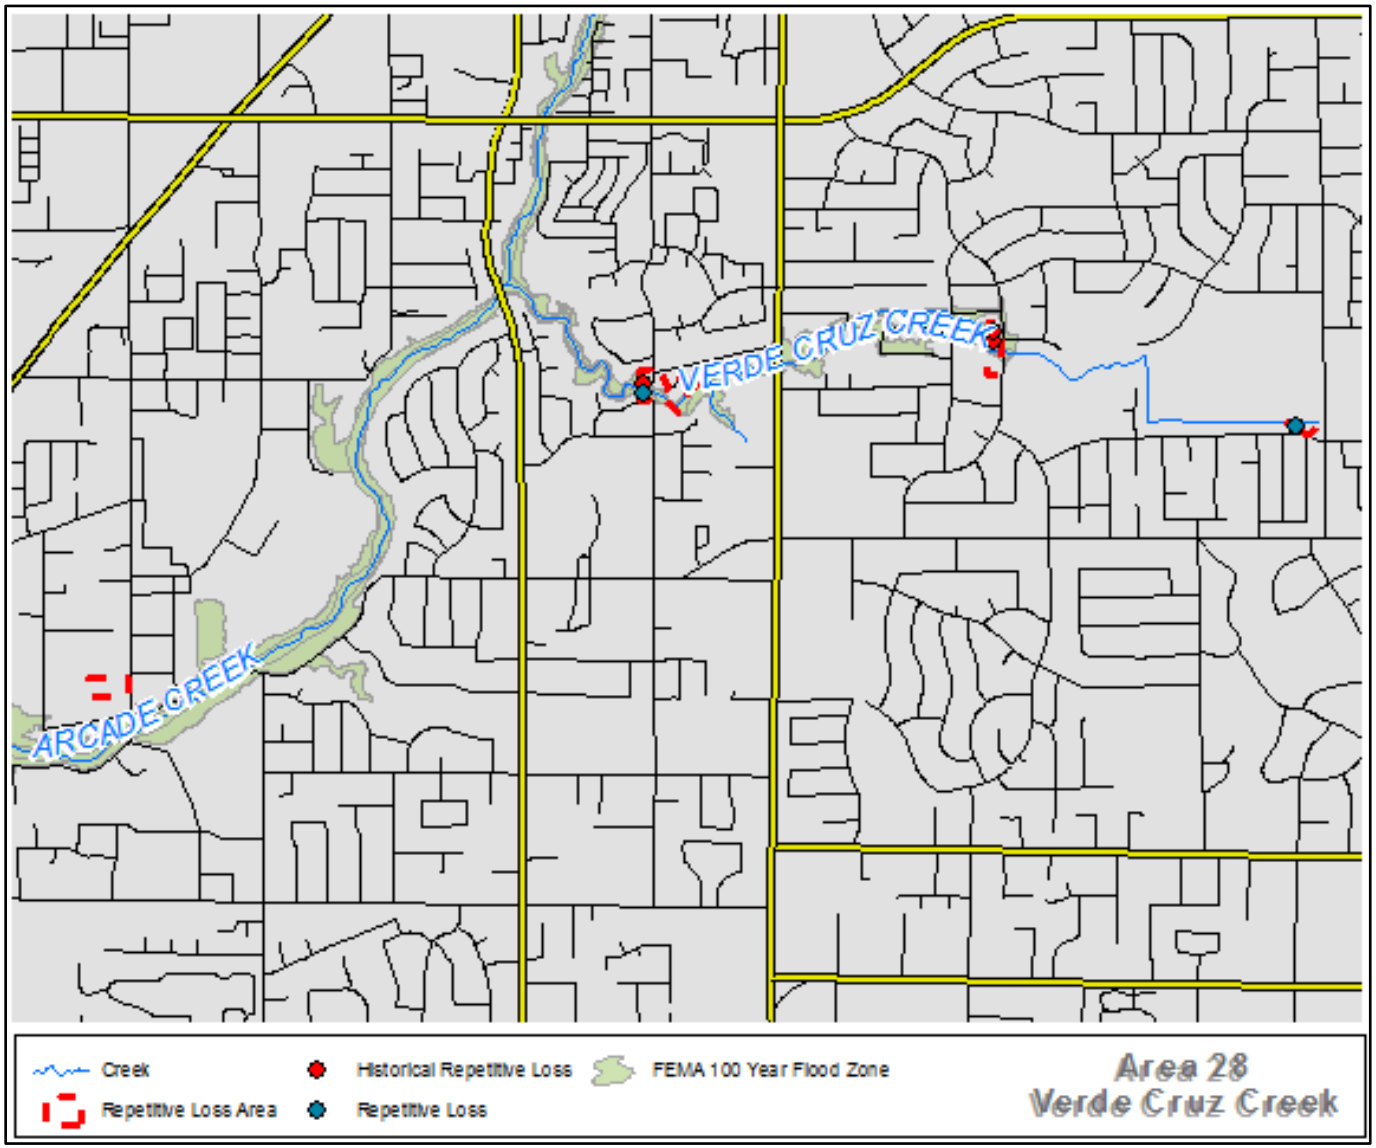
- Temporary Flood Barriers – Perhaps sandbags or other barriers could be employed on site in advance of a storm to help keep water out.
- Home Removal – If necessary, it may be recommended that the County purchase the property and remove the home from the lot.

A28.5 DATA COLLECTION

Sacramento County Plans and studies for Manzanita Avenue were utilized in this analysis. The sources listed below provided additional data related to the causes and impacts of flooding in the RLA.

- Crestview Culvert
- Crestview Oaks
- Moraga Drive and Dewey Drive Drainage Project
- Via Del Campo High School Drainage Project

FIGURE A28
Repetitive Loss Area #28



A28.5.1 Flood Insurance and Flood Event Data

Based on the FIRM (August 2012) 28 properties within the RLA are within the 100-year FEMA floodplain. The flooding occurs when flows exceed the capacity of Arcade Creek, and Verde Cruz Creek. The Sacramento County Local Floodplain on Sycamore Avenue for this RLA floods due to it being a low lying area.

A28.5.2 Flooding Experiences of Property Owners

Water Resources Service Request Tracking System (WR-SRTS) indicates that 4 of the overall 22 properties within the Dry Creek RLA had reported flooding.

A28.5.3 Structure Inspections

On-site inspections of buildings in the RLA were performed in March of 2015. This inspection was performed from both the public right-of-way, when not allowed onto the property and on the effected property by engineering staff (Drainage Maintenance and Operations, Drainage Development, and Drainage Design). As such, staff did not survey building elevations in relation to the 100-year flood elevation. Therefore, the flood protection assessments in this Report are based upon visual observation of relative elevations along with interviewing residence of observed accounts during the storm event to determine the extent of the damage to the structure. Each property within the RLA was visited and the following attributes were documented:

- Foundation type and condition;
- Relative elevation of first floor;
- Garage location and relative elevation;
- Property grading;
- Downspout discharge location; and
- Neighborhood topography and flow routes.
- High-water marks and debris mark levels

A28.5.4 Types of Foundations

The most common type of foundations within the Manzanita Avenue RLA is slab-on-grade.

A28.6 FUTURE MITIGATION MEASURES

The County continues to search for additional funding for future mitigation measures. The County further continues to encourage home owners to raise their structures above the flood hazard.

- **Responsible Office:** Department of Water Resources (Demolition) through HMGP& FMA and Property Owner (Home Elevation)
- **Timeline:** As opportunity and/or funding becomes available
- **Potential Funding:** State and/or Federal Grant

Appendix H Watershed Master Plan

Watershed Management Plan

2016

Sacramento County

City of Sacramento

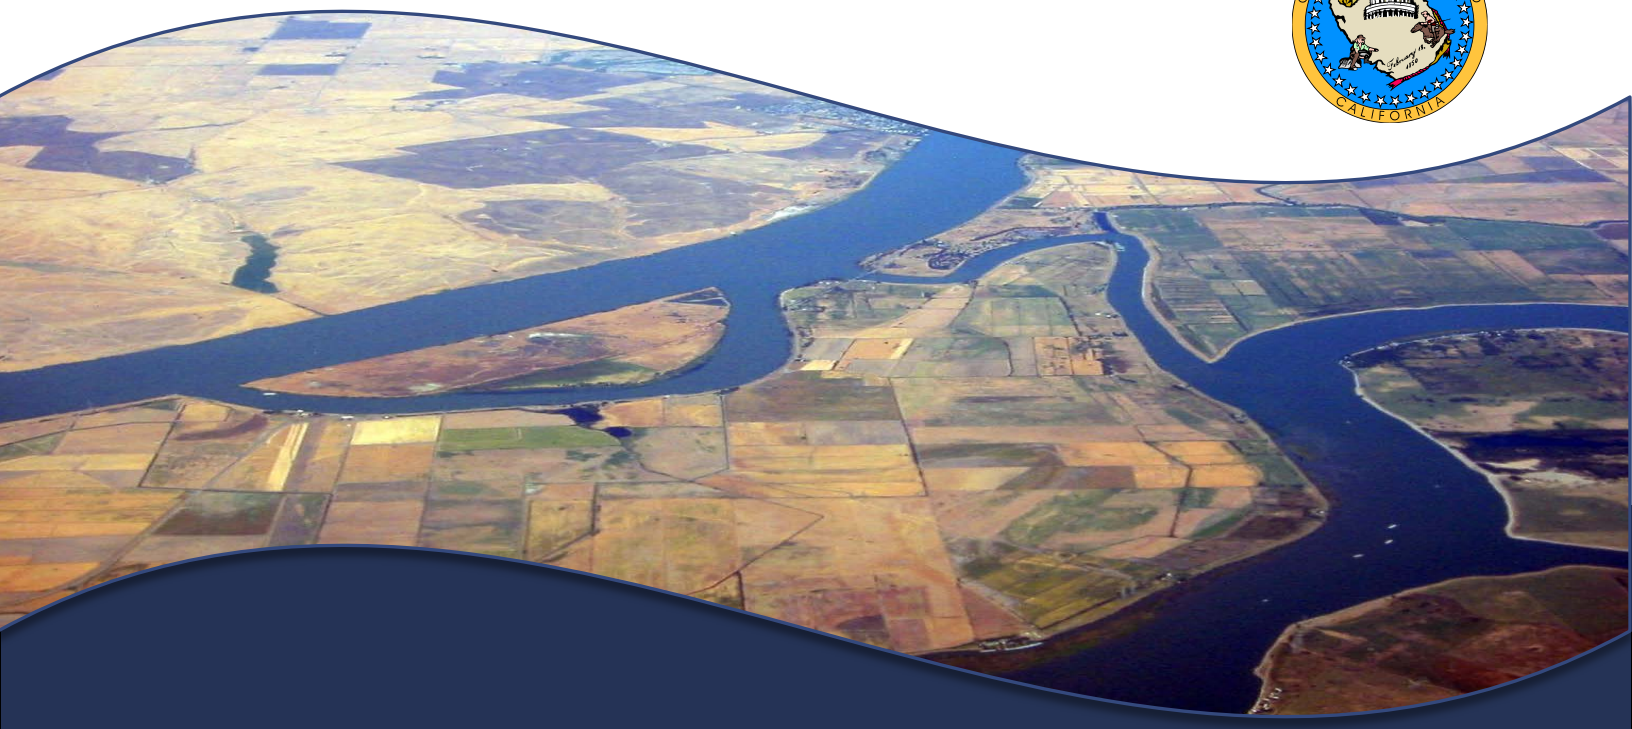

TABLE OF CONTENTS

WATERSHED MANAGEMENT PLAN

PURPOSE AND OVERVIEW

This Watershed Management Plan describes the regulatory framework, planning and coordination to reduce flooding caused by development on a watershed basis in Sacramento County. Development, consisting of buildings, parking lots, streets, gutters, drainage pipes and channels create impervious surfaces and speed up the flow of runoff that result in increases in storm runoff volumes and peak discharges. The impact of proposed development on existing development and hydraulic conveyance systems should always be evaluated.

Sacramento County lies mostly in the trough of the Sacramento Valley in the northern portion of the Central Valley of California. The county is bound on the east by the Sierra Nevada foothills and extends to the southwest into the Sacramento Delta. The county totals 994 square miles and has seven incorporated cities. There are seven incorporated cities in the County of Sacramento including:

- Citrus Heights
- Elk Grove
- Folsom
- Galt
- Isleton
- Ranch Cordova
- Sacramento

The total population of Sacramento County (2015) is 1,501,335. .

Additionally, there are two adjacent counties, Placer County and Sutter County, that have creek watersheds draining into Sacramento County.

The purpose of this plan is to provide an understanding of the region's watershed behaviors to base future decisions on that will reduce the increased flooding from development on a watershed-wide basis.

This plan will:

- Evaluate future conditions
- Identify wetlands and natural areas
- Address the protection of natural channels

- Provided a dedicated funding source for implementing the plan

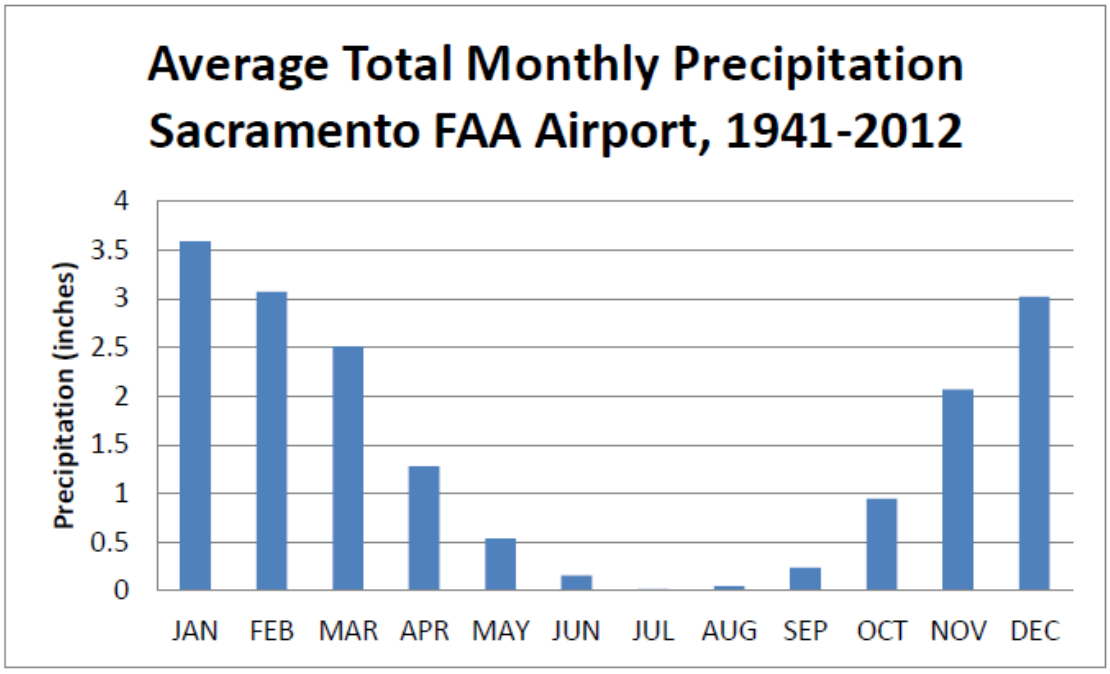
Sacramento County Flood Insurance Rate Maps were first issued March 15, 1979 and the county has continuously been a community in good standing with the National Flood Insurance Program (NFIP). Each city has a Federal Emergency Management Agency (FEMA) NFIP community number and an independent relationship with the NFIP.

The FEMA Community Rating System (CRS), under the Insurance Services Office recommends watershed management planning that is not limited to corporate boundaries. Under CRS Activity 450, a participating community may receive points toward improved rating and lowered flood insurance premiums for preparing a plan such as this and updating that plan every five years.

CONDITIONS

PRECIPITATION

The County experiences most precipitation between November and April. Essentially all of the precipitation that occurs in the area is rain. Based on data gathered at Sacramento FAA Airport between 1941 and 2012, average annual rainfall is approximately 17.54 inches, but can range from wet to dry years. Between 1941 and 2012, recorded annual rainfall ranged from a low of 6.25 inches in 1976 to a high of 33.44 inches in 1983 (Western Regional Climate Center 2012).



Source: Western Regional Climate Center 2012

SOIL TYPE

The prevalent soil in Sacramento County is Soil Conservation Service Type D, tightly bound and low permeability. Summertime humidity is quite low but the winter is more humid with lower temperatures (40 to 60 degrees Fahrenheit). Freezing conditions are rare, but there are often extended periods of fog. Consequently, soil remains quite moist throughout the rainy season. Therefore, land development, in general, has a greater effect on peak flow timing due to routing (gutters, pipes, channels) than volume increases due to increased impervious area (paving and rooftops). Flooding has been a major concern in this county since before the Gold Rush.

FUTURE CONDITIONS

According to the City of Sacramento's General Plan 2035, Cal-Adapt, a climate change scenario planning tool developed by California Energy Commission, average temperatures in the Sacramento region are projected to rise between four and six degrees by 2100, based on low and high emissions scenarios, respectively (Cal-Adapt 2013). Cal-Adapt uses a method to downscale global climate model data to local and regional resolution under two emissions scenarios; the A-2 scenario represents a business-as-usual future emissions scenario, and the B-1 scenario represents a lower GHG emissions future.

The increase in average temperature is expected to have the following effects:

- **Sea level rise.** Rising sea levels are expected due to temperature increases that cause ocean water to expand, Arctic and glacial ice to melt, and increased amounts of snowpack runoff to enter the sea. California's ocean surface temperature patterns have been warmer than normal for the past decade, a condition known as Pacific Decadal Oscillation. California sea level appears to have risen by about seven inches over the 20th century and is predicted to rise up to 55 inches by the end of the 21st century. Sacramento's location (70 miles inland coast) limits the most significant effects from sea level rise. However, rising sea levels may lead to levee failures in the Delta causing infrastructure damage, flooding, and saltwater intrusion into groundwater aquifers that may affect Sacramento region groundwater sources. It is also possible that sea level rise could reduce the effectiveness of Delta and nearby Delta levees, or increase flood levels in tidally affected reaches of the Sacramento River, if storm flow and tide conditions coincide. An influx of saltwater would degrade California's inland estuaries, wetlands, and groundwater aquifers. Saltwater intrusion could threaten the quality and reliability of California's biggest fresh water supply that is pumped from the southern edge of the Sacramento/San Joaquin River Delta (City of Sacramento 2011).

- **Changes to precipitation patterns.** Precipitation levels are difficult to predict compared to other indicators of climate change. Annual rain and snowfall patterns vary widely from year to year, especially in California. Generally, higher temperatures increase evaporation and decrease snowfall, resulting in a drier climate. A majority of scientific models have shown that northern California precipitation is expected to decrease after 2030. But, more precipitation is expected to fall as rain rather than as snow. According to DWR, the Sacramento region has actually seen an increase in annual precipitation of about one inch over the last century. DWR research from 1901 to 2000 shows that the Sacramento River system runoff volume has remained stable on an annual basis, but there has been a 9 percent reduction in runoff from April through July. This is likely the result of increased winter rainfall and less snowpack storage. DWR anticipates that over the next century the Sacramento region will likely experience a slight increase in annual precipitation, with larger and more intense storms resulting in flood conditions, and longer drought periods. However, according to Cal-Adapt, the Sacramento region is projected to experience a slight decrease in annual precipitation levels (rain and snow) by 2090. It is expected that there will be less snowfall in the Sierra Nevada and the elevations at which snow falls will rise. Coincidentally, there will be less snowpack water storage to supply runoff water in the warmer months. Already it has been documented that California's snow line is rising (City of Sacramento 2011).

- **Increased frequency of extreme events such as heat waves, drought, and storm events.** Extreme heat waves are expected to increase in number by ten times in the Sacramento region and could become an annual event by 2100. Sacramento could experience up to 100 additional days per year with temperatures above 95°F and by 2090, the average July temperature could reach over 104°F. Changes to air and land temperatures will have an impact on the timing, amount, type, and location of precipitation and runoff in the Sacramento and American Rivers watersheds. This will impact the quantity of water supplies, the management of those quantities, the quality of the source water, and the demand for treated drinking water. DWR has identified anticipated changes to the source water conditions in the watershed that will likely impact the quality of the source waters, including more intense storm events, longer drought periods, reduced snowpack at lower elevations, and earlier spring runoff. Extreme weather is expected to become more common throughout California. More extreme storm events are expected to increase water runoff to streams and rivers during the winter months, heightening flood risks. (City of Sacramento 2011).

These changing conditions are expected to affect our region in the following ways:

- **Impacts to biological resources:** Habitats that currently support local wildlife are expected to change, forcing plants and animals to either adapt to the new environment or move to more

hospitable areas. Some species will be able to adapt to changing habitats by shifting their range or altitudes in order to adjust to rising temperatures. Others, however, might not be able to adapt fast enough to keep pace with the rate of climate change. For some species, climate change may allow them to increase the range of habitat where they can live; however, where plants and animals need to move to survive they may find wildlife corridors blocked or competition from other species (City of Sacramento 2011).

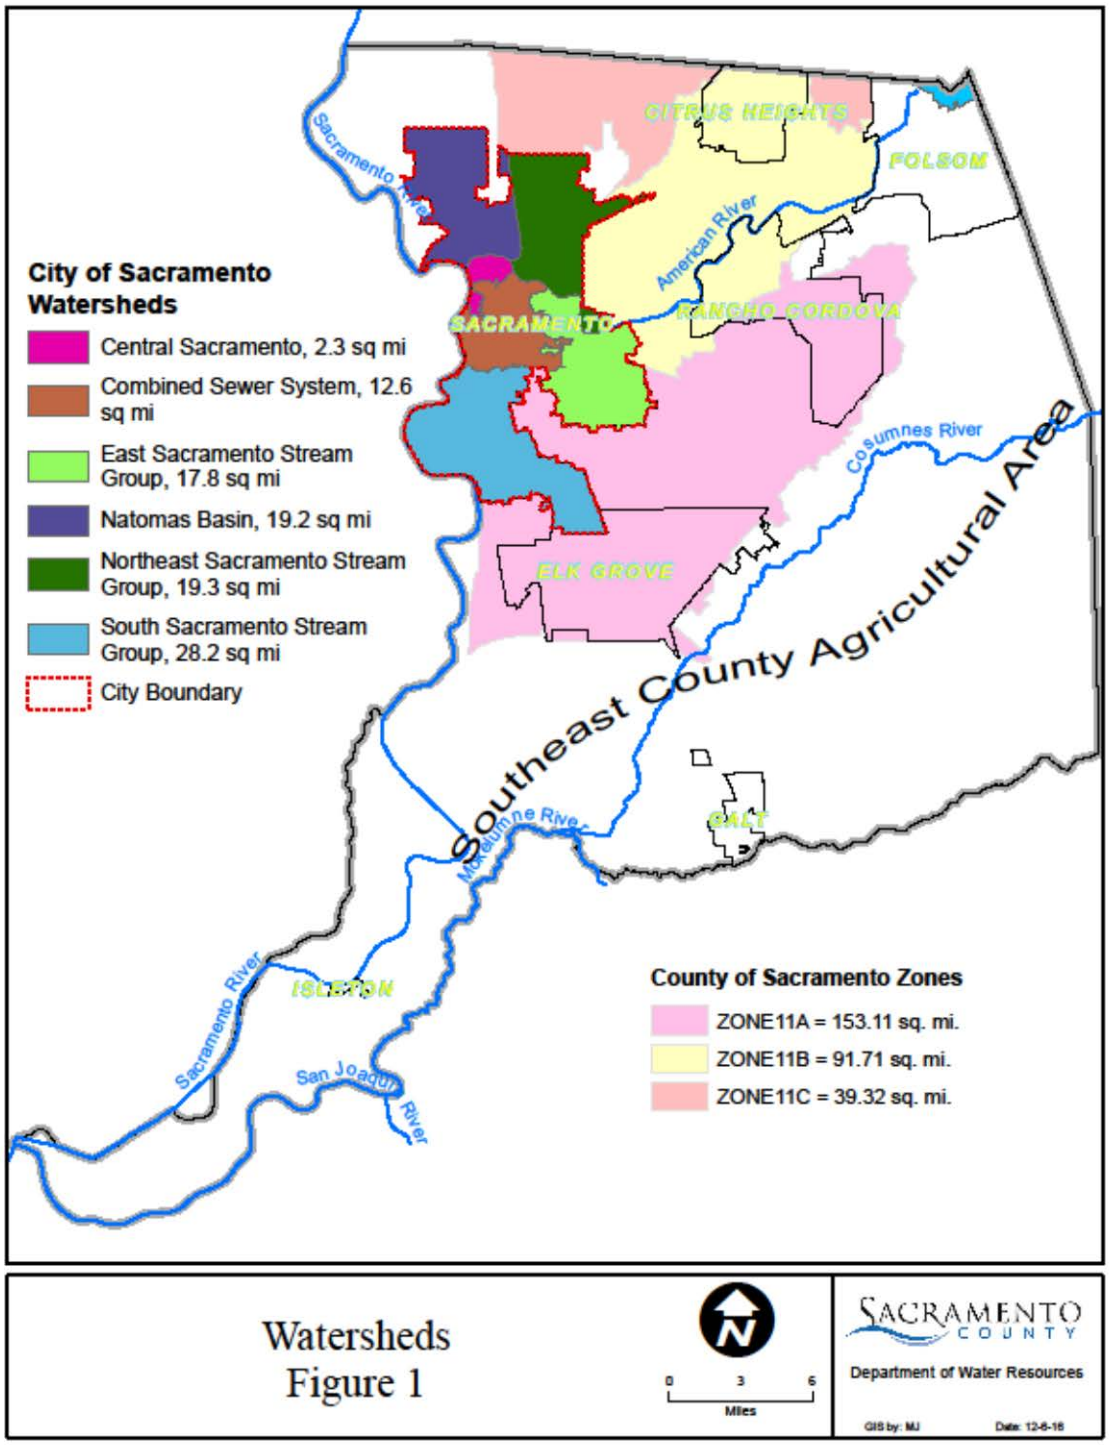
- **Increased risk of flood events:** Warmer ocean surface temperatures have caused warmer and wetter conditions in the Sierra Nevada, increasing flood risk. When the Sacramento or American Rivers are already at peak capacity, additional flows from increased snowpack runoff or storm intensity could cause flooding. During the last 50 years peak flow patterns have increased in the Sacramento River, making floods more likely in the future, especially if there is an increase in intense storms (City of Sacramento 2011).

WATERSHEDS

The urban and urbanizing areas of the County, including the Cities of Rancho Cordova, Elk Grove and Citrus Heights, are divided into three zones of the Sacramento County Water Agency, a statutorily created district operating under the authority of and pursuant to the provisions of the Sacramento County Water Agency Act (West's California Codes, Water Code Appendix, Chapter 66, commencing at Section 66-1, et seq.; Deering's California Codes, Water, Uncodified Acts, Act 6730a). These zones are identified on Figure 1 as 11A, 11B, and 11C.

The City of Sacramento is made up of two major waterways. The confluence of these two major waterways, the Sacramento River and American River, is within the City. The City also encompasses several other streams, creeks, and associated watersheds. The majority of these watersheds drain into the City from the County of Sacramento. The major drainage watersheds in the City can be divided into six groups and geographic areas. These areas are identified on Figure 1 as Natomas Basin, Northeast Sacramento Stream Group, East Sacramento Stream Group, South Sacramento Stream Group, Combined System, and Central Sacramento.

Figure 1: Watershed Boundaries with Calculated Areas



DRY CREEK AND NEMDC AND TRIBUTARIES (ZONE 11C)

The drainage master planning in the Dry Creek and Steelhead Creek (Natomas East Main Drainage Canal, NEMDC) tributary watersheds (Zone 11C) are fully master planned for pending development. These areas are generally large lot agricultural-residential parcels with roadside ditches and culvert crossings. There are two large developments being proposed known as Elverta Specific Plan, and South Placer Vineyard (the latter being in Placer County). The urban area known as Antelope was constructed in the late 1980s and early 1990s and is 86.4% developed and was fully master planned.

WATERSHEDS IN THE DRY CREEK STREAM GROUP

Dry Creek - 4138 acres in Sacramento County draining to the lower NEMDC, then to the American River, there are 48,966 acres upstream in Placer County. The Dry Creek study, dated 1992, was approved by both counties. There is a current effort in Placer County to update the hydrology study for Dry Creek and its tributaries. The two counties have enjoyed a good working relationship and technical cooperative partnership.

Basin A - A tributary to Antelope Creek draining toward Placer County and into Dry Creek. It was part of the Antelope community development master planning in the early 1990's and is fully developed.

Magpie Creek - 3789 acre watershed draining to the former McClellan Air Force Base (now a business park) and is master planned through the Base property and into the City of Sacramento. There is a 2008 study by West Yost that when constructed would serve to reduce flood risk to OptiSolar and adjacent buildings. There is no opportunity for major infill upstream of the McClellan Business Park.

Robla Creek - 5141 acre watershed in the county before it enters the City of Sacramento toward the confluence with Dry Creek and the NEMDC. It is 99.8% developed.

Linda Creek and Tributaries - 3580 acre watershed in Orangevale area draining to the City of Roseville which is a tributary to Dry Creek ultimately draining back to Elverta and Rio Linda in Sacramento County. The Linda Creek watershed is 99.5% developed.

Sierra Creek - 1743 acre watershed draining to Dry Creek in the Antelope community.

The Natomas East Main Drainage Canal (NEMDC) - Also known as Steelhead Creek has a backwater floodplain along the east side. The zoning in the eastern area is generally agricultural residences. American River backwater into the NEMDC is controlled by Pump Station Number D-15, which serves to reduce the base flood elevation upstream. There is a volume concern and there is a mitigation fee component of Zone 11C. No filling is allowed in the NEMDC backwater floodway area unless compensatory excavation is demonstrated. A fee is collected under the Sacramento County

Water Agency Code for the future addition of a pump at this pump station. Currently, floors are set based on a one pump failed scenario which generally provides an extra one foot of freeboard in the backwater area.

NEMDC Tributary 1 flows to the NEMDC and conveys flows from southwest Placer County. There are 1526 acres in Placer County and 865 acres in Sacramento County. South Placer Vineyard Development will pay the Pump Station D-15 mitigation fee.

NEMDC Tributary 2 is a 2744 acre watershed area with no planned infill development, except the Elverta Specific Plan, which will attenuate peak flow and volume impacts with large detention basins.

NEMDC Tributary 3 is a 1567 acre watershed area with no planned infill development, except the Elverta Specific Plan.

East Natomas is an 1816 acre watershed area with no planned infill development.

DRAINAGE STUDIES FOR ZONE 11C (DEVELOPING AREAS, AND AREAS IN NEED OF IMPROVEMENT)

NEMDC Tributaries - Drainage study was developed by Borcalli & Associates in 1994. It is being used by Water Resources to condition development. The precipitation data and land use are still appropriate, as well as the hydrology (HEC-1). The hydraulic model is updated from HEC-2 to HEC-RAS as appropriate.

Elverta Specific Plan - An approved drainage master plan that would include peak flow detention to minimize the impact to Tributaries 1 and 2.

- The Elverta Specific Plan Drainage Master Plan revision was prepared in 2011 by MacKay & Somps Engineers.

Dry Creek Watershed Flood Control Plan - Sponsored by both Placer County Flood Control District and the Sacramento County Water Agency and has been in use since 1992. It is currently being updated by Placer County. It is being used by both Placer County and Water Resources to condition development.

Robla/Magpie Creeks Drainage Study - Developed by Borcalli & Associates for SAFCA, and the City and County of Sacramento in 1998, and updated by Mead & Hunt Engineers in 2007. It is being used by Water Resources to condition development.

Robla and Magpie Creek Diversion Levee CLOMR - Developed by Ensign & Buckley on April 2002.

McClellan Park Magpie Creek Floodplain Improvements - Includes hydrologic and hydraulic modeling for Magpie Creek developed by West Yost in 2011 to revise FEMA floodplain from AO zone to AE zone in area of Idzorek Street. The CLOMR has been approved by FEMA in 2009.

South Placer Vineyard - Drainage study for the County of Placer.

Linda Creek Hydrology - Prepared by Nolte Associates, Inc. (the study contractor) for the Federal Emergency Management Agency (FEMA) under Contract No.EMS-2000-CO-0057 Order No. T002 and completed in September 2004. Both Placer and Sacramento Counties served as a Cooperating Technical Partners (CTP's) for this study.

NATURAL STREAMS GROUP AND TRIBUTARIES (ZONE 11B)

Drainage master planning in the natural streams and areas, draining to the American River (Zone 11B), is deemed 100% master planned. The 'natural streams' are protected by the county zoning code. These natural streams are generally lined with established oak and other vegetation serving as habitat and shade canopy. The county opposes disruption to these sensitive areas encompassing most of the Zone 11B creeks and primary tributaries.

WATERSHEDS IN THE NATURAL STREAM GROUP (ZONE 11B)

American River - 100% master planned and controlled by state and federal regulators. Folsom Dam and a system of certified levees control the flows in this river. Any proposed land development in the lower reach of this 2100 square mile watershed could not have any significant impact on peak flow. RBF Consulting prepared for Sacramento Area Flood Control Agency and the City and County of Sacramento a study and letter of map revision submitted to and approved by FEMA in 2010. MBK Engineers submitted an updated hydrology and hydraulic analysis for the process to certify the levees along the River. This new base flood profile will be mapped with the forthcoming FEMA map revision.

Arcade Creek – 6,508 acre watershed is 98.2% developed with only 54 acres of infill area remaining. There is no valid location for peak flow detention; however, as redevelopment occurs there will be opportunities for installation of stormwater quality treatment devices. Modeling on Arcade Creek was by County Water Resources staff (in 1995-98 and upstream of Auburn Blvd in 2007) and the resulting profile is used where it is higher than recorded high water and FEMA flood insurance study. An additional modeling effort conducted by County Water Resources staff was submitted to FEMA in 2015. The modeling showed 100-year water surface elevations that are significantly higher than the FEMA base flood elevations. **Arcade Creek South Branch** – 1,657 acre watershed in which lies the approved (104 acre) Gum Ranch Specific Plan, which is slated for a peak flow detention basin when the project is constructed by the development interests. The Gum Ranch hydrology study used in the project

environmental impact report is deemed current. Upon completion of Gum Ranch development, this watershed will be about 99% developed.

Brooktree Creek - City of Citrus Heights, is 97.8% developed.

Mariposa Creek - City of Citrus Heights, is 97.2% developed.

Carmichael Creek – 2,725 acre watershed draining to the American River. The watershed is 96.8% developed.

Chicken Ranch Slough – 3,722 acre watershed draining to the American river via Pump Station D-05. The watershed is 98.9% developed.

Cripple Creek – 4,327 acre watershed in Citrus Heights draining to Arcade Creek. The watershed is 98.5% developed.

Diablo Creek - 9,48 acre watershed draining to Arcade Creek and is 95.5% developed.

Fair Oaks Stream Group – Comprised of several smaller watersheds draining to the American River totaling 7819 acres and is 97.8% developed.

Manlove Creek – 1,893 acre watershed is 99.9% developed.

Kohler Creek - Also known also as Date Creek, is a 694 acre watershed draining to Arcade creek and is 97.1% developed.

Minnesota Creek – 1,095 acre watershed draining to the American River and is 95.7% developed.

Strong Ranch Slough – 4,573 acre watershed draining to the American River via Pump Station D-05. The shed is 99.3% developed.

Sunrise Creek – The watershed is entirely in the City of Citrus Heights and is 96.1% developed.

Verde Cruz Creek – 1,226 acre watershed draining to Arcade Creek and is 97.3% developed.

Alder Creek– 7,226 acre watershed draining to Lake Natomas reservoir on the American River. There is no need for flood flow or volume detention since the flow is to a federally operated reservoir. There will be hydromodification attenuation basins as well as low impact development measures. A detailed drainage study for Glenborough/Easton Development, dated 2013, was approved for environmental review, additional analysis is needed before the project can proceed to design.

Buffalo Creek – 9,167 acre watershed draining to the American River. The Westborough Drainage Master Plan accounts for the area known as Aerojet which is slated for development. There will be peak

flow detention in order to not exacerbate the downstream floodplain. The drainage master plan will be incorporated in the environmental impact report for the forthcoming project.

Mayhew Channel – 2,861 acre watershed draining to the American River. The shed is 96.6% developed.

Boyd Channel - Also known as Boyd Station Channel the 2201 acre watershed drains to the American River and is 95.9% developed.

Cordova/Coloma Stream Group – Comprised of several smaller shed areas draining to the American River totaling 1,728 acres and is 92.6% developed. This is in the City of Rancho Cordova.

DRAINAGE STUDIES FOR ZONE 11B (INFILL DEVELOPMENT AND CAPITAL IMPROVEMENT)

The following is a list of current drainage master plans including existing condition and fully development condition hydrology.

Chicken Ranch Slough - Drainage Master Plan was first developed by Water Resources staff in 1991 to identify solutions to flooding problems. Several large public meetings were held. A lack of consensus on an overall solution resulted in only one part of a recommended plan being implemented – revised channel maintenance procedures. Residences with low finish floor elevations were identified for elevating but home owners were not interested. The HEC-1 and HEC-2 models developed in the study were used as best available information until they were updated by staff in 2006 with SacCalc and HEC-RAS models.

Strong Ranch Slough/Sierra Branch - A drainage study was developed by David Ford Engineers for Water Resources in 2006 to analyze flood control alternatives. Staff expanded on the modeling in 2007 and developed a website and flood warning system for the area. The models are used by staff to analyze capital improvement projects.

D-05 - Drainage pump station that serves Strong Ranch and Chicken Ranch Sloughs. A 2003 Corps of Engineers Feasibility Study identified doubling the capacity of the D-05 pump station as the only feasible solution to reducing flooding in the area. There is no cost-effective solution that provides 100-year protection. A project to perform needed maintenance to the pump motor wiring resulted in a significant increase in motor horsepower and capacity to four of the six pumps. The benefit of the increased capacity is currently being modeled.

Arcade Creek - Water Resources commissioned a drainage study at Auburn Boulevard at the City of Sacramento Border in 2003 by a consultant to determine the level of protection for the Evergreen Estates floodwall. The county applied for and received provisional accreditation of this levee in 2009, but has

not submitted the required levee analysis needed to certify the levees. The County submitted as flood study to FEMA in 2015 that included reaches of Arcade and Cripple creeks. The modeling showed 100-year water surface elevations that are significantly higher than the FEMA base flood elevations. The study is under review by FEMA and is currently used for floodplain management.

South Branch Arcade Creek - Drainage studies were performed as referenced in the approved environmental impact reports for the Gum Ranch and Sheltonham developments. Hydrologic models were developed to analyze development impacts and mitigation measures.

Glenborough, Easton, Westborough - Drainage studies were developed associated with the proposed redevelopment of a portion of the GenCorp- Aerojet site in the Alder Creek and Buffalo Creek watersheds. These studies developed hydrologic and hydraulic modeling to determine development impacts and mitigation measures. Current study, by MacKay and Somps is dated 2013 and is being used for environmental review of the project.

Mayhew Drain Levee LOMR - Letter of Map Revision for Mayhew Drain was prepared by RBF Consulting in January 2010 to reflect improvements done by SAFCA, and the ACOE.

American River - American River Letter of Map Revision for American River was prepared by RBF Consulting, LOMR approved by FEMA 2010, mapping 145,000 cfs flow from Folsom Dam as the base flood.

MORRISON CREEK STREAM GROUP (ZONE 11A)

The Morrison Creek Stream Group may be deemed 100% master planned for peak flow, volume, and stormwater pollution prevention. The majority of growth in Sacramento County will occur in this area. Consequently, a great deal of effort has been put forth to master plan the necessary trunk drainage improvements. Ongoing master planning is occurring in the unincorporated County in association with the Vineyard Springs Comprehensive Plan, North Vineyard Station Specific Plan, West Jackson Master Plan, Mather South Community Master Plan, Newbridge Specific Plan, and Jackson Township Comprehensive Plan.

Many of the creeks in this watershed have reaches of natural bed and bank and are home for a variety of plant and animal species. These areas are treated with care and any hydraulic improvements would be only under strict guidance of the state and federal regulators under the Clean Water Act, Endangered Species Act and the California Environmental Quality Act. Thus, permits for creek corridor improvement projects will careful consideration of the habitat value and may include construction of naturalized side slopes, ponds, pools, and native landscaping.

Stormwater pollution prevention during construction and post development storm pollutant discharge treatment are always required. Additional measures are taken, where applicable, to assure minimal hydro-fluvial geomorphology impact due to proposed development by attenuating peak flow and volume.

WATERSHEDS IN THE MORRISON CREEK STREAM GROUP

Elder Creek – 7632 acres, 100% developed condition master planned for the approved North Vineyard Station and Florin Vineyard Specific plans. Master planning is ongoing in the Aspen 8 & 9 mining area, and the Jackson Township Comprehensive Plan area.

Elk Grove Creek- 4019 acres, 100% developed condition master planned for the East Elk Grove Specific Plan, City of Elk Grove.

Florin Creek – 2857 acres, 100% developed condition master planned for the proposed Florin Vineyard Specific Plan. The South Sacramento Stream Group project includes flood protection projects along Florin Creek consisting of channel improvements and construction of a flood control basin which will be completed late in 2016.

Gerber Creek – 2579 acres, 100% developed condition master planned for the approved North Vineyard Station Specific Plan and the approved Vineyard Springs Specific Plan. The latter is superseded by the North Vineyard Station Drainage Master Plan dated 2004 and subsequent revisions to the modeling to incorporate development planning for the Wildhawk North project. Construction of channel improvements began in 2016 in the upper reaches of Geber Creek in association with North Vineyard Station planned development.

Laguna Creek - Headwaters in the City of Rancho Cordova is 100% master planned for the proposed Suncreek Specific Plan. Laguna Creek between the cities of Elk Grove and Rancho Cordova is fully master-planned in the Vineyard Springs Specific Plan approved documents. The primary flood control facility is the Triangle Rock aggregate pit which mitigates the loss of floodplain due to mining activities south of Florin Road. This facility will helps control flood flows that jump from the Laguna Creek to Gerber Creek watershed at the CCTRR railroad embankment. Another detention basin planned just upstream of the railroad embankment will, in combination with the Triangle Rock Basin, fully mitigate cutting off the inter-basin transfer of flows from Laguna Creek to Elder Creek. The total Laguna Creek watershed is 21176 acres draining from just upstream of the City of Rancho Cordova's eastern boundary, through the planned development area over the Folsom South Canal, through Mather Field and preserve areas to the Vineyard Springs development area and into the City of Elk Grove ultimately discharging to Beach Stone Lakes. Elk Grove has modeled the creek up to the northern city boundary (Calvine Road) and County Water Resources has modeled the creek from the top of the shed to Calvine

Road. All models are existing condition and developed condition. The study by Wood Rodgers dated 2006 and the study by MacKay & Somps dated 2009 are superseded by the 2015 LOMR model by West Yost.

Laguna Creek and Tributary 1 in the City of Elk Grove was modeled with the 2009 submitted FEMA letter of map revision.

Morrison Creek – 34592 acres, Upper Morrison Creek is 100% master planned as part of developments in the City of Rancho Cordova. Middle Morrison Creek flood control is occurring at the Aspen 6 aggregate mine where there is a constructed weir. Lower Morrison Creek is in the City of Sacramento and has been fully studied by the Corps of Engineers who are designing a floodwall project. The large Jackson Highway Master Plan area encompasses much of the Morrison Creek watershed immediately upstream of the City of Sacramento. The hydrology study dated 2009 by Wood Rodgers will be succeeded by studies being prepared for the West Jackson Highway Master Plan which encompasses a large area of the Morrison Creek watershed in the county. **Strawberry Creek and Jacinto Creek**– Total 5588 acres partially in cities of Elk Grove and Sacramento is almost fully developed and master planned with several flood control and storm water quality detention basins. The study by/for Water Resources 1993 is deemed current.

Unionhouse Creek – 2193 acres tributary to Strawberry Creek and Morrison Creek is 100% master planned for the proposed Florin Vineyard Specific Plan. The developed condition drainage study by Civil Solutions dated 2007 is deemed current.

Whitehouse Creek – 100% master planned and developed in City of Elk Grove.

The South Sacramento Streams Project promoted by Sacramento Area Flood Control Agency with CA Department of Water Resources and the City of Sacramento intends to control flooding on Elder Creek, Unionhouse Creek, Florin Creek, and Morrison Creek west of Highway 99. The project consists of levee improvements starting south of the town of Freeport and running easterly into the urbanized areas of the City of Sacramento. The project also includes channel improvements along Florin and Unionhouse creeks.

Whitehouse Creek and Elk Grove Creek are tributaries to Laguna Creek which drains to the City of Sacramento then to the Beach Stone Lake Preserve

Strawberry Creek is tributary to Unionhouse Creek draining into the City of Sacramento and the South Sacramento Streams Group flood control project, then to the Beach Stone Lake Preserve.

Beach Stone Lake Tributaries drain the western half of the City of Elk Grove toward the Beach Stone Lake Preserve.

Mitigation of impacts to the Beach Stone Lake floodplain is discussed later in this document.

DRAINAGE STUDIES FOR ZONE 11A (DEVELOPING AREAS)

The following lists the current drainage master plans including existing condition and fully development condition hydrology.

Vineyard Springs Comprehensive Plan - The drainage plan for this planning area was developed by the Spink Corporation in 1999, and updated by Water Resources staff in 2003 and 2007. It was first adopted by the Sacramento County Board of Supervisors in 2003 and most recently in 2007. The plan, along with updates to the design and FEMA model are being used by Water Resources to condition development.

North Vineyard Station Specific Plan - The drainage plan for this planning area was developed by Borcalli & Associates in 2001 and updated by MacKay & Somps Engineers in 2006. It was approved by the Board of Supervisors in 2006. The modeling is going through updates as needed as new information is available, but the plan and revised modeling are being used by Water Resources to condition development.

Florin Vineyard Gap Community Plan - The drainage plan for this planning area was approved by Water Resources in 2007. The modeling is going through updates as needed as new information is available, but the drainage plan and revised modeling are being used by Water Resources to condition development.

Strawberry/Jacinto Creek Drainage Master Plan - This drainage master plan was developed by Water Resources staff in 1993. It was used to regulate pending development in the watersheds at the time, and is still used to condition development. The precipitation data is still appropriate, as well as the hydrology (HEC-1). The hydraulic model is updated from HEC-2 to HEC-RAS as necessary. The land use plan for the remaining undeveloped areas in the watershed is still appropriate.

Lower Laguna Creek Drainage Master Plan - This drainage master plan was developed by Water Resources staff in 1996. It was used to regulate pending development in the watersheds at the time, and is still used to condition development. The precipitation data is still appropriate, as well as the hydrology (HEC-1). The hydraulic model is updated from HEC-2 to HEC-RAS as necessary. The land use plan for the remaining undeveloped areas in the watershed is still appropriate.

Whitehouse Creek Drainage Study - This drainage study was first developed by Water Resources staff in 1996 and updated in 2006. It is being used by Water Resources to condition development.

Upper Morrison Creek - The Rio del Oro, Anatolia, and Sunridge drainage master plans in the City of Rancho Cordova serve to attenuate peak flow at the constraints crossing the Folsom South Canal.

Beach Stone Lake - Zone 11A watersheds converge to Morrison Creek, Laguna Creek which flow though the cities of Sacramento and Elk Grove, respectively, and ultimately to the preserve area known as Beach Stone Lake. In the Zone 11A program, is an impact fee that is collected, and separately accounted, for Beach Stone Lake mitigation. The Beach Stone Lakes Cumulative Impact Analysis dated September 1992 by Ensign and Buckley Consulting Engineers for Sacramento County used the DWR NETWORK unsteady-state hydraulic model to analyze the floodplain and the impacts of Zone 11A development. Subsequently, the Elliott Ranch South floodplain encroachment was presented in the Final Supplemental Environmental Impact Report for Elliott Ranch South General Plan Amendment (County Control Number 98-0617, dated July 1999, and an analysis of the impact of developing Shed B through the East Franklin Specific Plan and Laguna Ridge, in the City of Elk Grove was presented in those EIRs. This model is the current analysis of development impact to Beach Stone Lake.

Arboretum-Waegell Specific Plan - This specific plan for 1,350 acres enclosed by Sunrise Blvd, Jackson Road, and Grant Line Road was prepared by Wood Rodgers on March 24, 2010.

COMBINED SEWER SYSTEM

The City of Sacramento owns and operates a combined sewer system (CSS) that conveys residential and commercial wastewater and storm water runoff from approximately 11.7 square miles in downtown Sacramento, East Sacramento, Oak Park, and the Land Park area. There are 5.8 square miles of separated areas of the City north, east, and south of the CSS that contribute sanitary flows to the CSS. The CSS serves approximately 205,000 people. The CSS includes four key facilities to manage the collected flow: Sumps 1/1A, Sumps 2/2A, Pioneer Reservoir, and the Combined Wastewater Treatment Plant (CWTP). Sumps 1/1A and 2/2A pump up to 60 million gallons per day (mgd) of flows to the Sacramento Regional County Sanitation District's Regional Wastewater Treatment Plant (SRWTP). Pioneer Reservoir and CWTP provide additional storage and, when needed, primary treatment, and disinfection of combined sewage prior to discharge to the Sacramento River.

NATOMAS BASIN (COUNTY OF SACRAMENTO)

Located in the northwestern corner of Sacramento County is Natomas Basin Reclamation District 1000. 53,548 acres includes areas of Sutter County, the City of Sacramento, and Unincorporated Sacramento County. 26,449 acres of this reclamation district area is in Sacramento County. Sacramento Area Flood

Control Agency with the State of California and the Corps of Engineers is constructing a massive levee improvement project to bring the levees protecting the basin up to FEMA standards and 200-year level of protection (0.5% annual recurrence). The US Army Corps of Engineers lifted their previous certification of this levee system and FEMA remapped the area as an AE flood zone effective December 8, 2008. Building permits will no longer be issued after that date awaiting reaccreditation of the levees and revised flood insurance rate maps. In 2014, SAFCA, the City of Sacramento and the County requested FEMA remap the Natomas Basin into the Zone A99 floodplain citing the progress made to improve the levees and in securing federal authorization for the project. In 2015, FEMA remapped the entire basin into the Zone A99 floodplain and reincorporated the underlying Zone A floodplain that existed before the remap in 2008. In 2016, the City of Sacramento and Sutter and Sacramento counties contracted to have West Yost study and determine the 100-year and 200-year internal floodplain elevations in the Natomas Basin. The key source of floodwater within the Natomas Basin occurs when the river system spills over a low-hardened section of the northeast levee during very large storms events. Internal drainage canals and pumps to the river system are operated by Reclamation District 1000. Developments are conditioned to attenuate discharge flows to predevelopment levels in areas where Reclamation District 1000 (RD1000) pumps are not being improved.

There is industrial development in the unincorporated county in the Natomas area all draining to reclamation district channels and pump plants. The unincorporated portion of the Natomas area is 87.5% agricultural and 5% developed and 7.5% developing. The 2,000 acre Metro Air Park is currently under development and attenuates its peak flow discharge to the RD1000 channels and pumps. The 6,000 acre North Precinct Plan area is currently under design and will include internal levees and control peak discharge to the RD1000 channel and pumps.

This is the very bottom of the 2100 square mile American River watershed and nearly the bottom of the 27,000 square mile Sacramento River watershed so discharge from RD1000 would not exacerbate peak flow in the river.

NATOMAS BASIN (CITY OF SACRAMENTO)

Southern portions of the Natomas Basin are located in the City of Sacramento. As mentioned above, the Natomas interior drainage canals drain the Natomas Basin. Developments in the area are conditioned to attenuate discharge flows to predevelopment levels using a 2016 unified model. The unified model is maintained by RD1000. The portion of the Natomas Basin that is within the City of Sacramento is mostly built out. Currently, development is proposed in the Panhandle and Greenbriar.

Within the City of Sacramento, Drainage Master Plans (internal drainage) have been prepared for the entire area of Natomas located north of I-80 and west of Natomas East Main Drainage Canal. This area

was, until recently, a "greenfield" area, served only by natural, primitive, rural, and agricultural drainage systems. The master-planned drainage systems for this area have been installed, and continue to be installed, concurrent with, or just ahead of, urban development.

SOUTH COUNTY AGRICULTURAL AREA

The Southeastern part of the County is primarily zoned large lot agricultural with a population of 23,509 at an average density of 39 people per square miles. This area is controlled as agricultural land by the County General Plan. The FEMA special flood hazard designation envelopes 31% of the land in this

area. The FEMA flood insurance studies and California Department of Water Resources advisory floodplain study suffice to protect the modest amount of expected construction in this area.

Within this area is a proposed specific plan named Cordova Hills. This specific plan area mainly drains to Coyote Creek and Deer Creek. Impacts to these two creeks are being identified through master planning and FEMA mapping.

Cosumnes River is a wild and scenic river with agricultural levees and no flood control. The floodplain assumes levee breaches and is quite wide. The zoning within the floodplain area is large lot agricultural.

Beach Stone Lake floodplain is caused by Laguna and Morrison Creek watershed, Cosumnes River and backwater from the Delta. This expansive floodplain area is zoned large lot agricultural.

The Delta area is protected by levees that were first built during the Gold Rush era and have been subsequently improved by various state and federal programs. The Delta is an integral feature in the state water project providing water to the greater central and southern California agricultural and urban areas. The state and federal governments are working on long term solutions to problems in the delta concerning flood control, habitat, water quality and water supply.. The communities of Walnut Grove, Locke, Courtland, Hood, and Freeport in the unincorporated county and incorporated City of Isleton lie in areas of flood risk should there be levee failure on various Delta islands. Internal drainage is managed by Reclamation Districts who are also charged with maintenance of the levee systems. There are 100,000 acres in the FEMA floodplain in the Delta due to levee that are not accredited or were de-accredited in the 2012 DFIRM remap of Sacramento County. With the exception of the towns listed above, the Delta is large lot agricultural zoning.

DRAINAGE STUDIES FOR SOUTH COUNTY AGRICULTURAL AREAS

Upper Cosumnes River Flood Mapping Study - Hydrologic and hydraulic modeling was performed in 2008 by Civil Engineering Solutions, Inc. to update and revise the existing Zone A of the Flood Insurance Rate Map. The total study reach is approximately 9.8 miles from the upstream side of Dillard Road Bridge to approximately one mile upstream of Michigan Bar Road Bridge. FEMA is incorporated the revised flood data into a physical map revision which is expected to be effective in 2017.

Dry Creek Watershed Update Plan - This drainage study was prepared by Civil Solutions in April 2011.

Easton Drainage Master Plan - Alder Creek and Buffalo Creek Sheds - 1,400 acre Specific Plan located in Rancho Cordova between Sunrise Blvd, Jackson Road, and Grantline Road was prepared by McKay & Somps in March 2010. A detailed drainage study for the Glenborough/Easton Development

was approved for environmental review in 2013, additional analysis is needed before the project can proceed to design.

Cordova Hills Drainage Master Plan - 2,668 acre Specific Plan area is located between Grant Line Road and Scott/Stonehouse Road and south of White Rock Road. The study was prepared by McKay & Somps in March 2011 and is being updated pending comment from Sacramento County.

LIMITED LAND USE AREAS (COUNTY OF SACRAMENTO)

There are large areas of the County that are excluded from the Watershed Management Plan and CRS Activity 450 because of their land use and lack of impact to urban and urbanizing watersheds. Natomas is surrounded by levees and all of the stormwater is pumped from the basin to the river. The south county agricultural areas are zoned large lot agriculture and there is an extremely small level of proposed development.

ORIGINATING OUTSIDE SACRAMENTO COUNTY

The three counties with watersheds draining into Sacramento County are Placer, El Dorado, and Amador counties.

PLACER COUNTY

Dry Creek is the main creek entering Sacramento County from Placer County. It is a master planned creek described later in this report in Zone 11C Drainage Master Plans, and Watershed Agreements. The upper portions of the NEMDC and tributaries drain from Placer County. They are also described in Zone 11C.

EL DORADO COUNTY

Most of the area draining into Sacramento County from El Dorado County is undeveloped. Within that, however, is El Dorado Hills, an 18-square mile residential/commercial master planned community that was developed periodically between 1962 and recent years. It drains into Carson Creek, a tributary to Deer Creek, which feeds into the Consumnes River and has had negligible impact on Sacramento County. This area is included in the South County Agricultural Area.

AMADOR COUNTY

About 11 square miles of undeveloped (agricultural) watershed drains either directly into, or to Arkansas Creek and then into, the Cosumnes River. This area is included in the South County Agricultural Area.

WETLANDS AND NATURAL AREAS

All grading projects of more than 5-cares size must obtain a Clean Water Act Section 401 Certification from the State. All work in or near waters of the State and water of the U.S. must obtain permits from Fish and Game and/or Corps of Engineers.

It is noted in the City of Sacramento General Plan that grasslands throughout much of Sacramento historically supported vernal pools and seasonal wetlands. However, much of this habitat has been lost with development. The largest remaining concentration of vernal pool and seasonal wetland habitat is in North Sacramento and Natomas, though significant areas also occur in the Airport-Meadowview and south Sacramento areas and in undeveloped.

Vernal pools are ephemeral wetlands that form in shallow depressions underlain by a substrate near the surface that restricts the percolation of water. These depressions fill with rainwater during the fall and winter and can remain inundated until spring or early summer, sometimes filling and emptying numerous times during the rainy season. A flowering community, dominated by characteristic wetland plants, differentiates vernal pools from other seasonal wetlands. Vernal pool plant species likely to occur within the area include the winged water-starwort (Callitriche marginata), annual hairgrass (Deschampsia danthonioides), horned downingia (Downingia ornatissima), coyote thistle (Eryngium vaseyi), bractless hedge-hyssop (Gratiola ebracteata), slender popcorn flower (Plagiobothrys stipitatus), spine-fruit butter-cup (Ranunculus bonariensis), and purslane speedwell (Veronica peregrina).

COUNTY OF SACRAMENTO WETLANDS AND NATURAL AREAS

Careful consideration of endangered species and their habitat is an integral part of all projects in the county. Further, the County General Plan addresses open space under the conservation element. The County Planning Department addresses open space during public outreach and the preferred land use is incorporated in the DMP.

CITY OF SACRAMENTO WETLANDS AND NATURAL AREAS

The City has two land use zones, which are used to preserve open space. The first is Open Space, which means land and water essentially without improvements and used for public recreation, enjoyment or scenic beauty, conservation or use of natural resources, production of food or fiber, light and air or an environmental amenity. The second is the American River Parkway- Flood zone (ARP-F), which is an open space zone, which constitutes a designated floodway likely to be inundated by a flood having a one percent per annum chance of occurrence or greater. The ARP-F zone is intended to protect the natural features of property within the floodplain of the American River to prevent erosion and siltation and to preserve valuable open space in accordance with the provisions of the general plan.

MITIGATION ACTIVITIES

The mitigation activities outlined in this plan focus on future peak flows and volumes so that they do not increase over present values. The region deploys different forms of mitigation, but the mitigation tool is regulatory standard. Each community has adopted and enforces standards to insure future development will not impact current 10-year, 100-year, and 200-year peak flows.

Additionally, the management of the Sacramento region's watershed is heavily directed by regulatory standards that pertain to its major flood control systems. These systems are governed by project partnership agreements, the Urban Level of Flood Protection Plan, Executive Order 13690 and the Federal Flood Risk Management Standard, and eventually the American River Common Features General Reevaluation Report. These standards are designed to reduce the impacts of future flood events and preserve current levels of flood protection. Because of these regulations, the region's desired level of protection for its flood control systems is a minimum of 200-year level of protection or protection from 0.5 percent annual chance flood event.

Below is a detailed description of the mitigation activities that are currently in place in the Sacramento region.

STORMWATER AND WATERSHED MANAGEMENT

Regional Stormwater and Watersheds Management Standards

- The *Sacramento City/County Drainage Manual*, Volume 2: Hydrology Standards, 2006 [www.saccounty.net -search: volume 2 hydrology standards]
  The *Sacramento City/County Drainage Manual*, Volume 2: Hydrology Standards, was developed jointly by the Sacramento County Water Resources Division and the City of Sacramento Department of Utilities Division of Engineering Services. This volume presents the accepted methods for estimating surface water runoff peak flows and volumes for the analysis and design of drainage facilities in the City and County of Sacramento.

- Stormwater Quality Design Manual, 2007 [www.saccounty.net -search: stormwater quality design]
  The *Stormwater Quality Design Manual for the Sacramento and South Placer Regions* outlines planning tools and requirements to reduce urban runoff pollution to the maximum extent practicable from new development and redevelopment projects.

COUNTY OF SACRAMENTO MANAGEMENT STANDARDS

- Improvement Standards, 2006 [www.saccounty.net -search: improvement standards]
- Floodplain Management Ordinance, 2014, County Zoning Code [www.saccounty.net -search: floodplain management ordinance]
- County of Sacramento General Plan, 2011, and as currently being updated to address State required 200-year protection standards.
- Sacramento County Code, 2008 [www.saccounty.net -search: county code]
- Local Floodplain Management Plan, 2001 for Sacramento County was replaced with Multi-Hazard Mitigation Plan, 2004, Chapter 6.1 [www.saccounty.net -search: hazard mitigation plan]
- Title 1 and 2 of the Sacramento County Water Agency Code and the Zone 11 Fee Plan, 2004 [www.saccounty.net -search: zone 11]

CITY OF SACRAMENTO MANAGEMENT STANDARDS

- City of Sacramento Design and Procedures Manual and Improvement Standards, 2001
- Floodplain Management Regulations, City Code Chapter 15 Buildings and Construction, 2015
- Comprehensive Flood Management Plan, 2016
- City of Sacramento General Plan, 2016

COMMUNITY RATING SYSTEM ACTIVITIES

SACRAMENTO COUNTY CRS ACTIVITY 450 – PREREQUISITE

One of the prerequisites to be a Class 4 CRS community or higher is that the community manage runoff from all storms up to and including the 100-year storm (Activity 211.c(b)(ii)). Drainage planning in the County is directed by General Plan Policies, the County Zoning Code including the Floodplain Management Ordinance, and Improvement Standards. Together, these requirements ensure development is protected from flood damage and increased runoff is appropriately mitigated. Additionally, hydrology standards have been adopted by the County for use in drainage planning and design.

Stormwater and Floodplain Management Planning has been County policy since March 9, 1993 with Board of Supervisors adoption of floodplain management policies, and subsequently incorporated into the County's General Plan, adopted December 15, 1993, and amended November 9, 2011. These policies are intended to minimize the loss of life, injury, and property damage due to flood hazards and to strengthen regional flood protection and flood preparedness.

http://www.per.saccounty.net/PlansandProjectsIn-Progress/Pages/GeneralPlan.aspx

From the safety element of the General Plan:

Several key General Plan policies related to watershed and floodplain management are listed here;

SA-5 A comprehensive drainage plan for major planning efforts shall be prepared for streams and their tributaries prior to any development within the 100-year floodplain defined by full watershed development without channel modifications. The plan shall:

a. Determine the future 100-year flood elevations associated with planned and full development of the watershed;
b. Determine the future 100-year floodplain boundaries for both flood elevations (planned and full development) based on minimum 2-foot contour intervals;
c. Assess the feasibility of gravity drainage into the existing flowline of the stream;
d. Assess the feasibility of alternative means of drainage into the stream;
e. Identify potential locations for sedimentation ponds and other stormwater treatment facilities;
f. Determine practical channel improvements and/or detention basins to provide the flood control needs of the proposed development;
g. Determine the location and extent of marsh, vernal pool and riparian habitat;
h. Develop measures for protecting and mitigating natural habitat;
i. Develop measures for protecting and mitigating for federal and state listed endangered species;
j. Develop and ensure implementation of measures that would reduce vector larvae;
k. Identify appropriate plant species to be included as part of the natural features of the comprehensive drainage plan.

SA-10. Fill within the 100-year floodplain of creeks outside of the Urban Service Boundary is permissible to accommodate structures (e.g., residential, commercial, accessory) and septic systems, and only when the Board of Supervisors finds that the fill will not impede water flows or storm runoff capacity. Such development shall not cause an increase in base flood elevation of the 100-year floodplain exceeding 0.10 feet, unless analysis clearly indicated that the physical and/or economic use of adjacent property within the floodplain will not be adversely affected. A permit is required if the fill is within the jurisdiction of the Central Valley Flood Protection Board.

SA-13. Where new upstream development in Sacramento County will increase or potentially impact runoff onto parcels downstream in a neighboring jurisdiction, such as the City of Sacramento, Sacramento County will coordinate with the appropriate neighboring jurisdiction to mitigate such impacts.

SA-14. The County shall require, when deemed to be physically or ecologically necessary, all new urban development and redevelopment projects to incorporate runoff control

measures to minimize peak flows of runoff and/or assist in financing or otherwise implementing Comprehensive Drainage Plans.

AG-29. The County shall minimize flood risks to agricultural lands resulting from new urban developments by:

- Requiring that such developments incorporate adequate runoff control structures and/or
- Assisting implementing comprehensive drainage management plans to mitigate increased risks of farmland flooding resulting from such developments.

Floodplain Management Ordinance Requirements:

http://www.waterresources.saccounty.net/Drainage/2014%20Floodplain%20Management%20Ordinance.pdf

906-06 (H) No new construction or substantial improvements or development may occur without the approval of the Floodplain Administrator and without demonstrating that the cumulative effect of the proposed development when combined with all other existing and anticipated development will not have adverse impacts to downstream, upstream, or adjacent properties, and the FEMA mapping requirements of section 905-08 are met.

Improvement Standards requirements:

http://www.engineering.saccounty.net/Pages/ImprovementStandards.aspx 9-1.G- All new structures shall be protected from the 100-year (1-%) flood event. Certified pad elevations shall be set at least one and two tenths foot (1.2') above all sources of 100-year flooding.

9-1.H- The design of a new storm drain system shall include consideration of the downstream creek or storm drain. The consulting engineer shall show that the existing storm water system can convey the proposed drainage without adverse flooding, erosion or other water quality impacts to upstream, downstream or adjacent facilities or areas; or that such facilities or areas are being improved or protected to the point where the drainage can be conveyed without adverse impacts.

SacCalc is freeware developed by the Sacramento County Department of Water Resources and is available by searching SacCalc at www.saccodwr.org. SacCalc is a Windows platform for the Sacramento hydrology preprocessor and is used with Army Corps of Engineers HEC-1 program to analyze the 100-year storm. Hydraulics is calculated using Army Corps of Engineers HEC-RAS, UNET, or other appropriate software. There is no limitation on how large or small the project is nor where it is located within a drainage shed area. All projects must account for their impacts and mitigate as appropriate.

COUNTY CRS ACTIVITY 450- CREDIT CRITERIA

Another prerequisites to be a Class 4 CRS community or higher is to obtain 90 points (before the impact adjustment map) for meeting all the credit criteria for the Watershed Management Plan activity.

Sacramento County and the Cities of Elk Grove, Rancho Cordova and Citrus Heights are located within Zone 11 of the Sacramento County Water Agency Zone 11 programs. Zone 11 is subdivided by regional watershed areas 11A (draining to Morrison Creek / Beach Stone Lakes), 11B (draining to American River), and 11C (draining to Dry Creek / Natomas East Main Drainage Canal). The Zone 11 drainage impact fees pay for the installation and improvement of trunk drainage systems. The Sacramento County Water Agency is a separate subdivision of the state enveloping the cities of Citrus Heights, Rancho Cordova, and Elk Grove.

The Stormwater Utility was established in 1995 over an area of the Water Agency known as Zone 12. This program funds drainage maintenance and capital improvements in the urban areas of unincorporated Sacramento County and the cities of Citrus Heights, Rancho Cordova, and Elk Grove.

Activity 450 of the Community Rating System calls for certain prerequisites listed and responded to below:

a. *"The community must have adopted a watershed management master plan for one or more of the watersheds that drain into the community, and the plan must identify the natural drainage system and constructed channels."*

Sacramento County has adopted the following Drainage Master Plans (DMP) associated with watersheds, or particular development projects. The Zone 11 and watershed is indicated in parenthesis:

- Vineyard Springs Comprehensive Plan (Zone 11A, Upper Laguna Creek)
- North Vineyard Station Specific Plan (Zone 11A, Elder and Gerber Creeks)
- Florin Vineyard Gap Community Plan (Zone 11A, Morrison, Florin, Elder, Gerber, Unionhouse, and Strawberry Creeks)
- Dry Creek Watershed Flood Control Plan (Zone 11C, Dry Creek and Linda Creek)
- Strawberry/Jacinto Creek Drainage Master Plan (Zone 11A, Strawberry/Jacinto Creeks)
- Lower Laguna Creek Drainage Master Plan (Zone 11A, Laguna Creek)
- Whitehouse Creek Drainage Study (Zone 11A, Whitehouse Creek)
- Robla/Magpie Creeks Drainage Study (Zone 11C, Robla and Magpie Creeks)
- Chicken Ranch Slough Drainage Master Plan (Zone 11B, Chicken Ranch Slough)

- Strong Ranch Slough/Sierra Branch Drainage Study (Zone 11B, Strong Ranch Slough and Sierra Creek)
- NEMDC Tributaries (Zone 11C, NEMDC tributaries)
- West Galt Drainage Study (Stormwater Utility)
- East Elk Grove (Zone 11A, Laguna Creek and Elk Grove Creek)
- East Franklin (Zone 11A, Beach-Stone Lakes)
- Metro Air Park Master Drainage Study (Natomas Basin)
  Easton Glenborough Specific Plan (Alder Creek)

The following DMP's are pending adoption:

- Sunridge Specific Plan (the upper reaches of Morrison and Laguna Creeks), part of the Sunrise-Douglas Comprehensive Plan (Zone 11A)
- Elverta Specific Plan (NEMDC tributaries) (Zone 11C)
- Arcade Creek Flood Insurance Study (Zone 11B)
- Cordova Hills Specific Plan (Deer Creek)
- Mather South Specific Plan (Zone 11A, Morrison Creek)
- Newbridge Specific Plan (Zone 11A, Morrison Creek, Laguna Creek)
- Jackson Township Specific Plan Drainage Report (Zone 11A, Morrison Creek, Elder Creek and Laguna Creek)
- West Jackson Highway Specific Plan Area Master Drainage Plan (Zone 11A, Morrison Creek)
- Natomas North Precinct Master Drainage Plan (Natomas Basin)

The following DMP's have been adopted (with the County as one of the local agencies) in projects with the US Army Corps of Engineers:

- South Sacramento County Steams Investigation (Lower Morrison Creek and Tributaries) (Zone 11A and City of Sacramento)

Additional watershed management plans are being planned and will be coordinated by the Sacramento Area Flood Control Agency (SAFCA) to regulate drainage through State and Federal flood control projects. SAFCA will assist in the development of watershed management plans associated with SAFCA sponsored flood control projects along Arcade Creek, Dry Creek (North), and the Morrison Creek Stream Group.

b. "*The community must have adopted regulatory standards that are based on the plan and receive credit under SMR in Section 452.a* " Each DMP must be consistent with Sacramento County General

Plan Policies and Improvement Standards, and 1996 Hydrology Standards. The countywide policies are described in the document and further described in the Multi-Hazard Mitigation Plan. Drainage analysis is required for every project. Each DMP is incorporated in the Environmental Impact Report and the subsequent Mitigation and Monitoring Report Program (MMRP). The MMRP gives mitigation (e.g. construct channel improvements consistent with DMP) and timelines (e.g. prior to building Permits) and entity responsible for overseeing implementation (e.g. improvement plans shall be consistent with DMP and shall be approved by Sacramento County Department of Water Resources). The implementation of the DMP and MMRP becomes a condition of approval of the project.

c. *"The plan's regulatory standards manage future peak flows so that they do not increase over present values."*

Sacramento County has constructed many detention basins and is in the process of developing many more.

New development must show that any impacts are mitigated prior to the Sacramento County Board of Supervisors adoption of an EIR for the development to proceed. Each creek or watershed is unique, and is analyzed accordingly. Depending on the location in the watershed, the state of existing drainage facilities and/or existing residences, and downstream hydraulic conditions, the mitigation measures for impacts of development could range from no increase in flows (and/or volumes) for the 2- through 500-year event, or no measures at all. If management of peak flows runoff was not necessary, then the comprehensive drainage master plan established that existing structures and/or storm drain systems were not affected by the increase in peak flow. Typically however, DMP's result in detention that provides no increase in peak flows for the 10-year (because it could impact existing storm drain outfalls) and 100-year (because it could affect residential finish-floor elevations). This usually results in mitigation of the 10- through 100-year events.

d. *"The plan's regulatory standards require management of runoff from all storms up to and including the 25-year event."*

Watershed areas that have already been urbanized must abide by the County stormwater permit issued by the state Water Board. Policies are being developed regarding low impact development and hydro-modification measures that will protect stream systems by controlling discharges from developed areas to pre-development flow rates up to the 10-year event. Development will be required to incorporate follow the process and standards described in the Sacramento Stormwater Quality Partnership Hydromodification Management Plan in order to implement the hydromodification management in accordance with the stormwater permit.

For developing areas, depending on the location in the watershed, the state of existing drainage facilities and/or existing residences, and downstream hydraulic conditions, the mitigation measures for impacts of development could range from no increase in flows (and/or volumes) for the 2- through 500-year event or no measures at all. Typically, however, drainage master plans (DMP) result in detention that provides no increase in peak flows for the 10-year (because it could impact existing storm drain outfalls) and 100-year (because it could affect residential finish-floor elevations). This usually results in mitigation of the 10- through 100-year events.

COUNTY WATERSHED MASTER PLAN (WMP)

The CRS credit criteria for Activity 450 and County policies and standards require certain analyses in planning for new development. Activities defining this watershed management plan are listed and responded to below:

a. Up to and including 100-yr event (Activity 452.b (1) credit criteria.

All drainage master plans and drainage studies in the County consider storms from return frequencies ranging up to the 1% annual probability storm (100-year event) and include mitigation for more frequent events as required. The 10-year water surface elevation or hydraulic grade line are required to evaluate a development project's compliance with improvement standards. Additionally, some studies are required to demonstrate a project is protected from the 200-year storm event.

b. Management of future peak flows and volumes (Activity 452.b (1) credit criteria).

All drainage master plans must consider future condition hydraulic impacts and projects in the watershed must take appropriate mitigation actions. General Plan Policy SA-14 requires projects to incorporate runoff measures to reduce flooding. Project impacts and mitigation measures are included in the environmental document and projects are appropriately conditioned during the entitlement process.

c. The plan manages runoff from all storms up to and including the 25-year event (Activity 452.b (4) credit criteria).

The Sacramento County's Hydrology Standards are available online at www.saccodwr.org. Drainage master plans must consider effect of design storms ranging in duration from 6-hour to 10-day and frequency from 2-year to 500-year. The critical duration is defined for each project and used for the design of the channel and/or detention basin.

d. Plan identifies existing wetlands and/or other natural open space to be preserved from development to provide natural attenuation, retention, or detention of runoff.

Projects involving the discharge of fill material into the waters of the United States and wetlands must obtain a Clean Water Act Section 401 certificate from the state. All work in or near waters of the state and waters of the US must obtain permits from Fish and Game and/or the Corps of Engineers. Careful consideration of endangered species and their habitat is an integral part of all projects in the county. Further, the County General Plan addresses open space under the conservation element. The County Planning Department addresses open space during public outreach and the preferred land use is incorporated in the DMP.

e. Prohibiting development, alteration, or modification of existing natural channels.

There are a number of policies and implementation measures in the Conservation Element of the General Plan that protect natural stream functions, and discourage channel modifications and concrete lining.

f. Requiring that channel improvement projects use natural or "soft" approaches.

The above DMP's included natural channels. For example:

- The Lower Laguna DMP used a bypass channel to preserve the natural channel and wetlands.
- The East Franklin Specific Plan channel will incorporate meandering low flow, benching for habitat, and specific plantings to enhance storm water quality filtering.

All channels associated with DMPs are earthen, with no concrete lining, with appropriate roughness and side slope stability taken into account in the analysis.

Stormwater detention basins are designed to be aesthetically pleasing and habitat friendly. On some occasions, detention basins are designed as joint-use parks facilities.

There are several opportunities for active and passive park and recreation use of detention basins.

g. If the watershed plan was prepared in coordination or as a part of the floodplain management plan credited in Activity 510.

All of the DMP's are consistent with the Multi-Hazard Mitigation Plan and County Standards.

Freeboard for New Buildings in B, C, D, and X Zones (FRX) - regulations that require the applicant provide positive drainage away from the building site

The county improvement standards and floodplain management ordinance require, in addition to FEMA flood studies that all new structures be protected from the 1% annual recurrence storm with at least 18 inches of freeboard. This requirement is found in the Improvement Standards Section 9-15, Section 10-

4 and Section 10-5. It is also seen in the floodplain management ordinance that a local flood hazard is treated the same as a FEMA special flood hazard area.

(State Manadated) California's adoption of the IBC and the IRC which require positive drainage away from the foundation.
Legal basis: California Health and Safety Code, Sections 18901 and 18949, administered by the California Building Standards Commission. Positive drainage requirement is Section 1804.3 of the California Building Code.

Erosion and Sedimentation Control Regulations (ESC) - minimize erosion from land disturbed due to construction or farming.

(State Mandated) Requirement that construction projects of greater than 1 acre require erosion and sediment control measures.
Legal basis: 2009-0009-DWQ Construction general permit:
http://www.swrcb.ca.gov/water_issues/programs/stormwater/constpermits.shtml.

Water Quality Regulations (WQ) - regulations that improve the quality of stormwater runoff.

(State Mandated) Participation in the State NPDES Program.
Legal basis: California Regional Water Quality Control Board MS4 permit, Order No. R5-2008-0142 (NPDES No. CAS082597)

CITY OF SACRAMENTO CRS ACTIVITY 450 – PREREQUISITE

The City of Sacramento is not part of the Sacramento County Water Agency, but the City and County have a long-standing cooperative understanding on stormwater mitigation. The City of Sacramento responds to the CRS perquisites as follows:

a. "The community must have adopted a watershed master plan for one or more of the watersheds that drain into the community, and the plan must identify the natural drainage system and constructed channels."

The City has Drainage Master Plans for many of its watersheds for localized flooding, natural drainage system and constructed channels, and development driven studies.

b. "The community must have adopted regulatory standards for new construction in the watershed based on the plan that are based on the plan and receive credit under SMR in Section 452.a."

The City has adopted regulatory standards for new construction which are in alignment with this plan.

13.08.145 Mitigation of drainage impacts; design and procedures manual for water, sanitary sewer, storm drainage, and water quality facilities.

A. When property that contributes drainage to the storm drain system or combined sewer system is improved or developed, all stormwater and surface runoff drainage impacts resulting from the improvement or development shall be fully mitigated to ensure that the improvement or development does not affect the function of the storm drain system or combined sewer system, and that there is no increase in flooding or in water surface elevation that adversely affects individuals, streets, structures, infrastructure, or property.

The City's Design & Procedures Manual also requires that developments within the City of Sacramento shall be provided with storm drainage facilities that will, at minimum, provide 100-year protection to structures and 10-year protection to streets.

c. "The plan's regulatory standards manage future peak flows so that they do not increase over present values."

Our Drainage Master Plans identify a "preferred plan" that is usually the least-cost alternative that provides the required level of performance to mitigate peak flows and volumes. By virtue of being on the downstream half of local stream systems, the City can control the release of water with the City's pump stations and drainage basins without increasing peak flows in the receiving streams.

The City of Sacramento has also emphasized the value of detention basins in solving flooding problems. The primary purposes of a detention basin are to mitigate flooding, to lessen the impact of peak flows on existing or proposed infrastructure (pump stations, channels and pipelines) and to improve water quality. Detention basins are also effective because they lessen the impact on receiving streams, they provide the best opportunity to obtain mandated water quality benefits, and they provide a variety of secondary use benefits.

d. "The plan's regulatory standards require management of runoff from all storms up to and including the 25-year event."

The City's drainage system consists of 94 sumps and pumps, 140 drainage basins, many miles of improved channels and a vast network of pipes and drainage inlets that control runoff. Detention basins have been constructed in Sacramento since 1955. Ten were built before 1985. In the last 14 years, 50 more detention basins have been constructed and there are plans to build many more to help eliminate flooding. he City's Master Planning Program requires performance standards include eliminating street flooding during a 10-year storm and to prevent property damage and public safety hazards for a 100-year storm.

e. "Any plan that is more than five years old, the community must evaluate the plan to ensure that it remains applicable to current conditions."

The WMP will be evaluated and revised every five years along with the County-wide Multi-Hazard Mitigation Plan (Section 510).

CITY OF SACRAMENTO WATERSHED MASTER PLAN (WMP)

The City of Sacramento requires certain analyses in planning for new development. Activities defining this watershed management plan are listed and responded to below:

a. Up to and including the 100-year event (Activity 452.b (1) credit criteria).

The City's Master Planning Program has performance standards include eliminating street flooding during a 10-year storm and to prevent property damage and public safety hazards for a 100-year storm. Where applicable by State of California standards, many areas of the city are required to meet the 200-year storm.

b. Management of future peak flows and volumes (Activity 452.b (1) credit criteria).

The City's Master Planning Program and requires performance standards that include eliminating street flooding during a 10-year storm and to prevent property damage and public safety hazards for a 100-year storm for future development. By virtue of the City being on the downstream half of local stream systems, the peak flows and volumes can be controlled by the City's pump stations and detention basins in the receiving stream.

In addition, the City's Floodplain Ordinance (Section 15.104.040) states that, "proposed construction or development shall not result in any increase in flood levels during the occurrence of the base flood". Development driven Drainage Master Plans must consider future condition hydraulic impacts and projects in the watershed must take appropriate mitigation actions. Development projects impacts and mitigations measures are included in environmental documents and conditioned during the entitlement process.

c. The plan manages runoff from all storms up to and including the 25-year event (Activity 452.b (4) credit criteria).

The City's Design and Procedure Manual requires managing runoff for development up to a 100-year storm. The specific criteria differentiates for a greenfield development, infill development and for upgrading an existing drainage system, but all require plans to manage runoff up to the 100-year.

Non-leveed channels shall, at a minimum, must be designed to accommodate the 100-year, 10-day storm event with 1 foot of freeboard. Leveed channels shall, at a minimum, be designed to accommodate the 200-year, 10-day storm with 3 feet of freeboard.

d. Plan identifies existing wetlands and/or other natural open space to be preserved from development to provide natural attenuation, retention, or detention of runoff.

All grading projects of more than 5-cares size must obtain a Clean Water Act Section 401 Certification from the State. All work in or near waters of the State and water of the U.S. must obtain permits from Fish and Game and/or Corps of Engineers.

The City has two land use zones, which are used to preserve open space. The first is Open Space, which means land and water essentially without improvements and used for public recreation, enjoyment or scenic beauty, conservation or use of natural resources, production of food or fiber, light and air or an environmental amenity. The second is the American River Parkway- Flood zone (ARP-F), which is an open space zone, which constitutes a designated floodway likely to be inundated by a flood having a one percent per annum chance of occurrence or greater. The ARP-F zone is intended to protect the natural features of property within the floodplain of the American River to prevent erosion and siltation and to preserve valuable open space in accordance with the provisions of the general plan.

e. Plan was prepared in coordination with or as part of the community's floodplain management plan credited under Activity 510.

This Plan was prepared in coordination as an appendix with the County Local Hazard Mitigation Plan.

STANDARDS FOR DEVELOPMENT

DESIGN STANDARDS AND REVIEW – COUNTY OF SACRAMENTO

Piped storm drain systems are designed to convey the County design flow which approximates the peak run off from a 5-year storm event. The larger less frequent storm events exceed the pipe capacities and travel through streets and overland from the upper shed areas to the receiving creek. Water is typically allowed to pond in streets up to 30-minutes (+/-) until the storm subsides. Development designers must analyze the 100-year, 1% annual recurrence, storm event and assure that ponding and overland flow is safely managed and that freeboard is adequate for each new structure. The impact downstream and adjacent to the proposed development must also be analyzed and mitigated.

Large development plan areas, known as specific plans and community plans, must prepare a detailed drainage study often including channel improvements and peak flow detention basins. Computer modeling is done for a watershed downstream to a point of confluence and/or hydraulic constraint. By doing so, the peak flow and volume as well as routing and storm centering are correctly analyzed using dynamic modeling tools.

New levees to reclaim floodplain are discouraged and whenever such are proposed they must be constructed to at least a 200-year (0.5% annual recurrence) level of protection in areas subject to State Urban Level of Protection criteria, and meet FEMA certification standards (44CFR65.10).

All discretionary applications are routed to Water Resources for comments and conditions. The County has a computer system that tags all parcels with known flood hazards and all building permits for those parcels are routed to Water Resources for review and approval.

From the safety element of the General Plan:

- SA-14. The County shall require, when deemed to be physically or ecologically necessary, all new urban development and redevelopment projects to incorporate runoff control measures to minimize peak flows of runoff and/or assist in financing or otherwise implementing Comprehensive Drainage Plans.

Improvement Standards require:

- 9-1G All new structures shall be protected from the 100-year (1-%) flood event.
  9-1H The design of a new storm drain system shall include consideration of the downstream creek or storm drain. The consulting engineer shall show that the existing storm water system can convey the proposed drainage without adverse flooding, erosion or other water quality impacts to upstream, downstream or adjacent facilities or areas; or that such facilities or areas are being improved or protected to the point where the drainage can be conveyed without adverse impacts.

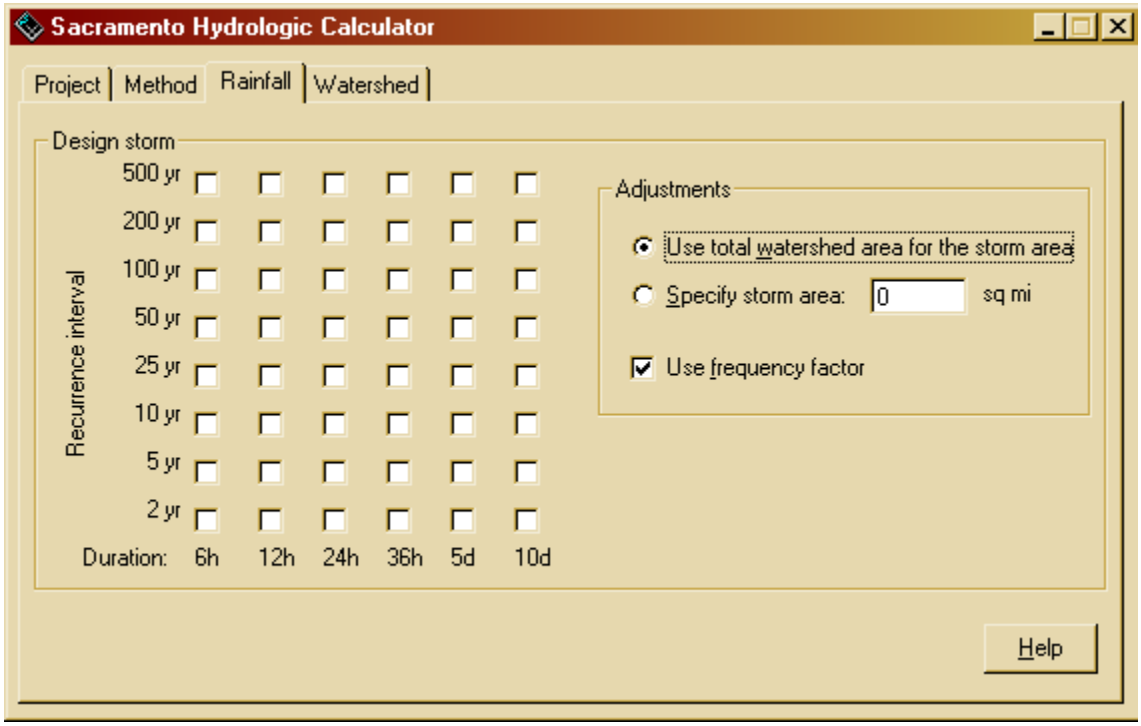
HYDROLOGY STANDARDS

Sacramento County developed hydrology standards that were adopted in 1996 and have been approved for FEMA map revisions. These standards include regional rainfall tables of depth-duration-frequency; design storms of various durations, infiltration rates based on land use and soil type, and employ the unit hydrograph theory. Hydrology is modeled using the SacCalc Sacramento Calculator and hydraulics is modeled using tools from the US Army Corps of Engineers Hydraulic Engineering Center (HEC) or proprietary tools like XPSWIMM and Mike- 11.

Hydrology modeling includes a range of storms from 6-hours to 10-days, from 50% annual recurrence to 1% annual recurrence. Small watersheds tend to respond to short duration storms while larger shed

areas and those with basins and convergences must consider the volume and routing characteristics of the longer duration storm event. There is also the ability to model record storm events and continuous simulation.

The County has three hydrologic rainfall zones. Sacramento County developed a hydrology calculator known as SacCalc, which is available at no cost to consulting engineers. SacCalc is a preprocessor to the US Army Corps of Engineers HEC-1 hydrology computer program. The program (freeware found at www.saccodwr.org search: SacCalc) allows modeling of a wide range of storm events, table shown below. The user may develop a hydrograph for a watershed of specified size, shape, slope, roughness, soil type and land use for a range of storms 2 year 6 hour through 500 year 10 day.



Flood control detention basins are constructed when there is need to attenuate impacts to peak flow in a watershed. Such basins are generally designed as off-line taking the peak flow off of an open channel. Stormwater quality basins are used to treat storm water pollution by maintaining a residence time at zero velocity allowing suspended solids to settle before the water is discharged, normally by gravity, to the adjacent open channel. Combined basins have a flood control volume over a permanently wet volume serving as storm water pollution prevention. Basins are designed to be aesthetic amenities for the developing community.

Urban drainage is conveyed by piped storm drain systems to the nearest open channel, creek or stream. Water quality treatment is required in accordance with the county's storm water permit from the State

Regional Water Quality Control Board under Section 401 of the Clean Water Act. This is a joint permit with the cities, the County and our neighboring county of Placer as well as the City of Roseville. The group prepared a Stormwater Quality Design Manual, dated 2007. www.saccodwr.org click on Stormwater Quality.

Hydromodification and geomorphologic studies are being prepared for urbanizing watersheds to assure minimized impact to the erosion and deposition characteristics of the streambed. This is regulated by the State Regional Water Quality Control Board and the findings will be made a part of the forthcoming regional permit. It is not anticipated that mitigation for hydromodification will have an impact on the FEMA 100-year floodplain but it will likely require additional care in the design of developments including low impact development features, attenuating flows below the 10-year event.

The Sacramento County Department of Water Resources Drainage Development and Hydrology Section reviews all grading and drainage projects in the County for conformance with drainage improvement standards and the Floodplain Management Ordinance. A grading permit is required for any project that moves more than 350 cubic yards of soil. Improvement plans are required for any on-site or off-site development and for any drain pipe other than a driveway culvert. All grading plans and improvement plans are reviewed and approved by Water Resources to assure adherence to design standards. Staff also assures that new homes are constructed safely above the highest determined base flood elevation whether mapped on the FEMA Flood Insurance Rate Map or designated by County study including future condition hydrology.

COOPERATIVE TECHNICAL PARTNERSHIPS AND WATERSHED AGREEMENTS

Sacramento County has a cooperative technical partnership agreement with each of its seven cities as part of the FEMA map modernization project.

SACRAMENTO COUNTY AND PLACER COUNTY

Dry Creek conveys flows from Placer County. The Dry Creek drainage study dated 1992 was a joint effort of both the counties of Placer and Sacramento. Placer County agreed to attenuate peak flow impacts. Sacramento County agreed to pay a fair share impact fee for development in watersheds draining toward Placer County (Linda Creek and north flowing Dry Creek Tributaries such as Parkway Greens).

Placer County has prepared an update flood study for Dry Creek, Civil Engineering Solutions and RBF Consulting 2011.

The South Placer Vineyard proposed development north of the Sacramento County line drains mostly to Steelhead Creek, known also as Natomas East Main Drainage Canal, tributaries. The development is conditioned to pay the Steelhead Creek Fair Share Fee as described in the Zone 11C Engineer's Report dated August 16, 2004.

SACRAMENTO COUNTY AND CITY OF SACRAMENTO

The following watersheds flow from the County to the City: Morrison, Elder, Gerber, Florin, Unionhouse, Strawberry, Whitehouse, Laguna and Elk Grove Creeks in the south. Dry, Magpie, Robla, and Arcade Creek and the American River in the north. Natomas interior drainage canal, NEMDC, and the Sacramento River in the Natomas basin.

The South Sacramento Streams Group Project is an ongoing US Army Corps of Engineers project working in partnership with the State and the Sacramento Area Flood Control Agency as the local sponsors for the benefit of the County and City. The project included a floodwall project in the City of Sacramento on the following creeks:

- Lower Morrison
- Florin
- Elder
- Unionhouse

The South Sacramento Stream Group Project also includes channel work along the Florin and Unionhouse Creek and the construction of a flood control detention basin along Florin Creek. The County of Sacramento, the City of Sacramento, and SAFCA are coordinating on a plan to ensure these flood protection measures are not compromised by upstream development.

A drainage study was performed on Upper Morrison Creek by a consultant for Water Resources. The study focused on a reach of aggregate strip mines from the City boundary upstream to the Aspen VI/Vineyard I mining pit just upstream of Jackson Road. High flows from the channel are diverted into the Aspen VI/Vineyard pit over a weir constructed in a realigned channel. This weir controls peak flows downstream. The study developed hydrologic (SacCalc) and hydraulic (HEC-RAS) models that are being used for planned development throughout the reach. It also ensures that design flows for the South Sacramento Streams Group flood control projects will not be exceeded. Additional analysis is being conducted in relation to the master planning for the West Jackson Highway Plan which will include a revision to the FEMA floodplain for the upper reaches of Morrison Creek.

SACRAMENTO COUNTY AND CITY OF RANCHO CORDOVA

Rancho Cordova has their own drainage and floodplain management staff. Rancho Cordova is located within Zone 11 A and B of the Sacramento County Water Agency which charges a development fee to new projects to fund the planning, design and construction of new trunk drainage systems. The City of Rancho Cordova charges city residents a Rancho Cordova Stormwater Utility Fee to pay for the bulk of drainage program services. Generally, Rancho Cordova is upstream of the unincorporated county.

SACRAMENTO COUNTY AND CITY OF ELK GROVE

Elk Grove has their own drainage and floodplain management staff but the City still lies within Zone 11A of the Sacramento County Water Agency and participates in the regional trunk drainage development fee program. City residents pay an Elk Grove Storm Water Utility Fee for drainage services provided by the City. All of the watersheds in the City have been master-planned. The city sits low in the county watersheds and drains to the Beach Stone Lake floodplain. Development in Zone 11A pay a Beach Stone Lake volume mitigation fee held in a trust for a future project. The Laguna West and Laguna Stonelake projects paid lump sum fees toward Beach Stone Lake Mitigation. Proposed projects for agricultural residences in the Beach Stone Lake floodplain include elevation, berms, and walls. The County Department of Water Resources pays flood insurance premiums for many homes in this floodplain from interest earned on funds held in the account.

Upstream watersheds draining into the City of Elk Grove include Strawberry Creek and Laguna Creek. Strawberry Creek is built out. Laguna Creek is master-planned and there is a flow rate at the city border that will be held as the maximum 100-year peak. This is memorialized in a FEMA Letter of Map Revision. The County is planning to utilize a large aggregate mine as a peak flow detention basin, known as Triangle Rock, to control flood flows while allowing a range of lower frequency flows to maintain aquatic habitat and geomorphologic characteristics.

COUNTY OF SACRAMENTO AND CITY OF CITRUS HEIGHTS

Citrus Heights is almost entirely built-out and is located in the upstream (northeast) portion of the natural stream watersheds. The largest infill is at Gum Ranch on South Branch Arcade Creek, which is slated for a regional detention basin. This basin will serve to attenuate peak flow immediately downstream and at the confluence with Arcade Creek.

The City of Citrus Heights is in Zone 11B and residents pay the Stormwater Utility Fee. The City's General Services Department provides over site for its drainage program, however, the bulk of City drainage services are provided by under an agreement with the County of Sacramento.

CITY OF FOLSOM

The City of Folsom is at the top of its watersheds and drains directly to the American River. Because of this there is little interaction between agencies regarding drainage and floodplain issues.

CITY OF GALT

The City of Galt is located in the middle of the rural unincorporated south County and is a pass-through for upstream rural County runoff as it drainage southwest. Deadman's Gulch and Hen Creek are the two primary watersheds serving the City. There is much cooperation between the City of Galt and the County of Sacramento Department of Water Resources associated with managing flows in these watersheds. Peak flow detention is not deemed necessary on the main branches of these streams, but there is need for detention basins to attenuate flow where there are storm drain system deficiencies. Much of the area is topographically flat and the defined drainage systems handle about a 2-year storm event.

West Galt Drainage Study

This drainage study was developed by Water Resources in 2003. It was approved for use by Sacramento County and the City of Galt. It is being used by Water Resources to condition development. The precipitation data and land use are still appropriate, as well as the hydrologic (HEC-1) and hydraulic (HEC-RAS) methods.

CITY OF ISLETON

The City of Isleton is a relatively small area of development on the rural and agricultural lands of Andrus Island. All runoff on Andrus Island drains to agricultural/ drainage ditches operated by RD545 and then pumped to the Sacramento River. The RD545 drainage system is sized for all runoff including Isleton, and discharges to the Sacramento River are not significant.

FUTURE MITIGATION STRATEGIES

To help determine mitigation strategies for the region, an accurate and comprehensive picture of the future conditions is needed. The development of a watershed modeling project to create models for each major waterway impacting the region would provide a foundation for all stakeholders to plan for the

future and not increase peak flows and volumes. Information from a unified model can be utilized to determine high priority mitigation projects and the impacts of proposed development projects.

The County, City of Sacramento, and SAFCA will work to together to development mitigation strategies that ensure future development does not increase the risk of flooding in these communities. Additional watershed management plans and agreements will be developed related to development and drainage facilities in the Dry Creek (North), Arcade Creek, and South Sacramento Stream Group (Morrison Creek) watersheds.

FUNDING

SACRAMENTO COUNTY FUNDING

Sacramento County Storm Water Utility funds maintenance and improvement of existing storm drain systems within the urban services area. This fee is billed bi-monthly on the County Utility Bill. Routine repairs and improvements are made on a continuous basis throughout the unincorporated county. Citizens are encouraged to call the drainage hotline at (916)875-RAIN to request immediate maintenance, improvement projects, or on-site technical assistance related to all drainage matters. The County Stormwater Utility is defined as the area known as Zone 12 of the Sacramento County Water Agency and includes the urban areas of unincorporated county and the cities of Elk Grove, Citrus Heights, and Rancho Cordova.

The Sacramento County Water Agency Zone 11 Drainage Impact Fee Program has been in existence since 1965. New storm drainage systems are generally constructed by contractors working for private developers. Drainage fees are collected prior to improvement plan approval on a schedule rate based on percent impervious area impact to the watershed. Components of the fee include piped storm drain, open channel peak flow impact, detention volume impact, and stormwater quality. Zone 11 is divided into three sheds, 11A is the Morrison Creek and Beach Stone Lake Stream Groups, 11B is natural streams draining toward the American River, 11C is the Dry Creek and Natomas East Main Drainage Canal shed area. The fees collected are used to finance comprehensive drainage plans for urban streams.

Developers are credited and reimbursed for construction of trunk drainage facilities that are permanent and efficient systems in accordance with County standards. Trunk drainage is defined as a 30-acre water shed area or greater within a Zone of the Sacramento County Water Agency Drainage Fee Plan.

Supplemental drainage fee plans are prepared for specific plan areas where there are costs associated with trunk drainage that are not covered by Zone 11, such as environmental mitigation and channel rights-of-way.

CITY OF SACRAMENTO FUNDING

Operation, maintenance, repair and rehabilitation (OMR&R) of the City's water, sewer, drainage, and flood control facilities is the Department of Utilities'(DOU) first task. For this reason, the revenues that make up the DOU budget are first allocated to OMR&R. Any surplus may be used for new facilities, and/or improvements to existing facilities.

DOU has an annual budgeting process, which determines whether any funds will be available for capital improvements, and, if so, how much will be allocated to water, sewer, drainage, and flood control. DOU's drainage unit has a Drainage Master Planning process that identifies desirable drainage improvement projects, and a prioritization process, which sorts the recommended projects according to cost-effectiveness.

When the annual budget for drainage improvements is known, the drainage unit looks through the recommended drainage improvement projects, focusing on the ones that have highest priority. From this list, the decision-makers will usually set aside any projects whose estimated cost exceeds available funds, and make final selections among the remaining projects.
