Action 20. Adoption of Hydromodification and Low Impact Development (LID) Standards

Hazards Addressed: Localized Flooding and Drought

Goals Addressed: 1, 2, 3, 4

Issue/Background: As part of the City's region wide NPDES permit, new development and redevelopment projects will be required under certain conditions to incorporate stormwater hydromodification and Low Impact Development into their projects. Development projects that incorporate hydromodification and LID will more closely mimic the natural hydrology of their site which will result in less potential for flooding and erosion of stream banks due to a reduction of stormwater runoff volume into rivers, streams, pipes and culverts. Use of LIDs will also help increase water supply by increasing groundwater recharge.

Project Description: Over the next several years, the City's new region wide NPDES stormwater permit will require permittees to adopt development standards that include the use of hydromodification and LID for new and redevelopment projects.

Other Alternatives: Do Nothing

Existing Planning Mechanism(s) through which Action Will Be Implemented: Identified in the City's 5-yr Capital Improvement Plan

Responsible Office/Partners: Public Works

Project Priority: Medium

Cost Estimate: $10,000

Benefits (Losses Avoided): Requiring new development and redevelopment projects to implement hydromodification and LID will reduce flooding and increase groundwater recharge.

Potential Funding: Local funds (Stormwater Utility Fee)

Timeline: To be implemented over 5 years

Action 21. Stormwater Capital Improvement Program Master Plan

Hazards Addressed: Localized Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City experiences localized flooding in older areas of the City where storm drain pipes and culverts are undersized and cannot convey the design storm. Areas along Sunset Blvd. south of White Rock Road are particularly prone to significant flooding due to undersized siphons and over chute that cross the Folsom South Canal.

Project Description: Develop a Stormwater Capital Improvement Program Master Plan that will identify existing flooding problems within the City and provide recommended solutions. The plan will include hydrologic and hydraulic analysis of the City's drainage system, including pipes and culverts and develop a priority list of recommended capital improvement projects including estimated costs and implementation schedule.

Other Alternatives: Do Nothing

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Public Works

Project Priority: High

Cost Estimate: $700,000 -$1,000,000

Benefits (Losses Avoided): Provide a prioritized list of drainage capital improvement projects that will protect property and improve public safety by reduce flooding within the City.

Potential Funding: Local funds (Stormwater Utility Fee)

Timeline: To be implemented over 5 years

Action 22. Sunrise Blvd. & Monier Circle Drainage Improvements

Hazards Addressed: Localized Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Sunrise Blvd. floods between Monier Circle and Fitzgerald during severe rain events due to limited capacity of culverts the Folsom South Canal siphon.

Project Description: Project includes retrofitting existing detention basin located between Sunrise Blvd. and the Folsom South Canal to increase storage capacity and replacing two undersized culverts across Sunrise Blvd between Recycle Road and Monier Circle.

Other Alternatives: Do Nothing

Existing Planning Mechanism(s) through which Action Will Be Implemented: Identified in the City's 5-yr Capital Improvement Plan

Responsible Office/Partners: Public Works

Project Priority: High

Cost Estimate: $2,000,000 - $3,000,000

Benefits (Losses Avoided): Project will allow unimpeded public access including access for emergency vehicles along Sunrise Blvd. during significant flooding events

Potential Funding: Local Funds (Stormwater Utility Fee)

Timeline: To be implemented over 5 years

Action 23. Roundabouts

Hazards Addressed: High wind and storms (evacuations)

Goals Addressed: 1, 2, 3

Issue/Background: Traffic control

Project Description: Encourage round-abouts in place of traffic signals where appropriate

Other Alternatives:

Existing Planning Mechanism(s) through which Action Will Be Implemented: Development Process

Responsible Office/Partners: Planning/Public Works

Project Priority: Medium

Cost Estimate: Staff time; Undetermined as a case by case basis

Benefits (Losses Avoided):

Potential Funding: Local Funds

Timeline: On-going

Annex F City of Sacramento

F.1 Introduction

This Annex details the hazard mitigation planning elements specific to the City of Sacramento, a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the City. This Annex provides additional information specific to the City of Sacramento, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this community.

F.2 Planning Process

As described above, the City of Sacramento followed and met all DMA and CRS planning process requirements detailed in Section 3 of the Base Plan and as documented by Appendix A to this LHMP. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC) and Steering Committee, the City formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table F-1. Additional details on plan participation and City representatives are included in Appendix A.

Table F-1 City of Sacramento Planning Team

Name	Position/Title	How Participated
Tony Bertrand	Supervising Engineer	Utilities Department - Development Services. Provided information on floodplain management and impacts on development.
Elissa Callman	Senior Engineer	Utilities Department - Environmental and Regulatory Compliance: Provided information on mitigation projects related to water quality issues.
Roberta Deering	Preservation Director	Community Development Department – Planning Design/Preservation: Provided information on cultural and historical resources.
Lisa Deklinski	Program Specialist	Utilities Department - Security and Emergency Preparedness: Provided information on the Department Operations Center, levee security, and emergency management practices.
Brett Ewart	Senior Engineer	Utilities Department - Capital Improvement Program (CIP): Provide information on current and future Capital Improvement Project related to water.
Brett Grant	Supervising Engineer	Utilities Department - Drainage and Sewer CIP: Provided information on current and future conditions of the drainage system. Identified hazard area and possible mitigation projects.

Name	Position/Title	How Participated
Dave Hansen	Supervising Engineer	Utilities Department – Information Technology: Provided information on the technology infrastructure of our utilities. Also, provided background to generator mitigation project.
Kevin Hocker	Arborist/Urban Forester	Public Works - Urban Forestry: Provided information on natural resources.
Sherill Hunn	Supervising Engineer	Utilities Department - Environmental and Regulatory Compliance: Provided input on regulatory mitigation capabilities as well as water quality issues.
Niko King	Deputy Chief	Sacramento Fire Department: Provided information on the Fire Department's public education efforts and ISO rating.
Rick Matsuo	Supervising Engineer	Utilities Department - Integrated Planning and Asset Management: Provided perspective on maintenance and disaster recovery related to city assets.
Jessica McCabe	Program Analyst	Utilities Department - Public Affairs: Provided information on current and future public outreach programs.
Remi Mendoza	Associate Planner	Community Development Department - Long Term Planning: Provided information on the City's development, building procedures, and planning aspects.
Mike Nolan	Consultant	Utilities Department – Floodplain Management: Provided information and status on infrastructure projects. Also, provided possible mitigation projects for flood hazards.
Connie Perkins	Senior Engineer	Utilities Department - Floodplain Management: Provide information on flooding hazards, dam failure, and levee failure.
William Roberts	Superintendent	Utilities Department - Operations and Maintenance: Provided mitigation projects related to levee patrols and flood fighting activities.
Rhea Serran	Media & Communications Specialist	Utilities Department - Public Affairs: Provided insight on emergency public outreach and media relations.
Kelly Sherfey	Program Analyst	Utilities Department - Floodplain Management: Provided information on flood hazards and researched other natural hazards within the City.
Jason Sirney	Emergency Manager	City of Sacramento - Emergency Operation Center: Provided information on the City's hazard history, current preparedness, and identified multiple mitigation projects.
Pravani Vandeyar	Superintendent	Utilities Department - Water Quality Lab and Research & Development: Provided information on the City's water plant and provided mitigation project related to flood recovery.
Steve Winton	Police Lieutenant	City of Sacramento - EOC Coordinator: Provided law enforcement perspective.
Asad Akhtar	Engineering Student Intern	Utilities Department – Intern. Provided many of the mitigation action worksheets for inclusion into the Plan. Provided detailed research on mitigation actions included in this plan.

F.2.1. Coordination with Other Community Planning Efforts

Coordination with other community planning efforts is paramount to the successful implementation of this plan. This Section provides information on how the City integrated the previously-approved 2011 Plan into existing planning mechanisms and programs. Specifically, the City incorporated into or implemented the 2011 LHMP through other plans and programs shown in Table F-2.

Table F-2 2011 LHMP Incorporation

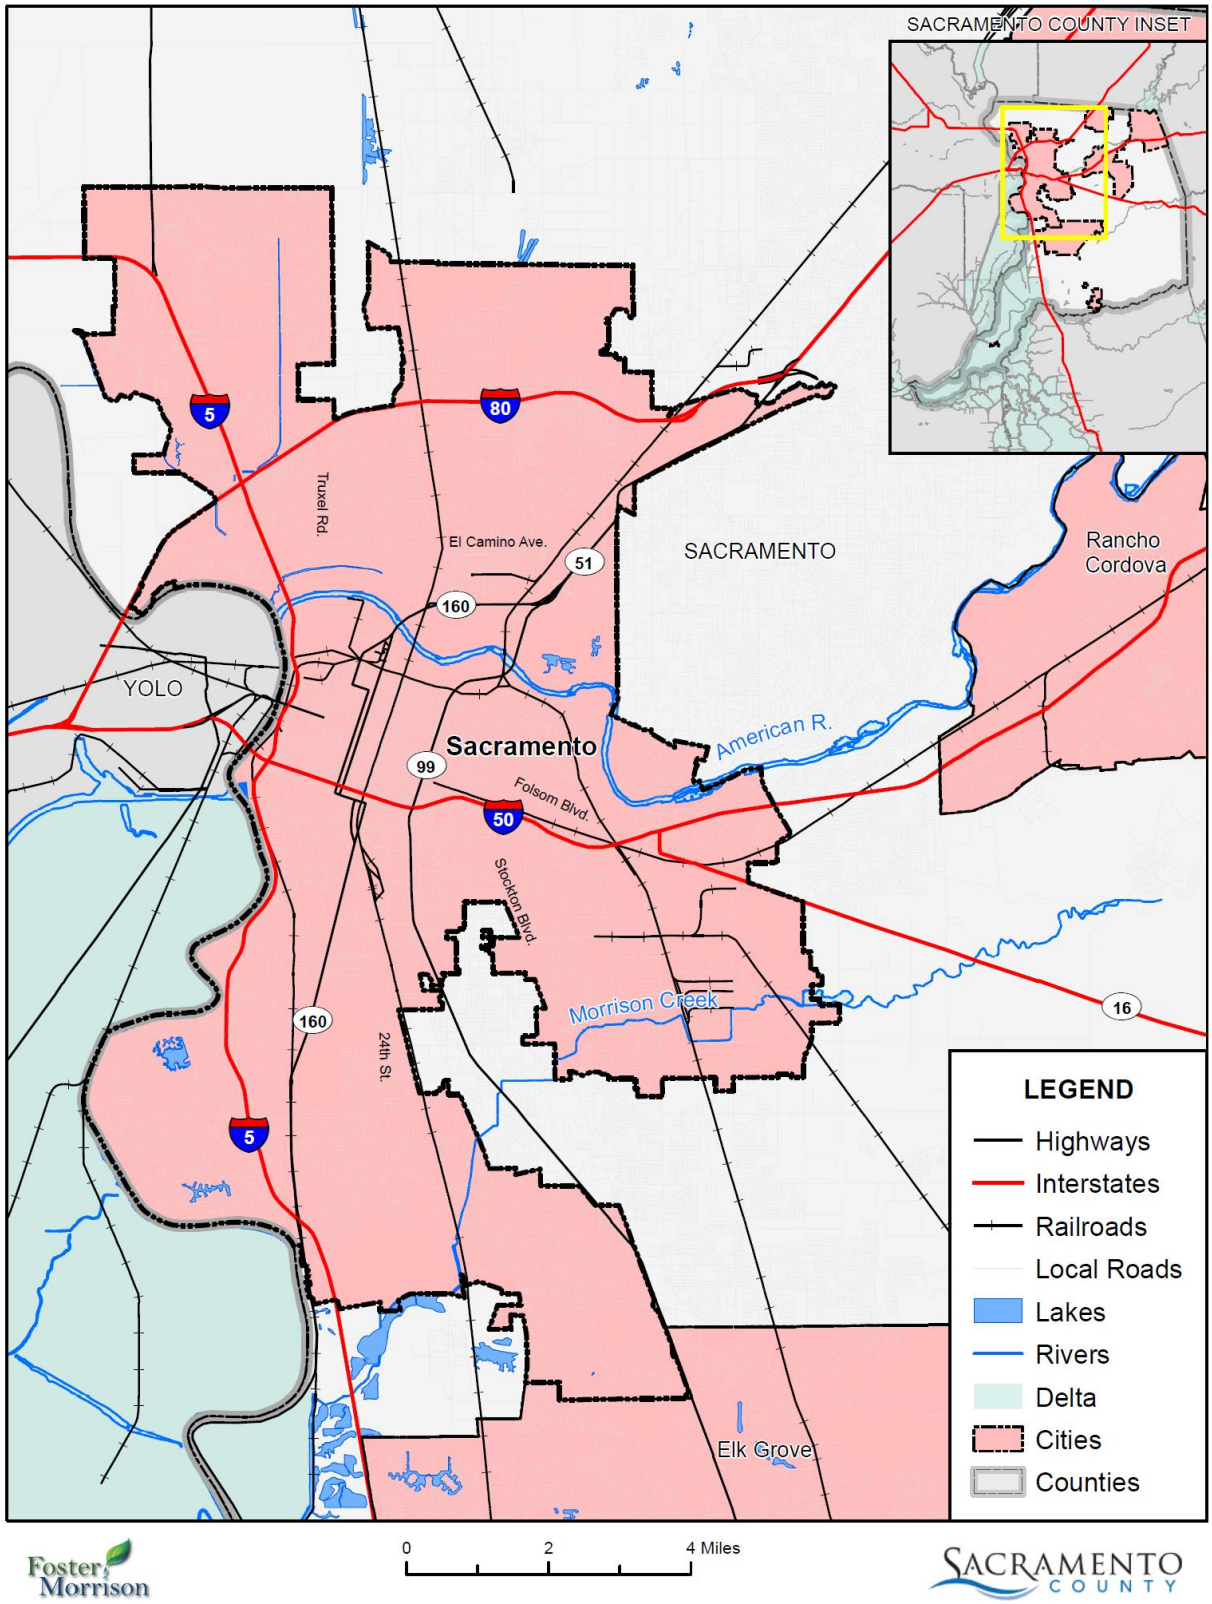
Planning Mechanism 2011 LHMP Was Incorporated/Implemented In.	Details?
2035 General Plan	Goals and Policies related to fire prevention and suppression and flood protection have been incorporated into the Land Use, Public Health and Safety, and Environmental Constraints elements of the 2035 General Plan. The Public Health and Safety Goal 4.1.1 is to maintain and implement the Sacramento County Multi-Hazard Emergency Plan to address the major hazards facing the City of Sacramento
City Emergency Operations Plan/ Department of Utilities Emergency Action Plan	Plans to set procedures for emergency response based on natural hazards defined in the 2011 LHMP. In addition, critical facilities identified in the 2011 LHMP were incorporated into these plans for emergency notification. The City of Sacramento, situated within Sacramento County, faces a variety of hazards. The city developed this plan on the basis of hazard and vulnerability findings that are identified in the Sacramento County Multi-Hazard Mitigation Plan. The analysis of these threats included both natural and technological hazards that affect the operational area.
Comprehensive Flood Management Plan	Another planning mechanism for the City that addresses flooding related hazards identified in the 2011 LHMP. This Plan discusses future development, internal drainage, Community Rating System program, National Flood Insurance Program, levee security, and flood control projects.
Repetitive Loss Area Analysis	A plan to further analyze repetitive loss properties that have flooded because of a high hazard – flooding, which was identified in the 2011 LHMP.

In addition, the development of this City of Sacramento Annex to the 2016 LHMP Update involved the review and coordination with an exhaustive list of existing studies and plans as detailed and referenced in Chapters 3 and 4 of the Base plan, throughout this Annex, and within the LHMP Appendices. Coordination with key stakeholders, including other communities and agencies and public and private stakeholders was paramount to the development of this Annex and is further discussed herein and within the Base plan and associated appendices.

F.3 Community Profile

The community profile for the City of Sacramento is detailed in the following sections. Figure F-1 displays a map and the location of the City of Sacramento within Sacramento County.

Figure F-1 City of Sacramento



Data Source: Sacramento County GIS, Cal-Atlas; Map Date: 05/2016.

F.3.1. Geography and Climate

The City of Sacramento is located in the heart of California's Central Valley at the confluence of the Sacramento and American Rivers. The Great Valley is a flat alluvial plain approximately 50 miles wide and 400 miles long in the central portion of California. Its northern part is the Sacramento Valley drained by the Sacramento River, and its southern part is the San Joaquin Valley drained by the San Joaquin River. It is surrounded by the Sierra Nevada to the east, the Tehachapi Mountains to the south, Coastal Range to the west, and Cascade Range to the north. The topography of the area is relatively flat. There is a gradual slope rising from elevations as low as sea level in the southwestern portion of the Policy Area up to approximately 75 feet above sea level in the northeastern portion.

Sacramento is the cultural and economic center of its six-county metropolitan area (El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba counties) and the largest city in the Central Valley. The regional location of Sacramento, as shown on the map above, is roughly halfway between San Francisco to the west and Lake Tahoe to the east. Sacramento covers a total area of approximately 99 square miles and is the seventh most populous city in California with a 2010 estimated population of 466,087. Sacramento has a Mediterranean climate that is characterized by mild winters and dry, hot summers. Rain typically falls between November and March, with the rainy season tapering off almost completely by the end of April. Average daily high temperatures range from the 50s in December and January to the 90s in July (with many days of over 100).

Sacramento is accessible from Interstate 80 and U.S. Highway 50 (running east/west) and Interstate 5 and U.S. Highway 99 (running north/south). Amtrak serves Sacramento's passenger rail needs, while Sacramento International Airport (SMF) provides domestic and international flights through most major airlines. Within the city and surrounding region, Sacramento Regional Transit provides bus and light rail service.

F.3.2. History

Prior to European settlement, Nisenan (Southern Maidu) and Plains Miwok Indians lived in the area. In the early 1800s, the Spanish explorer Gabriel Moraga "discovered" and named the Sacramento Valley and the Sacramento River after the Spanish term for "sacrament." Sacramento was founded during the California Gold Rush and grew quickly due to the protection of Sutter's Fort, which was established by John Sutter in 1839.

The citizens of Sacramento adopted a city charter in 1849 and became the first incorporated city in California on February 27, 1850. During the California Gold Rush and through the 1800s, Sacramento became a major distribution point, a commercial and agricultural center, a terminus for wagon trains, stagecoaches, riverboats, the telegraph, the Pony Express, and the First Transcontinental Railroad, and in 1854 the state capital of California.

The city's current charter was adopted by voters in 1920, establishing a city council-and-manager form of government, still used today. The City expanded continuously over the years in the first half of the 1900s and in 1964 merged with the city of North Sacramento, just north of the American River. Large

annexations of the Pocket area on the south and Natomas area on the north eventually led to significant population growth throughout the 1970s, 1980s, and 1990s.

Sacramento experienced a massive growth in population in the 1990s and early 2000s. Primary sources of population growth are migration from the San Francisco Bay Area due to lower housing costs, as well as immigration from Asia, Central America, Mexico, Ukraine, and the rest of the former Soviet Union. From 2010 to 2014, the city's population grew by over 4 percent.

F.3.3. Economy and Tax Base

Economy

Sacramento has established itself as an important suburb in the Sacramento region with its solid base of small businesses, retail chains, and food service establishments. With an ongoing commitment to providing high-quality, economical, responsive services to the local community, the City is well-positioned for future commercial redevelopment, neighborhood enhancements, and positive changes.

US Census estimates show economic characteristics for the City of Sacramento. These are shown in Table F-3 and Table F-10. Mean household income in the City was $67,758. Median household income in the City was $50,013.

Table F-3 City of Sacramento Civilian Employed Population 16 years and Over

Industry	Estimated Employment	Percent
Agriculture, forestry, fishing and hunting, and mining	1,257	0.6%
Construction	11,162	5.5%
Manufacturing	10,189	5.0%

Tax Base

The County has a wide and varied tax base. Tax base information is tracked and maintained by the Sacramento County Assessor's Office. The following tables show the tax base for the City. The County has a wide and varied tax base. Tax base information is tracked and maintained by the Sacramento County Assessor's Office. The following tables show the tax base for the County as well as for the incorporated jurisdictions. Table F-6 shows the secured real property value by property type for the entire County.

Table F-6 2016-2017 Sacramento County Planning Area Distribution of Value by Property Type

Property Type	Assessments	2015-16 Value ($)	2016-2017 Value ($)	Ratio of Total Value to Prior Value
Single Family Residential	380,907	85,511,262,266	90, 146,646,411	1.054
Mobile Homes	7,856	372,879,553	380,928,297	1.028

F.4 Hazard Identification

Sacramento's planning team identified the hazards that affect the City and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to Sacramento (see Table F-10).

Table F-10 City of Sacramento—Hazard Identification Assessment

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Limited	Occasional	Limited	Low
Bird Strike	Limited	Occasional	Negligible	Low
Climate Change	Likely	Extensive	Critical	High
Dam Failure	Extensive	Unlikely	Catastrophic	High
Drought and Water Shortage	Extensive	Occasional	Critical	High
Earthquake	Limited	Occasional	Critical	Medium
Earthquake: Liquefaction	Limited	Occasional	Critical	Low
Flood: 100/200/500-year	Critical	Occasional	Critical	High
Flood: Localized Stormwater Flooding	Significant	Highly Likely	Critical	High
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Significant	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Limited	Likely	Limited	High
Severe Weather: Extreme Temperatures – Cold/Freeze	Limited	Occasional	Limited	Medium
Severe Weather: Extreme Temperatures – Heat	Significant	Likely	Critical	Medium
Severe Weather: Fog	Limited	Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Significant	Likely	Critical	Medium
Severe Weather: Wind and Tornadoes	Limited	Occasional	Limited	Medium
Subsidence	Limited	Likely	Limited	Low
Volcano	Limited	Unlikely	Catastrophic	Low
Wildfire:(Burn Area/Smoke)	Significant	Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

F.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile Sacramento's hazards and assess the City's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 Hazard Profiles and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describe the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the City of Sacramento is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the City of Sacramento. This vulnerability assessment also includes the three primary hazards to the State of California: earthquake, flood, and wildfire. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

F.5.1. Hazard Profile

Each hazard vulnerability assessment in Section F.5.3, includes a description as to how the hazard affects the City and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

F.5.2. Vulnerability Assessment and Assets at Risk

This section identifies Sacramento's assets at risk, including values at risk, critical facilities and infrastructure, historic assets, economic assets, and growth and development trends.

Assets at Risk

The following data from the Sacramento County Assessor's Office is based on the 2015 Assessor's data. The methodology used to derive property values is the same as in Section 4.3.1 of the Base Plan. This data should only be used as a guideline to overall values in the County, as the information has some limitations. The most significant limitation is created by Proposition 13. Instead of adjusting property values annually, the values are not adjusted or assessed at fair market value until a property transfer occurs. As a result, overall value information is most likely low and does not reflect current market value of properties within the County. It is also important to note, in the event of a disaster, it is generally the value of the infrastructure or improvements to the land that is of concern or at risk. Generally, the land itself is not a loss. Table F-11 shows the 2015 Assessor's values (e.g., the values at risk) broken down by property type for the City of Sacramento.

Table F-11 City of Sacramento – Total Assets at Risk by Property Use

Property Use	Parcels	Improved Parcel Count	Total Land Value	Improved Structure Value	Total Value
Agricultural	8	2	$3,139,047	$363,864	$3,502,911
Care / Health	193	155	$94,395,950	$1,011,672,113	$1,106,068,063
Church / Welfare	515	438	$88,746,595	$450,826,711	$539,573,306
Industrial	1,991	1,753	$561,373,838	$1,455,939,263	$2,017,313,101
Miscellaneous	1,239	8	$2,499,937	$264,443	$2,764,380
Office	1,425	1,261	$930,980,040	$3,549,091,415	$4,480,071,455
Public / Utilities	3,348	4	$4,899,884	$1,024,489	$5,924,373
Recreational	117	77	$45,664,143	$99,483,869	$145,148,012
Residential	126,465	124,940	$8,183,541,010	$20,698,119,834	$28,881,660,844
Retail / Commercial	2,672	2,271	$1,051,694,923	$1,847,391,072	$2,899,085,995
Vacant	7,121	171	$628,437,347	$12,994,627	$641,431,974
No Data	8	5	$542,436	$1,460,705	$2,003,141
Total	**145,102**	**131,085**	**$11,595,915,150**	**$29,128,632,405**	**$40,724,547,555**

Source: Sacramento County 2016 Parcel/2015 Assessor's Data

Critical Facilities and Infrastructure

For purposes of this plan, a critical facility is defined as:

> *Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.*

This definition was refined by separating out three classes of critical facilities, that include Essential Services Facilities, At Risk Population Facilities, and Hazardous Materials Facilities, as further described in Section 4.3.1 of the Base Plan.

An inventory of critical facilities in the City of Sacramento from the City of Sacramento GIS is shown on Figure F-2 and detailed in Table F-12. Details of critical facility definition, type, name, address, and jurisdiction by hazard zone are listed in Appendix E.

Figure F-2 City of Sacramento – Critical Facilities

Natural Resources

Habitats

The City of Sacramento has a variety of natural resources of value to the community:

- Annual Grassland
- Ruderal Habitats
- Riparian Woodland
- Oak Woodlands
- Wetlands
- Rivers, Creeks, and Canals
- Freshwater Marsh
- Vernal Pools and Seasonal Wetlands
- Ornamental Landscaping

Wetlands

The wetland and related habitat areas are some of the most important resources of the City. Wetlands are habitats in which soils are intermittently or permanently saturated or inundated. Wetland habitats vary from rivers to seasonal ponding of alkaline flats and include swamps, bogs, marshes, vernal pools, and riparian woodlands. Wetlands are considered to be waters of the United States and are subject to the jurisdiction of the U.S. Army Corps of Engineers as well as the California Department of Fish and Wildlife (CDFW). Where the waters provide habitat for federally endangered species, the U.S. Fish and Wildlife Service may also have authority.

Wetlands are a valuable natural resource for communities providing beneficial impact to water quality, wildlife protection, recreation, and education, and play an important role in hazard mitigation. Wetlands provide drought relief in water-scarce areas where the relationship between water storage and streamflow regulation is vital, and reduce flood peaks and slowly release floodwaters to downstream areas. When surface runoff is dampened, the erosive powers of the water are greatly diminished. Furthermore, the

reduction in the velocity of inflowing water as it passes through a wetland helps remove sediment being transported by the water.

Wetlands are often found in floodplains and depressional areas of a watershed. Many wetlands receive and store floodwaters, thus slowing and reducing downstream flow. Wetlands perform a variety of ecosystem functions including food web support, habitat for insects and other invertebrates, fish and wildlife habitat, filtering of waterborne and dry-deposited anthropogenic pollutants, carbon storage, water flow regulation (e.g., flood abatement), groundwater recharge, and other human and economic benefits.

Wetlands, and other riparian and sensitive areas, provide habitat for insects and other invertebrates that are critical food sources to a variety of wildlife species, particularly birds. There are species that depend on these areas during all parts of their lifecycle for food, overwintering, and reproductive habitat. Other species use wetlands and riparian areas for one or two specific functions or parts of the lifecycle, most commonly for food resources. In addition, these areas produce substantial plant growth that serves as a food source to herbivores (wild and domesticated) and a secondary food source to carnivores.

Wetlands slow the flow of water through the vegetation and soil, and pollutants are often held in the soil. In addition, because the water is slowed, sediments tend to fall out, thus improving water quality and reducing turbidity downstream.

These natural floodplain functions associated with the natural or relatively undisturbed floodplain that moderates flooding, such as wetland areas, are critical for maintaining water quality, recharging groundwater, reducing erosion, redistributing sand and sediment, and providing fish and wildlife habitat. Preserving and protecting these areas and associated functions are a vital component of sound floodplain management practices for the City of Sacramento.

Wetlands function as natural sponges that trap and slowly release surface water, rain, snowmelt, groundwater and flood waters. Trees, root mats, and other wetland vegetation also slow the speed of floodwaters and distribute them more slowly over the floodplain. This combined water storage and braking action lowers flood heights and reduces erosion. Wetlands within and downstream of urban areas are particularly valuable, counteracting the greatly increased rate and volume of surface- water runoff from pavement and buildings. The holding capacity of wetlands helps control floods and prevents water logging of crops. Preserving and restoring wetlands, together with other water retention, can often provide the level of flood control otherwise provided by expensive dredge operations and levees. Figure F-3 provides a map of the City's wetland areas.

Special Status Species

The following special-status species are known to occur within the natural habitats most likely to be present within the Policy Area boundaries. These and other species potentially occurring in the Policy Area can be found in Table F-13. Figure F-4 shows the locations of sensitive elements within the Policy Area.

Table F-13 Special-Status Species Potentially Occurring in the City of Sacramento

Scientific Name	Common Name	Status	Habitat
Plants			
Astragalus tener var. tener	Alkali milk-vetch	1B.2	Vernal pools, playas and Valley grasslands on adobe clay and/or alkaline soils.
Atriplex depressa	Brittlescale	1B.2	Chenopod scrub, meadows, playas, valley grassland, vernal pools. Usually in alkali scalds or alkali clay in meadows or annual grassland.
Atriplex joaquiniana	San Joaquin saltbush	1B.2	Chenopod scrub, alkali meadow, valley and foothill grassland.
Balsamorhiza macrolepis var. macrolepis	Big-scale balsamroot	1B.2	Grassland
Chloropyron molle ssp. hispidum	Hispid bird's beak	1B.1	Grassland/ vernal pool.
Chloropyron palmatum	Palmate-bracted bird's-beak	FE, CE, 1B.1	Chenopod scrub, valley and foothill grassland. usually on alkaline clay, with Distichlis, Frankenia, etc.
Downingia pusilla	Dwarf downingia	2.2	Vernal pool
Gratiola heterosepala	Boggs Lake hedge-hyssop	CE, 1B.2	Vernal pool
Hibiscus lasiocarpus	Woolly rose-mallow	2.2	Freshwater marshes and swamps in the Central Valley.
Juglans hindsii	Northern California black walnut	1B.1	Riparian forest, and woodland. Few extant native stands remain; but is widely naturalized from rootstock plants
Juncus leiospermus var. ahartii	Ahart's dwarf rush	1B.2	Vernal pool
Legenere limosa	Legenere	1B.1	Vernal pool
Lepidium latipes var. heckardii	Heckard's pepper-grass	1B.2	Valley and foothill grassland and vernal pools on alkaline soils
Navarretia myersii ssp. myersii	Pincushion navarretia	1B.1	Vernal pool
Orcuttia tenuis	Slender orcutt grass	FT/CE/1B.1	Vernal pool
Orcuttia viscida	Sacramento orcutt grass	FE, 1B.1	Vernal pool and occasionally seasonal wetlands
Sagittaria sanfordii	Sanford's arrowhead	1B.2	Marshes and swamps (assorted shallow fresh water).
Invertebrates			
Branchinecta lynchi	Vernal pool fairy shrimp	FT	Vernal pools and seasonal wetlands in grassland habitats

Scientific Name	Common Name	Status	Habitat
Desmocerus californicus dimorphus	Valley elderberry longhorn beetle	FT (under review for de-listing)	Elderberry shrubs, typically in or near riparian areas.
Lepidurus packardi	Vernal pool tadpole shrimp	FE	Vernal pools and seasonal wetlands in grassland habitats
Fish			
Archoplites interruptus	Sacramento Perch	CSC	Historically found in the sloughs, slow-moving rivers, and lakes of the central valley. Prefer warm water. Aquatic vegetation is essential for young. Tolerant of a wide range of physiochemical water conditions.
Acipenser medirostris	Green Sturgeon	FT, CSC	Long-lived anadromous species that migrates through the Sacramento River to spawning grounds in the Feather and upper Sacramento rivers. Occurs in low numbers in the San Francisco Estuary and Sacramento River. Thought to spawn in deep holes with fast moving water over cobble substrates. Larvae develop within freshwater systems, migrate downstream and remain in the estuaries for between one and four years before migrating to the ocean. Mature adults move into estuaries in the spring, and spawning adults continue into natal rivers in late spring/early summer. Post spawning adults return to the estuary before migrating back to the ocean in late fall. Sub-adult fish are also thought to enter estuaries during the summer and fall months. The Sacramento River adjacent to the Policy Area does not support spawning habitat for adult fish or rearing habitat for juveniles.
Hypomesus transpacificus	Delta smelt	FT, CE	Occurs in Sacramento-San Joaquin Delta most of the year. Spawns in tidally influenced freshwater wetlands and seasonally submerged uplands along the Sacramento River, downstream from its confluence with the American River
Oncorhynchus mykiss	Central Valley steelhead	FT	Occurs in the Pacific Ocean for most of its life. Travels to clean gravel beds in the upper Sacramento and portions of the American River for spawning
Oncorhynchus tshawytscha	Central Valley spring run Chinook salmon	FT, CT	Occurs in the Pacific Ocean for most of its life. Travels to clean gravel beds in the upper Sacramento and portions of the American River for spawning

Scientific Name	Common Name	Status	Habitat
Oncorhynchus tshawytscha	Central Valley Winter run Chinook salmon	FE, CE	Occurs in the Pacific Ocean for most of its life. Travels to clean gravel beds in the upper Sacramento and portions of the American River for spawning.
Pogonichthys macrolepidotus	Sacramento splittail	SC/CSC	Endemic to the lakes and rivers of the central valley, but now confined to the Delta, Suisun Bay & associated marshes. Prefers slow moving river sections, dead end sloughs. Requires flooded vegetation for spawning & foraging for young.
Amphibians			
Spea hammondii	Western spadefoot	CSC	Breeds in seasonal wetlands and large vernal pools, spends most of the year underground in adjacent upland areas.
Reptiles			
Actinemys marmorata	Western pond turtle	CSC	Ponds, streams, rivers, marshes and canals with suitable basking sites and vegetative cover. Nests and aestivates in adjacent uplands.
Phrynosoma coronatum frontale	California horned lizard	CSC	Annual grassland, chaparral, saltbush scrub, alkali flats, oak woodland, riparian woodland, and coniferous forest; open habitats with loose fine (often sandy) soils.
Thamnophis gigas	Giant garter snake	FT, CT	Cattail and tule marshes, low gradient streams, rice fields and canals on the Valley floor
Birds			
Agelaius tricolor	Tricolor blackbird	CSC (nesting)	Nest in dense stands of cattails, thickets of willows, blackberries, or tall herbs adjacent to open grasslands
Athene cunicularia	Burrowing owl	CSC (burrow sites)	Grassland, deserts and other open habitats. Requires ground squirrel or other small mammal burrows for nesting
Buteo swainsoni	Swainson's hawk	CT	Nests in riparian trees; forages in open fields
Circus cyaneus	Northern harrier	CSC (nesting)	Nests in freshwater marsh and agricultural fields; forages in marshes, grasslands and agricultural fields
Elanus leucurus	White-tailed kite	CFP (Nesting)	Nests colonially in large trees adjacent to open grasslands for foraging.
Lanius ludovicianus	Loggerhead shrike	CSC (nesting)	Nests in woodlands adjacent to grassland foraging habitat
Melospiza melodia	Song sparrow "Modesto" population	CSC (year round)	Associated with emergent freshwater marshes, irrigation canals, riparian scrub, riparian woodland.

Scientific Name	Common Name	Status	Habitat
Progne subis	Purple martin	CSC (nesting)	Nest in cavities in trees, under bridges and other human-made structures
Riparia riparia	Bank swallow	CT	Nests in sandy banks or cliffs, usually over water (typically rivers and streams).
Mammals			
Antrozous pallida	Pallid bat	CSC	Roosts in crevices in caves, mines, large rock outcrops, under bridges and in abandoned buildings. Forages on or near the ground in a wide variety of open habitats
Corynorhinus townsendii townsendii	Pacific western big eared bat	CSC	Roosts in the open in large caves, abandoned mines and buildings. Very sensitive to roost disturbance
Lasiurus blossevillii	Western red bat	CSC	Roosts primarily in tree foliage, especially in cottonwood, sycamore, and other riparian trees or orchards. Although potential habitat for these species is present within the Policy Area, none have been recorded. Distribution of special-status bat species is difficult to study and therefore poorly known. Bat colonies that may harbor some or all of these specialstatus species are present in several of the older buildings in downtown Sacramento and in humanmade structures along the American and Sacramento rivers.
Taxidea taxus	American Badger	CSC	Principal habitat requirements include: sufficient prey base; friable soils; and relatively open, uncultivated ground such as grasslands. Prey primarily on burrowing rodents such as gophers, ground squirrels, marmots, and kangaroo rats. Badgers survive only in low numbers in peripheral parts of the Central Valley. The CNDDB includes one recorded occurrence in the Policy Area near Power Inn and Fruitridge roads.

Scientific Name	Common Name	Status	Habitat

Notes: Status =
Federal:
FE = Endangered, legally protected by the Federal Endangered Species Act (ESA)
FT = Threatened, legally protected by the Federal Endangered Species Act (ESA)
State:
CE = Endangered, legally protected by the California Endangered Species Act (CESA)
CFP = Fully Protected species (legally protected under Fish and Game Code)
CSC = California Species of Concern by DFG (no formal protection other than CEQA consideration)
CT = Threatened, legally protected by the California Endangered Species Act (CESA)
SA = Animal included on the CDFW's Special Animal List.
California Rare Plant Ranks (no formal protection other than CEQA consideration):
1B - Plant species that is rare or endangered in California or elsewhere.
2 - Plant species that is rare or endangered in California, but is more common elsewhere.
Threat code extensions:
.1 - Seriously endangered in California
.2 – Fairly endangered in California
.3 – Not very endangered in California

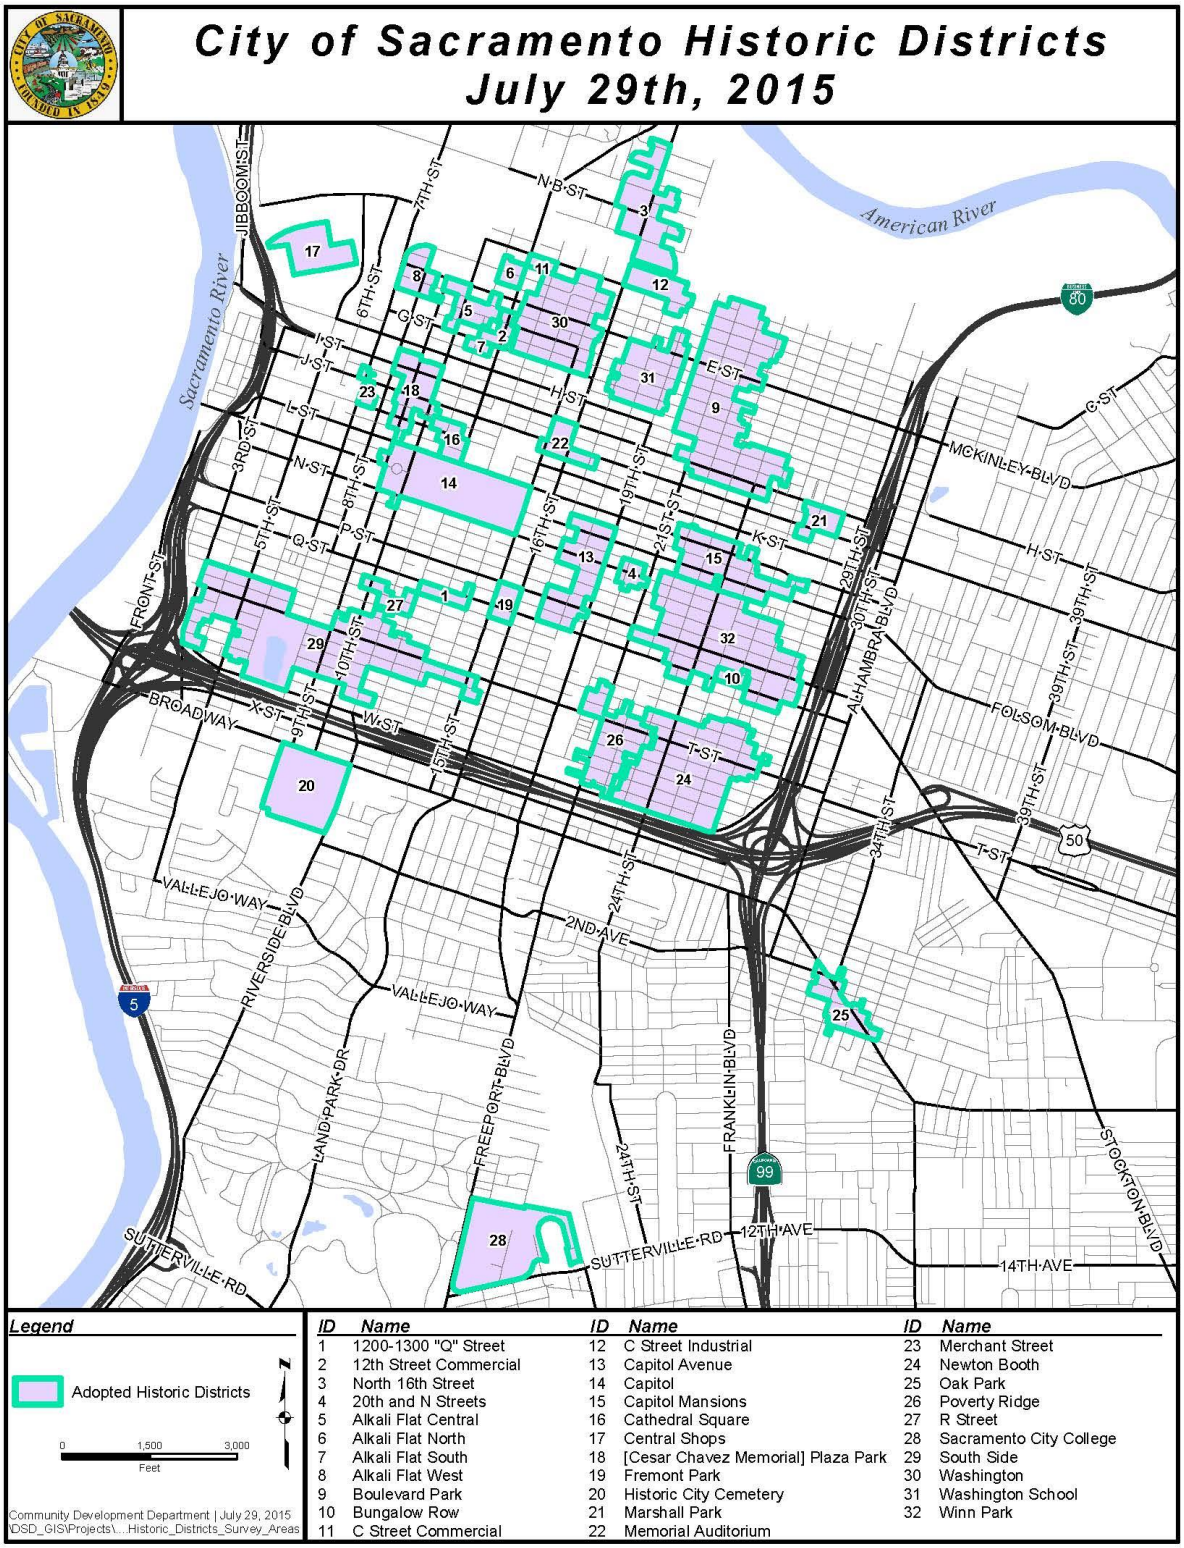
Over the years the City of Sacramento has undertaken several historic building surveys in an effort to establish specific Historic Districts. As of the date of this document's publication, the City of Sacramento has designated 32 Historic Districts and 14 Design Review Districts. The City Code provides for the compilation of Landmarks, Contributing Resources, and Historic Districts into the Sacramento Register of Historic and Cultural Resources (Sacramento Register). The Sacramento Register includes all listed or surveyed historic resources in the city of Sacramento. The Sacramento Register also includes listings or maps of the properties within the city's Design Review Districts that have been afforded preservation protection by ordinance, but are not designated as a Historic District. The historic districts are shown in Figure F-5.

Figure F-5 Historic Districts in the City of Sacramento



ID	Name	ID	Name	ID	Name
1	1200-1300 "Q" Street	12	C Street Industrial	23	Merchant Street
2	12th Street Commercial	13	Capitol Avenue	24	Newton Booth
3	North 16th Street	14	Capitol	25	Oak Park
4	20th and N Streets	15	Capitol Mansions	26	Poverty Ridge
5	Alkali Flat Central	16	Cathedral Square	27	R Street
6	Alkali Flat North	17	Central Shops	28	Sacramento City College
7	Alkali Flat South	18	[Cesar Chavez Memorial] Plaza Park	29	South Side
8	Alkali Flat West	19	Fremont Park	30	Washington

The National Park Service administers two programs that recognize the importance of historic resources, specifically those pertaining to architecture and engineering. While inclusion in these programs does not give these structures any sort of protection, they are valuable historic assets.

The Historic American Buildings Survey (HABS) and Historic American Engineering Record (HAER) document America's architectural and engineering heritage. The HABS and HAER structures in the City of Sacramento are listed below:

Albert Gallatin Mansion (Governor's Mansion)
Source: Sacramento Register of Historic & Cultural Resources

- Adams & Company Building, 1014 Second Street, Sacramento, CA
- Albert Gallatin House, 1527 H Street, Sacramento, CA
- Apollo Building, 228-230 K Street, Sacramento, CA
- Aschenauer Building, 1022 Third Street, Sacramento, CA
- B. F. Hastings Bank Building, 128-132 J Street, Sacramento, CA
- Bank Exchange Building, 1030 Second Street, Sacramento, CA
- Bee Building, 1016-1020 Third Street, Sacramento, CA
- Big Four Building, 220-226 K Street, Sacramento, CA
- Blake-Waters Assay Office, 222 J Street, Sacramento, CA
- Booth Building, 1019-1021 Front Street, Sacramento, CA
- Brannon Building, 106-110 J & Front Streets, Sacramento, CA
- California State Library & Courts Building, 914 Capitol Mall, Sacramento, CA
- California State Office Building No. 1, 915 Capitol Mall, Sacramento, CA
- California State Printing Office, 1020 O Street, Sacramento, CA
- Cavert Building, 1207 Front Street, Sacramento, CA
- Central Pacific Transcontinental Railroad, Sacramento to Nevada state line, Sacramento, CA
- Cienfugo Building, 1119 Second Street, Sacramento, CA
- City Market, 118 J Street, Sacramento, CA
- Collicott Drug Store, 129 J Street, Sacramento, CA
- Coolot Building, 812 J Street, Sacramento, CA

It should be noted that these lists may not be complete, as they may not include those currently in the nomination process and not yet listed. Additionally, as defined by the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA), any property over 50 years of age is considered a historic resource and is potentially eligible for the National Register. Thus, in the event that the property is to be altered, or has been altered, as the result of a major federal action, the property must be evaluated under the guidelines set forth by CEQA and NEPA. Structural mitigation projects are considered alterations for the purpose of this regulation.

Growth and Development Trends

Past growth within the City of Sacramento has been strong and steady. Current California Department of Finance estimates for July 1, 2015 were 480,105. Table F-15 shows past growth trends since 1970.

Table F-15 Past Growth in the City of Sacramento

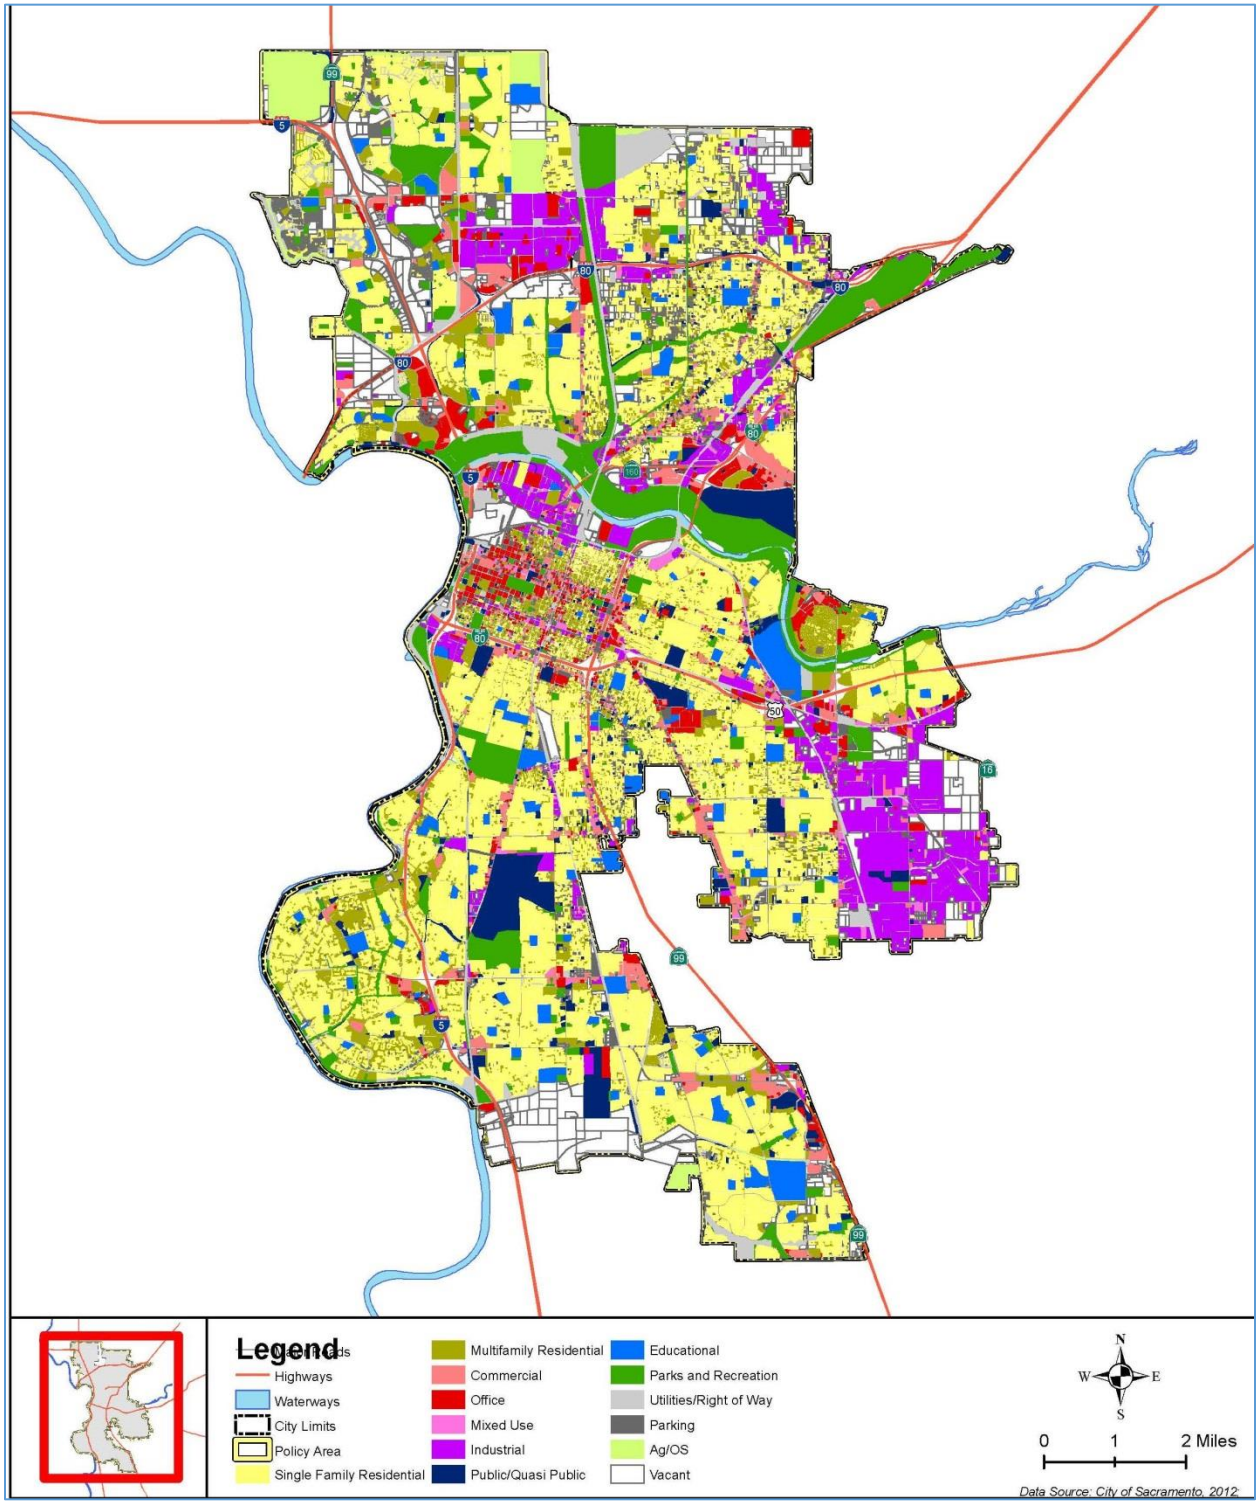
Year	Population	Change	Percent Change
1970	257,105	–	–
1980	282,400	25,295	9.8%
1990	366,500	84,100	29.8%
2000	407,018	40,518	11.1%
2010	466,488	59,470	14.6%

Source: State of California Department of Finance, US Census Bureau 2010

Land Use

Current land use in the City of Sacramento is shown in Figure F-6.

Figure F-6 Existing Land Use in Sacramento County



Source: City of Sacramento General Plan Update Technical Background Report

Table F-16 presents the proposed land uses for the 2035 General Plan Policy Area. The land use designations included in the table provides a summary and combines all the applicable land use

designations designated on the land use diagram included within the Policy Area boundaries. Figure F-7 shows the land uses in the Policy Area.

Table F-16 Land Uses for the 2035 General Plan

Land Use	Acres	Percent of City's Total[4]
Neighborhoods[1]	34,880	54%
Centers[2]	4,658	7%
Corridors[3]	3,111	5%
Employment Center/Industrial	9,163	14%
Public/Quasi Public	4,716	7%
Open Space, Parks, Recreation	8,554	13%
Total	**2**	**100%**

Source: City of Sacramento, GIS Database, 2012.

Notes:

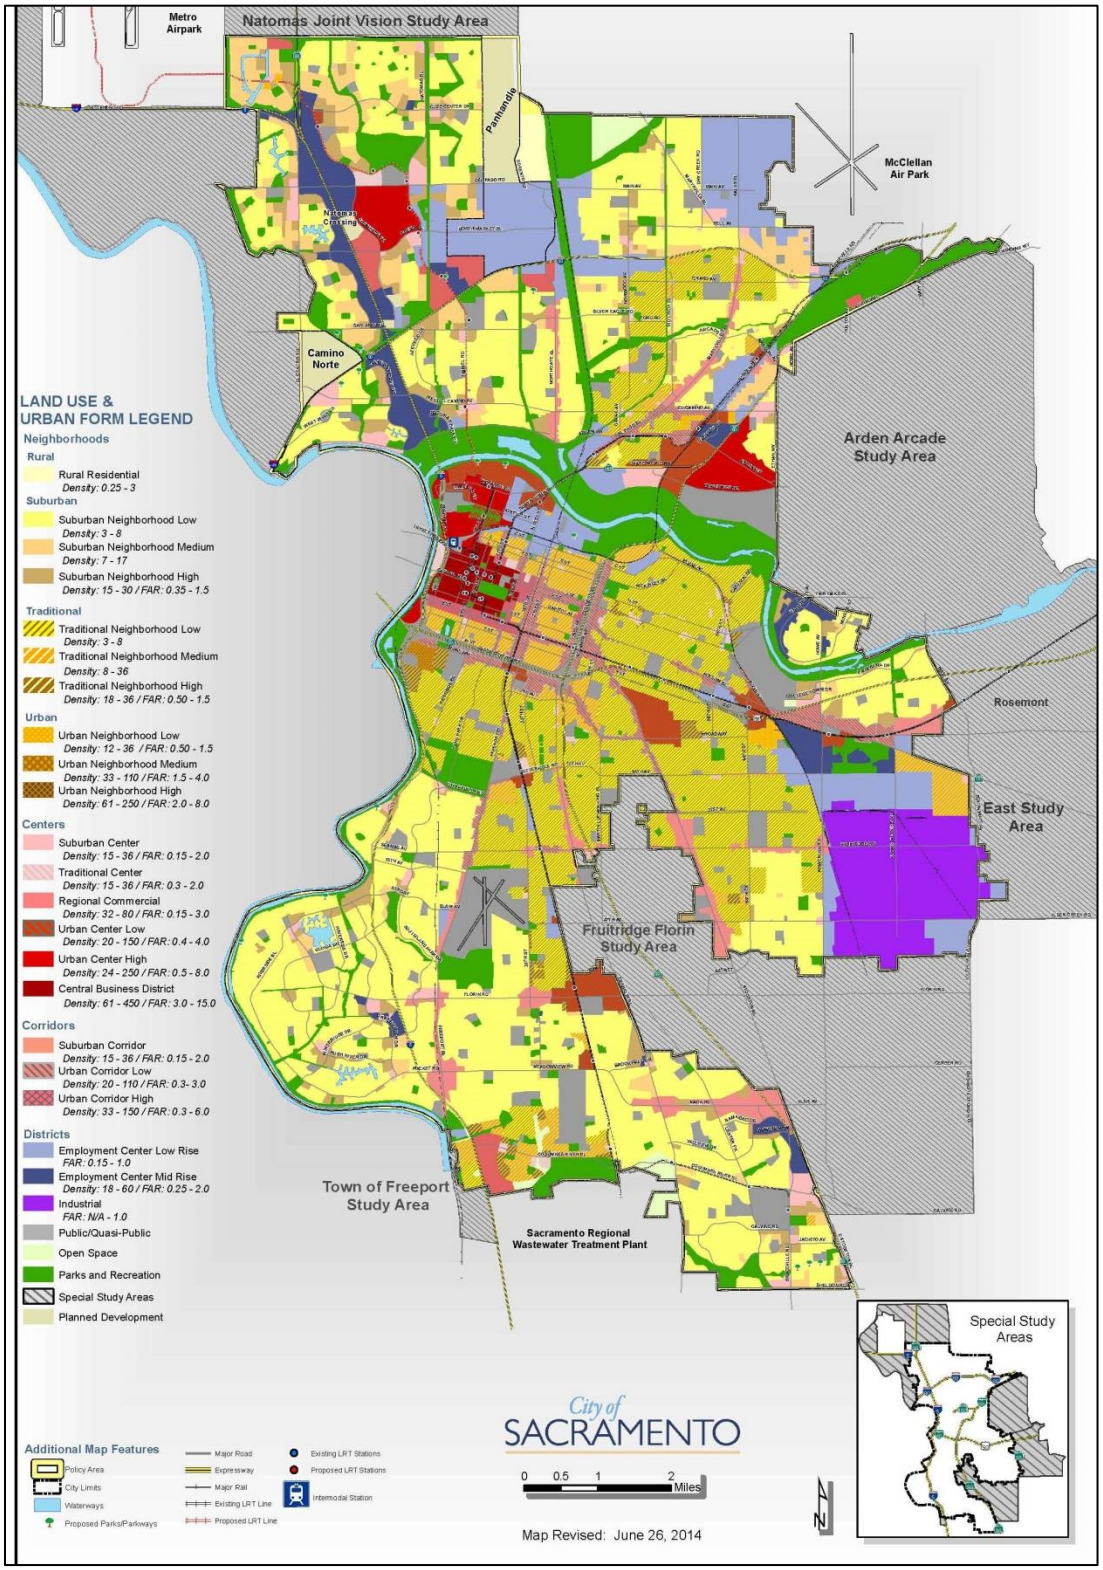
[1] Includes all residential designations including Planned Development/Special District, Rural Residential, Suburban Low Density, Suburban Medium Density, Suburban High Density, Traditional Low Density, Traditional Medium Density, Traditional High Density, Urban Low Density, Urban Medium Density, and Urban High Density.

[2] Includes Suburban Center, Traditional Center, Urban Center Low and High and CBD.

[3] Includes Suburban Corridor and Urban Corridor High and Low.

[4] Due to rounding the City's total % may be slightly higher than 100%.

Figure F-7 2035 General Plan Land Use and Urban Form



Source: City of Sacramento General Plan Environmental Impact Report

The Shovel-Ready Sites Program was established in FY2004/2005 with the intent of encouraging economic development at key areas in the City. These sites are based on the 2035 General Plan opportunity areas. They are broken down into Tier 1 and Tier 2 based on economic development potential. Tier 1 sites are more likely to generate a return on investment (e.g., property taxes, sales taxes, new jobs) sooner than Tier 2 sites.

Each tier is also broken down by the following types: Centers, Corridors, Neighborhoods, New Growth Areas, and Transit Centers. Table F-17 shows counts of all parcels centroids (geographic center of parcel polygon) that intersect these opportunity areas, sorted by opportunity area tier and type. There are a total of 17,229 parcels in the Opportunity Area. The two categories with the highest parcel counts within this area are Tier 2 Corridors and Neighborhoods.

Table F-17 Number of Parcels in Opportunity Areas - City of Sacramento

Tier	Type	Parcel Count
1	Centers	2,400
1	New Growth Areas	58
1	Transit Center	726
2	Centers	1,639
2	Corridors	4,907
2	Neighborhoods	6,252
2	New Growth Areas	311
2	Transit Center	1,325
Total		**17,618**

Source: City of Sacramento GIS

Development since 2011 Plan

As shown in Table F-18, Sacramento has seen a growth of 2.9% of population between 2010 and January 1, 2015.

Table F-18 City of Sacramento Population Changes Since 2011

Year	Population	Change	% Change
2010[1]	466,488	–	–
2015[2]	480,105	13,617	2.9%

Source: [1]US Census Bureau, [2]California Department of Finance

The Sacramento Community Development Department tracked total building permits issued since 2011 for the City. These are tracked by total development, property use type, and hazard risk area. These are shown in Table F-19 and Table F-20. All development in the identified hazard areas, including the 1% annual chance floodplains, areas protected by levees, and high wildfire risk areas, were completed in accordance with all current and applicable development codes and standards and should be adequately protected. Thus, with the exception of more people living in the area potentially exposed to natural

hazards, this growth should not cause a significant change in vulnerability of the City to identified priority hazards.

Table F-19 City of Sacramento Total Development Since 2011

Property Use	2011	2012	2013	2014	2015
Residential	166*	205*	431*	477*	267*
Commercial	73,931 sq.ft.	77,948 sq.ft.	133,761 sq.ft.	295,164 sq.ft.	302,434 sq.ft.
Industrial	21,553 sq.ft.	22,298 sq.ft.	25,185 sq.ft.	3,748 sq.ft.	174,456 sq.ft
Office	0 sq.ft.	52,012 sq.ft.	28,075 sq.ft.	11,489 sq.ft.	50,512 sq.ft.
Total	**95,484 sq.ft.**	**152,258 sq.ft.**	**187,021 sq.ft.**	**310,401 sq.ft.**	**527,402 sq.ft.**

Future Development

The Sacramento Council of Governments (SACOG) modeled population projections for the City of Sacramento and other areas of the region in 2012 for a Metropolitan Transportation Plan/Sustainable Communities Strategy report. This forecast uses a 2008 base year estimate with projections to 2020 and 2035 for population, housing units, households and employment. SACOG estimated the City population in 2020 and 2035 to be 517,401 and 630,131 respectively.

The 2016 City of Sacramento Comprehensive Flood Management plan noted that:

> *It is anticipated that by the year 2035, Sacramento will have added 168,000 individuals; 86,000 jobs; and 68,000 residential units. The City has historically relied on Greenfield development to meet the housing, retail, and service needs generated by growth. The City's 2035 General Plan, adopted in March 2015, takes a different approach and focuses growth inward, encouraging infill development.*

GIS Analysis

Table F-21 shows counts of all parcels centroids (geographic center of parcel polygon) of the Shovel Ready Sites that intersect these opportunity areas, sorted by opportunity area tier and type. There are a total of 17,267 parcels in the Opportunity Area.

Table F-21 City of Sacramento – Number of Parcels in Opportunity Areas

Type	Parcel Count	Acres
Tier 1		
Centers	2,356	2,403
Corridors	0	0
Neighborhoods	0	0

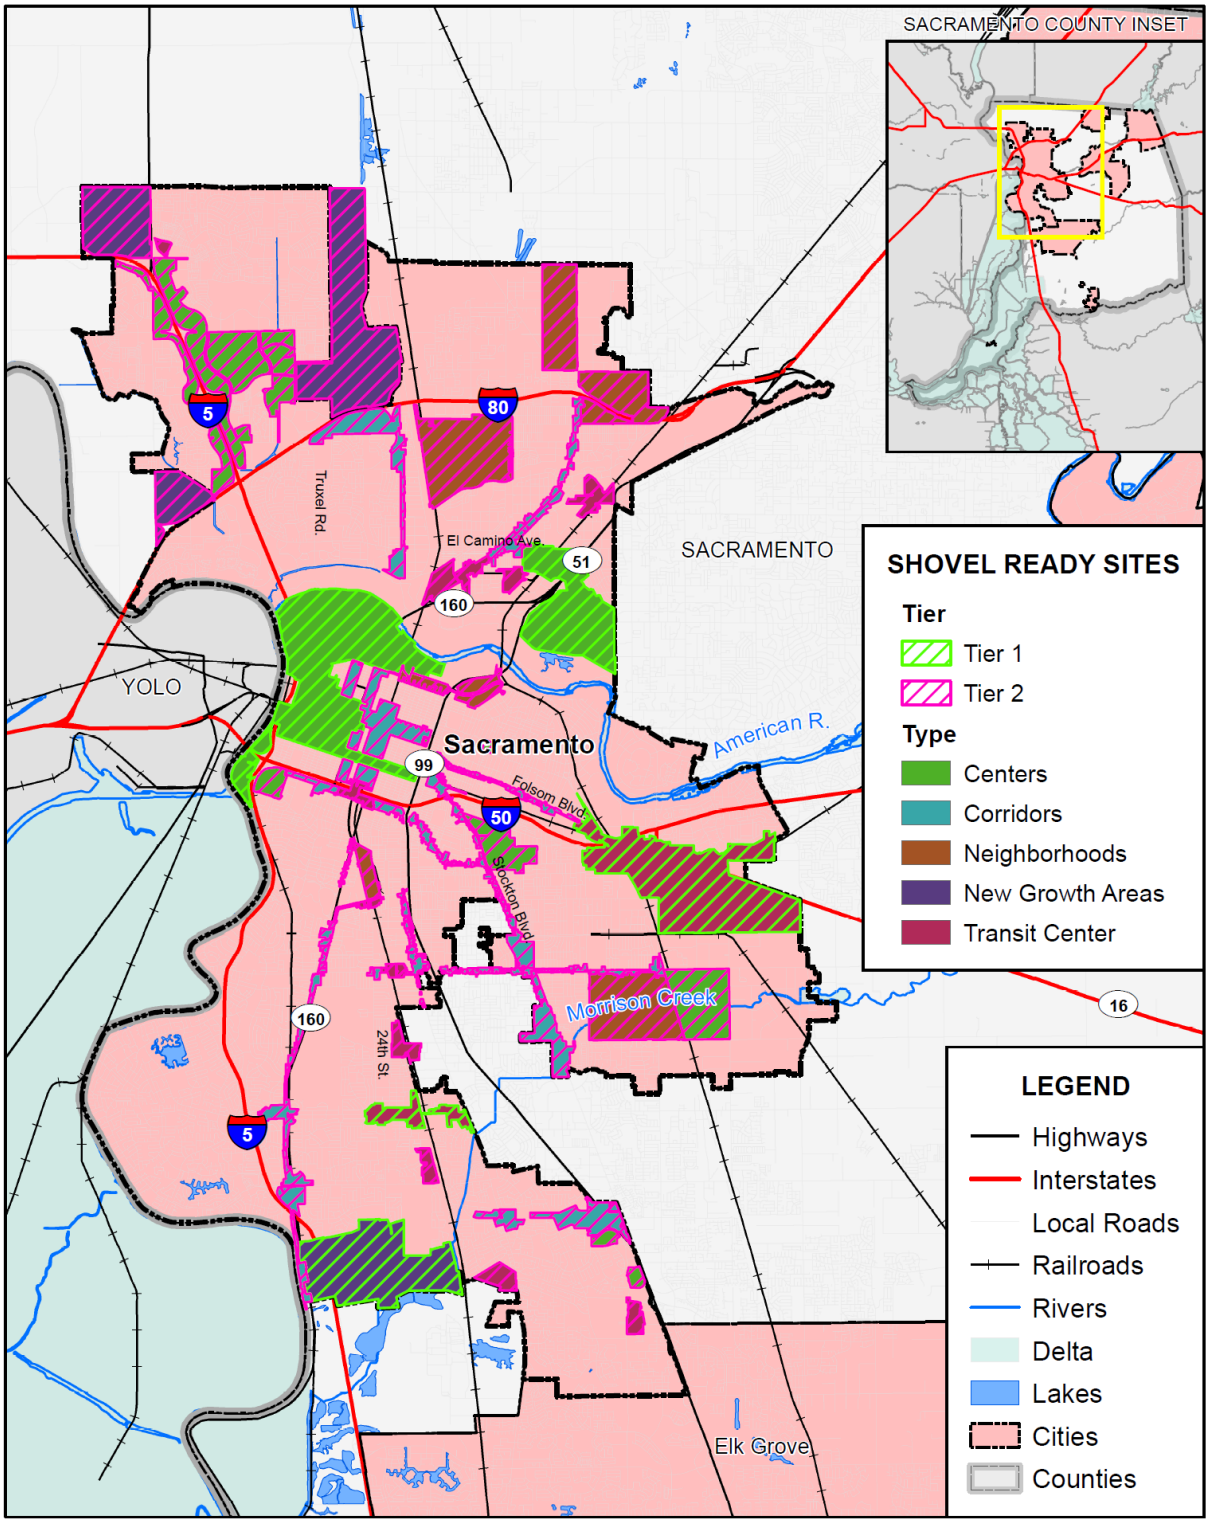
Figure F-8 identifies those areas where future development is anticipated to occur over the next 25 years in different parts of the City.

Figure F-8 City of Sacramento Future Development Areas



Data Source: Sacramento County GIS, Cal-Atlas; Map Date: 05/2016.

More general information on growth and development in Sacramento County as a whole can be found in "Growth and Development Trends" in Section 4.3.1 Sacramento County Vulnerability and Assets at Risk of the main plan.

F.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table F-10 as high or medium significance hazards and primary hazards to the State of California. Impacts of past events and vulnerability of the City to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the same as those described in Section 4.3 of the Base Plan. In general, the most vulnerable structures are those located within the flood risk areas, wildfire risk areas, unreinforced masonry buildings, and buildings built prior to the introduction of modern building codes.

An estimate of the vulnerability of the City to each identified priority hazard, in addition to the estimate of risk of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Climate Change

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Climate change will require the City of Sacramento to prepare for warmer and more extreme temperatures, decreased water supply, drought, flooding, increasing energy and water demand, and public health risks. In California average temperatures are projected to rise as much as 9 degrees Fahrenheit by 2100. This is especially pertinent for Sacramento where extreme heat events are likely to increase and urban heat islands may intensify already high temperatures. Characterized by asphalt roads, concrete roofs, and energy use, urban developments modify the natural landscape using materials that create and/or retain heat.

Past Occurrences

- 1973-74: La Nina
- 1975-76: La Nina
- 1982-83: El Nino
- 1988-89: La Nina
- 1997-98: El Nino
- 2006: California Heat Wave
- 2012-15: North American Drought
- 2015-16: El Nino

Vulnerability to Climate Change

Assets at Risk

The City's population, resources, and economy are vulnerable to climate change impacts, particularly flooding, extreme heat, and water supply. Without reduction strategies in place, community-wide greenhouse gases (GHG) emissions are anticipated to increase by about 18 percent by 2020, and by about 31 percent by 2030 based on the City's anticipated growth.

Future Development

The Sacramento 2035 General Plan meets the State's standards as a qualified plan for the reduction of greenhouse gas emissions. The overall framework of the General Plan provides the foundation for Sacramento's overall approach to achieve sustainable land use. The places we live, the methods used to construct our homes, and where we work dictate how far and by what means we travel and how much energy we use. Goals and policies of the 2035 General Plan are intended to result in more compact development patterns, infill and reuse of underutilized properties, intensify development near transit and mixed use activity centers, and locate jobs closer to housing. Similarly, "green" buildings and development projects, as part of a broader sustainability plan, will consume less energy, produce fewer emissions, protect occupant health, minimize waste, and create jobs. Future development in the City is subject to the standards of 2035 General Plan.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–High

Hazard Profile and Problem Description

Dam failures can result from a number of natural or man-made causes such as earthquakes, erosion of the face or foundation, improper siding, rapidly rising flood waters, structural/design flaws, and deliberate human actions.

Past Occurrences

July 17, 1995: Folsom Dam Spillway Gate Failure – The failure resulted in the uncontrolled release of nearly 40 percent of Folsom Lake at a peak rate of approximately 40,000 cubic feet per second (1,100 m^3/s). The freshwater reaching San Francisco Bay was atypical for the summer season and confused salmon and striped bass, whose instincts told them that fall rains had arrived; they began their annual fall migrations months ahead of schedule.

Vulnerability to Dam Failure

Folsom and Nimbus Dams are the two major dams which affect the City of Sacramento and the populations in their respective inundation areas. Of prime concern are the failures of the Folsom and/or Nimbus Dams, which are owned by the US Bureau of Reclamation. The flood waters from either dam would affect the City of Sacramento and the surrounding unincorporated areas.

The Sacramento Municipal Utility District (SMUD) inundation map indicates that a failure of the Rancho Seco Dam would flow to the Laguna Creek Basin and stop approximately at Stockton Boulevard. Failure of Shasta Dam would affect populations south along the Sacramento River basin to about Knights Landing where the water would lose momentum. An Oroville Dam failure would impact populations southwest along the Feather River basin to about the Yolo Bypass.

Warning ability is generally determined by the frequency of inspections for structural integrity, the flood wave arrival time (the time it takes for the flood wave to reach its maximum distance of inundation), or the ability to notify persons downstream and their ability to evacuate. Having an evacuation plan that is updating and exercised frequently assists in the warning and evacuation functions.

A dam failure will cause loss of life, damage to property, and other ensuing hazards, as well as the displacement of persons residing in the inundation path. Damage to electric generating facilities and transmission lines could also impact life support systems in communities outside the immediate hazard areas.

A catastrophic dam failure, depending on size of dam and population downstream, could exceed the response capability of local communities. Damage control and disaster relief support would be required from other local governmental and private organizations, and from the state and federal governments. Mass evacuation of the inundation areas would be essential to save lives, if warning time should permit. Extensive search and rescue operations may be required to assist trapped or injured persons. Emergency medical care, food, and temporary shelter would be required for injured or displaced persons. These and other emergency operations could be seriously hampered by the loss of communications, damage to transportation routes, and the disruption of public utilities and other essential services.

Governmental assistance could be required and may continue for an extended period. These efforts would be required to remove debris and clear roadways, demolish unsafe structures, assist in re-establishing public services and utilities, and provide continuing care and welfare for the affected population including, as required, temporary housing for displaced persons.

Figure 4.75 in Section 4.3.6 shows the inundation areas in the City of Sacramento and the County.

major concern. Many families would be separated, particularly if the failure should occur during working hours, and a personal inquiry or locator system would be essential.

Values at Risk

Sacramento County provided inundation as a GIS layer for the Folsom Dam system, as part of the following breaks:

- Folsom Right Wing
- Folsom Mormon
- Folsom Dike 4
- Folsom Dike 5
- Folsom Dike 6
- Folsom Dike 7
- Folsom Dike 8
- Folsom Dam

GIS was used to determine the possible impacts of dam failure flooding within the City of Sacramento. The methodology described in Section 4.3.6 of the Base Plan was followed in determining structures and values at risk in potential dam inundation areas. Table F-22 shows the property use, improved parcel count, improved values, estimated contents, total values and estimated loss of parcels that fall in a floodplain in the City.

Table F-22 City of Sacramento – Count of Parcels and Values in Dam Inundation Zones

Property Use	Total Parcel Count	Improved Parcel Count	Total Land Value	Improved Structure Value	Total Value
Agricultural	8	2	$3,139,047	$363,864	$3,502,911
Care / Health	189	151	$93,639,050	$1,001,284,994	$1,094,924,044
Church / Welfare	496	421	$86,643,945	$436,820,261	$523,464,206
Industrial	1,890	1,659	$533,537,335	$1,360,701,794	$1,894,239,129
Miscellaneous	1,145	8	$2,341,766	$264,443	$2,606,209
Office	1,419	1,255	$930,077,177	$3,546,609,472	$4,476,686,649
Public / Utilities	3,163	4	$4,088,725	$1,024,489	$5,113,214
Recreational	112	76	$45,466,233	$98,792,491	$144,258,724
Residential	122,989	121,544	$7,994,777,549	$20,189,320,019	$28,184,097,568
Retail / Commercial	2,635	2,240	$1,041,984,551	$1,824,488,753	$2,866,473,304
Vacant	6,612	168	$601,613,685	$12,938,229	$614,551,914
No Data	8	5	$542,436	$1,460,705	$2,003,141
Total	**140,666**	**127,533**	**$11,337,851,499**	**$28,474,069,514**	**$39,811,921,013**

Sacramento County 2016 Parcel/2015 Assessor's Data

Table F-23 shows potential losses from a Folsom Dam failure with loss estimate and loss ratios for the City. The loss ratio is the loss estimate (i.e., total of improved and contents value for all parcels located in the dam inundation zone in the City) divided by the total potential exposure and displayed as a percentage

of loss. Due to the varying flood depths that may occur during flooding, the loss estimate uses 3 scenarios: 3-foot flood depth (30% damage), 6-foot flood depth (60% damage to structure and contents), and total loss (all structure and contents are lost). Land values are not included in the loss estimates, as the land itself is usually not a loss. FEMA considers loss ratios greater than 10% to be significant and an indicator that a community may have more difficulties recovering from a dam failure.

Table F-23 City of Sacramento – Dam Inundation Loss Estimates

Flood Zone	Improved Parcel Count*	Improved Structure Value	Estimated Contents Value	Total Value	Loss Estimate*	Loss Ratio
Folsom Dam Inundation	127,533	$28,474,069,514	$19,046,822,173	$47,520,891,687	$14,256,267,506.10 $28,512,535,012.20 $47,520,891,687.00	35.0% 70.0% 100%

Source: Sacramento County GIS, Sacramento County 2016 Parcel/2015 Assessor's Data

*Three values are shown here due to varying flood depths expected – 3 foot, 6 foot, and total loss.

According to the information in Table F-22 and Table F-23, the City of Sacramento has 127,533 improved parcels and roughly $47.5 billion of structure and contents value in the Folsom Dam inundation area. The 3-foot loss ratio of 35.0%, the 6-foot loss ratio of 70.0%, and the total loss ratio of 100% indicates that the City has large amounts of assets at risk to a possible Folsom Dam failure.

Population at Risk

The dam inundation zones were overlayed on the parcel layer using GIS. Those residential parcel centroids that intersect the severity zones were counted and multiplied by the 2010 Census Bureau average household factors for the City. According to this analysis, there is a total population of 318,445 residents of the City at risk to dam inundation. This is shown in Table F-37.

Table F-24 City of Sacramento – Count of Improved Residential Parcels and Population in Dam Inundation Zones

Improved Residential Parcels	Population*
121,544	318,445

Source: FEMA4/16/2016 DFIRM, Sacramento County 2016 Parcel/2015 Assessor's Data, 2010 US Census Bureau

* Average household populations from the 2010 US Census were used: Sacramento – 2.62.

Critical Facilities at Risk

An analysis was performed on the critical facility inventory in the City of Sacramento in identified Folsom Dam inundation zones. GIS was used to determine whether the facility locations intersects the inundation area. Details of critical facilities in the inundation area in Sacramento are shown in Figure F-9 and Table F-25. As shown on the table and figure, Sacramento has 897 critical facilities located in the Folsom Dam inundation areas. Details of critical facility definition, type, name and address and jurisdiction by flood zone are listed in Appendix E.

Figure F-9 City of Sacramento – Critical Facilities in Dam Inundation Zones

Future Development

GIS Analysis

Hazard analysis was performed to determine the number of parcels in the dam inundation zones within the Opportunity Areas. Results can serve as a vulnerability analysis guide for future development. Figure F-10 shows the Opportunity Areas overlaid on the Folsom Dam Inundation zone. Table F-21 shows results of the parcel hazard analysis, sorted by Opportunity Area tier and type. There are 16,324 parcels in the inundation zones. This represents a great majority of Opportunity Areas.

Drought and Water Shortage

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for manufacturing, tourism, recreation, and commercial and domestic use. The demand for water will be ever present as the city grows.

Past Occurrences

Based on historical information, the occurrence of drought in California, including the City of Sacramento, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts is often extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users.

California Droughts:

- 1928-1934
- 1987-1992
- 2012-2015

Vulnerability to Drought and Water Shortage

Assets at Risk

The vulnerability of the City of Sacramento to drought is City-wide, but impacts may vary and include reduction in water supply, new algae growth due to warmer temperatures of the water and an increase in dry fuels increasing the risk of fire and pressure in the system.

Future Development

The demand for water will be ever present as the population of the city grows. Water shortages in the future may be worsened by drought, as the City relies on surface water for its water source. Increased planning will be needed to account for population growth and increased water demands.

Earthquake

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

There are no known faults within the City of Sacramento. However, significant earthquakes have occurred on previously undetected faults. Known faults located nearest to Sacramento are Foothills fault system to the east, the Midland Fault to the west, and the Dunnigan Hills Fault to the northwest.

The Foothills fault system is located on the western edge of the Sierra Nevada Range over 20 miles from the Policy Area and consists of a complex of north-south trending faults. The active Bear Mountain fault zone is at the western edge of the system (California Division of Mines and Geology 1978). The anticipated maximum magnitude of an earthquake originating from this fault zone is 6.5 moment magnitude (Mw). The Sacramento region has experienced groundshaking originating from faults in the Foothills fault system in the past. The Midland fault zone is considered to be a deep pre-Pleistocene subsurface feature extending nearly 50 miles along the west side of the Sacramento Valley, from the Delta to Lake Berryessa. This fault has been only approximately located from natural gas exploration work. Subsurface data indicate that there has been no appreciable movement on the Midland fault in the last 24 to 36 million years, and no evidence of surface expression has yet been found (Harwood and Helley 1987). The Dunnigan Hills Fault is located approximately 20 miles northwest of the City of Sacramento. The active fault is not within an Alquist-Priolo Earthquake Fault Zone.

Other faults in the region include the Great Valley fault (segments 3 and 4), located over 25 miles from the Policy Area and capable of producing a 6.5 – 6.8 Mw earthquake. The Concord-Green Valley fault and Hunting Creek-Berryessa fault are both located approximately 40 miles from the Policy Area and are capable of producing 6.9 Mw earthquakes. The Greenville fault is located approximately 50 miles from

the Policy Area and is capable of producing a 6.8 Mw earthquake. The West Napa fault is also located approximately 50 miles from the Policy Area and could produce a 6.5 Mw earthquake.

Past Occurrences

- 1892: Winters Earthquake (Magnitude 6.6) – Undetermined fault
- 1906: San Francisco Earthquake (Magnitude 7.8) – San Andreas Fault
- 1989 Loma Prieta Earthquake (Magnitude 6.9) – San Andreas Fault

Vulnerability to Earthquake

There are no known faults running under the City of Sacramento, however there are major faults close enough to cause the City to prepare for an earthquake.

Assets at Risk

The City Planning Team noted that the City's infrastructure and levee system may be impacted by an earthquake.

Natural Resources at Risk

The City Planning Team noted that there are no natural resources at notable risk from earthquake.

Historic and Cultural Resources at Risk

The City Planning Team noted that the City's historical buildings and historic districts would be at risk to earthquakes.

Future Development

The City enforces the state building code and other ordinances, which regulate construction techniques that minimize damage from earthquakes. Future development in the City is subject to these building codes.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional(100-year)/Unlikely (200-/500-year)
Vulnerability–High

Hazard Profile and Problem Description

Flooding is the rising and overflowing of a body of water onto normally dry land. History clearly highlights floods as one of the most frequent natural hazards impacting the City of Sacramento. Floods are among the most costly natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. A car will float in less than two feet of moving water and can be swept downstream into

deeper waters. This is one reason floods kill more people trapped in vehicles than anywhere else. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures, such as dam spillways. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Where flooding occurs in populated areas, warning and evacuation will be of critical importance to reduce life and safety impacts from any type of flooding.

Health Hazards from Flooding

Certain health hazards are also common to flood events. While such problems are often not reported, three general types of health hazards accompany floods. The first comes from the water itself. Floodwaters carry anything that was on the ground that the upstream runoff picked up, including dirt, oil, animal waste, and lawn, farm and industrial chemicals. Pastures and areas where cattle and other livestock are kept or their wastes are stored can contribute polluted waters to the receiving streams.

Floodwaters also saturate the ground, which leads to infiltration into sanitary sewer lines. When wastewater treatment plants are flooded, there is nowhere for the sewage to flow. Infiltration and lack of treatment can lead to overloaded sewer lines that can back up into low-lying areas and homes. Even when it is diluted by flood waters, raw sewage can be a breeding ground for bacteria such as e. coli and other disease causing agents.

The second type of health problem arises after most of the water has gone. Stagnant pools can become breeding grounds for mosquitoes, and wet areas of a building that have not been properly cleaned breed mold and mildew. A building that is not thoroughly cleaned becomes a health hazard, especially for small children and the elderly.

Another health hazard occurs when heating ducts in a forced air system are not properly cleaned after inundation. When the furnace or air conditioner is turned on, the sediments left in the ducts are circulated throughout the building and breathed in by the occupants. If a city or county water system loses pressure, a boil order may be issued to protect people and animals from contaminated water.

The third problem is the long-term psychological impact of having been through a flood and seeing one's home damaged and irreplaceable keepsakes destroyed. The cost and labor needed to repair a flood-damaged home puts a severe strain on people, especially the unprepared and uninsured. There is also a long-term problem for those who know that their homes can be flooded again. The resulting stress on floodplain residents takes its toll in the form of aggravated physical and mental health problems.

The HMPC for the City also noted another issue. When the City's combined sewer system is overloaded with stormwater, it frequently backs up into the streets causing a health hazard.

Warning and Evacuation Procedures

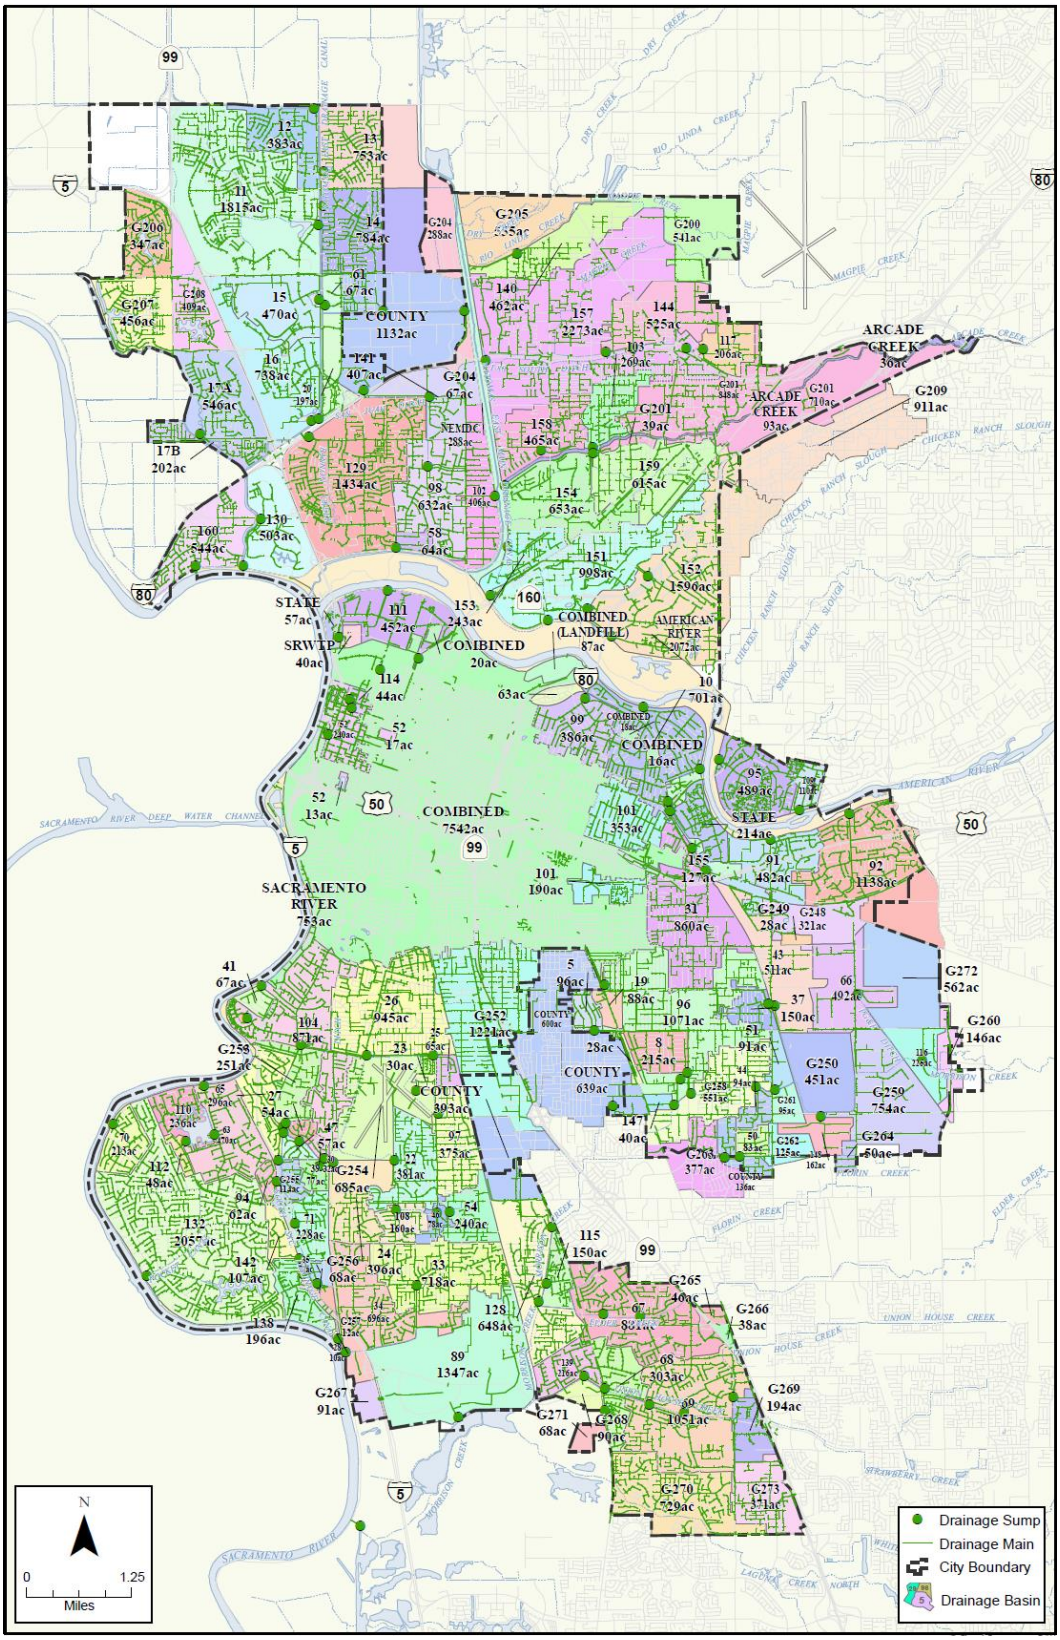
The City of Sacramento in conjunction with Sacramento County and other incorporated communities have a variety of systems and procedures established to protect its residents and visitors to plan for, avoid, and respond to a hazard event including those associated with floods and wildfires. This includes Pre-Disaster Public Awareness and Education information which is major component in successfully reducing loss of life and property in a community when faced with a potentially catastrophic incident. Much of this information is not specific to a given hazard event and is always accessible to the public on local City and County websites. Specific warning and evacuation systems and procedures include information relative to: Flood Forecasting (e.g., California Data Exchange Center), ALERT System, Warning Systems, dam protocols, evacuation procedures, and sheltering in place. Additional information on these warning and evacuation procedures as well as post-disaster mitigation policies and procedures can be found within the Capability Section of this Annex and in Section 4.4, Capabilities, of the Base plan and in the Emergency Management discussions in Appendix C.

Major Sources of Flooding

The City of Sacramento is traversed by several stream systems and is at risk to both riverine flooding and localized stormwater flooding. As previously described in Section 4.2.14 of the main plan, the Sacramento County Planning Area and the City of Sacramento have been subject to previous occurrences of flooding. In the City of Sacramento, much of the riverine flood damage occurs in the floodplains of the Sacramento River and the American River.

Six small tributaries of the Sacramento River pass through and provide drainage for the City of Sacramento. These tributaries are Dry Creek, Magpie Creek, and Arcade Creek in the northern portion of the city (north of the American River), and Morrison Creek, Elder Creek, Florin Creek, Unionhouse Creek, and Laguna Creek in the southern portion of the city (south of the American River). Waterways and drainages in the City are shown on Figure F-11.

Figure F-11 City of Sacramento Waterways and Drainage

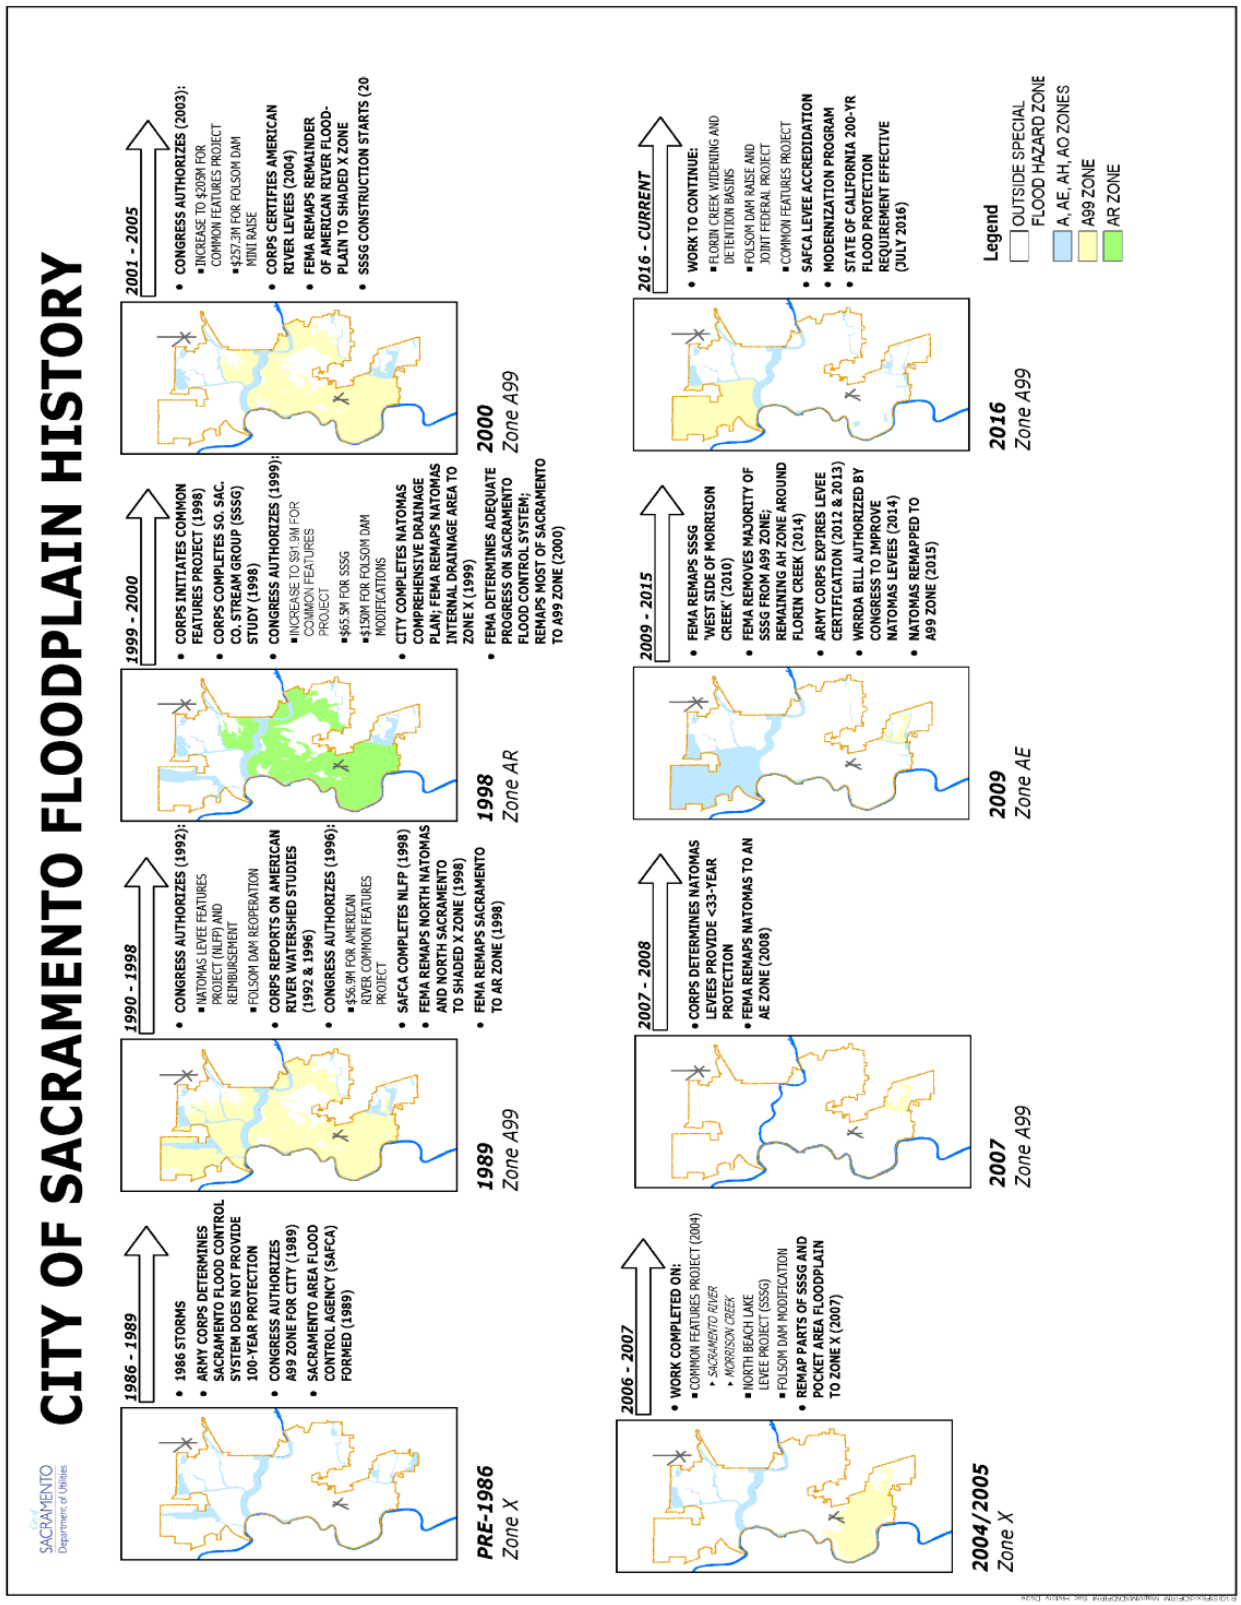


Source: City of Sacramento Department of Utilities

The City Planning Area contains many natural and man-made drainage features that ultimately drain into the Sacramento River. In addition to those listed above, local surface water drainages or creeks such as Chicken Ranch and Strong Ranch sloughs, Florin Creek, and Robla Creek are additional major natural drainages within the Policy Area. Man-made drainage canals, such as the Natomas East Main Drain Canal and the East, West, and Main Drainage Canals provide drainage for a large portion of the urbanized areas within the Policy Area that are not served by the City's combined sewer system or the City's storm drainage collection system.

The City Planning area has had many changes to the designated floodplain since the 1986 flooding base on Flood Insurance Rate Maps provided by FEMA. These changes are shown in Figure F-12.

Figure F-12 City of Sacramento Floodplain History



Past Occurrences

Sacramento experienced great floods in 1850, 1852, 1862, 1911, 1913, 1951, 1956, 1963, 1964, 1986, 1995, 1997, and 2005. Record breaking flood events are detailed further below:

1850 Flood - During the night of January 7, 1850, a great storm swept in from the west. Almost overnight the water posed a grave threat to life and property. Within two days of the storms beginnings, downpours that reached an inch an hour, had transformed the rivers into raging torrents. There was no levee protecting the new city which started right at the river banks. Within hours, the entire community, for a mile back from the river, was deep under rushing waters. Houses were toppled; businessmen watched as thousands of dollars in inventory was washed out their doors; and a small steamboat navigated the town's streets to deliver goods. Very few homes escaped having water on the first floors. Many were swept from their underpinnings.

Figure F-13 Sketch of the City of Sacramento during the Flood of 1850

Source: California State Library

1852-53 Flood – In December of 1852, the Sacramento Valley was again inundated, even more deeply than they had in the high water of 1850. On March 29, 1853, the Sacramento River rose twelve feet within twenty-four hours. When the water finally broke through the levees, it was at a point south of the city, toward Sutterville. The out rush of waters on the flatlands were sweeping and violent. By April 2, 1853, the water had backed up into the city. Again the City was under water. Sacramento was a city submerged. The City was a lake, boats were in the streets and the water didn't drain away for two months. The City had levees along both the Sacramento and American Rivers. Although levees served to prevent the rivers from invading the growing city, they also served to trap storm and refuse water that would otherwise drain directly into those rivers.

1861-1862 Flood – Sacramento had enjoyed eight winters of the rivers staying in-bank. The City had prospered and became the State capital. On December 9, 1861, at 8:00 A.M., the American River suddenly went over the levee at Smith's Gardens, about 31st & B Streets, in the northeastern part of the City. The water took its old channel, rushed through the slough west of the Fort and over its banks in less than 30 minutes, the low lots between 0 & R Streets were overflowed two to three feet deep. The R Street levee stopped its flow, causing it to back up into the City. By 9 A.M., the entire City, south of J Street,

was inundated. By 11:30 A.M., only J, K and the levee streets (1, R, and Front) were above water. Within an hour and a half, J and K Streets were under water.

1951 Record Flood – Just after ground is broken on Folsom Dam, the American River watershed experiences the first of five record storms.

1956 Record Flood – Though engineers had been predicting it would take a year to fill the nearly completed upstream Folsom Dam, the second record storm filled the dam in a week and Sacramento is saved from flooding.

1964 Record Flood – the 3rd record flood in less than 15 years. Engineers concluded that Folsom Dam was only designed to handle a 120-year storm, not a 500-year storm.

1986 Record Flood: In February 1986, major storms in northern California caused record flood flows in the American River basin. Overflows from Folsom Reservoir, together with high flows in the Sacramento River, caused water levels to rise above the safety margin on levees protecting the Sacramento area. A series of tropical storms roared through the State that month. Ten inches of rain fell in 11 days. The levee overtopped in a low spot of Strawberry Manor, flooding approximately 500 homes. Outflows from Folsom Reservoir, together with high flows in the Sacramento River, caused water levels to rise above the safety margin on levees protecting the Sacramento area. The storm brought large flood flows into Folsom Reservoir with a maximum six-day record inflow of 1.14 million acre-feet, exceeding the six-day design inflow of 987,000 acre- feet. To relieve the pressure on the dam, 115,000 cubic feet per second (cfs), the design capacity of the levees downstream, was released from the reservoir for two days. As the rain continued, officials boosted those releases to 130,000 cfs for 24 hours. Officials considered increasing releases to 150,000 cfs, but the rain let up, and disaster was averted. At that point, it was estimated by flood officials that three more hours of rainfall would have overwhelmed the system, flooding thousands of homes. Runoff in the American River quickly filled the temporary diversion dam built at the Auburn Dam site, approximately ten years earlier, causing it to burst, and sending 100,000 acre feet of water rushing into Folsom Reservoir. Folsom Dam was downgraded to about a 60-year storm. The USACE determined that a majority of the City did not have 100-year level of flood protection.

Figure F-14 Ariel View of 1986 Flood

Source: SAFCA

1997 Record Flood: The fifth record flood in 46 years occurs over the New Year's holiday. Unprecedented flows from rain and melted snow surge into the Feather and the San Joaquin. Sacramento is spared when the fury of the storm hits 40 miles north in the Feather River. Levee failures flood Olivehurst, Adboga, Wilton, Manteca, and Modesto. By the end of January 1997, 48 counties were declared disaster areas and 290 square miles of property, valued at about $2 billion, including homes, farmlands, bridges, roads and flood management infrastructures were damaged. Nine people were killed and 120,000 people were evacuated from their homes.

Other large flood events will certainly occur in the future, leaving the City vulnerable to additional, potentially catastrophic flooding. Further localized flooding problems both in and outside of the natural floodplains are likely to continue as drainage channels are altered and confined with new development.

December 2012: McKinley Park Flooding - Several houses were flooded during a rain storm due to a failed programmable logic controller. DOC activation due to weather forecast.

Flood Hazard Assessment

This risk assessment for the City of Sacramento's Annex to the Sacramento County LHMP Update assessed the flood hazard specific to the City. This included an evaluation of multiple flood hazards including the Special Flood Hazard Area (SFHA) shown on the DFIRM; Repetitive Loss (RL) Areas; localized, stormwater flooding areas; other areas that have flooded in the past, but not identified on the DFIRM; other areas of shallow flooding identified through other studies and sources; levee failure flooding; dam failure flooding; erosion based flooding, and flooding caused by land subsidence. This comprehensive flood risk assessment included an assessment of less-frequent flood hazards, areas likely to be flooded, and flood problems that are likely to get worse in the future as a result of changes in floodplain development and demographics, development in the watershed, and climate change or sea level rise. Existing studies, maps, historical data, and federal, state, and local community expertise and knowledge contributed to this current flood assessment for the City of Sacramento. An evaluation of the success of completed and ongoing flood control projects and associated maintenance aspects contributed to this flood hazard assessment and the resulting flood mitigation strategy for the City. This flood risk assessment for this LHMP Update includes an assessment of future flooding conditions based on historic development in the floodplains, proposed future development, climate change influences, and worst case flood scenarios such as the ARkStorm as further described throughout this plan. Due to GIS mapping constraints, the remainder of this flood vulnerability assessment focuses on the flood hazard based on the updated FEMA DFIRMs.

Flood Mapping and Flood Zones

A small portion of the City is located inside of the 100-year flood zone as defined by the Federal Emergency Management Agency (FEMA). Portions of the City are located in the 500-year flood zone, X Protected by Levee zone, and A99 zone. This is seen in Figure F-17. More information on the levees can be found in the levee vulnerability section of this annex.

In addition to FEMA floodplains, the City also regulates a local floodplain. FEMA floodplains and local floodplains are shown on Figure F-18. For purposes on analysis in this plan, only FEMA floodplains are analyzed.

Figure F-17 City of Sacramento – FEMA DFIRM Flood Zones

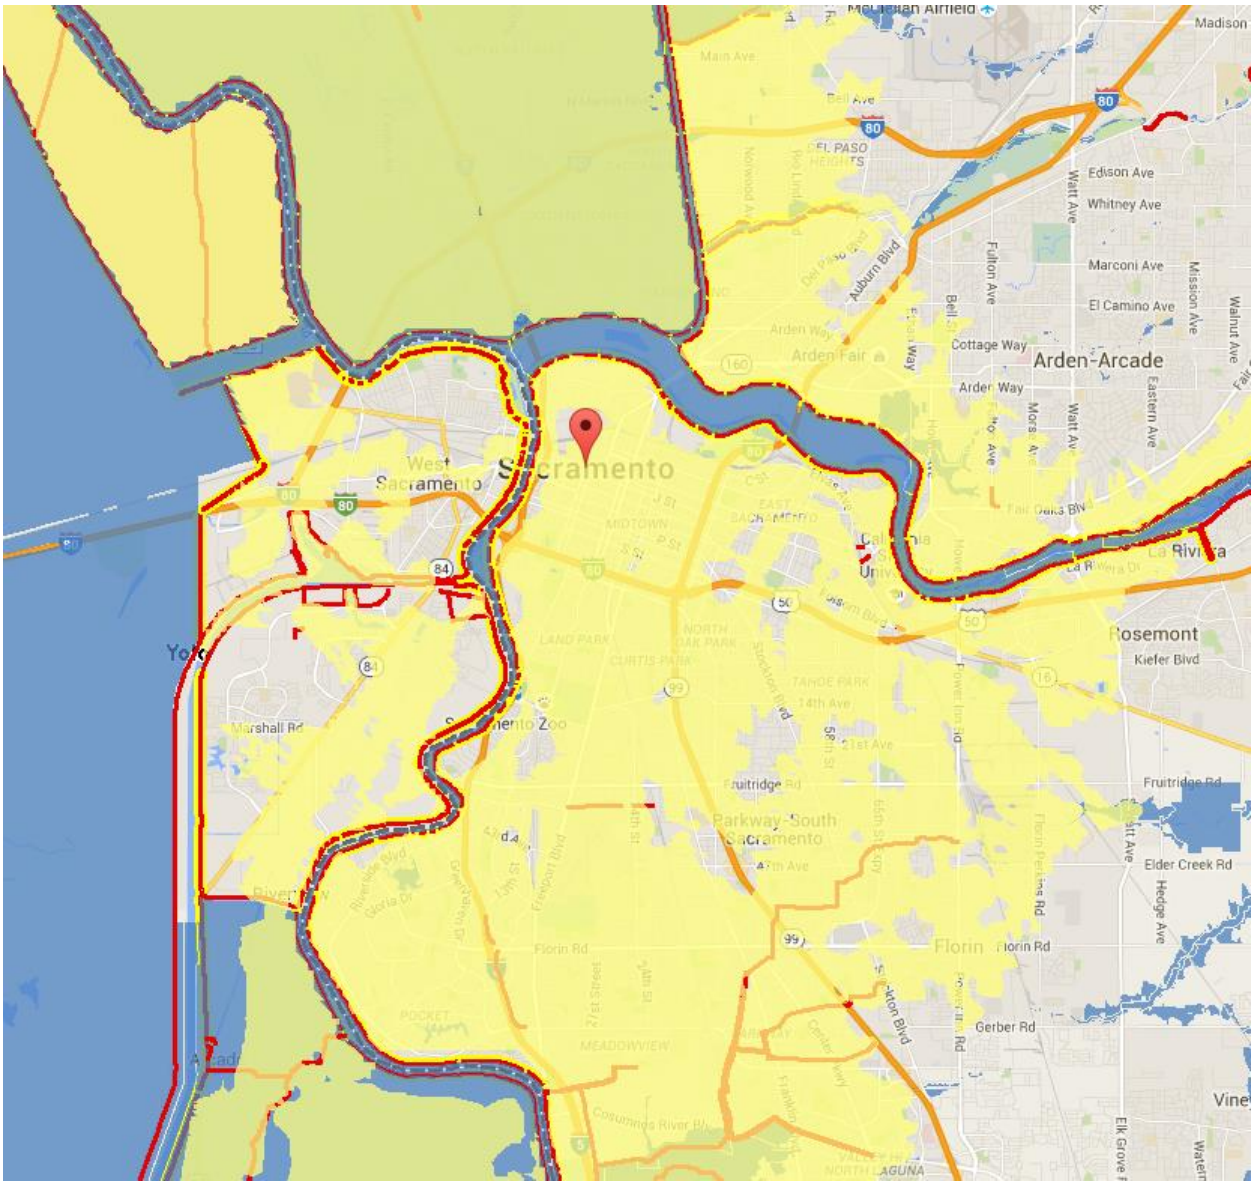
California Department of Water Resources Best Available Maps (BAM)

The FEMA regulatory maps provide just one perspective on flood risks in Sacramento County. Senate Bill 5 (SB 5), enacted in 2007, authorized the California DWR to develop the Best Available Maps (BAM) displaying 100- and 200-year floodplains for areas located within the Sacramento-San Joaquin (SAC-SJ) Valley watershed. SB 5 requires that these maps contain the best available information on flood hazards and be provided to cities and counties in the SAC-SJ Valley watershed. This effort was completed by DWR in 2008. DWR has expanded the BAM to cover all counties in the State and to include 500-year floodplains.

Different than the FEMA DFIRMs which have been prepared to support the NFIP and reflect only the 100-year event risk, the BAMs are provided for informational purposes and are intended to reflect current 100-, 200-, and 500-year event risks using the best available data. The 100-year floodplain limits on the BAM are a composite of multiple 100-year floodplain mapping sources. It is intended to show all currently identified areas at risk for a 100-year flood event, including FEMA's 100-year floodplains. The BAM are comprised of different engineering studies performed by FEMA, Corps, and DWR for assessment of potential 100-, 200-, and 500-year floodplain areas. These studies are used for different planning and/or regulatory applications. They are for the same flood frequency, however, they may use varied analytical and quality control criteria depending on the study type requirements.

The value in the BAMs is that they provide a bigger picture view of potential flood risk to the City than that provided in the FEMA DFIRMs. This provides the community and residents with an additional tool for understanding potential flood hazards not currently mapped as a regulated floodplain. Improved awareness of flood risk can reduce exposure to flooding for new structures and promote increased protection for existing development. Informed land use planning will also assist in identifying levee maintenance needs and levels of protection. By including the FEMA 100-year floodplain, it also supports identification of the need and requirement for flood insurance. The BAM map for Sacramento is shown in Figure F-19.

Figure F-19 City of Sacramento Best Available Map



Floodplains are displayed using semi transparent colors. When viewing overlapping floodplains, the combination of multiple semi transparent colors will not match the legend colors. For accurate color representation, view floodplains individually.

County Boundary	Federal Levee Centerline	Non-Federal Levee Centerline
FEMA Effective	DWR Awareness	Regional/Special Study
USACE Comprehensive Study	USACE Comprehensive Study

Vulnerability to Flood

The City of Sacramento has extensive vulnerability to flooding. This is shown in the analysis below.

Values at Risk

GIS was used to determine the possible impacts of flooding within the City of Sacramento. The methodology described in Section 4.3.10 of the Base Plan was followed in determining structures and values at risk to the 1% (100-year) and 0.2% (500-year) annual chance flood event. Table F-27 shows the property use, improved parcel count, improved values, estimated contents, total values and estimated loss of parcels that fall in a floodplain in the City.

Source: FEMA DFIRM June 16, 2015, Sacramento County 2016 Parcel/2015 Assessor's Data

*This parcel count only includes those parcels in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all parcels in the 1% annual chance floodplain.

Table F-28 summarizes Table F-27 above and shows City of Sacramento loss estimates and shows improved values at risk by FEMA 1% and 0.2% annual chance flood zones.

Table F-28 City of Sacramento – Flood Loss Summary

Flood Zone	Improved Parcel Count	Total Improved Value	Estimated Contents Value	Total Improved/ Contents Value	Loss Estimate	Loss Ratio
1% Annual Chance	24,861	$6,675,340,607	$3,993,844,418	$10,669,185,025	$2,133,837,005	3.54%
0.2% Annual Chance*	14,495	$2,822,713,159	$2,315,826,604	$5,138,539,763	$1,027,707,952.60	1.71%

Source: FEMA DFIRM June 16, 2015, Sacramento County 2016 Parcel/2015 Assessor's Data
*This parcel count only includes those parcels in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all parcels in the 1% annual chance floodplain.

According to Table F-27 and Table F-28, the City of Sacramento has 24,861 improved parcels and roughly $10.7 billion of structure and contents value in the 1% annual chance floodplain. The City of Sacramento has an additional 14,495 improved parcels and roughly $5.1 billion of structure and contents value in the 0.2% annual chance floodplain. These values can be refined a step further. Applying the 20 percent damage factor as previously described in Section 4.3.10 of the Base Plan, there is a 1% chance in any given year of a flood event causing roughly $2.13 billion in damage, and a 0.2% chance in a given year of a flood event causing roughly $1.0 billion in damages in the City of Sacramento. A loss ratio (loss estimate divided by the total assets of the City) of 3.54% and 1.71% indicates that losses in Sacramento to flood would be relatively minor compared to the total value of properties in the City.

Flooded Acres

Also of interest is the land area affected by the various flood zones. The following is an analysis of flooded acres in the City in comparison to total area within the City limits. The same methodology, as discussed in Section 4.3.10 of the Base Plan that was used for the County as a whole, was used for the City of Sacramento. Table F-29 represents a summary analysis of total acres in the 1% and 0.2% annual chance flood zones in the City.

Table F-29 City of Sacramento – Flooded Acres

Flood Zone	Total Flooded Acres	Improved Flooded Acres	% of Improved Flooded Acres
1% Annual Chance	12,958.27	5,468.67	5.89%
0.2% Annual Chance*	6,385.63	4,477.68	36.96%

Source: FEMA DFIRM June 16, 2015, Sacramento County 2016 Parcel/2015 Assessor's Data
*This parcel count only includes those parcels in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all parcels in the 1% annual chance floodplain.

Insurance Coverage, Claims Paid, and Repetitive Losses

Two separate analysis are included below. One from the NFIP, which contained slightly newer data. The second is from the City's CFMP. While the data is slightly older, it contains a much more detailed analysis. As such, both are included here.

2016 NFIP Flood Insurance Analysis

The City of Sacramento joined the National Flood Insurance Program (NFIP) on September 15, 1978. The City joined in CRS program on October 1, 1992 and maintains a CRS rating of Class 5. This rating gives flood insurance policyholders in the City a 25% discount for properties located in a special flood hazard zone, and a 10% discount for those properties located outside the special flood hazard zone. A more detailed description and summary of the flood zones is provided in Section 4.3.10 of the Base Plan.

NFIP data indicates that as of February 19, 2016, there were 43,937 flood insurance policies in force in the City with $14,355,078,500 of coverage. Of the 43,937 policies, 42,827 were residential (single-family homes) and 1,110 were nonresidential; 2,153 of the policies were in A zones (the remaining 41,784 were in B, C, and X zones). The GIS parcel analysis detailed above identified 24,861 parcels in the 100-year flood zone. 2,153 policies for 24,861 parcels in the 100-year floodplain equates to insurance coverage of 28.8 percent. It should be noted, however, that many of the 24,861 parcels in the 100-yr floodplain are located in the Natomas Basin, which is an A99 zone.

There have been 967 historical claims for flood losses totaling $9,906,307.99. 682 of these were for pre-FIRM structures; 280 were for post-FIRM structures, and 5 were unknown.

2016 CFMP Flood Insurance Analysis

Most every primary building or substantial improvement within the City of Sacramento's SFHA must have a flood insurance policy if there is a federally-backed mortgage. The majority of mortgage loans are backed by the federal government through either Fannie Mae or Freddie Mac. Since flood insurance rates are driven by location of the building and the BFE, structures in the SFHA usually pay higher rates than do those buildings located outside the designated higher risk areas. Typically when BFEs increase, flood insurance premiums also increase, unless some type of mitigation is implemented on that building.

While flood insurance can do nothing to prevent actual flood damage or loss of life it can mitigate the economic risk associated with flooding to the insured in many ways. Flood insurance is a property owner's first line of defense against flood damage. A property which is damaged or destroyed can be replaced more quickly without using financial resources devoted to other things such as the mortgage, utilities or maintenance. Additionally, compensation for flood losses (through flood insurance payments) can help families get back on their feet with minimal financial hardship and can also aid businesses in getting back open to avoid potential financial ruin.

Table F-30 shows historically the number of flood insurance policies in the A, AE, AH and AO-Zones, the number of Standard X-Zone policies in AR, A99-Zones, and the number of Preferred Risk Policies in the B, C or X-Zones. The table also shows the average number of flood insurance policies by flood zone from August 2008 through March of 2012.

Table F-30 Flood Insurance Policies in Sacramento by Zone and Year

Table F-31 indicates that as of January 31, 2016, the City of Sacramento had 43,937 active flood insurance policies in force with total premiums of more than $20 million. These active polices represent more than $14 billion of insurance in place covering both structure and contents. Historically, the City has had 967 claims paid against the NFIP totaling $9.9 million in paid losses.

Table F-31 Flood Insurance Policies by Occupancy (Data as of 01/31/2016)

Property Type	Policies in Force	Premium	Insurance in Force	Number of Closed Paid Losses	$ of Closed Paid Losses	Adjustment Expense
Single Family	37,691	$16,291,601	$12,278,053,400	799	$7,237,612.26	$332,146.93

Table F-33 indicates the number of flood insurance policies by flood zone as of January 31, 2016. The total number of flood insurance policies in the A, AE, AH and AO-zones decreased by 12 from 372 in April 2015 to 360 in January of 2016. The number of flood insurance policies in the A99, AR, and Standard X increased from 13,350 in April of 2015 to 22,170 in January of 2016. The total number of flood insurance policies dropped in the B, C and X-zones from 28,245 to 21,407, a net decrease of 6,838 policies or 24.2%. The total number of flood insurance policies in the City decreased from 2015 to 2016. In April 2015, the City had 41,967 flood insurance policies in force and in January of 2016 the total policies in force increased to 43,937 or 4.69%.

Table F-33 Flood Insurance Policies by Flood Zone (Data as of 01/31/2016)

Property Type	Policies in Force	Premium	Insurance in Force	Number of Closed Paid Losses	$ of Closed Paid Losses	Adjustment Expense

Source: 2016 City of Sacramento Comprehensive Flood Management Plan

As of January 31, 2016, the City of Sacramento had 14,768 pre-FIRM flood insurance policies in force as shown in Table F-34 These pre-FIRM policies in the AE, A, and AH zones have the potential to be affected by rate increases through the Biggert-Waters Flood Insurance Reform Act of 2012 and the Homeowner's Flood Insurance Affordability Act of 2014. The City does not have any AO or AR zone currently.

Table F-34 Pre-FIRM Flood Insurance Policies by Zone (Data as of 01/31/2016)

Property Use	Policies in Force	Premium	Insurance in Force	# of Closed Paid Losses	$ of Closed Paid Losses	Adjustment Expense
A01-30 & AE Zones	147	$249,203	$26,677,500	30	$413,959.08	$15,789.98

Source: 2016 City of Sacramento Comprehensive Flood Management Plan

Many factors change the number of flood insurance policies in the City. In 2015, the City saw a drop in the number of A99 policies in Pre-FIRM and Post-FIRM policies because over 3,000 residents were removed from the A99 Zone on May 12, 2014 in South Sacramento. Hopefully, the City will see an increase in PRP policies as residents convert in this area over the next few years. On another note, Natomas was remapped from an AE to A99 zone in June 2015, so the City expects to see an increase in A99 policies in the first part of 2016. Also, the numbers may conflict in the table above because Natomas residents have been in multiple subsidized programs since 2008 – Preferred Risk Policy Eligibility Extension and Properties Newly Mapped. Also, the numbers may conflict in the table above because the Natomas Basin was remapped from X to AE zone in 2008 and from AE to A99 zone in 2015 and has been in multiple subsidized programs since 2008 - Preferred Risk Policy Eligibility Extension, Properties Newly Mapped, and now PRP.

Repetitive Loss Analysis

NFIP data further indicates that there are 21 repetitive loss (RL) buildings, with 5 RL buildings being insured. There have been a total of 49 RL losses, with 10 insured RL losses. None of the insured RL buildings has incurred 4 or more losses. 18 of the properties are located in the A zone, and 3 RL buildings are located outside of the 100- and 500-year floodplain in the B, C, or X zones. The RL properties are located throughout the city. Repetitive flooding is generally a result of a combination of poor drainage and homes below the street elevation. Drainage improvements in the area have alleviated some of the flooding issues to these RL structures over the years. Citizens are required to have flood insurance in an A zone if they have a federally backed mortgage. Repetitive loss properties are shown in Figure F-21 and detailed in Table F-36. A detailed repetitive loss area analyses of the City's repetitive loss properties is located in the City's Comprehensive Flood Management Plan.

Population at Risk

The DFIRM flood zones were overlayed on the parcel layer. Those residential parcel centroids that intersect the severity zones were counted and multiplied by the 2010 Census Bureau average household factors for Sacramento. According to this analysis, there is a total population of 63,970 and 35,794 residents of the City at risk to flooding in the 1% and 0.2% annual chance floodplains, respectively. This is shown in Table F-37.

Table F-37 City of Sacramento – Count of Improved Residential Parcels and Population by Flood Zone

Flood Zone	Improved Residential Parcels	Population*
1% Annual Chance	24,416	63,970
Shaded X (0.2% Annual Chance)*	13,622	35,794

Source: FEMA DFIRM June 16, 2015, Sacramento County 2016 Parcel/2015 Assessor's Data, US Census Bureau

* Average household populations from the 2010 US Census were used: Sacramento– 2.62.

**This parcel count only includes those parcels in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all parcels in the 1% annual chance floodplain.

Critical Facilities at Risk

An analysis was performed on the critical facility inventory in Sacramento in identified FEMA DFIRMs. GIS was used to determine whether the facility locations intersects a DFIRM flood hazard areas, and if so, which zone it intersects. Details of critical facilities in the floodplain in the City of Sacramento are shown in Figure F-22 and Table F-38. As shown on the table and figure, Sacramento has 84 critical facilities located in 1% annual chance and 128 critical facilities in the 0.2% annual chance DFIRM flood zones. None of these critical facilities are located in an A Zone. Details of critical facility definition, type, name and address and jurisdiction by flood zone are listed in Appendix E.

*This count only includes those critical facilities in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all critical facilities in the 1% annual chance floodplain.

Natural Resources at Risk

The City Planning Team noted that many of the City's natural resources are protected by levees, however if there was a greater than 1%-annual-chance storm event (100-year storm), or other event that results in a breach of City levees, the City's natural resources will be at risk.

Historic and Cultural Resources at Risk

The City Planning Team noted that the historical and cultural resources are protected by levees, however if there was a greater than 1%-annual-chance storm event (100-year storm) or other event that results in a breach of City levees, the City's historic and cultural resources will be at risk.

Overall Community Impact

Floods and their impacts vary by location and severity of any given flood event and will likely only affect certain areas of the City during specific times. Based on the risk assessment, it is evident that floods will continue to have potentially devastating economic impacts to certain areas of the City. However, many of the floods in the City are minor, localized flood events that are more of a nuisance than a disaster. Impacts that are not quantified, but can be anticipated in large future events, include:

- Commercial and residential structural and property damage;
- Costs incurred due to post-flood clean up and repair of buildings and infrastructure;
- Damage to roads/bridges resulting in loss of mobility;
- Decreased revenue due to loss of income, sales, tourism, and property taxes;
- Deterioration of homes and neighborhoods as floods recur;
- Disruption of and damage to public infrastructure and services;
- Health hazards associated with mold and mildew, contamination of drinking water, etc.;
- Impact on the overall mental health of the community;
- Injury and loss of life, including first responders rescuing those who did not evacuate or are stranded;
- Loss of historical or unique artifacts;
- Loss of jobs due to businesses closing or cutting back on operating hours;
- Loss of programs or services that are cut to pay for flood recovery;
- Mental health and family impacts, including increased occurrence of suicides and divorce
- Negative impact on commercial and residential property values;
- Significant disruption to students and teachers as temporary facilities and relocations would likely be needed; and
- Significant economic impact (jobs, sales, tax revenue) to the community.

Future Development and Future Flood Conditions

This section provides an analysis of the flood hazard and proposed future development within the City based on FEMA DFIRMs and also discusses considerations in evaluating future flooding conditions.

Future Development: General Considerations

Communities that participate in the NFIP adopt regulations and codes that govern development in special flood hazard areas, and enforce those requirements through their local floodplain management ordinances

through the issuance of permits. The City of Sacramento's floodplain management ordinance provides standards for development, subdivision of land, construction of buildings, and improvements and repairs to buildings that meet or exceed the minimum requirements of the NFIP.

The International Residential Code (IRC) and International Building Code (IBC), by reference to ASCE 24, include requirements that govern the design and construction of buildings and structures in flood hazard areas. FEMA has determined that the flood provisions of the I-Codes are consistent with the requirements of the NFIP (the I-Code requirements shown either meet or exceed NFIP requirements). ASCE 24, a design standard developed by the American Society of Civil Engineers, expands on the minimum NFIP requirements with more specificity, additional requirements, and some limitations.

With the adoption of the 2015 International Code, communities will be moving towards a more stringent approach to regulatory floodplain management. The adoption and enforcement of disaster-resistant building codes is a core community action to promote effective mitigation. When communities ensure that new buildings and infrastructure are designed and constructed in accordance with national building codes and construction standards, they significantly increase local resilience now and in the future. With continued advancements in building codes, local ordinances should be reviewed and updated to meet and exceed standards as practicable to protect new development from future flood events and to further promote disaster resiliency.

Master planning will also be necessary to assure that open channel flood flow conveyances serving the smaller internal streams and drainage areas are adequately prepared to accommodate the flows. Preservation and maintenance of natural and riparian areas should also be an ongoing priority to realize the flood control benefits of the natural and beneficial functions of these areas. Also to be considered in reducing flooding in areas of existing and future development is to promote implementation of stormwater program elements and erosion and sediment controls, including the clearing of vegetation from natural and man-made drains that are critical to flood protection. Both native and invasive species can clog drains, and reduce flows of floodwaters, which slow that natural drainage process and can exacerbate flooding.

One of the most effective ways to reduce vulnerability to potential flood damage is through careful land use planning that fully considers applicable flood management information and practices. California's 2007 flood legislation (Senate Bill 5) directly linked system-wide flood management planning to local land use planning, requiring local jurisdictions to demonstrate an urban level of flood protection before approving new development in urban and urbanizing areas. "Urban level of flood protection" means the level of protection necessary to withstand flooding that has a 1-in-200 chance of occurring in any given year (California Government Code Section 65007). DWR has been developing criteria to guide local jurisdiction compliance with the new requirements. In addition to developing criteria to help local jurisdictions in their land use planning, DWR is preparing criteria for use in the design of levees protecting urban and urbanizing areas. DWR is also working with local partners to develop guidance related to nonurban flood protection levels.

As of July 2, 2016 these standards became effective, and cities and counties within the Sacramento-San Joaquin Valley cannot enter into development agreements or issue a permit to construct a new structure in areas located within a flood hazard zone unless the following is established:

- Find that existing facilities protect urban and urbanizing areas to a 1-in 200 chance of flooding in any given year or the FEMA standard of flood protection in non-urbanized areas, or
- Find that the local flood management agency has made adequate progress on the construction of the flood protection system to provide the required level of protection, or
- Impose conditions on the development agreement that will provide the required level of protection.

City of Sacramento SB 5 Compliance

Senate Bills (SB) 5 and 17 and Assembly Bills (AB) 5, 70, 156, and 162 (Legislation) were signed into law in 2007 to address flood problems. As part of this Legislation, DWR was required to develop a Central Valley Flood Protection Plan (CVFPP). The CVFPP was adopted in 2012 and will be updated every 5 years. In 2012, SB1278 and AB1965 were enacted, revising provisions related to planning and zoning for flood protection.

The City will be required to make findings related to an urban level of flood protection (200-year) as stipulated in California Government Code Sections 65865.5, 65962, and 66474.5, using criteria consistent with, or developed by DWR. DWR has developed draft criteria, *Urban Level of Flood Protection* (ULOP) (November 2013).

The ULOP requires a minimum urban level of 200-year flood protection before a community can issue a building permit or approve a parcel map. This requirement affects areas in the Sacramento-San Joaquin Valley where flood depths are anticipated to exceed three feet and are in a watershed greater than 10 square miles for the 200-year flood event. If a ULOP plan is in place to reach 200-year flood protection and adequate progress is shown annually, then these requirements can be delayed until 2025. SAFCA will have a ULOP plan by the July deadline.

Many areas of the City that are in watersheds greater than 10 square miles and exceed three feet in depth will not be covered by the ULOP plan. The 200-year floodplain in these areas were mapped and will be utilized for development purposes.

The City enforces the floodplain ordinance. If any development is to occur in the FEMA 100-year flood hazard area or the 200-year flood hazard area not covered by the ULOP plan, it will have to conform to the elevation or floodproofing standards of the floodplain ordinance.

Future Development: DFIRM Analysis

Hazard analysis was performed to determine the number of parcels in the FEMA DFIRM flood zones within the Opportunity Areas. Results can serve as a vulnerability analysis guide for future development. Figure F-23 shows the Opportunity Areas overlaid on the DFIRM flood zones. Table F-39 shows results of the parcel hazard analysis, sorted by Opportunity Area tier and type. There are 1,868 and 3,464 parcels in the 1% and 0.2% annual chance DFIRM flood zones, respectively.

Future Flooding Conditions

The flood risk assessment included a detailed analysis of historic and existing conditions through documentation of past occurrences and various mapping efforts conducted by multiple agencies, as well as an evaluation of areas likely to flood in the future/future flooding conditions. Future flooding conditions were considered by the City for this assessment using a variety of tools:

- The new FEMA DFIRMs (6/16/2015) and updated FIS provide information on the updated 1% and 0.2% annual chance floods and X-protected by levee areas based on the latest studies and considering recent growth and development in the City as well as recent and ongoing improvements to the area's flood control system. This new mapping is a representation of areas subject to major floods in the future and is used for regulatory and future planning and development purposes.
- Local Flood Mapping prepared by the City of Sacramento Department of Utilities. These maps have local floodplains identified throughout the City that are based on high water data, local hydrologic and hydraulic studies, and other reports of flooding.
- The City also maintains a separate database and mapping effort of all RL and historical loss properties in the City. This RL/historical loss analysis is also used to identify areas likely to flood in the future and to assist with the development of mitigation measures to mitigate future flood damage to these areas. This information and analysis is included in the City of Sacramento's updated 2015 RLAA Reports, attached as an Appendix to this plan.

- Also to be considered when evaluating future flood conditions in the City of Sacramento, the California DWR developed Best Available Maps (BAM)/Flood Awareness Maps.

Regulatory Considerations for Future Flood Conditions

As previously described, the City of Sacramento has been evaluating and determining the impact of both existing and future flood conditions, including development of a local program to address the 200-year state requirement for the ULOP. The City recently finalized updates to the General Plan and Floodplain Management Ordinance addressing new flood protection requirements that establish a 200-year flood standard of protection in urban areas (e.g., ULOP). This is the primary policy change that will affect construction in urban or urbanizing areas that are in an identified flood hazard zone. Areas not considered to be urbanizing will remain subject to the FEMA 0.1% standard of flood protection. Figure F-20 shows the 200-year ULOP areas within the City of Sacramento.

Future Flood Conditions: The Effects of Climate Change

The effects of climate change on future flood conditions should also be considered. While the risk and associated short and long term impacts of climate change are uncertain, experts in this field tend to agree that among the most significant impacts include those resulting from increased heat and precipitation events that cause increased frequency and magnitude of flooding. Changes associated with climate change and flooding could be significant given the effects of snowmelt runoff combined with significant rain events. Increases in damaging flood events may cause greater property damage, public health and safety concerns displacement, and loss of life. In addition, an increase in the magnitude and severity of flood events can lead to potential contamination of potable water and contamination of food crops. Displacement of residents can include both temporary and long-term displacement.

The City of Sacramento will continue to study the risk and vulnerability associated with future flood conditions, both in terms of future growth areas and other considerations such as climate change, as they evaluate and implement their flood mitigation and adaptation strategy for the City.

Future Flood Conditions: ARkStorm Scenario

Also to be considered in evaluating potential "worst case" future flood conditions for the City of Sacramento, is the ARkStorm Scenario. The USGS Multi Hazards Demonstration Project's (MHDP) developed a product called ARkStorm, which addressed massive U.S. West Coast storms analogous to those that devastated California in 1861-1862. Over the last decade, scientists have determined that the largest storms in California are the product of phenomena called Atmospheric Rivers (discussed above in the flood assessment in the discussion of Pineapple Express), and so the MHDP storm scenario is called the ARkStorm, for Atmospheric River 1000 (a measure of the storm's size).

Scientific studies of offshore deposits in northern and southern California indicate that storms of this magnitude and larger have occurred about as often as large earthquakes on the southern San Andreas Fault. Such storms are projected to become more frequent and intense as a result of climate change. This scientific effort resulted in a plausible flood hazard scenario to be used as a planning and preparation tool by hazard mitigation and emergency response agencies. A more complete discussion of the ARkStorm and potential impacts to Central Valley communities is included in Chapter 4 of the Base plan.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely
Vulnerability–High

Hazard Profile and Problem Description

Historically, the City has been at risk to flooding primarily during the spring months when river systems in the County swell with heavy rainfall. Localized flooding also occurs at various times throughout the year with several areas of primary concern unique to the City. Due to data limitations, these areas could not be mapped.

The risk of stormwater/localized flooding to future development can be minimized by accurate recordkeeping of repetitive localized storm activity. Mitigating the root causes of the localized stormwater or choosing not to develop in areas that often are subject to localized flooding will reduce future risks of losses due to stormwater/localized flooding.

The City local drainage system services approximately 100 square miles and is handled by a combination of gravity and lift stations which a total of approximately some 140 storm drainage basins. Since the City is typically lower than the elevated rivers by as much as 5-25 feet, the majority of the local drainage must be pumped into the rivers. The City operates 94 sumps and pumps to keep the drainage pumped down. A major power outage within any of these basins can cause significant local flooding.

The situation brought about by extremely heavy local rain storms could conceivably result in badly flooded streets and flooding of homes in some areas. It is probable that such situations would be brought about by a slow-moving high-intensity rainstorm over several hours reaching a peak intensity of ½" per hour later in the storm event. Any higher intensity storm event will cause localized flooding problems. An example is shown in Figure F-24.

Figure F-24 City of Sacramento – Localized Flooding at Anita Avenue and 23rd Street

Source: City of Sacramento Department of Utilities

Past Occurrences

December 2012: Severe rain for several days. The Department Operation Center (DOC) was activated for approximately a week due extreme weather forecasts.

2013: Sewer system overflow incident. DOC activation was not required.

December 2014 – Media and reports claimed severe rain predicted for multiple days. DOC activated for several days.

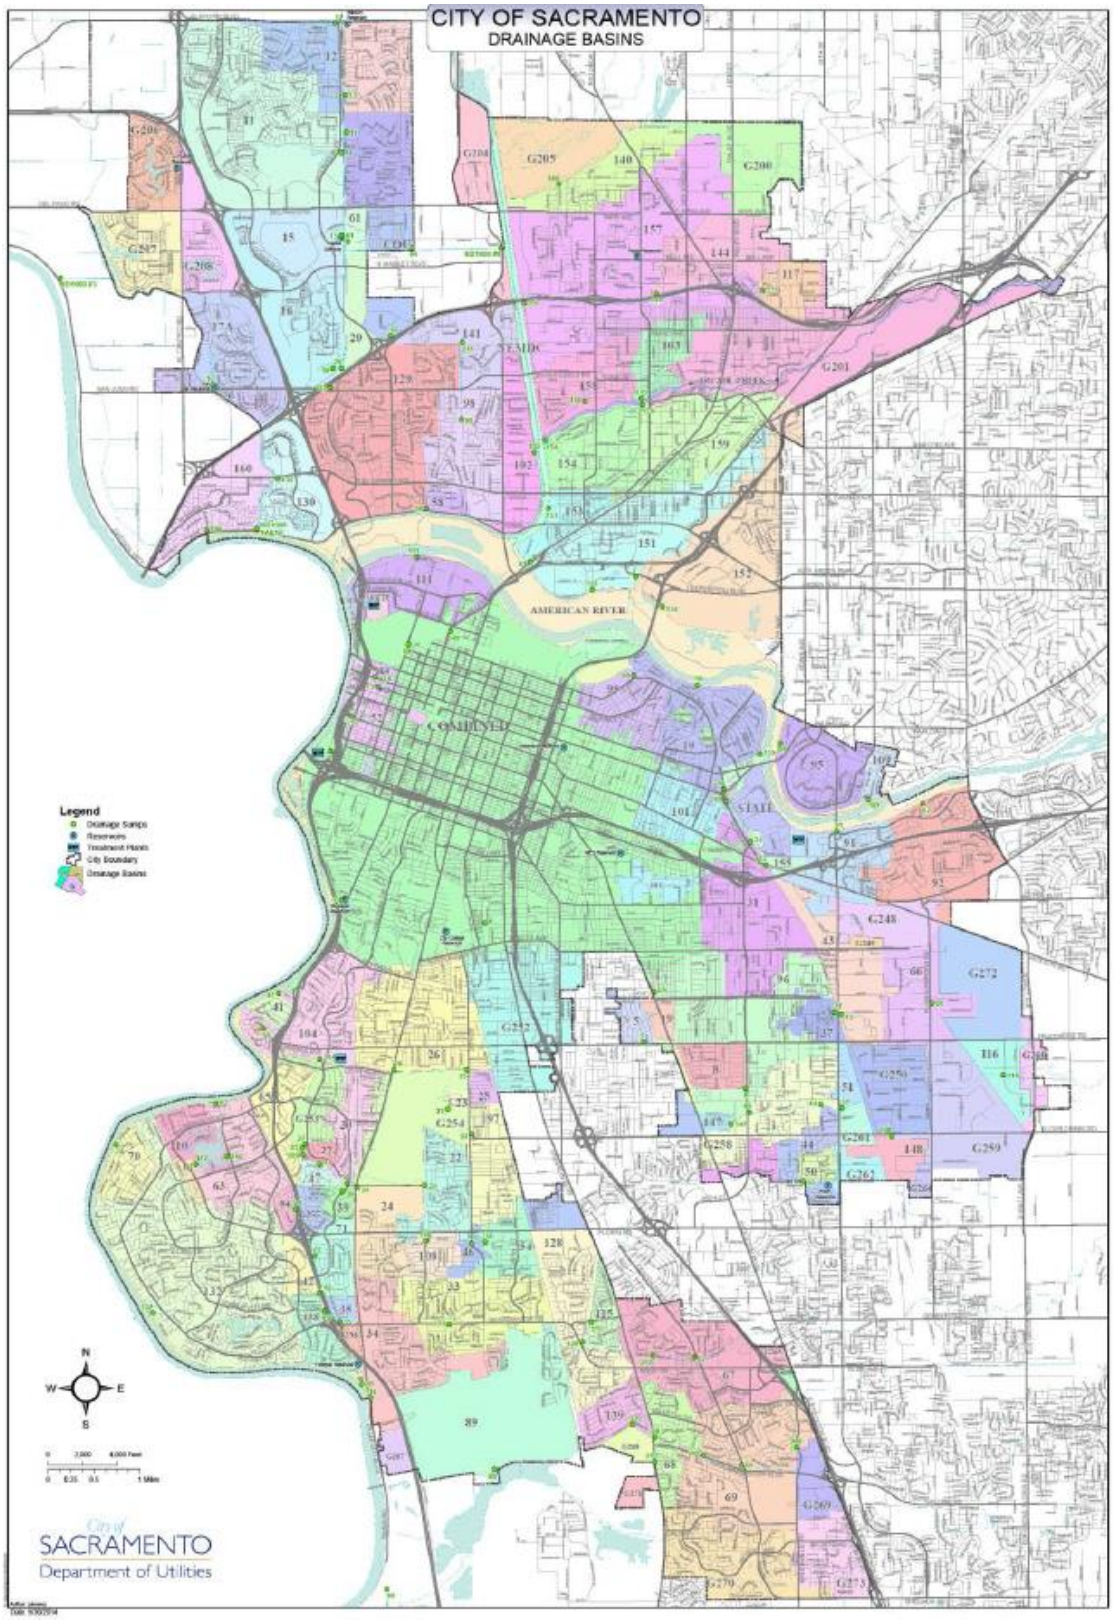
March 2016 – DOC was on alert due to heavy rain projections. DOC activation was ultimately not required.

Vulnerability to Localized Flooding

Although levee failure may result in much more catastrophic damage than flooding from internal drainage, most of the City's flood damage since 1955 has resulted from drainage deficiencies. In 1995, for instance, approximately 100 homes in 4 south area drainage basins incurred flood damage due to

internal drainage system failure during a particularly intense storm. The City has a total of 1,354 miles of storm drain pipes, 49,914 DIs, and 105 pump stations. The City's drainage basins are shown in Figure F-25. Much of this infrastructure was constructed before current storm drainage design guidelines were in place. In many areas, the system is sized based on outdated hydrology and does not have capacity to drain a 100-year storm event.

Figure F-25 City of Sacramento – Drainage Basins



Source: 2016 Comprehensive Flood Management Plan

Assets at Risk

Sewer and Drainage System Damage

In case of a major disaster, such as an earthquake or flood, the City of Sacramento's sewer collection system may be subject to many severe pipe failures. In the City's combined system, there may be complete pipe collapses, especially where the City's brick mains are located. Sewage pumping stations could and probably would be damaged at these locations. The Operations & Maintenance Division's sewer maintenance would close down and isolate areas where severely damaged pipes were located and bypass pumping would be implemented. Furthermore, this Division would have the responsibility of inspecting and evaluating the restoration of all sewers, sewer collections mains, and service laterals.

Energy Shortage

Should the City experience a shortage or shut-down of the fuel supply or electrical distribution system due to a flood, the Public Works Energy Emergency Coordinator will provide critical information and coordination. The Energy Coordinator will report to the Emergency Operations Center and provide information regarding critical City facilities in relation to function and auxiliary power.

Back-up generators at the pump stations are also available in case of a loss of power.

Problem Areas

The list below and Table F-40 identify known and past occurrences of such areas and the associated problems encountered. This list is an initial inventory of key problem areas and is not intended to be a complete inventory of all problems and locations associated with severe weather events and localized flooding in the City of Sacramento.

1. Sump (pump station) 157 screen. During rain events the north channel which empties into sump 157 conveys debris onto the screen which can reduce the pumping capacity of the station. The screen is monitored during rain events and cleaned as necessary.
2. Riza ditch near Stockton Boulevard and Riza Avenue. During rain events the screen on the culvert on the east side of Stockton Boulevard can become clogged with debris. The screen is monitored during rain events and cleaned as necessary.
3. Culvert at John Stiles ditch at Interstate 5 upstream of Sump 134. This culvert tends to clog during rain events. The culvert is monitored and cleaned as necessary.
4. Bypass pipe between Sumps 37 and 43 under Power Inn Road. Pipe tends to clog. Maintenance crews keep the pipe free and clear prior to rain events.
5. Inverted siphon under Fruitridge Road – Proctor and Gamble Ditch. Headwalls have been installed upstream and downstream of the inverted siphon, which allows crews to better service the siphon. During rain events the siphon is monitored and cleaned as necessary.
6. Sears ditch near Arden Way onramp to Business 80 freeway. This ditch terminates at a box culvert. The box culvert has a screen at the entrance to the culvert which tends to clog during first flush rain events. The screen is monitored and cleaned as necessary.
7. San Juan Road bridge. Screen on the south side of the bridge tends to clog during rain events. The screen is monitored during rain events and cleaned as necessary.

8. Sump 95 and 98. If these stations lose electrical power during rain events, the watershed tends to flood rapidly. Power to these stations is monitored during rain events and trailer mounted generators are available to provide backup power to these pump stations.
9. Sutterville Road at 24th Street. An 8-inch pipe in this area routinely plugs. Field crews check this pipe during storm events and provide the necessary maintenance to keep the pipe cleared.
10. Hagginwood ditch downstream of Arcade Boulevard near Acacia Avenue. This ditch has an ongoing trash problem and is difficult to clean. This ditch is monitored during rain events and cleaned as necessary.
11. Low lying area of the Valley Hi neighborhood
12. River Park neighborhood
13. Downtown Area – during rain events, the combined storm/sewer system can't handle all of the water causing a lot of street flooding
14. Florin Road and Meadowview Intersection
15. Sump 96 at Beach Lake Stables
16. Magpie Creek at Raley Blvd. A low lying area of Raley Blvd always fills up with water during rain events making it almost impossible to drive through.
17. Elvas Avenue & 65th Street near walking path to Sacramento State University
18. Sump 99 at McKinley Park in East Sacramento

Table F-40 City of Sacramento's Road List of Localized Flooding Problem Areas

Future Development

Future development in the City will add more impervious surfaces and need to drain those waters. The City will be proactive to ensure that increased development has proper siting and drainage for

stormwaters. New development and redevelopment requirements have been approved to mitigate flooding, hydromodification and water quality issues.

The risk of localized flooding to future development can also be minimized by accurate recordkeeping of repetitive localized storm activity. Mitigating the root causes of the localized stormwater flooding will reduce future risks of losses.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the City of Sacramento from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Levee Overtopping

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters. For example, on the American River, stages should be predictable for up to eight hours. On the Sacramento River system, depending on which dams are releasing the flows, advance warning of river stages may be as much as 24 hours.

When a flood control system provides 100-year flood protection, it means that in any given year there is a one-in-100 chance that a storm might occur that is beyond the containment capacity of levees and reservoirs. Similarly, 200-year flood protection means there is a one-in-200 chance that a storm might occur that the system could not handle, and 500-year protection means there is a one-in-500 chance that a storm will overwhelm the system.

Levee Status

USACE expired the City's levee certifications in 2012 and 2013 because the certifications no longer met USACE's risk & uncertainty criteria and/or were older than 10 years. This is shown in Table F-41. Figure F-26 shows the City of Sacramento's current levee status.

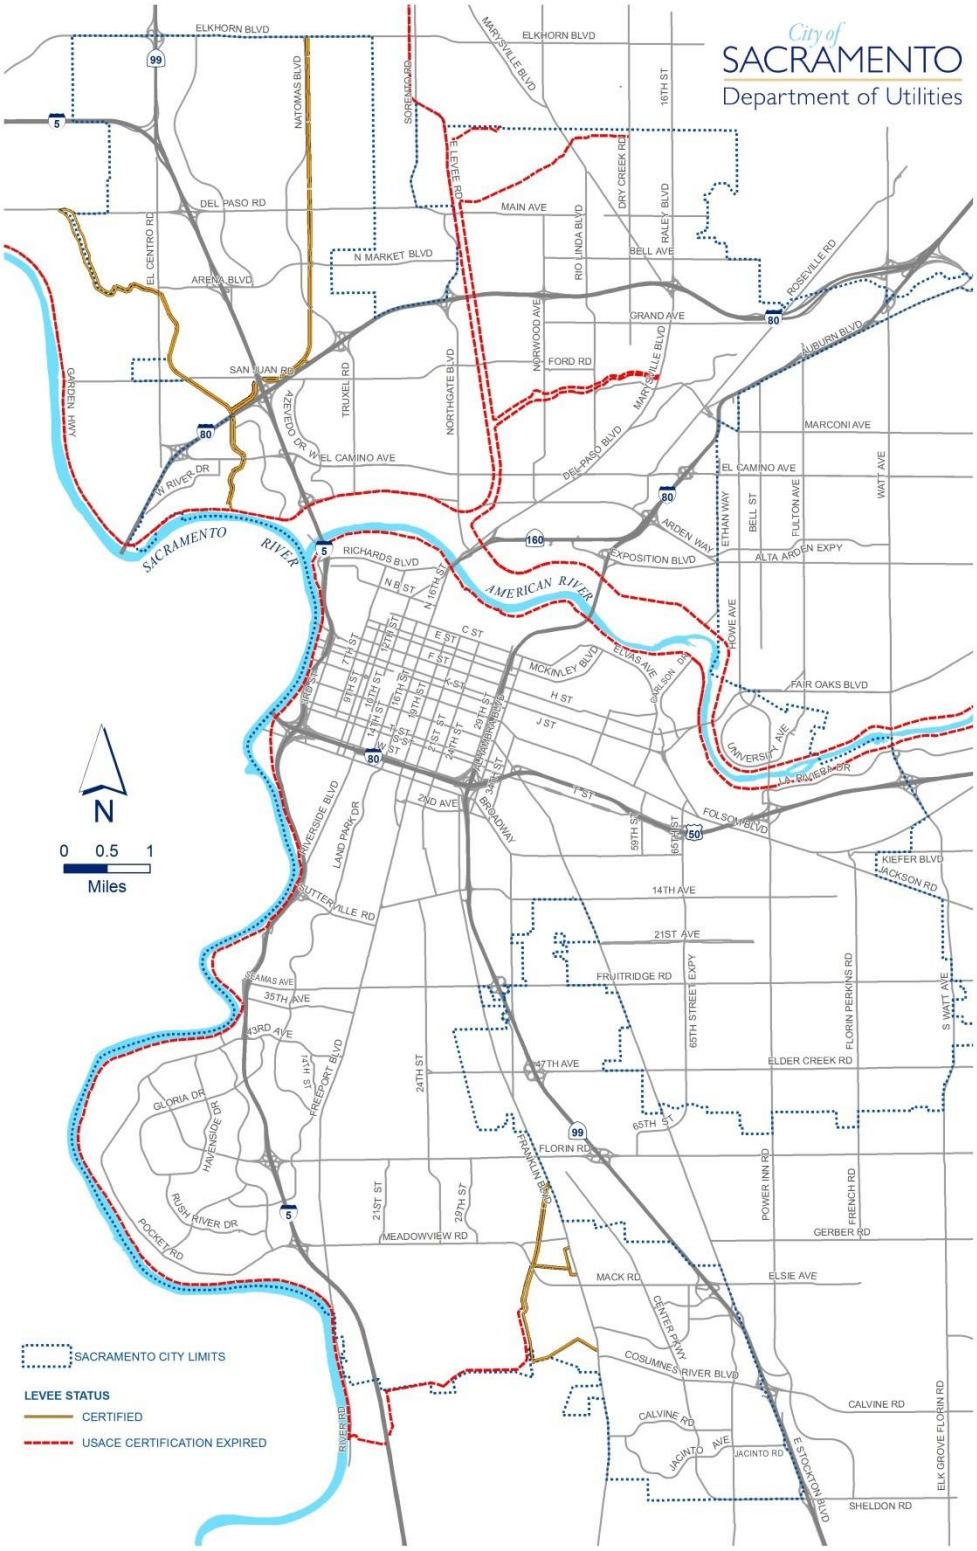
Table F-41 USACE Levee Certification Expiration Dates Stream Reach Expiration Date

Stream	Reach	Expiration Date
Dry Creek	North levee	March 19, 2012

Stream	Reach	Expiration Date
Robla Creek	South levee from approximately Sully Street to City border on the east	August 31, 2013
Robla Creek	South levee from junction with Natomas East Main Drainage Canal to approximately Sully Street	March 19, 2012
Arcade Creek	North and south levees	March 19, 2012
Natomas East Main Drainage Canal	East levee from junction with American River north levee to the pump station north of Dry Creek	March 19, 2012
American River	North and south levee (not including Natomas)	August 31, 2013
Sacramento River	Left bank levee from the junction with the American River to the southern City limits	August 31, 2013
Morrison Creek	Junction with Sacramento River to Unionhouse Creek Right bank from Unionhouse Creek to Brookfield Drive	August 31, 2013

Source: 2016 Comprehensive Flood Management Plan

Figure F-26 City of Sacramento Levee Status



Source: City of Sacramento Department of Utilities

In 2012, SAFCA along with the local communities and maintaining agencies, began developing a levee accreditation program to determine whether the levees protecting Sacramento along the lower American and Sacramento rivers and their tributaries (outside the Natomas Basin) adequately met the minimum requirements of the NFIP. The following projects need to be completed to accredit the levees:

Federal projects:

- Folsom Dam JFP
- Folsom Dam Raise
- American River Common Features WRDA 96/99
- South Sacramento Streams

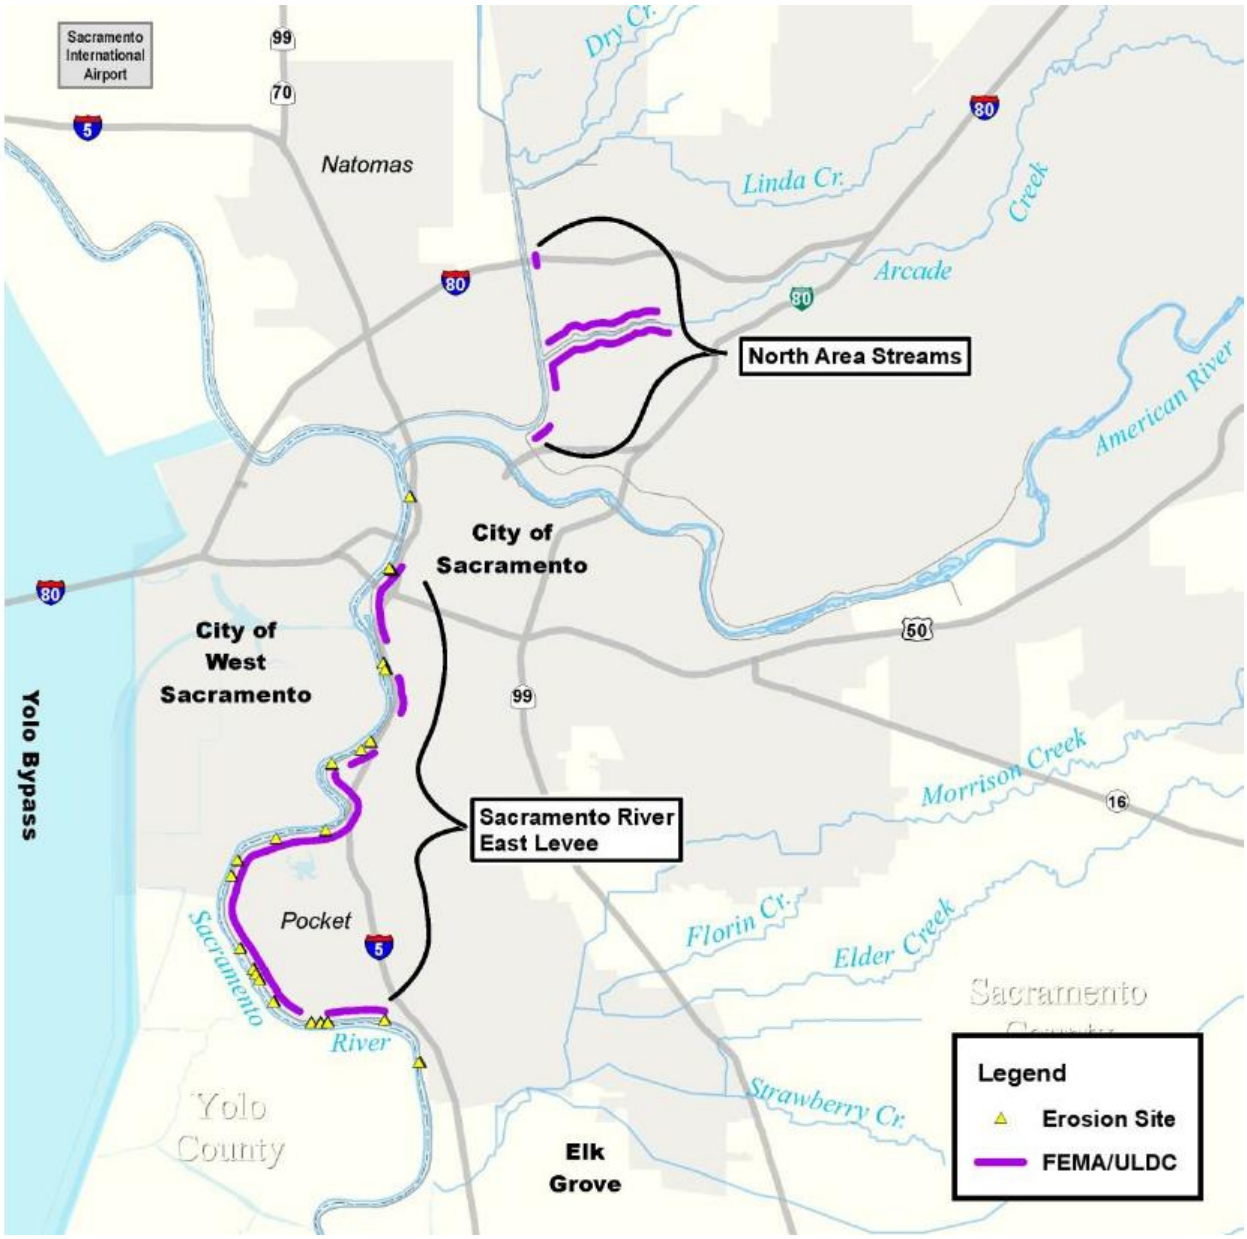
State and local projects:

- North Area Streams
- Sacramento River East Levee downstream of the American River
- Various high hazard encroachments/vegetation

The levees must also meet the State of California's Urban Levee Design Criteria (ULDC). The ULDC requires the city to address additional criteria including encroachments, vegetation, and access to the levees. It was decided that the levee deficiencies would be addressed in two phases – accreditation and modernization.

Figure F-27 shows areas that need to be addressed in the short term (5 to 7 years) to meet the NFIP accreditation and immediate ULDC requirements.

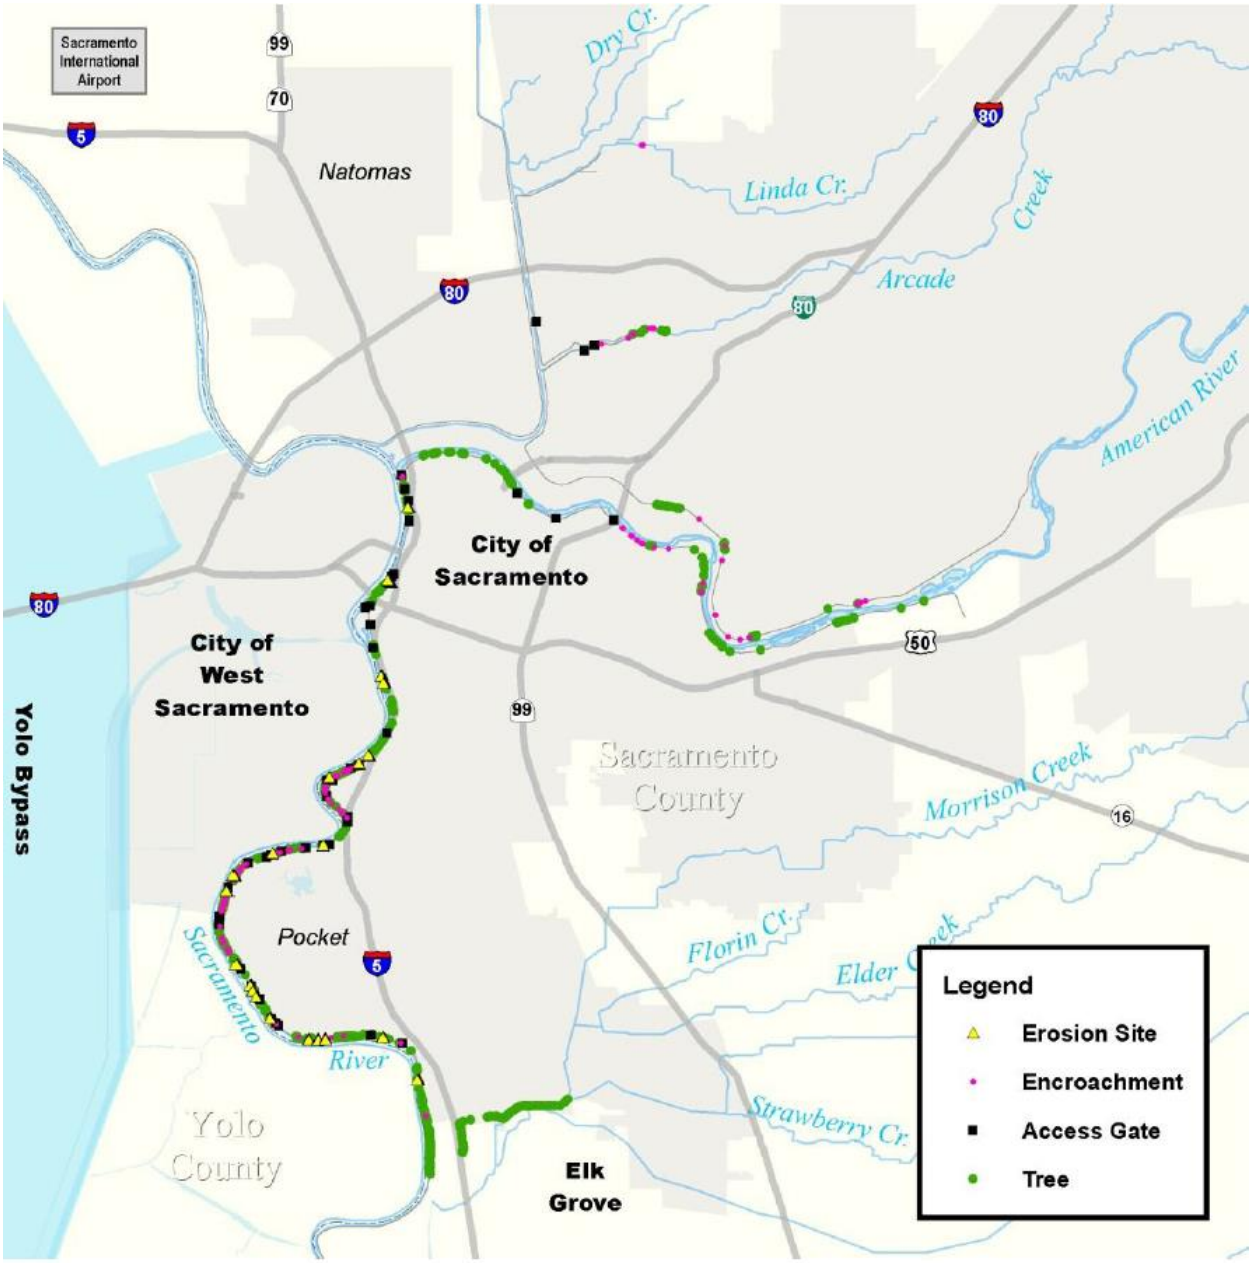
Figure F-27 City of Sacramento – Areas to be Addressed to Meet NFIP Accreditation and Immediate ULDC Requirements



Source: 2016 Comprehensive Flood Management Plan

The second phase is the modernization phase, which will be accomplished over 10-30 years. This will address encroachments, access, and vegetation that are categorized as low risk at the sites shown in Figure F-28.

Figure F-28 City of Sacramento – Sites in Long Term Modernization Process



Source: 2016 Comprehensive Flood Management Plan

Past Occurrences

December 9, 1861 - American River Levee failed east of 30th street, flooding what is now known as River Park. The water then overran the City's levee built to protect it. To relieve the building water levels, the levee at R & 5th Streets was cut to drain the "lake" but houses were swept away in the current in the cut in the levee.

Figure F-29 January 1862 K Street Flooding

Source: Drainage and Flood Control, 152 Year.

Vulnerability to Levee Failure

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee that causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

Values at Risk

GIS was used to determine the possible impacts of levee failure flooding within the City of Sacramento. The methodology described in Section 4.3.12 of the Base Plan was followed in determining structures and values at risk to a levee failure. However, this analysis was performed based on the most current 2015 DFIRMs which still reflect some levees as providing 100-year level of protection. According to the County, all levees have since been decertified as not providing a 100-year level of protection, so this analysis is based solely on the information presented in the DFIRMs. Further it is important to note that many levee improvement projects are ongoing throughout the Planning Area, some of which will be providing certification of area levees to both a 100-year and 200-year levels depending on applicable requirements. Thus, this analysis reflects a moment in time and while it does provide information on areas developed behind levees, the X Protected by Levee flood zone will continue to change as these projects are completed and new certifications obtained.

Table F-42 shows the property use, improved parcel count, improved values, estimated contents, total values and estimated loss of parcels that fall in a X Protected by Levee floodzone in the City.

Table F-42 City of Sacramento – Count and Improved Value by Property Use in X Protected by Levee Flood Zones

Property Use	Total Parcel Count	Improved Parcel Count	Total Land Value	Improved Structure Value	Total Value
X Protected by Levee Zone					
Agricultural	0	0	$0	$0	$0
Care / Health	120	94	$57,548,864	$419,739,056	$477,287,920
Church / Welfare	241	216	$43,415,824	$172,789,435	$216,205,259

Source: FEMA 4/16/2016 DFIRM, Sacramento County 2016 Parcel/2015 Assessor's Data

Table F-43 shows potential losses from levee failure with loss estimates and loss ratios for the City. The loss ratio is the loss estimate (i.e., total of improved and contents value for all parcels located in levee protected zones in the City) divided by the total potential exposure and displayed as a percentage of loss. Due to the varying flood depths that may occur during flooding, the loss estimate uses 3 scenarios: 3 foot flood depth (30% damage), 6 foot flood depth (60% damage to structure and contents), and total loss (all structure and contents are lost). Land values are not included in the loss estimates, as the land itself is usually not a loss. FEMA considers loss ratios greater than 10% to be significant and an indicator that a community may have more difficulties recovering from a dam failure.

Table F-43 City of Sacramento – X Protected by Levee Zone Loss Estimates

Flood Zone	Improved Parcel Count*	Improved Structure Value	Estimated Contents Value	Total Value	Loss Estimate*	Loss Ratio
X Protected by Levee	65,183	$14,955,735,307	$12,364,491,033	$27,178,507,343	$8,153,552,202.90 16,307,104,405.80 $27,178,507,343.00	17.6% 34.3% 57.2%

Source: Sacramento County 2016 Parcel/2015 Assessor's Data; Sacramento County DFIRM, April 2016

*Three values are shown here due to varying flood depths expected – 3-foot, 6-foot, and total loss.

According to the information in Table F-42 and Table F-43, the City has 65,183 improved parcels and roughly $27.2 billion of structure and contents value in the X Protected by Levee areas. The 3-foot loss

ratio of 17.6%, the 6-foot loss ratio of 34.3%, and the total loss ratio of 57.2% indicates that the City has significant amounts of assets at risk to possible levee failures.

Structures protected by levees that fail are often total losses. The analysis above assumes all levees in the City break at one time, which is unlikely. The extent and depth of actual flooding and associated damage will vary depending on the location, nature, depth, and extent of any levee break.

Population at Risk

The DFIRM flood zones were overlayed on the parcel layer. Those residential parcel centroids that intersect the severity zones were counted and multiplied by the 2010 Census Bureau average household factors for Sacramento. According to this analysis, shown in Table F-44, there is a total population of 161,675 residents of the City in an X Protected by Levee zone.

Table F-44 City of Sacramento – Count of Improved Residential Parcels and Population in X Protected by Levee Zones

Residential Parcels	Population
61,708	161,675

Source: FEMA 4/16/2016 DFIRM, Sacramento County 2016 Parcel/2015 Assessor's Data, US Census Bureau
* Average household populations from the 2010 US Census were used: Sacramento– 2.62.

Critical Facilities at Risk

An analysis was performed on the critical facility inventory in Sacramento in identified FEMA DFIRMs. GIS was used to determine whether the facility locations intersects a DFIRM X Protected by Levee area. Details of critical facilities in the levee protected areas in the City of Sacramento are shown in Figure F-22 and Table F-38. Details of critical facility definition, type, name and address and jurisdiction by flood zone are listed in Appendix E.

Natural Resources at Risk

The City Planning Team noted that the City's natural resources are at great risk from levee failure. Many habitats and biological resources would be impacted by flood waters.

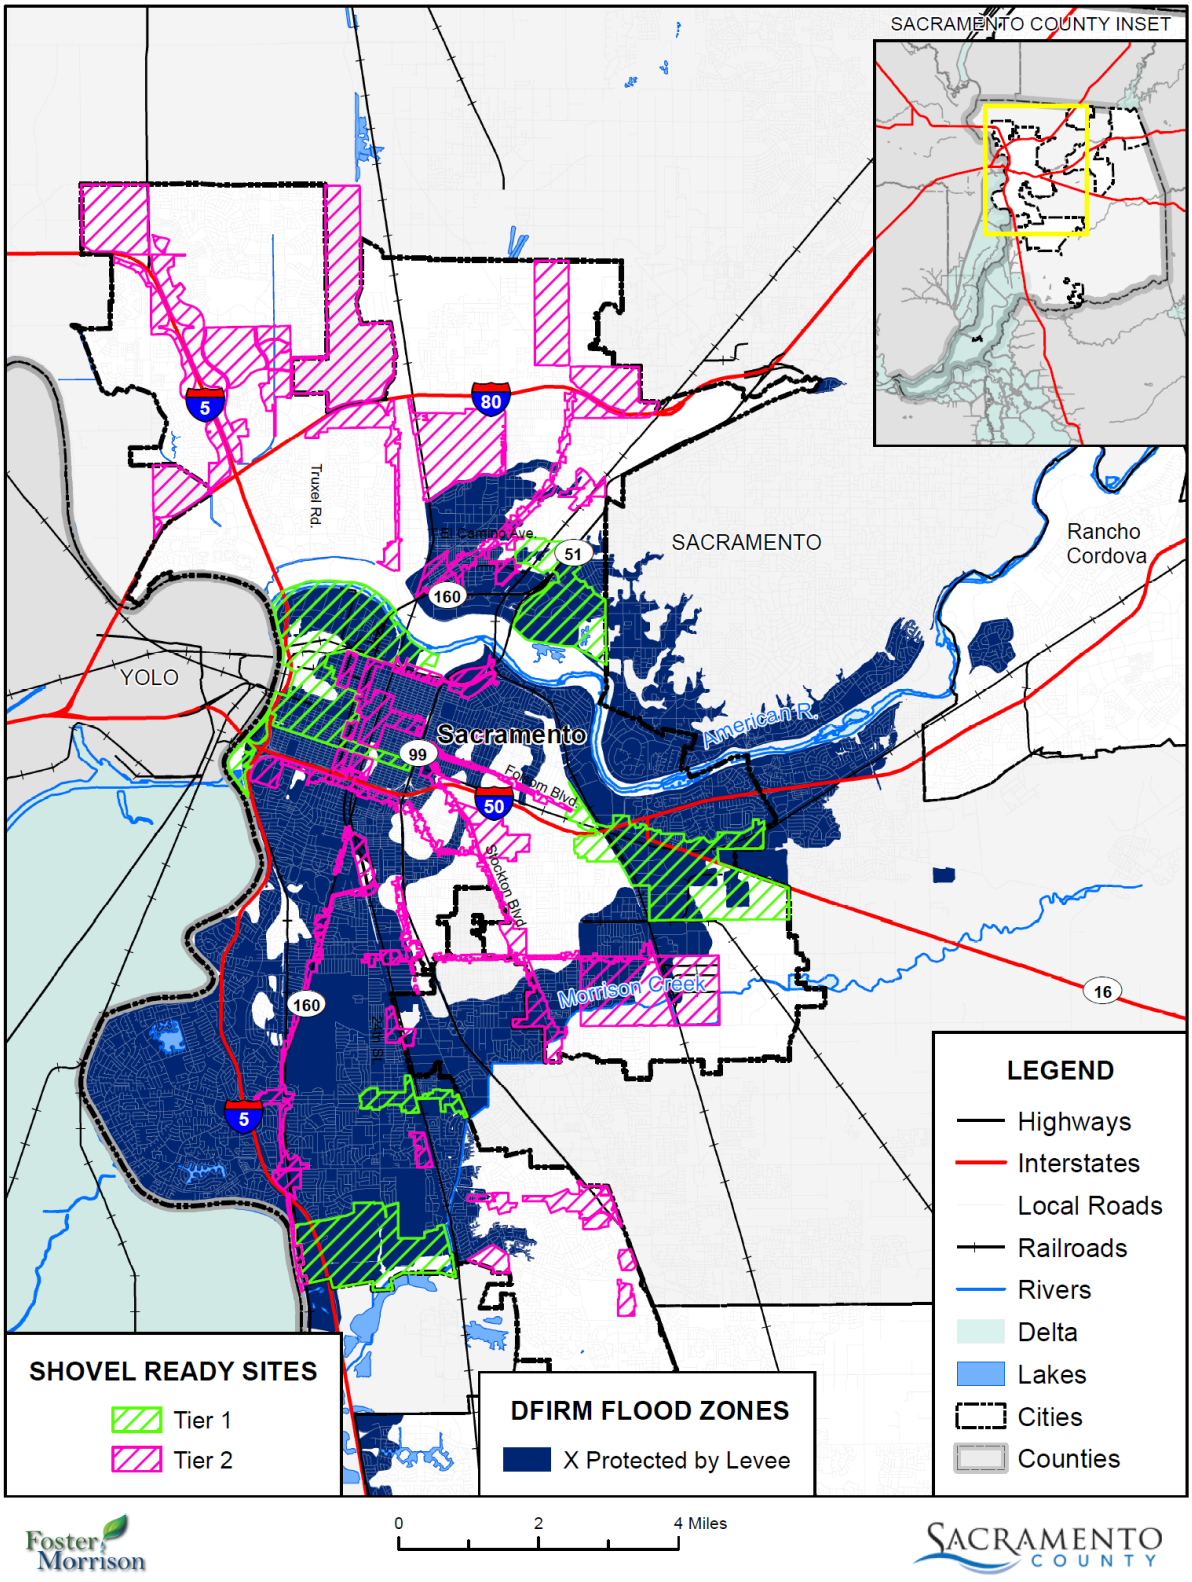
Historic and Cultural Resources at Risk

The City Planning Team noted that the City's historic and cultural resources are at great risk from levee failure. Many of these resources are located near the City's levee system and in low lying areas that would be impacted by flood waters.

Future Development

Hazard analysis was performed to determine the number of parcels in the FEMA DFIRM X Protected by Levee flood zones within the Opportunity Areas. Results can serve as a vulnerability analysis guide for future development. Figure F-31 shows the Opportunity Areas overlaid on the DFIRM flood zones. Table F-46 shows results of the parcel hazard analysis, sorted by Opportunity Area tier and type. There are 8,064 parcels in the X Protected by Levee DFIRM flood zone.

Figure F-31 City of Sacramento – Future Development in DFIRM X Protected by Levee Flood Zone



Data Source: Sacramento County GIS, Cal-Atlas, FEMA NFHL 04/16/2016; Map Date: 05/2016.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system. Due to the vast system of levees that protect the City (see Figure 4.75 in Section 4.3.10 for areas of the City protected by levees), erosion of levees is of critical importance.

Past Occurrences

2005: Sacramento River, River Mile 78.3 – Left Bank – Bank erosion that required the site to be staked and rock was stockpiled along the top of the bank. Erosion length is approximately 654 feet.

2006: Sacramento River, River Mile 47.0 – Left Bank - Bank erosion which required rock slope protection repair. The length of the repair was approximately 1,156 feet.

Figure F-32 Sacramento River Mile 47.0

Source: US Army Corps of Engineers, Critical Levee Erosion Site Fact Sheet

2006: Sacramento River, River Mile 68.9 – Left Bank - Bank erosion which required rock slope protection repair. The length of the repair was approximately 786 feet.

Vulnerability to Erosion

The 2016 CFMP reported that the USACE receives yearly appropriations to implement the Sac Bank program, which addresses erosion issues. As a result, erosion repair work occurs yearly along the river system. Over the last several years, the Sacramento area has had an average of three to four sites a year repaired, averaging over $2 million per year.

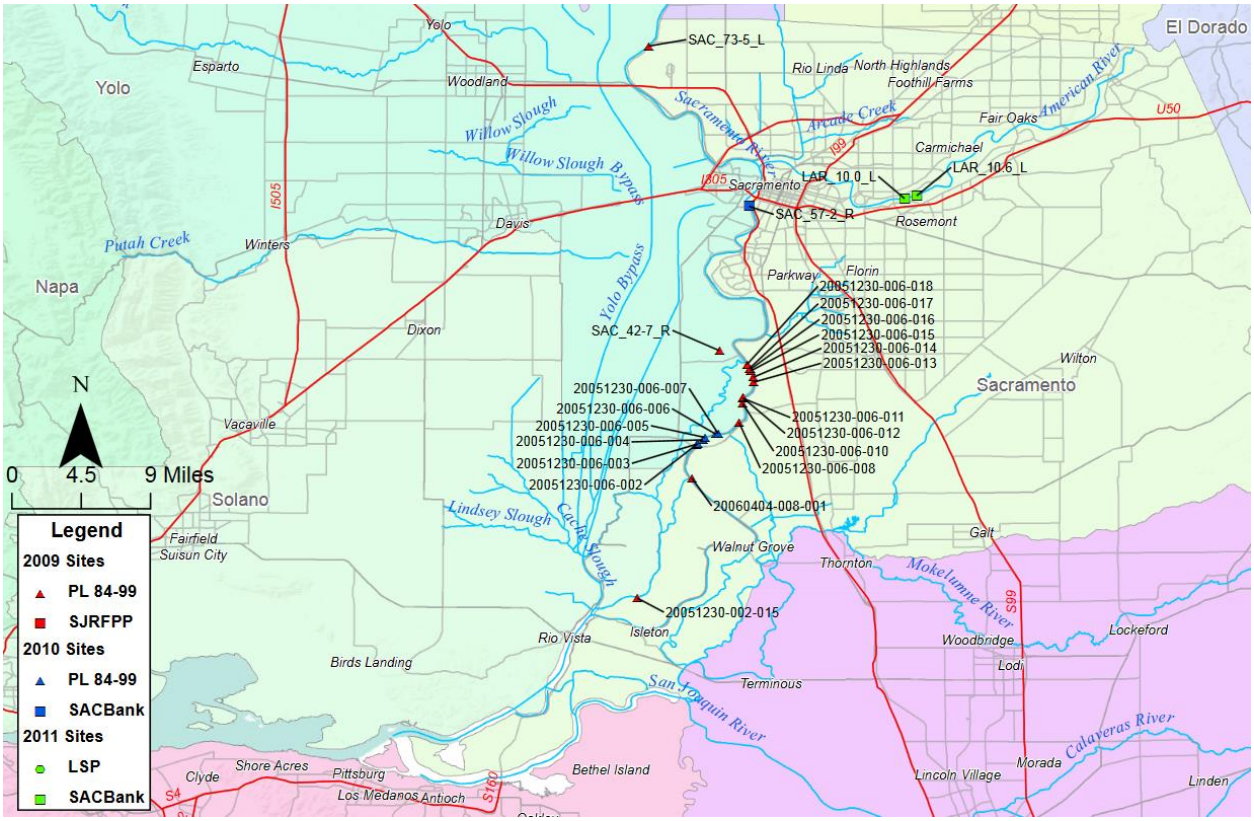
Assets at Risk

On February 24, 2006, following sustained heavy rainfall and runoff, Governor Arnold Schwarzenegger declared a State of Emergency for California's levee system, commissioning up to $500 million of state funds (AB142) to repair and evaluate State/federal project levees. Following the emergency declaration, Governor Schwarzenegger directed the California Department of Water Resources (DWR) to secure the necessary means to fast-track repairs of critical erosion sites. To date, nearly 300 levee repair sites have been identified, with more than 100 of the most critical sites having already been completed with AB142 funds. Repairs to others are either in progress or scheduled to be completed in the near future, and still more repair sites are in the process of being identified, planned, and prioritized.

DWR is the lead agency for the Sacramento-San Joaquin Erosion Repairs Program, while the United States Army Corps of Engineers (USACE) is the lead agency for the Sacramento River Bank Protection Project. There are essential differences between the types of repair sites. "Critical Erosion Repair sites" are the highest-priority erosion sites where levee degradation from erosion has occurred to the extent that they are at risk of failure even during normal flow conditions.

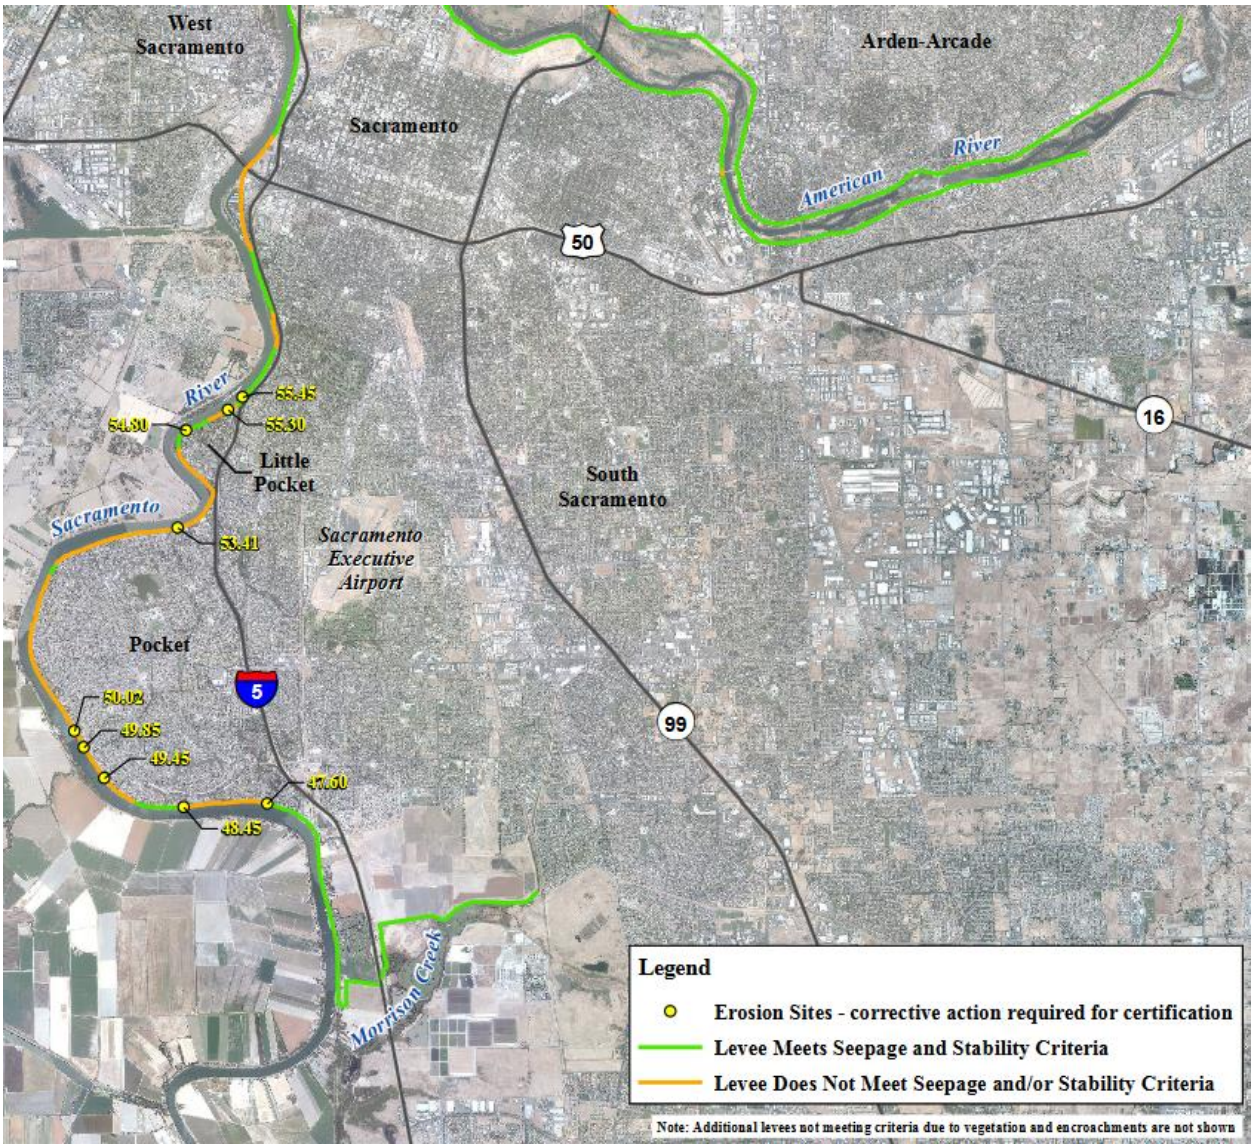
The Urban Level of Flood Protection Plan will address many erosion sites within the City of Sacramento over the next ten years. Recent erosion repair sites on levees that protect the City of Sacramento are shown on Figure F-33 and Figure F-34.

Figure F-33 Streambank Erosion Sites in 2009 and 2011



Source: California Department of Water Resources, Levee Repairs Program, 2009-2011 Sites

Figure F-34 Sacramento River Erosion Sites in 2013



Source: SAFCA Levee Certification, MBK Engineers, July 2013

Future Development

Within the Sacramento area, programs addressing long term erosion protection have been developed. Bank protection measures typically consist of large angular rock placed to protect the bank topped with a layer of soil/rock material to allow vegetation re-grow back on the bank. In addition, dead trees may be added to the mixture for additional habitat value.

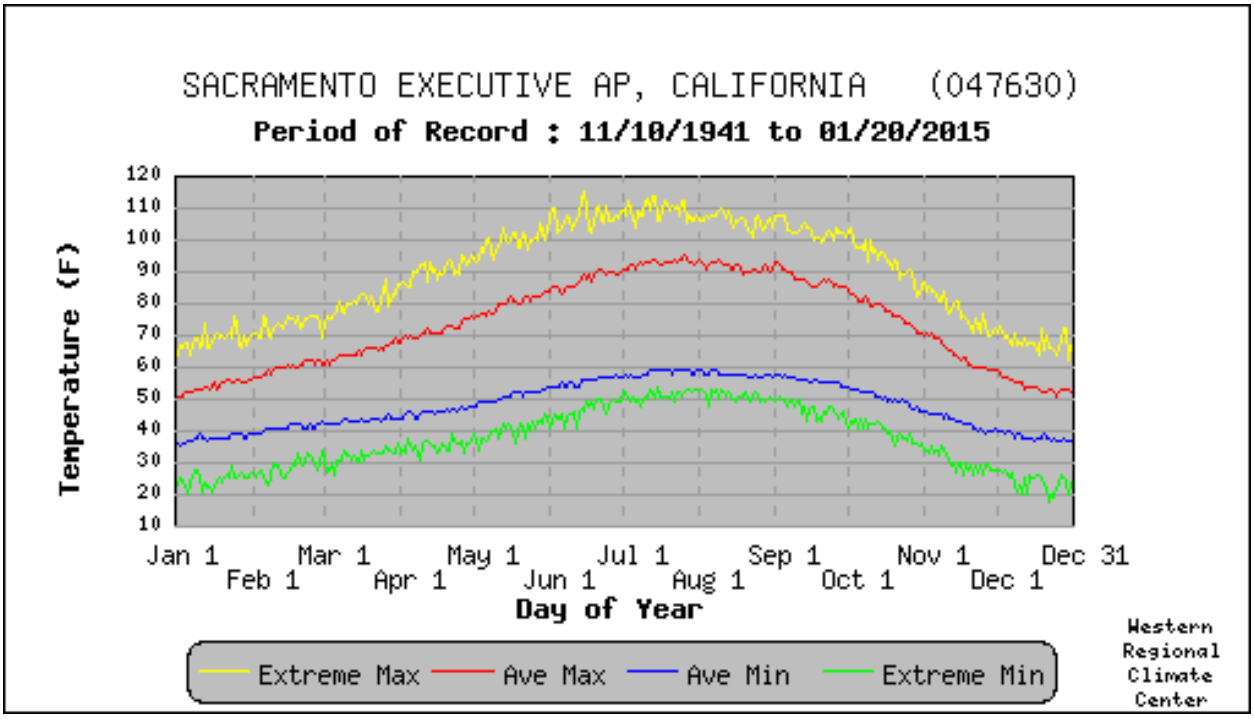
Severe Weather: Extreme Temperatures – Extreme Cold/Freeze

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

The City of Sacramento experiences severe weather including peak periods of extreme cold and freeze. In general, individuals are able to dress appropriately and stay sheltered during these peak periods, however the City's elderly population and homeless are highly susceptible to the extreme temperatures. The City experiences temperatures that hover around or below 32 degrees during the winter months (see Figure F-35). Many months see a high number of days where daily low temperatures fall below 32°F. Generally, people who live and work in this weather are prepared to cope with the extremes in that they dress appropriately and stay indoors.

Figure F-35 Daily Temperatures Averages and Extremes for the City of Sacramento



Source: Western Regional Climate Center, Sacramento FAA Airport Station

Past Occurrences

Past average occurrences of extreme cold in the City of Sacramento are shown in both Table F-47 and Table F-48.

Table F-47 Record Low Temperatures in the City of Sacramento

Month	Temperature	Date	Month	Temperature	Date
January	23°	1/1979	July	48°	7/1983
February	23°	2/1989	August	49°	8/1978
March	26°	3/1971	September	43°	9/1978
April	32°	4/1953	October	36°	10/1989

Vulnerability to Severe Weather: Extreme Temperatures – Extreme Cold/Freeze

Assets at Risk

Impact to such cold temperatures has resulted in damage to such infrastructure as; domestic water pipes, irrigation systems, unprotected fire protection systems (fire sprinklers) and surface icing on streets and walkways. Health impacts are the primary concern with this hazard, though economic impacts are also an issue. The elderly and individuals below the poverty level are the most vulnerable to extreme temperatures. Nursing homes and elder care facilities are especially vulnerable to extreme heat events if power outages occur and air conditioning is not available. In addition, individuals below the poverty level may be at increased risk to extreme heat if use of air conditioning is not affordable.

Future Development

Future development in the City is regulated by building codes that mitigate the problems of cold and freeze on these structures. Future development will continue to happen in the City and will not be constrained by cold and freeze.

The Sacramento Housing and Rehabilitation Agency and County Department of Human Services currently operate programs such as the Winter Shelter Program and In-Home Support Services which help address severe weather conditions needs for vulnerable populations. Continued community outreach and

potential regulatory mitigation capabilities would further address the extreme cold/freeze hazard within the community.

Severe Weather: Extreme Temperatures – Extreme Heat

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

The City of Sacramento experiences temperatures in excess of 100 degrees during the summer and fall months. The temperature moves to 105-110° F in rather extreme situations (see Figure F-35 above). Many months see a high number of days where daily high temperatures exceed 90°F. Generally, people who live and work in this weather are prepared to cope with the extremes in that they dress appropriately and stay in air conditioned buildings during the peak temperature periods of the day.

Past Occurrences

Past average occurrences of extreme heat in the City of Sacramento are shown in both Table F-49 and Table F-50.

Table F-49 Record High Temperatures in the City of Sacramento

Month	Temperature	Date	Month	Temperature	Date
January	74°	1/12/2009	July	114°	7//1983
February	76°	2/19/1964	August	110°	8/10/1996
March	88°	3/5/1971	September	108°	9/01/1950
April	95°	4/9/1999	October	104°	10/02/2001
May	105°	5/3/1950	November	87°	11/01/1960
June	115°	6/7/1950	December	73°	12/02/2011

Source: Western Regional Climate Center, Sacramento FAA Airport Station

Table F-50 Average Number of Days in a Month Exceeding 90°F

Month	Days Exceeding 90°F	Month	Days Exceeding 90°F
January	0	July	21.3
February	0	August	19.1
March	0	September	12.8
April	0.5	October	2.5
May	5.4	November	0
June	11.6	December	0

Source: Western Regional Climate Center, Sacramento FAA Airport Station

During the writing of this plan, extreme temperatures were experienced in late July. Temperatures reached 105°F on multiple days.

Vulnerability to Extreme Heat

Assets at Risk

Health impacts are the primary concern with this hazard, though economic impacts are also an issue. The elderly and individuals below the poverty level are the most vulnerable to extreme temperatures. Nursing homes and elder care facilities are especially vulnerable to extreme heat events if power outages occur and air conditioning is not available. In addition, individuals below the poverty level may be at increased risk to extreme heat if use of air conditioning is not affordable.

Reliance on air conditioning causes a strain on the electrical energy in the Sacramento area. Occasionally peak demands outweigh supply and a condition known as brown-out occurs. This is an extremely dangerous situation for electrical equipment as it operates without the needed electricity causing damage to the systems. Days of extreme heat have been known to result in medical emergencies, civil unrest, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts.

Future Development

Vulnerability to extreme heat will increase as the average age of the population in each City shifts. Greater numbers of future senior citizens will result from the large number of baby boomers in the City. The elderly are more at risk to the effects of extreme heat, especially those without proper air conditioning. However, many of the residents of the City are accustomed to living with extreme heat and take precautions to guard against the threat of extreme heat. The City will continue to enhance the City's tree canopy and encourage "green" infrastructure, such as rooftop gardens and light-colored pavement, to reduce urban heat island effects.

Severe Weather: Heavy Rains and Storms

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the City of Sacramento. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

December 2012 – Severe rain for several days. The DOC was activated for approximately a week due extreme weather forcasts.

December 2014 – Media and reports claimed severe rain predicted for multiple days. DOC activated for several days.

March 2016 – DOC was on alert due to heavy rain projections. DOC activation was ultimately not required.

Vulnerability to Heavy Rain and Storms

Assets at Risk

Heavy rain and thunderstorms are the most frequent type of severe weather occurrence in the area. Wind and lightning often accompany these storms and have caused damage in the past. Problems associated with the primary effects of severe weather include flooding, pavement deterioration, washouts, high water crossings, landslide/mudslides, debris flows, and downed trees.

Future Development

The City enforces the state building code and other ordinances, which regulate construction techniques that minimize damage from heavy storms and rain. Future development in the City is subject to these building codes. New critical facilities such as communications towers should be built to withstand hail damage, lightning, and heavy rains.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

On an annual basis the City of Sacramento experiences severe storms accompanied by strong wind and wind gusts. High winds combined with cold temperatures have caused significant damage to public infrastructure (primarily the electric grid). Since 1978, the Sacramento area has experienced 12 tornados. The longest path of a tornado in the area was 2 miles and the widest path was 100 yards. No injuries or fatalities have been recorded.

Past Occurrences

- January 2006: A series of storms accompanied by winds as fast as 63 MPH struck Northern California for a period of a week. Two deaths were recorded by falling trees as a result of high winds. The storm resulted in over $300 million of damage and 10 counties, including Sacramento, being classified as federal disaster areas.
- January 2008: Severe winds exceeding hurricane force strength were a part of the January 2008 North American Storm Complex, a series of 3 storms that hit the California region. In California, 1.2 million residents were left without power due to the approximately 500 miles of power lines were damaged in the state. Listed below are the largest tornadoes for the Sacramento area.

Listed below are the largest tornadoes for the Sacramento area:

- **February 7, 1978**: Fujita 2, Width 20 yards, Length 1.9 miles
- **March 22, 1983**: Fujita 1, Width 50 yards, Length 2 miles
- **April 19, 1988**: Fujita 1, Width 30 yards, Length 1 mile

Source: Tornado History Project

Vulnerability to Severe Weather: Wind and Tornadoes

Assets at Risk

Strong wind is a frequent type of severe weather occurrence in the area. Wind often accompanies the region's storms and has caused damage in the past. Buildings that house populations at risk such as schools, nursing homes, hospitals, and urgent care facilities are at risk to wind and tornadoes. Also at risk are power lines, which can arc or be damaged during high wind events. The City has had power outages and damages to electric lines in past storms. This is especially difficult when the outages impact the stormwater pumps, which can exacerbate flooding.

Future Development

The City enforces the state building code and other ordinances, which regulate construction techniques that minimize damage from high winds. Future development in the City is subject to these building codes.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Because of the expansion of development into the rural areas adjacent to and within many communities, the urban-wildland interface fire is one that burns along the interfaces and can result in major losses of property and structures. The City of Sacramento is not immune to the threat of an urban wildfire. Generally, the fire season extends from early spring to late fall. Hazards arise from a combination of hot weather, an accumulation of vegetation, and low moisture content of the air. These conditions, when coupled with high winds and years of drought, compound the potential impact of a fire.

Some areas of the City have been identified as susceptible to urban-wildland fires. The areas are generally along the America River Parkway from Watt Avenue to the Sacramento River and along the Garden Highway in the Natomas area.

The American River Parkway is a stretch of a dense trees and brush on both sides of the American River. It is bordered by extensive commercial and residential development, including California State University, Sacramento. The parkway property is owned by the State of California, maintained by the Sacramento County Parks Department, and protected from fire by the Sacramento City Fire Department. The area is natural habitat with no fire break areas. Access for fire equipment is difficult and is limited to the paved stretches of the bicycle path. Some of the potential fire areas are not accessible to vehicular traffic. Fires occurred in the area in 1985 and 1992.

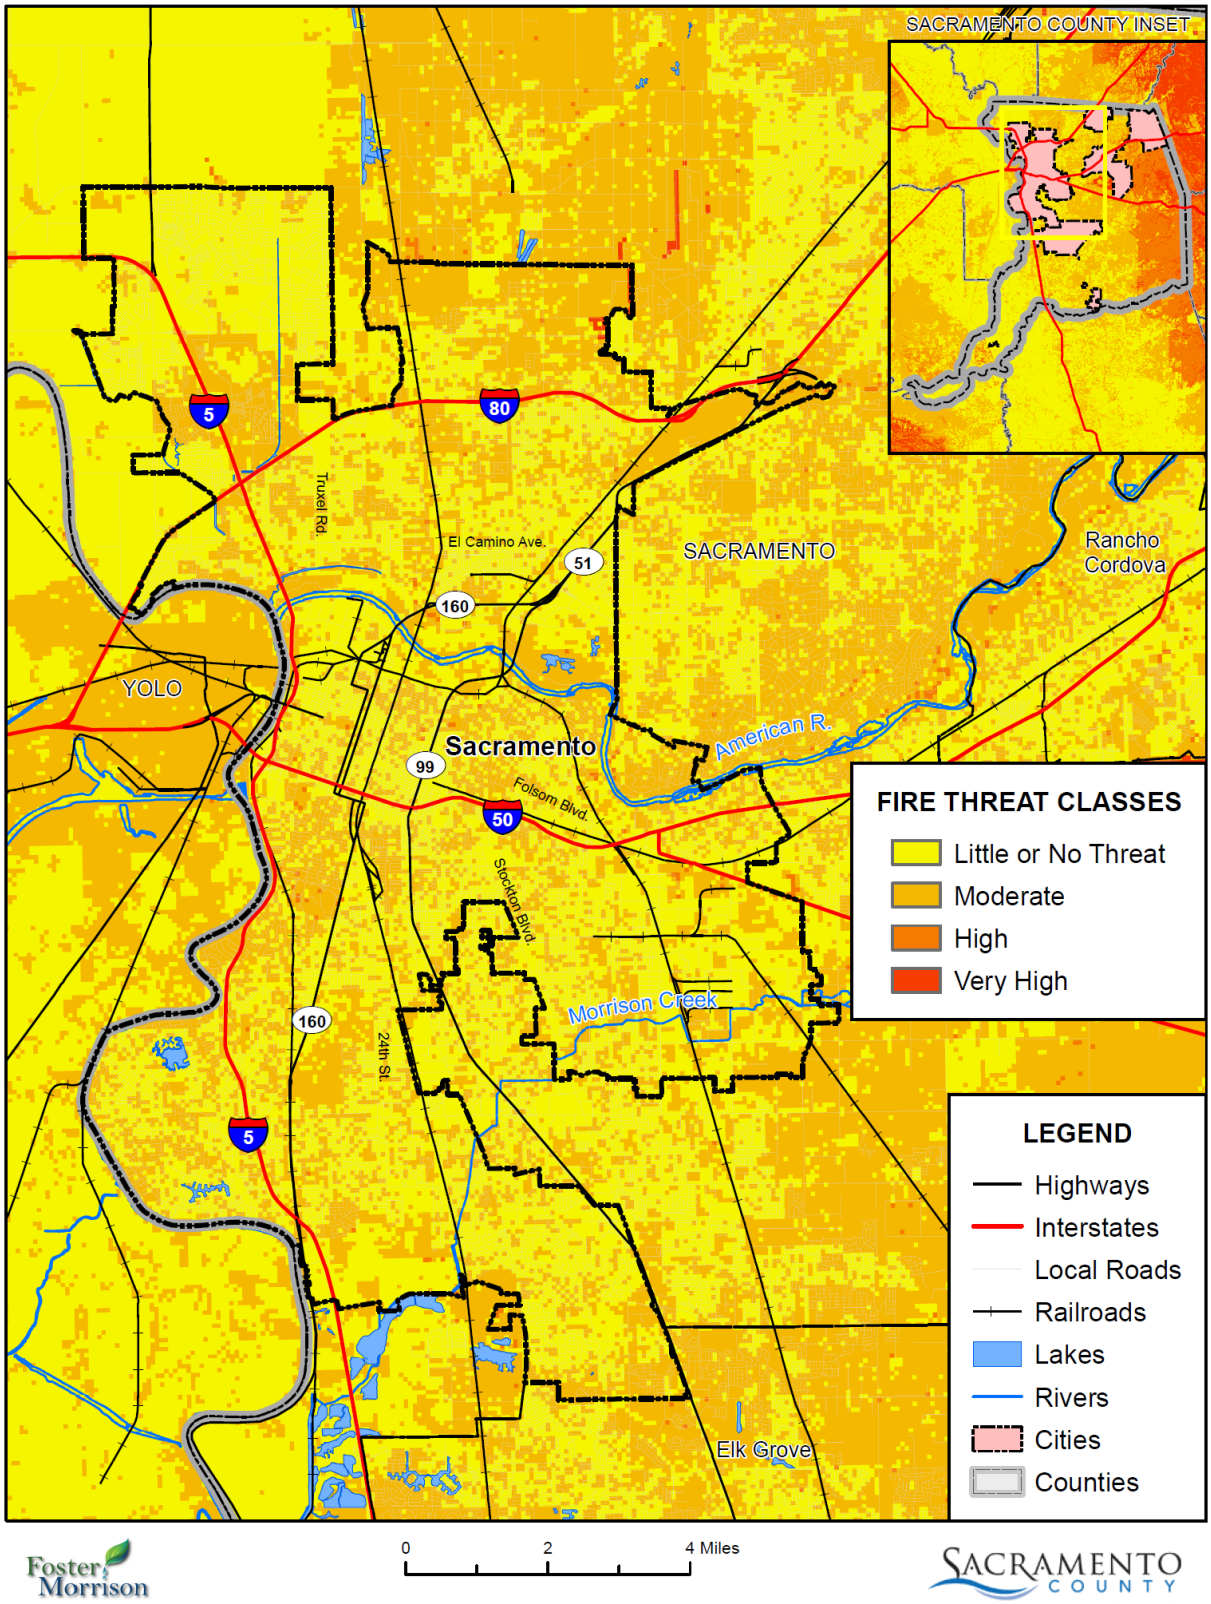
Past Occurrences

According to the City Planning Team, large wildland fires occur approximately every 2-3 years that require a large number of fire resources and affect the adjacent populations. The last large fire occurred on July 4, 2014 that burned approximately 100 acres in the Bushy Lake area adjacent to the Cal Expo Fairgrounds. The fire caused the evacuation of the nearby water park, caused the cancellation of the professional soccer game, and postponed the largest pyrotechnic show in the region. Additionally, the incident drew down fire resources from the entire county and required the request of resources from Cal Fires Amador, El Dorado Ranger Unit to assist in mitigation.

Vulnerability to Wildfire

Following the methodology described in Section 4.3.17, a wildfire map for the City of Sacramento was created (see Figure F-36). Wildfire threat within the City ranges from little or no threat to moderate.

Figure F-36 City of Sacramento's Fire Threat Zones



Data Source: Sacramento County GIS, Cal-Atlas, Cal-Fire 2004 Fire Threat Data; Map Date: 05/2016.

Assets at Risk

Analysis results for Sacramento are shown in Table F-51, which summarizes total parcel counts, improved parcel counts and their structure values by occupancy type as well as the percentage of parcels affected by fire.

Table F-51 City of Sacramento – Count and Value of Parcels by Property Use and Fire Threat Zone

Property Use	Total Parcel Count	Total Land Value	Improved Parcel Count	Improved Structure Value	Total Value
Little or No Threat					
Agricultural	6	$2,922,804	1	$150,617	$3,073,421

Population at Risk

The Fire Threat Zone dataset was overlayed on the parcel layer. Those residential parcel centroids that intersect the severity zones were counted and multiplied by the 2010 Census Bureau average household factors for each jurisdiction and unincorporated area. Results were tabulated by jurisdiction. According to this analysis, there is a total population of 110,200 residents of Sacramento at risk to moderate or higher wildfire risk. This is shown in Table F-52.

Table F-52 City of Sacramento – Count of Improved Residential Parcels and Population by Fire Threat Zone

Fire Threat Zone	Improved Residential Parcels	Population*
Little or No Threat	82,879	217,142
Moderate	42,026	110,108
High	34	89
Very High	1	3

* Average household populations for Sacramento (2.62) from the 2010 US Census were used

Critical Facilities at Risk

Wildfire analysis was performed on the critical facility inventory in Sacramento County and all jurisdictions. GIS was used to determine whether the facility locations intersect a fire severity zone provided by CAL FIRE, and if so, which zone it intersects. There are 289 facilities in the moderate or higher fire severity zone in the City. These are shown in Figure F-37 and detailed in Table F-53. Details of critical facility definition, type, name and address and jurisdiction by fire severity zone are listed in Appendix E.

Future Development

Development may occur in the moderate or higher wildfire severity areas; however, City ordinances for buildings in these areas are enforced. Most the City's wildfire hazard area is owned by the State of California or Sacramento County and is preserved as a natural habitat.

GIS Analysis

Hazard analysis was performed to determine the number of parcels in the CAL FIRE fire threat zones within the Opportunity Areas. Results can serve as a vulnerability analysis guide for future development. Figure F-38 shows the Opportunity Areas overlaid on the fire threat zones. Table F-56 shows results of the parcel hazard analysis, sorted by Opportunity Area tier and type. There are 5,146 parcels in the moderate or higher fire threat zone.

F.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

F.6.1. Regulatory Mitigation Capabilities

Table F-55 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the City of Sacramento.

Table F-55 City of Sacramento's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
General Plan	Y 2015	The General Plan identifies hazards within the City. Identified mitigation actions can be implemented from this document.
Capital Improvements Program	Y 2012-2017	The Capital Improvement Program is a five-year expenditure plan which provides the City with a financial plan for the funding of infrastructure and facility projects. The program identifies projects to address the City's natural hazards.
Economic Development Plan	N	
City Emergency Operations Plans	Y 2016	This plan addresses potential hazards that face the community. Mitigation projects are not identified.
Continuity of Operations Plan	Y	Essential functions of City staff, relocation strategies, recover and reconstruction strategies have been developed in the event of a disaster. Does not identify mitigation strategies.

Transportation Plan	Y	This City's transportation plan is incorporated into the 2035 General Plan, Mobility. This portion of the plan identifies mitigation goal for greenhouse gases related to extreme weather hazards.
Stormwater Management Program	Y	This program regulates future and current stormwater standards to protect the City against high priority hazards, such as, flooding and severe storms.
Engineering Studies for Streams	Y	Many of the studies exam the impacts of a 100-year and 200-year storm. At times the studies provide mitigation options for flooding issues.
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y	The City has prepared the 2035 General Plan as a qualified plan for the reduction of greenhouse gas emissions. Therefore, the General Plan serves as the City's Climate Action Plan.
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year: 2013 The Building Code is adequately enforced.
Building Code Effectiveness Grading Schedule (BCEGS) Score	Y	Score: 2/2 The Building Code is adequately enforced.
Fire department ISO rating:	Y	Rating: 2 (within city limits), 3 (in contract areas – Natomas and Fruitridge Pacific) The fire protection codes is adequately enforced.
Site plan review requirements	Y	Site plan review requirements are adequately enforced.
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts?** **Is the ordinance adequately administered and enforced?**
Zoning ordinance	Y	Yes, the ordinance is an effective measure for reducing hazard impacts and is adequately administered and enforced.
Subdivision ordinance	Y	Yes, the ordinance is an effective measure for reducing hazard impacts and is adequately administered and enforced.
Floodplain ordinance	Y	Yes, the ordinance is an effective measure for reducing hazard impacts and is adequately administered and enforced.
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	2008 American River Parkway Plan is an effective measure for reducing hazard impacts and is adequately administered and enforced.
Climate Action Plan	Y	This plan presents a set of strategies that will achieve a community-wide greenhouse gas reduction goal.
Flood insurance rate maps	Y	Yes, the FIRMs are an effective measure for reducing hazard impacts and is adequately administered and enforced.
Elevation Certificates	Y	Yes, the Elevation Certificates are an effective measure for reducing hazard impacts and is adequately administered and enforced.
Acquisition of land for open space and public recreation uses	Y	When used, acquisition of land is an effective measure for reducing hazard impacts and is adequately administered and enforced.

Erosion or sediment control program	Y	Yes, the erosion control program for the region is an effective measure for reducing hazard impacts and is adequately administered and enforced.
Other		
How can these capabilities be expanded and improved to reduce risk?

City of Sacramento 2035 General Plan

The City of Sacramento 2035 General Plan serves as a blueprint for future growth and development and provides comprehensive planning for the future. It encompasses what the City currently is and what it intends to be. It provides the general framework to achieve the desired future condition.

The General Plan includes a Public Health and Safety Element that focuses on safety issues to be considered in planning for the present and future development for the City. The General Plan also addresses Environmental Resources which considers climate change and severe weather hazards facing the City. Goals related to mitigation strategies are outlined.

City of Sacramento Emergency Operations Plan

The City of Sacramento Emergency Operations Plan (EOP) addresses the planned response for the City of Sacramento to emergencies associated with disasters, technological incidents, or other dangerous conditions created by either man or nature. It provides an overview of operational concepts, identifies components of the City emergency management organization, and describes the overall responsibilities of local, state, and federal entities. It addresses the hazards addressed in the previous 2011 City and County of Sacramento Hazard Mitigation Plan.

Sacramento County Warning and Evacuation Procedures

The City of Sacramento in conjunction with Sacramento County and other incorporated communities have a variety of systems and procedures established to protect its residents and visitors to plan for, avoid, and respond to a hazard event including those associated with floods and other natural disasters. This includes Pre-Disaster Public Awareness and Education information which is major component in successfully reducing loss of life and property in a community when faced with a potentially catastrophic incident. Much of this information is not specific to a given hazard event and is always accessible to the public on local City and County websites, while other information is incident-specific. A general overview of specific warning and evacuation systems and procedures are summarized further below.

Monitoring for Alerts, Watches and Warnings

Emergency officials constantly monitor events and the environment to identify specific threats that may affect their jurisdiction and increase awareness levels of emergency personnel and the community when a threat is approaching or imminent.

The National Weather Service (NWS), a part of the U.S. Department of Commerce's National Oceanic and Atmospheric Administration (NOAA), is the prime agency for detecting meteorological threats, such as floods and severe weather. Severe weather warnings are transmitted through NOAA's Weather Radio System, considered by the federal government as the official source for weather information. Federal agencies can only look at the large scale, (e.g., whether conditions are appropriate for the formation of a thunderstorm.) Local emergency managers can provide more site-specific and timely recognition by sending out NWS trained spotters to watch the skies when the Weather Service issues a watch or a warning. The NWS page for Sacramento County and incorporated communities is accessible through the Sacramento County website and at the following: http://forecast.weather.gov/MapClick.php?zoneid=CAZ017

A flood threat recognition system predicts the time and height of a flood crest. This can be done by measuring rainfall, soil moisture, and stream flows upstream of the community and calculating the subsequent flood levels.

On larger rivers, this measuring and calculating is performed by the NWS. Support for NOAA's efforts is provided by cooperating partners from state and local agencies. Forecasts of expected river stages are made through the Advanced Hydrologic Prediction Service (AHPS) of the NWS. Flood threat predictions are disseminated on the NOAA Weather Wire or NOAA Weather Radio.

On smaller rivers, locally established rainfall and river gauges are needed to establish a flood threat recognition system. The NWS may issue a "flash flood watch." This is issued to indicate current or developing hydrologic conditions that are favorable for flash flooding in and close to the watch area, but the occurrence is neither certain nor imminent. These events are so localized and so rapid that a "flash flood warning" may not be issued, especially if no remote threat recognition equipment is available. In the absence of a gauging system on small streams, the best threat recognition system is to have local personnel monitor rainfall and stream conditions. While specific flood crests and times will not be predicted, this approach will provide advance notice of potential local or flash flooding.

The City and County EOPs include procedures for threat identification. The City and County work closely with the NWS for issuing an Emergency Alert System (EAS). Additional threat identification mechanisms include:

California Data Exchange Center (CDEC). The CDEC provides information for flood forecasting information at http://cdec.water.ca.gov/. The CDEC installs, maintains, and operates an extensive hydrologic data collection network including automatic snow reporting gages for the Cooperative Snow Surveys Program and precipitation and river stage sensors for flood forecasting.

Automated Local Evaluation in Real Time (ALERT) System. ALERT was created by the NWS to provide continuous and automatic reports from river levels and rainfall gauges detect impending high water levels. ALERT information includes:

- Rainfall Summary
- Stage Summary
- Storm Ready
- Sandbag Information

- Detailed Forecast
- Quantitative Precipitation Forecasts (QPF)
- NWS River Forecasts

The regional ALERT system consists of 2 base stations, and 50 gaging stations. The purpose of the County's ALERT website is to provide real time monitoring information to stage and rainfall information during storm events, which assist in informing the activation of additional warning and potential evacuation of affected areas. This information which can be accessed through links from the City of Sacramento's website to the Sacramento County website includes information for: Stream Level Summaries and Maps; and Rainfall Summaries and Maps. See https://www.sacflood.org/home.php.

Dam Protocols. Should an event trigger the activation of an Emergency Action Plan (EAP) for a potential dam failure, City and County OES receives this information via direct phone calls from the originating source/agency or from Sacramento County Dispatch and/or Cal OES. City OES then follows the notification and evacuation procedures called for in the EOP.

Notifications and Warning Systems

Once a disaster is imminent, action is taken to control the situation, save lives, protect property, and minimize the effects of the disaster. During this phase, warning systems are activated; resources and first responders notified and mobilized; and evacuations begin.

After a threat recognition system tells the emergency services office that a flood, severe weather or other hazard is coming, the next step is to notify the public and staff of other agencies and critical facilities. Providing adequate and timely notification to the public is the greatest challenge, especially with sudden or no-notice events. The earlier and more specific the warning, the greater the number of people that can implement protection measures.

As previously described, the NWS issues notices to the public using two levels of notification:

- **Watch.** Conditions are right for flooding, thunderstorms, or other hazard event.
- **Warning**. A flood or other event has started or been observed.

In coordination with established public safety warning protocols, the activated EOC will manage the dissemination of timely and adequate warnings to threatened populations in the most direct and effective means possible. Depending upon the threat and time availability, the City and County EOCs will initiate alerts and warnings utilizing any of the following methods:

- Activation of the Emergency Alert System (EAS)
- Activation of the Telephonic Alert and Warning System (Everbridge and Reverse 911)
- Activation of the Emergency Digital Information System (EDIS)
- Activation of the California Law Enforcement Mutual Aid Radio System (CLEMARS)
- Media broadcast alerts.
- Commercial or public radio or TV stations
  - ✓ Radio: KFBK 1530 am, KSTE 650, KGBY, 92.5 FM
  - ✓ TV: KCRA Channel 3, www.KCRA.com; KXTV Channel 10; KOVR Channel 13; KTXL Channel 40

- NOAA Weather Radio
- www.saccounty.net; SacramentoReady.org websites
- 211/311 Sacramento
- CalTrans 511
- Telephone trees/mass telephone notifications
- Tone activated receivers in key facilities
- Fire and Law enforcement loudspeakers
- Outdoor warning sirens
- Mobile public address sirens/systems
- Door-to-door contact
- Vulnerable population databases
- Email notifications

Multiple or redundant systems are most effective – if people do not hear one warning, they may still get the message from another part of the system. Just as important as issuing a warning is telling people what to do in case of an emergency. A warning program should have a public information aspect that details appropriate warnings and responses.

Sacramento ALERT

The City of Sacramento Police Department in partnership with all public safety agencies within Sacramento, Yolo and Placer counties, use a state-of-the-art emergency alert system known as Sacramento Alert. The system provides information to residents about emergency events quickly and through a variety of communication methods.

The alert system currently includes all listed and unlisted landline telephone numbers in Yolo, Placer, and Sacramento counties that are serviced by AT&T and Verizon.

To ensure emergency notices are received quickly both at work and home, residents are encouraged to log onto the Sacramento Alert Self- Registration Portal and provide phone numbers for both home and work, including land and cell phone numbers, email addresses, TTY device information and instant messaging information.

Residents will only receive alerts that are critical and time-sensitive, including: flooding, levee failures, severe weather, disaster events, unexpected road closures, missing persons, and evacuations of buildings or neighborhoods in specific geographic locations.

The system, which uses Everbridge Alert and Notifications System, was made possible for all three counties by a grant from CAL OES and supported by CA Department of Water Resources, Flood Operations Center.

StormReady

The NWS established the StormReady program to help local governments improve the timeliness and effectiveness of hazardous weather related warnings for the public. The City of Sacramento and Sacramento County are StormReady certified. StormReady communities are better prepared to save live from the onslaught of severe weather through advanced planning, education, and awareness. Being designated a StormReady community by the NWS is a good measure of a community's emergency warning program for weather hazards.

Evacuation and Shelter-in-Place

The principle of evacuation is to move citizens from a place of relative danger to a place of relative safety, via a route that does not pose significant danger. There are six key components to a successful evacuation:

- Adequate warning
- Adequate routes
- Proper timing to ensure the routes are clear
- Traffic control
- Knowledgeable travelers
- Care for special populations (e.g., disabled, hospital patients, school children)

Evacuation planning also considers sheltering options for those that cannot get out of harm's way. Shelters can also serve as a temporary place after the storm for those who have lost their homes.

The City maintains an Evacuation Plan that outline strategies and protocols for medium to high-level (catastrophic) evacuation events. These plans also include procedures for sheltering to provide people affected by a disaster with a safe, temporary place to be housed during or immediately after a disaster until they can either return to their homes or be relocated to other housing facilities. Highlights of these City plans are detailed below.

City of Sacramento Evacuation Plan

The Evacuation Plan is an Annex to the City of Sacramento's Emergency Operations Plan. As such its intent is to support and guide the City's Emergency Managers, Emergency Operations Center staff, and other governmental and non-governmental agencies who would be involved with an Evacuation Event in the City. The Evacuation Plan provides evacuation specific strategy and information that is intended to support but not supplant operational strategy as provided in the City's EOP and Departmental operations plans.

The primary threat that would incite the City to begin an evacuation event is a flood. As such, much of the material was written with flood as the primary concern. The overall evacuation strategy and associated plan details, however, would also serve the City in conducting an evacuation due to other hazards and as such the Plan is intended to provide an all-hazards approach.

The plan is organized such that the first five sections provide quick reference materials to support emergency workers. The plan begins with Section 1 – Triggers and Activation, which details the flood

threat triggers that would initiate the opening and staffing of the City EOC, and initiate notification, evacuation, and sheltering actions that need to take place as the imminent and substantial threat of a flood increases. Section 2 - Roles, Responsibilities, and Resources is meant to support emergency managers with deciding minimal personnel requirements to complete actions defined in the trigger section, who they should seek to fulfill certain roles, and to provide some general notion of resources likely already available for the situation. The next part, Section 3- Emergency Public Notifications, provides the emergency staff with a brief description of each of the notification systems the City has available to notify the citizenry, along with a How To Activate description. Section 4 – Area Evacuation Control by Police Beats, provides evacuation routes for every area of the City as broken out by the Sacramento Police Department Beat maps. Many critical facilities, schools and shelters in each beat are identified. This information is useful both for supporting evacuations out of an area, and supporting evacuees coming into an area. In Section 5 – Care and Sheltering, the community centers and schools that have been assessed as available and ready to support sheltering of people and their pets, and may be assessable to people with disabilities, are listed with contact information.

Evacuation maps, by police beat, are shown. Flood scenarios are also given, and evacuation routing planned for. An example is shown in Figure F-39.

Figure F-39 Sacramento River Sutter Scenario Evacuation Routes for Beat 1-A

Evacuation Routes: 0-4 Hours
Police Beat 1A

Flood Scenario **1 - Sacramento River - Sutter**

Rescue and Evacuation Maps

These maps show the depth of flooding with a 300-foost levee breach, 100-year storm, and running 10 days straight without mitigation. These maps also show the rescue and evacuation areas. The rescue areas show which areas would have 2' of water within an hour. These maps are available online at: http://mysacramento.org/utilities/flood-ready/city_county_neighborhood_flood_depth_maps.cfm.

More information on the importance of including evacuation procedures and maps as part of a sound mitigation strategy can be found in Appendix C to this plan. In addition, Appendix C contains additional information on post mitigation policies and procedures. More information specific to the City can be found in their various other response and recovery plans.

City of Sacramento Post Disaster Mitigation Policies and Procedure

The City of Sacramento EOP, and related documents, are intended to facilitate multi-agency and multi-jurisdictional coordination during emergencies including hazard events. Through it policies and procedures it seeks to mitigate the effects of hazards, prepare for measures to be taken which will preserve life and minimize damage, enhance response during emergencies and provide necessary assistance, and establish a recovery system in order to return the community to their normal state of affairs.

The goal of the recovery phase of an emergency incident or natural disaster is to return the residents, public services and private sector in an impacted area to their pre-disaster state, and through implementation of hazard mitigation measures, seek to prevent, as much as possible, similar damage, destruction or chaos after incidents and disasters in the future. Sacramento policies include objectives, responsibilities and procedures for restoration of services and returning of the affected area to its pre-emergency condition. Mitigation is emphasized as a major component of recovery efforts.

Post-disaster recovery activities are designed to protect public health and safety and facilitate recovery. Appropriate measures include:

- Patrolling evacuated areas to prevent looting
- Providing safe drinking water
- Monitoring for diseases
- Vaccinating residents for tetanus and other diseases
- Clearing streets
- Cleaning up debris and garbage

As the initial and sustained operational priorities are met, emergency management officials consider the recovery phase needs. Short-term and long-term recovery is covered in EOP and related documents. Short-term recovery operations begin during the response phase and include rapid debris removal and cleanup and restoration of essential services to minimum operating standards. Long-term recovery operations work to restore the community to pre-disaster conditions and include hazard mitigation activities, restoration and reconstruction of public facilities, and disaster response cost recovery. Local Assistance Centers and/or Disaster Recovery Centers are opened and damages assessed. Elements of recovery include:

- Windshield survey and documentation of flood impacts
- Safety assessment
- Damage assessments
- Engineering assessments
- Post-flood building entry
- High water marks (also risk communication)
- Code enforcement/triage process

- Permitting process
- Temporary housing
- After action reporting

Regulating Reconstruction

Requiring permits for building repairs and conducting inspections are vital activities to ensure that damaged structures are safe for people to reenter and repair. The NFIP requires that local officials enforce the substantial damage regulations. These rules require that if the cost to repair a building in the mapped floodplain equals or exceeds 50% of the building's market value, the building must be retrofitted to meet the standards of a new building in the floodplain. In most cases, this means that a substantially damaged building must be elevated above the base flood elevation.

Mitigation

Mitigation measures to reduce the risk and vulnerability of a community to future disaster losses can be implemented in advance of a disaster event and also as part of post-disaster recovery efforts. Mitigation is the effort to reduce loss of life and property by lessening the impact of disasters. Effective mitigation can break the cycle of disaster damage, reconstruction, and repeated damage. Categories of mitigation measures include prevention, emergency services, property protection, natural resource protection, structural, and public information, many of which are discussed throughout this document.

Additional mitigation elements specific to the Sacramento area are discussed further below.

LHMP

The Federal Disaster Mitigation Act (DMA) of 2000 requires communities to develop an approved Local Hazard Mitigation Plan (LHMP) to remain eligible to apply for certain FEMA Hazard Mitigation Assistance (HMA) grants. Applications submitted for funding from the FEMA HMA grant programs must "be consistent with" the mitigation strategy outlined in the LHMP. Sacramento County and the City of Sacramento are in process with the update of their 2016 LHMP Update. Once complete and adopted, this LHMP update will provide continued eligibility for all participating jurisdictions for FEMA pre- and post- disaster mitigation funding.

Grant Funding

An understanding of the various funding streams and opportunities will enable the communities to match up identified flood mitigation projects with the grant programs that are most likely to fund them. Additionally, some of the funding opportunities can be utilized together. Mitigation grant funding opportunities available pre- and post- disaster include the following:

- FEMA Hazard Mitigation Assistance (HMA) Grants (Pre-disaster Mitigation (PDM), Flood Mitigation Assistance (FMA), and Hazard Mitigation Grant Program (HMGP))
- FEMA Public Assistance Section 406 Mitigation
- Community Development Block Grants
- Small Business Loans
- Increased Cost of Compliance

Other Key City Data Related to Education and Communication of Flood Hazard Information

- FEMA DFIRMs and Flood Insurance Studies (FIS)
- DWR BAM maps
- Ultimate flood depths map
- Areas dependent on levees map
- Levee break scenario mapping
- Historical flood information which may include location of nearest high water mark, repetitive loss area, flood photos, and flood calls
- Rescue and evacuation maps
- Community assets inventory: people, structures, infrastructure, critical facilities
- Emergency Action Plans

Climate Action Plan

The City's Climate Action Plan (CAP) was adopted in February 2012 pursuant to General Plan Policy ER 6.1.7. The City's CAP presents a set of strategies that will achieve a community-wide greenhouse gas reduction goal. Many of these strategies will have environmental co-benefits including improving air quality.

City of Sacramento Extreme Heat Plan/Cooling Centers

When summer temperatures rise, staying safe in the heat is critical for Sacramento residents. The City publishes information on its website on how to deal with extreme heat.

> *It is necessary to take precautions to ensure that you, your friends and family, neighbors, and pets don't suffer the effects of extreme heat. Make sure that you stay hydrated as much as possible and try to limit your activities to indoor areas that are air conditioned to avoid possible heat–related illnesses*

The City has a cooling center plan. The criteria for opening one includes temperatures of 105 degrees or more for three consecutive days WITH night time low temperatures of 75 or above. If cooling centers are open at faith-based and other community facilities, the list is posted at 211sacramento.org or is available by calling 2-1-1.

The City website notes that:

A fun way to beat the heat and cool off is by using any of the 17 pools that are open in the City. Kids swim for as little as $2 per session, adults are $4. Discounts are available. There is free admission at play pools located in Colonial Park, Land Park, Robertson Park, Mama Marks Park, and Bertha Henschel Park.

A complete list of pools and openings can be found on the City's website.

Ordinances

The City of Sacramento has many ordinances related to mitigation. These ordinances can be primarily or secondarily focused on mitigation.

Ordinances Primarily Focused on Mitigation

Zoning and Land Use Ordinance (Title 17)

This title and its accompanying maps are known as "the comprehensive zoning plan of the City of Sacramento." It is adopted as a further refinement of the land use plan for Sacramento under the provisions of the "Conservation and Planning Law of the State of California." The purpose of these regulations is to do the following:

- Regulate the use of land, buildings, or other structures for residences, commerce, industry, and other uses required by the community;
- Regulate the location, height, and size of buildings or structures, yards, courts, and other open spaces, the amount of building coverage permitted in each zone, and population density, among other things;
- Divide the city into zones of such shape, size, and number best suited to carry out these regulations, and to provide for their enforcement;
- Ensure the provision of adequate open space for recreational, aesthetic and environmental amenities.

These zoning regulations are necessary to:

- Encourage the most appropriate use of land;
- Conserve, stabilize and improve the value of property;
- Provide adequate open space for recreational, aesthetic and environmental amenities;
- Control the distribution of population;
- Promote health, safety and the general welfare.

Subdivision Ordinance (Title 16)

This title is adopted pursuant to Article XI, Section 7 of the California Constitution, and to supplement and implement the Subdivision Map Act, Government Code Section 66410, et seq., and may be cited as the subdivision ordinance of the city. The regulations established by this title are designed to assist in the

systematic implementation of the general plan, specific and community plans, the zoning ordinance, and other land use regulations, and to provide for public needs, health and safety, convenience, and general welfare.

Neither the approval nor conditional approval of the tentative map shall constitute or waive compliance with any other applicable provisions of the city code or other applicable ordinances or regulations adopted by the city, nor shall any such approval authorize or be deemed to authorize a violation or failure to comply with other applicable provisions of the city code or other applicable ordinances or regulations adopted by the city. Nothing in these regulations shall be construed to permit the premature or haphazard subdivision of lands in violation of the applicable zoning and land use regulations.

Building Code (Title 15)

The chapters of this title shall be known and referred to as the Sacramento City Building Code, and may be cited as such, and will be referred to as "this code" or "this building code." The purpose of this code is to provide minimum requirements and standards for the protection of the public safety, health, property, and welfare. This code is not intended as a design specification or an instructional manual for untrained persons. This code shall apply to all new construction and to any alterations, repairs, relocations or reconstruction of a building or any portion thereof including any electrical, mechanical, gas, or plumbing equipment installed on any property or used on or within any building.

As part of the construction permitting process, the City requires completed reports of soil conditions at the specific construction sites to identify potentially unsuitable soil conditions including liquefaction, settlement, subsidence, lateral spreading, and collapse. The City requires that these evaluations be conducted by registered soil professionals, and measures to eliminate inappropriate soil conditions must be applied, depending on the soil conditions. The design of foundation and excavation-wall support must conform to the analysis and implementation criteria described in the CBC, Chapters 16, 18, 33, and the appendix to Chapter 33. Adherence to the CBC and City policies contained in the 2035 General Plan would ensure the maximum practicable protection available for users of buildings and infrastructure and their associated trenches, slopes, and foundations.

Floodplain Management Ordinance (Chapter 15.104)

This chapter is designed to promote the public health, safety, and general welfare, and to minimize public and private losses due to flood conditions in specific areas. This chapter regulates development which is or might be dangerous to health, safety and property by requiring at the time of initial development or substantial improvement methods of protection against flood damage in areas vulnerable to flooding in order to minimize flood damage. This chapter regulates the following developmental impacts: filling, grading or erosion, alteration of natural flood plains, stream channels or water courses, the imposition of barriers which increase flood hazards, or any other impacts that aggravate or cause flood hazards. This ordinance establishes the City's participation in the NFIP, and establishes base flood elevations at 1 foot above the FIRM flood depth for zones A, AH, and AE. In zones AO, the lowest floor will be elevated to one foot above the FIRM flood depth, or two feet above the highest adjacent grade if not depth number is specified.

Since the floodway is an extremely hazardous area due to the velocity of flood waters which carry debris, potential projectiles, and erosion potential, the following provisions apply:

- Prohibit encroachments, including fill, new construction, substantial improvements, and other development unless certification by a registered professional engineer is provided demonstrating that encroachments shall not result in any increase in flood levels during the occurrence of the base flood discharge.
- If the above subsection of this section is satisfied, all new construction and substantial improvements shall comply with all other applicable flood hazard reduction provisions of this section.

The local administrator is empowered to issue a variance only for purposes consistent with the objectives of FEMA's floodplain management regulations. However, a variance could affect flood insurance rates and may result in flood insurance premium rates on structures which are beyond the means of the person receiving the variance. FEMA requires the city to make an annual report on any variance which is granted, and if FEMA determines that such variance is inconsistent with the objectives of sound floodplain management, FEMA may take action to suspend the city from the National Flood Insurance Program.

Weed and Rubbish Abatement Ordinance (Chapter 8.28)

In order to reduce wildfire potential in the City, excess weeds and rubbish must be mitigated. Weed and rubbish abatement in the city is performed pursuant to Title 4, Division 3, Part 2 of the Government Code. This ordinance places the fire chief as the code enforcement director.

Stormwater Management Ordinance (Chapter 13.16)

This chapter is known as the Stormwater Management and Discharge Control Code. The purpose of this chapter is to protect and promote the health, safety and general welfare of the citizens of the City by controlling non-stormwater discharges to the stormwater conveyance system, by eliminating discharges to the stormwater conveyance system from spills, dumping, or disposal of materials other than stormwater, and by reducing pollutants in urban stormwater discharges to the maximum extent practicable. This chapter is intended to assist in the protection and enhancement of the water quality of watercourses, water bodies, and wetlands in a manner pursuant to and consistent with the Federal Water Pollution Control Act, Porter-Cologne Water Quality Control Act, and National Pollutant Discharge Elimination System (NPDES) Permit No. CAS082597, as such permit is amended and/or renewed.

Grading and Erosion and Sediment Control (Chapter 15.88)

The City's grading ordinance is enacted for the purpose of regulating grading on property within the city to safeguard life, limb, health, property and the public welfare; to avoid pollution of watercourses with nutrients, sediments, or other materials generated or caused by surface water runoff from construction sites; to comply with the City's National Pollution Discharge Elimination System (NPDES) Permit No. CAS082597 issued by the California Regional Water Quality Control Board; and to ensure that the graded site within the city limits complies with all applicable City ordinances and regulations. The grading ordinance is intended to control all aspects of grading operations within the city.

Ordinances Secondarily Focused on Mitigation

City of Sacramento Tree Preservation Ordinance

The City of Sacramento adopted the Tree Preservation Ordinance to protect trees as they are a significant resource for the community. It is the City's policy to retain trees whenever possible regardless of their size. When circumstances will not allow for retention, permits are required to remove heritage trees that are within the City's jurisdiction. Removal of, or construction around, trees that are protected by the tree ordinance are subject to permission and inspection by City arborists. The City of Sacramento Tree Service Division reviews project plans and works with the City of Sacramento Public Works during the construction process to minimize impacts to street trees in the city.

Historic Preservation Ordinance

The City of Sacramento's historic preservation program began in 1975 with the enactment of the City's first Historic Preservation Ordinance. The current Historic Preservation Ordinance (No. 2006-063) was enacted in October 2006. The purpose of the Historic Preservation Ordinance is to identify, protect, and encourage the preservation of significant resources; maintain an inventory and ensure the preservation of these resources; encourage maintenance and rehabilitation of the resources; encourage retention, preservation, and re-use of the resources; safeguard city resources; provide consistency with state and federal regulations; protect and enhance the city's attraction to tourists; foster civic pride in the city's resources; and encourage new development to be aesthetically compatible.

F.6.2. Administrative/Technical Mitigation Capabilities

Table F-56 identifies the City department(s) responsible for activities related to mitigation and loss prevention in Sacramento.

Table F-56 City of Sacramento's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning and Design Commission	Y	Approves variances, special permits, tentative maps, and development plans
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Department of Utilities', RD1000, and American River Flood Control District, and State of CA maintain the drainage system, pump stations, and levees within the City. Public Works trims trees.
Mutual aid agreements	Y	Mutual aid agreements are maintained, but reside with different departments in the City.
Other	Y	Law and Legislation Committee

Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	Y	Staff is adequate and trained. Coordination efforts between agencies.
Floodplain Administrator	Y	Staff is adequate and trained. Coordination efforts between agencies.
Emergency Managers	Y	Staff is adequate and trained. Coordination efforts between agencies.
Community Planners	Y	Staff is adequate and trained. Coordination efforts between agencies.
Civil Engineers	Y	Staff is adequate and trained. Coordination efforts between agencies.
GIS Coordinators	Y	Staff is adequate and trained. Coordination efforts between agencies.
Other		
Technical		
Warning systems/services (Everbridge, outdoor warning signals)	Y	Sacramento, Yolo, and Placer County oversee an alert system called Everbridge. In addition, the City has outdoor warning signals.
Hazard data and information	Y	Sacramento County Environmental Management runs a hazardous materials program
Grant writing	Y	The City employees grant writers. The Department of Utilities has a grant writer on staff in the Business Services Division.
Hazus analysis	N	Many of the studies performed include Hazus analysis.
California Data Exchange Center/ALERT system	Y	River and creeks conditions, water levels, forecasts, etc.
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: City of Sacramento

F.6.3. Fiscal Mitigation Capabilities

Table F-57 identifies financial tools or resources that the City could potentially use to help fund mitigation activities.

Table F-57 City of Sacramento's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Funding has been used for mitigation action projects. It also can be used for future projects.

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Authority to levy taxes for specific purposes	Y	There are special taxes to mitigate hazards (i.e., SAFCA development impact fee and property tax assessment). This method can be used in the future.
Fees for water, sewer, gas, or electric services	Y	Utility bill fees and development review costs are used and can be used in the future.
Impact fees for new development	Y	Development impact fees for certain hazards
Stormwater utility fee	Y	
Incur debt through general obligation bonds and/or special tax bonds	Y	
Incur debt through private activities	Y	
Community Development Block Grant	Y	
Other federal funding programs	Y	FEMA, HUD, etc.
State funding programs	Y	DWR, SRF loans, etc.
Other		
How can these capabilities be expanded and improved to reduce risk?		
Future increases in the City's drainage rate will allow for needed improvements to the system. The improvements will reduce the flooding risk.		

Source: City of Sacramento

F.6.4. Mitigation Education, Outreach, and Partnerships

Table F-58 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information. More information can be found below the table.

Table F-58 City of Sacramento's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	American River Parkway Foundation Certified Emergency Response Teams (CERT)

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	The City of Sacramento has multiple public education campaigns that promote preparedness and mitigation information. The campaigns include: Stormwater Program CRS Program for Public Information (Flood) Fire Suppression Fire Safety
Natural disaster or safety related school programs	No	
StormReady certification	Yes	
Firewise Communities certification	No	
Public-private partnership initiatives addressing disaster-related issues	Yes	
Other		
How can these capabilities be expanded and improved to reduce risk?		
Work with teachers, students, and school administrators to develop a program that addresses natural hazards and preparedness.		

The City currently has several outreach programs that are conducted on an annual basis:

- Public Assistance: The City has a floodplain information hotline (916) 808-5061 or floodinfo@ciytofsacramento.org for citizen inquiries about flood insurance, development standards in a floodplain, and flood map information.
- "Be Flood Ready" brochure – this brochure is sent annually to all parcel owners in the City of Sacramento through their Utility bill in October/November.
- "Be Flood Ready" billboard – this billboard is posted up in various locations within the City of Sacramento in October/November.
- Dam Brochure – this brochure is sent annually in the Utility bill in November/December to warn residents about how to be prepared in case of a dam break.
- Repetitive Loss Outreach. The City annually mails a letter of notice on property protection to repetitive loss properties.
- Storm Preparation Outreach
  - ✓ The City annually encourages residents to purchase flood insurance with bus advertising and a billboard along Business 80.
  - ✓ The City works closely with its Fire Department and the City/County Office of Emergency Services to share information at community events about flood risks in our community and flood insurance.
  - ✓ The City is actively working with community volunteers through "Sacramento Ready" to prepare our community for flooding emergencies. The group works with Community Emergency Response Volunteers, American Red Cross and local service agencies to have a team of volunteers ready to assist residents with winter weather preparation and planning, evacuation, and care and shelter.

- "Flood Watch". SAFCA develops and distributes a newsletter called, "Flood Watch", to provide information to the public on levee work status, and assessment information. SAFCA periodically holds community meetings in coordination with the City in areas where levee work is being completed.
- "Flood Risk Notice". As part of Assembly Bill 156, which is part of the Central Valley Flood Protection Plan, the Department of Water Resources is required to send out a "Flood Risk Notice" to all property owners receiving protection from State-Federal project levees. The goal of the notice is to raise flood risk awareness and encourage actions on an individual basis to reduce flood losses. The first notice was sent in approximately September 2010 and will be continued to be sent annually. Instead of sending out a separate notice to all floodplain residents in the City, the City used this notice in 2010 instead as required by the Community Rating System program.
- "Program for Public Information". The City are completed an outreach program under the Community Rating System guidelines, which gives citizens discounts on flood insurance. This strategy will under Activity 330-Outreach Projects.
- The City sponsors/encourages participation in area clean up events and funded several clean up events in Spring/Summer through its Community Action Grant Program.
- The City funds the Sacramento Splash in the Class program, which provides presentations focused on stormwater pollution prevention to third through sixth grade classrooms. On average, the presentations are given to 102 classrooms throughout the City.
- The City supports/sponsors the Pups in the Parkway program which provides pet waste stations along the American River Parkway including Discovery Park.
- The City carries out stormwater pollution prevention outreach by participating in various community outreach events throughout the year (i.e., Earth Day events, cultural events, etc.).
- The City is part of the Sacramento Stormwater Quality Partnership, and as a partner, the City both sponsors and directly carries out stormwater pollution prevention outreach activities. These activities include, but are not limited to:
  - ✓ Participating in clean up events and engaging the public in clean ups.
  - ✓ Implementing pet waste reduction programs and promoting the use of pet waste disposal stations.
  - ✓ Developing and distributing stormwater pollution prevention brochures and promotional materials. Conducting mixed media campaigns (e.g., radio, print ads, television, signage, etc.).
  - ✓ Implementing home and garden care programs, including the distribution of educational materials (e.g., Our Water Our World, Waterwise, and River-Friendly Landscaping).
  - ✓ Increasing awareness on the impact of fundraiser carwash discharges in waterways by maintaining the River-Friendly Fundraiser Carwash Program (RFFCP) website and distributing promotional materials
  - ✓ Working with the Business Environmental Resource Center (BERC) to encourage stormwater pollution prevention and to establish stormwater practices for businesses and mobile businesses

F.6.5. Other Mitigation Efforts

To mitigate winter storms and the flooding associated with them, the Department of Utilities and Department of Public Works perform work year around.

- During the summer, crews assist in maintaining channels, canals and creeks by removing weeds and debris that can impede water flow during winter storms.
- Floodgates are inspected and maintained throughout the City. Also inspected and maintained are drainage inlets, pumps and generators, which are vital tools in removing water from City streets and discharging storm water into local waterways.

- Materials are stored close to floodgates or areas prone to flooding. Not only does this provide easy access to materials when needed, but also it helps City crews to open a sandbag station within two hours of being instructed to do so.
- Drills are held to rehearse floodgate closures to ensure that they can be quickly closed in an emergency.
- The City's 100,000 public trees are pruned on a 10-year cycle and crews respond promptly to calls about trees that may pose a safety hazard.
- During a storm event, extra crews are on-call after hours responding to hundreds of calls to 311.

F.7 Mitigation Strategy

F.7.1. Mitigation Goals and Objectives

The City of Sacramento adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

F.7.2. 2016 LHMP Update Mitigation Strategy

The City of Sacramento further adopts the overall mitigation Strategy developed by the HMPC and described in Chapter 5 Mitigation Strategy. This includes the following umbrella mitigation strategy:

- Communicate the hazard information collected and analyzed through this planning process as well as HMPC success stories so that the community better understands what can happen where and what they themselves can do to be better prepared.
- Implement the action plan recommendations of this plan.
- Use existing rules, regulations, policies, and procedures already in existence.
- Monitor multi-objective management opportunities so that funding opportunities may be shared and packaged and broader constituent support may be garnered.

In addition, the City through its updates to the City's EOP and their Comprehensive Flood Management Plan, as well as through implementation of many of their mitigation actions detailed below, are committed to evaluating and revising their post-disaster redevelopment and mitigation policies and procedures as described in Chapter 5, Mitigation Strategy for this 2016 LHMP Update.

F.7.3. NFIP Mitigation Strategy

Given the flood hazard in the Planning Area, an emphasis will be placed on continued compliance with the National Flood Insurance Program (NFIP) and participation by Sacramento County and the City of Sacramento in the Community Rating System. Other cities are encouraged to begin participating in the CRS. Detailed below is a description of the City's flood management program to ensure continued compliance with the NFIP.

City of Sacramento's Flood Management Program: Recent Activities

The City of Sacramento has participated in the Regular Phase of the NFIP since September 1978. Since then, the City has administered floodplain management regulations that meet the minimum requirements

of the NFIP. Under that arrangement, residents and businesses paid the same flood insurance premium rates as most other communities in the country.

The City of Sacramento submitted applications to participate in the CRS program in December 1990 and again 1992, shortly after its 1990 launch. It is designed to recognize floodplain management activities that are above and beyond the NFIP's minimum requirements. CRS is designed to reward a community for implementing public information, mapping, regulatory, loss reduction and/or flood preparedness activities. On a scale of 10 to 1, the City is currently ranked Class 5. As of January 2011, the City of Sacramento receives the highest reduction in flood insurance rates, about $1.7 million per year, than any other community in California.

The activities credited by the CRS provide direct benefits to the City of Sacramento and its residents, including:

- Enhanced public safety;
- A reduction in damage to property and public infrastructure;
- Avoidance of economic disruption and losses;
- Reduction of human suffering; and
- Protection of the environment.

The activities that City of Sacramento implements and receives CRS credits include:

- **Activity 310** – Elevation Certificates: The Department of Utilities (DOU) maintains elevation certificates for new and substantially improved buildings. Copies of elevation certificates are made available upon request. Elevation Certificates are also kept for post-FIRM and pre-FIRM buildings. The City maintains hard copies in folders at DOU (away from the permit office) and electronically in the City's building permit database.
- **Activity 320** – Map Information Service: Credit is provided for furnishing inquirers with flood zone information from the community's Flood Insurance Rate Map (FIRM), publicizing the service annually and maintaining records.
- **Activity 330** – Outreach Projects: A community brochure is mailed to all properties in the community on an annual basis. An outreach brochure is mailed annually to all properties in the community's Special Flood Hazard Area (SFHA). The community also provides flood information through displays on buses and billboards, and at community events.
- **Activity 340** – Hazard Disclosure: Credit is provided for state and community regulations requiring disclosure of flood hazards.
- **Activity 350** – Flood Protection Information: Documents relating to floodplain management are available in the reference section of the Sacramento Public Library. Credit is also provided for floodplain information displayed on the City's website.
- **Activity 360** – Flood Protection Assistance: The community provides technical advice and assistance to interested property owners and annually publicizes the service.
- **Activity 410** – Additional Flood Data: Credit is provided for conducting and adopting flood studies for areas not included on the flood insurance rate maps and that exceed minimum mapping standards. Credit for determining Base Flood Elevations in approximate A zones. Credit is also provided for a cooperating technical partnership agreement with FEMA.
- **Activity 420** – Open Space Preservation: Credit is provided for preserving approximately 5 acres in the Special Flood Hazard Area (SFHA) as open space. Credit is also provided for open space land that is deed restricted.

- **Activity 430** – Higher Regulatory Standards: Credit is provided for enforcing regulations that require freeboard for new and substantial improvement construction, protection of floodplain storage capacity, natural and beneficial functions, enclosure limits, other higher regulatory standards, land development criteria and state mandated regulatory standards. Credit is also provided for a Building Code Effectiveness Grading Schedule (BCEGS) Classification of 2/2, certification as a floodplain manager, EMI NFIP class graduates, and the adoption of the International Building Codes.
- **Activity 440** – Flood Data Maintenance: Credit is provided for maintaining and using digitized maps in the day to day management of the floodplain. Credit is also provided for maintaining copies of all previous FIRMs and Flood Insurance Study Reports.
- **Activity 450** – Stormwater Management: The community enforces regulations for stormwater management, soil and erosion control, and water quality. Credit is also provided for watershed management master planning.
- **Activity 510** – Floodplain Management Planning: Based on NFIP Repetitive Losses data as of January 2016, the City has 21 repetitive loss properties and is a Category C community for CRS purposes. Credit is provided for preparing an area analyses the covers the repetitive loss areas.
- **Activity 520** – Acquisition and Relocation: Credit is provided for acquiring and relocating buildings from the community's flood hazard area.
- **Activity 530** – Flood Protection: Credit is provided for buildings that have been flood proofed, elevated or otherwise modified to protect them from flood damage.
- **Activity 540** – Drainage System Maintenance: Portions of the community's drainage system are inspected regularly throughout the year and maintenance is performed as needed by the Department of Water Resources. Records are being maintained for both inspections and required maintenance. Credit is also provided for an ongoing Capital Improvements Program. The community also enforces a regulation prohibiting dumping in the drainage system.
- **Activity 610** – Flood Warning Program: Credit is provided for a program that provides timely identification of impending flood threats, disseminates warnings to appropriate floodplain residents, and coordinates flood response activities.
- **Activity 620** – Levees: Credit is provided for maintaining levees, having a warning system, a response operations, and critical facilities planning.
- **Activity 630** – Dam Safety: All California communities currently receive CRS credit for the state's dam safety program.

City of Sacramento's Flood Management Program: 5-year Outlook

The following is a description/list of those flood management activities that will be enhanced and/or added over the next five years to show continued compliance with the NFIP

- Continuing in the CRS program, while making an effort to implement new CRS activities to benefit the City of Sacramento and residents.
- Working with more Repetitive Loss properties to mitigate flooding problems and implement the Repetitive Loss Area Analysis
- Adding more restrictions in Building Divisions on building next to a levee and compensatory storage
- Increasing the amount of public outreach by implementing a Program for Public Information
- Implementing the requirements in the State of California's Central Valley Flood Protection Plan
- Improving the City/County's emergency response system
- Implementing flood control projects to better protect property and life safety

More information about the floodplain administration in the City of Sacramento can be found in Table F-59.

Table F-59 City of Sacramento Compliance with NFIP

NFIP Topic	Comments
Insurance Summary	
How many NFIP policies are in the community? What is the total premium and coverage?	Policies: 43,937 Total Premiums: $20,734,054 Coverage: $14,355,078,500
How many claims have been paid in the community? What is the total amount of paid claims? How many of the claims were for substantial damage?	Paid Claims: 967 Amount of Paid Claims: $9,906,307.99 Substantial Damage Claims: 33
How many structures are exposed to flood risk within the community?	149,004
Describe any areas of flood risk with limited NFIP policy coverage	The Natomas Basin (A99) is an area within the City that has a relatively low percentage of NFIP policies compared to the number of insurable structures.
Staff Resources	
Is the Community Floodplain Administrator or NFIP Coordinator certified?	Yes
Provide an explanation of NFIP administration services (e.g., permit review, GIS, education or outreach, inspections, engineering capability)	The City reviews permits, provides flood insurance information, GIS support, and many outreach/education projects
What are the barriers to running an effective NFIP program in the community, if any?	The large community size makes communication with all residence difficult. Also, changes in the status of level certifications have cause major changes in the City's floodplains over the years.
Compliance History	
Is the community in good standing with the NFIP?	Yes
Are there any outstanding compliance issues (i.e., current violations)?	No
When was the most recent Community Assistance Visit (CAV) or Community Assistance Contact (CAC)?	7/16/2008
Is a CAV or CAC scheduled or needed?	Yes
Regulation	
When did the community enter the NFIP?	FM to complete
Are the FIRMs digital or paper?	Digital
Do floodplain development regulations meet or exceed FEMA or State minimum requirements? If so, in what ways?	Yes, Freeboard and local floodplain requirements
Provide an explanation of the permitting process.	Permit system flags permits applied for in floodplain areas. Floodplain staff review the permit and advise the owner of flood protection measures that must be done. Permit is not issued until flood projection requirements are met.
Community Rating System	
Does the community participate in CRS?	Yes

NFIP Topic	Comments
What is the community's CRS Class Ranking?	5
What categories and activities provide CRS points and how can the class be improved?	Receive points for all categories. Class will be improved by new Plan for Public Information, additional outreach to stakeholders, flood response projects, and completion of Comprehensive Flood Management Plan
Does the plan include CRS planning requirements?	Yes

F.7.4. Mitigation Actions

The planning team for the City of Sacramento identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Multi-Hazard Actions

Action 1. Integrate Local Hazard Mitigation Plan into Safety Element of General Plan

Hazards Addressed: All hazards

Goals Addressed: 1, 2, 3, 4

Issue/Background: Local jurisdiction reimbursement for mitigation projects and cost recovery after a disaster is guided by Government Code Section 8685.9. Specifically, this section requires that the City must adopt a local hazard mitigation plan (LHMP) in accordance with the federal Disaster Mitigation Act of 2000 as part of the safety element of its general plan adopted pursuant to subdivision (g) of Section 65302. It is important for the City of Sacramento to incorporate the City's LHMP annex into the safety element as part of the next general plan update.

Other Alternatives: No action

Existing Planning Mechanisms through which Action will be Implemented: The Long Range Planning section of the Community Development Department will be managing the City of Sacramento's General Plan Update.

Responsible Office: City of Sacramento Community Development Department

Priority (H, M, L): High

Cost Estimate: $100,000

Potential Funding: Local budgets, State and/or Federal Grant

Benefits (avoided Losses): Incorporation of an adopted LHMP into the Safety Element of the General Plan will help jurisdictions maximize the cost recovery potential following a disaster.

Schedule: Concurrent with the next General Plan Update (2018-2020).

Action 2. Coordination with Relevant Organizations and Agencies to Consider the Impacts of Urbanization and Climate Change on Long-Term Natural Hazard Safety

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: In 2014, due to extremely low water levels, the City of Sacramento Department of Utilities performed an emergency retrofit of the water intake on the Sacramento River. This is an example of the kind of adaptive measures that may be required in the future as Sacramento adapts to the impacts of climate change.

Climate change and urbanization may intensify natural and manmade hazards, sometimes combining to amplify hazards such as increased flooding, water shortages, disease vectors, and air pollution. The City of Sacramento provides infrastructure and services including water supply, wastewater, stormwater drainage, solid waste, street and urban forest maintenance. Management plans and specifications are prepared and updated by various City Departments and agencies, including but not limited to:

- Urban Water Management Plan – City of Sacramento Department of Utilities
- Comprehensive Flood Management Plan - City of Sacramento Department of Utilities
- City of Sacramento Standard Specifications for Public Construction (with Addendums #1 and #2)
- Stormwater Quality Design Manual for Sacramento and South Placer Regions
- Hydomodification Management Plan – Sacramento Stormwater Quality Partnership
- Additional standards and design manuals can be found at: http://www.cityofsacramento.org/Utilities/Resources/Specs-and-Drawings

The 2035 General Plan includes a policy to "continue to analyze information on potential impacts of climate change on government operations and the local economy, and actively share results to foster public awareness and support for adaptation policy."

Predictions on the specific local impacts of climate change are not necessarily available, however to the extent feasible, climate change impacts should be incorporated into City infrastructure and operations.

Project Description: Develop an Interagency Adaptation Team to work with appropriate agencies (e.g., California Natural Resources Agency, State Lands Commission, California Energy Commission, Sacramento Area Flood Control Agency [SAFCA], UC Davis) and neighboring jurisdictions (e.g., Sacramento County) to:

- Ensure that current information and data on climate change effects and impacts are considered and addressed as part of updates to infrastructure and utility plans, manuals, and specifications.
- Review existing infrastructure plans, policies, standards, and investments to ensure information about projected climate change impacts is included.

- Assess impacts of climate change effects when siting new infrastructure and maintaining or renovating existing infrastructure.
- Incorporate climate change impact information into the design, construction, operation, and maintenance of infrastructure.
- Identify inadequate existing infrastructure.

The work products of this effort are updated standards and specifications for infrastructure; updated management plans; and design guidelines; and an inventory of inadequate existing infrastructure.

Other Alternatives: Actively collaborate with regional agencies and neighboring jurisdictions to ensure that planning for future development and redevelopment incorporates risks from climate change effects/impacts.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Project is an implementation program listed in the 2035 General Plan.

Responsible Office/Partners: Community Development Department, Public Works Department, Department of Utilities

Project Priority: High

Cost Estimate: $500,000

Benefits (Losses Avoided): Reduced damage to property and/or infrastructure.

Potential Funding: State and/or Federal Grant

Timeline: 2014-2019

Action 3. Maintain and Identify Changes in Critical Facilities GIS Layer to Support Emergency Management Efforts

Hazards Addressed: Multi-Hazard – Flood, Wildfire, Dam Failure, Severe Weather, Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: GIS databases of critical facilities have been used by the City for incident management and emergency planning purposes. These databases need to be continuously updated with the results from GIS analysis associated with the development of the Multi-Hazard Mitigation Plan.

Project Description: Businesses, Schools, EMS Services or any other identified critical facilities will have contact information collected and mapped for analyzing and preparation for the Multi-Hazard Mitigation Plan.

Other Alternatives: No action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implement through existing emergency preparedness activities.

Responsible Office/Partners: City GIS Technical Group, City Department of Utilities, and City & County Office of Emergency Services

Project Priority: High

Cost Estimate: City staff time

Benefits (Losses Avoided): Life safety and early notification

Potential Funding: None

Timeline: 2016

Action 4. Community Outreach on Multi-Hazard Preparation & Pre-mitigation

Hazards Addressed: Multi-Hazard – Flood, Dam Failure, Fire, Earthquake, Severe Weather, Drought

Goals Addressed: 1, 2, 3, 4

Issue/Background: With the broad spectrum of hazards that can affect the City of Sacramento it is important for the Community to know how to be prepared for and execute pre-mitigation (if possible) for these hazards.

Project Description: Construction of a webpage to address the multi-hazard threat and add measures for preparation and pre-mitigation. Webpage will be maintained and improved over time.

Other Alternatives: Other forms of media outreach (costlier)

Existing Planning Mechanism(s) through which Action Will Be Implemented: Adding to the flood preparation page managed by the City.

Responsible Office/Partners: City of Sacramento, Department of Utilities, Office of Emergency Services

Project Priority: High

Cost Estimate: Staff time

Benefits (Losses Avoided): Reduction in the loss of life & property damage through education. Better prepared citizens before and during an event.

Potential Funding: None

Timeline: Long-term

Action 5. Evaluation and Mitigation of Critical Facilities in Identified Hazard Areas

Hazards Addressed: Multi-Hazard – Flood, Dam Inundation, Levee Failure, Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: Based on the critical facility analysis completed for this plan, over 3,000 critical facilities have been identified within the Sacramento County Planning Area. This number is anticipated to go up based on additional mapping of critical facilities as the GIS mapping effort is completed. For Sacramento County, 52 mapped critical facilities have been identified within the 100-year floodplain and another 164 (81-city) in the 500-year floodplain. A detailed list of those affected critical facilities are included in Appendix E. Due to the significant number of critical facilities identified within the flood and other hazard areas, additional evaluation of each affected facility is required in order to determine which facilities should be potentially relocated and/or protected.

Project Description: This project addresses the additional evaluation of identified critical facilities to determine options for mitigation. The initial focus will be on those facilities within the flood hazard areas, with other hazard-prone facilities to follow. The end result of this analysis will be a list of facilities within the 100- and 500-year floodplain and their mitigation recommendations and priorities.

Other Alternatives: No action or remove all critical facilities from the floodplain

Existing Planning Mechanism(s) through which Action Will Be Implemented: This will be implemented through existing floodplain management programs.

Responsible Office/Partners: City of Sacramento, Department of Utilities

Project Priority: High

Cost Estimate: Analysis and recommendations should involve staff time; resulting mitigation measures will be cost on an individual facility basis.

Benefits (Losses Avoided): Analyzing mitigation measures for critical facilities will increase both property protection and life safety for City residents.

Potential Funding: City of Sacramento and possible grants

Timeline: 5 years

Action 6. Retrofit of Repetitive Loss Properties

Hazards Addressed: Multi-Hazard – Flood, Localized Stormwater Flooding, Severe Weather: Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento has 21 repetitive loss structures. Some of these structures can be structurally retrofitted or elevated to fix the flooding problem and remove them from FEMA's Repetitive Loss List.

Project Description: The City must identify property owners interested in retrofits and also obtain grant money to assist with the retrofits.

Other Alternatives: Promote Flood Insurance

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento's Repetitive Loss Area Analysis

Responsible Office/Partners: City of Sacramento, Department of Utilities

Project Priority: High

Cost Estimate: $250,000-$1,000,000 (depending on the number of structures retrofitted)

Benefits (Losses Avoided): The structures would no longer be damaged resulting in less flood insurance claims

Potential Funding: FEMA grants, Department of Utilities, and property owners.

Timeline: 3-5 years

Action 7. Safeguard Essential Communication Services

Hazards Addressed: Multi-Hazard – Flood, Dam Failure, Earthquake, Fire, Severe Weather, Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: Communication services during and after a disaster event is essential. The ability to communicate real time information to first responders, the public, and the Emergency Operations Center is critical.

Project Description: Maintenance and continued testing of essential communication services, and have a plan in place to restore those essential services should they be damaged in an event. They include the City phone system, electronic mail, network services and servers. The creation of redundancy and safeguarding the City's communication infrastructure will be necessary.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implement through existing emergency preparedness activities.

Responsible Office/Partners: Emergency Operations Center, City of Sacramento Department of Utilities, City of Sacramento Department of Information Technology

Project Priority: High

Cost Estimate: $300,000

Benefits (Losses Avoided): Ensured communication, faster response time

Potential Funding: None

Timeline: 2017

Action 8. Multi-lingual Disaster Education

Hazards Addressed: Multi-Hazard – Floods, Severe Weather, Fires, Earthquakes, Dam/Levee Failure, Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento is a diverse city. The City must establish a method to inform our diverse population of seasonal disaster safety issues and general emergency preparedness.

Project Description: Develop Public Service Announcements, educational videos, a social media campaign, and other material in a variety of languages to provide our diverse community with information on how to develop a personal/family safety plan.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Program for Public Information Committee (Flooding Hazard) and Neighborhood Services activities

Responsible Office/Partners: Office of Emergency Services, City of Sacramento Department of Utilities, City of Sacramento Community Development Department

Project Priority: High

Cost Estimate: $50,000

Benefits (Losses Avoided): Vulnerable populations will be better prepared to protect themselves and property before and during an event. As well as, faster notifications and evacuations.

Potential Funding: FEMA Grants

Timeline: End of 2017

Action 9. Cal OES Safety Assessment Program Evaluators

Hazards Addressed: Multi-Hazard – Flood, Levee Failure, Dam Failure, Earthquake, Fire, Severe Weather

Goals Addressed: 1, 2, 3, 4

Issue/Background: A large disaster in Sacramento would have a major impact on the city's built environment. The city's ability to quick recovery from a disaster will require a large amount of personnel to inspect and evaluate the condition of structures in the impacted areas. It is important city staff to be trained in post-disaster assessment. This will allow the community to return to their homes and business in a timely manner as well has prohibit people from entering unsafe structures after a disaster.

Project Description: Increase the number of Cal OES Safety Assessment Program Evaluators within the City. The Safety Assessment Program utilizes volunteers and mutual aid resources to provide professional engineers and architects and certified building inspectors to assist local governments in safety evaluation of their built environment in the aftermath of a disaster.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implement through current Building Department personnel training program.

Responsible Office/Partners: City of Sacramento, Community Development Department

Project Priority: High

Cost Estimate: $3,000

Benefits (Losses Avoided): Life Safety, Correct Structural Evaluation

Potential Funding: City of Sacramento, Community Development Department

Timeline: One year

Action 10. National Flood Insurance Program & Community Rating System Continuation

Hazards Addressed: Multi-Hazard – Flood, Levee/Dam Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento is susceptible to various types of flood events: riverine, flash, and localized stormwater flooding; and levee and dam failure flooding. Regardless of the type of flood, the cause is most often the result of severe weather patterns and excessive rainfall, either in the flood area or upstream reach. Flooding is the most significant natural hazard that the City faces.

Project Description: Continue to meet minimum NFIP requirements and exceed those requirements by participating in the CRS program.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Floodplain Management Staff

Responsible Office/Partners: Department of Utilities

Project Priority: High

Cost Estimate: $10,000-$20,000 and staff time

Benefits (Losses Avoided): Increased flood insurance, increased public awareness, and community preparedness

Potential Funding: Local

Timeline: On-going

Action 11. Coordinate with Sacramento Area Flood Control Agency on Completion of South Sacramento Streams Group Projects

Hazards Addressed: Multi-Hazard – Flooding and Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: The flood of 1986 revealed that the South Sacramento Streams do not provide the desired level of protection to the community. In 1997, another series of storms confirmed that additional protection was needed. A project study was undertaken that identified measures that would provide greater than 100-year level of protection to the community. A USACE document describes issues and alternatives and is available from Sacramento Area Flood Control Agency (SAFCA).

Project Description: Coordinate with SAFCA for the Completion of the South Sacramento Streams (includes Florin and Morrison Creeks) Group Projects to provide greater than 100-year protection by improving conveyance and raising levees.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: South Sacramento Streams Coordination Group

Responsible Office/Partners: Sacramento Area Flood Control Agency, California Department of Water Resources, State Reclamation Board, US Army Corp of Engineers, City of Sacramento, County of Sacramento

Project Priority: High

Cost Estimate: $90 Million

Benefits (Losses Avoided): Life safety, reduced flood losses, significantly reduced insurance premiums

Potential Funding: Sacramento Area Flood Control Agency, California Department of Water Resources, State Reclamation Board, US Army Corp of Engineers, Grants

Timeline: 2021

Action 12. Develop a Master Generation Plan for Pump Stations

Hazards Addressed: Multi-Hazard – Severe weather, Earthquakes, Floods, Dam/Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: The city is divided into approximately 120 drainage basins. Drainage from most of these basins flows to local rivers or creeks or drainage channels through pumping. The City owns and operates 105 storm drainage pumping stations throughout the city. The drainage canals and local creeks eventually drain into the Sacramento and American Rivers.

Project Description: Develop a plan for identifying, prioritizing, and implementing power generation needs for pumping stations. Perform a power audit to identify needs. Plan will identify needs, costs, funding, and lead personnel. Plan will include the purchase and installation of necessary built-in and mobile generators and additional equipment.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implement through existing Capital Improvement Program.

Responsible Office/Partners: City of Sacramento Department of Utilities

Project Priority: High

Cost Estimate: $100,000

Benefits (Losses Avoided): Avoids flooding during power outages to pumping stations

Potential Funding: FEMA Grant

Timeline: 2018

Action 13. Develop a Disaster Housing Plan

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: Effective disaster housing is a critical step on the road to long-term recovery. A balance between providing housing assistance rapidly in the wake of a disaster and meeting the diverse needs of individuals and households within the community for a longer period of time during disaster recovery.

Project Description: Develop a Disaster Housing Plan to identify potential disaster housing partners and outline the principles, practices, and implantation phase of such a plan.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Unknown

Responsible Office/Partners: City of Sacramento Community Development Department, City of Sacramento Office of Emergency Services

Project Priority: High

Cost Estimate: $30,000

Benefits (Losses Avoided): Increased community resiliency, avoid potential financial losses

Potential Funding: Grants

Timeline: 2020

Action 14. Disaster Resistant Business Program

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: During a disaster businesses are disrupted. This disruption can cause loss in revenue, costumers, and potentially employees.

Project Description: Provide materials and administrative support for a comprehensive Business Continuity Planning (BCP) program, to include presentation s to business, non-profits and professional groups, Chamber of Commerce events, etc. The program would include a one-day event with an overview on developing a Business Continuity Plan and breakout sessions addressing specific BCP issues.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: City of Sacramento and Local Business Partners

Project Priority: Medium

Cost Estimate: $80,000 ($30,000 annual program costs)

Benefits (Losses Avoided): Increased community resiliency and avoided financial losses.

Potential Funding: Grants, Local Funding

Timeline: 2020

Action 15. Develop Enhanced Emergency Planning for Special Needs Populations in the City of Sacramento Emergency Operations Plan and Other Planning Documents

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: Special needs populations will require additional measures in order to support alerts and warnings, evacuation, and medical response.

Project Description: By working with local advocacy groups, and by identifying weaknesses and gaps in the City's emergency planning, the increased capabilities of the enhanced plan will enable emergency responders to more effectively support the most vulnerable segment of the population.

Other Alternatives: No Action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Emergency Operations Plan

Responsible Office/Partners: City of Sacramento Office of Emergency Services

Project Priority: High

Cost Estimate: $20,000

Benefits (Losses Avoided): Preservation of life and ability to evacuate more effectively

Potential Funding: Grant Funding, City of Sacramento Office of Emergency Services

Timeline: 2020

Action 16. Establish a Post-Disaster Action Plan

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: As home of the State Capitol, it is imperative that the city of Sacramento can recover quickly from a disaster. The amount of time it takes for the City's infrastructure, cultural resources, and the economy to recover will impact the ability of California's government to function.

Project Description: Create a post-disaster action plan that outlines the procedures for public information, post-disaster damage assessment, code enforcement, financial recovery, and redundant operations.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Emergency preparedness planning.

Responsible Office/Partners: City of Sacramento Emergency Services, Department of Utilities, Community Development Department

Project Priority: High

Cost Estimate: $50,000

Benefits (Losses Avoided): A more resilient community and avoided economic loss.

Potential Funding: Grants

Timeline: Short-Term

Action 17. Flood Recovery Plan

Hazards Addressed: Flood, Localized Flooding, Levee/Dam Break

Goals Addressed: 1, 2, 3, 4

Issue/Background: Immediately following a flood, the City will be left with massive amounts of debris and debilitated infrastructure. A proactive approach to this portion of the recovery process with increase the community's resiliency.

Project Description: Create a plan that addresses key elements of flood recovery, such as, restoring infrastructure, debris removal, water quality, building inspection, facilitating access to individual assistance, providing temporary housing, assisting with business recover, and identify needed resources to support recovery efforts.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Emergency Response Protocols for Floods

Responsible Office/Partners: City of Sacramento Department of Utilities, City of Sacramento Office of Emergency Services

Project Priority: Medium

Cost Estimate: $20,000 or Staff Time

Benefits (Losses Avoided): Improved Community Resilience

Potential Funding: Department Budgets, Grants

Timeline: 2018

Action 18. Public Information Flood Response Plan

Hazards Addressed: Flood, Levee/Dam Failure, Localized Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Program for Public Information (PPI) Committee recommends the development of outreach materials that will be implemented during and after a flood. These projects are drafted and made ready for production and dissemination after a flood warning. The PPI Committee also discussed the use of the City's website during a flood event. General emergency preparedness information and citywide evacuation routes are on the website, however, special elements will need to be added during a flood threat. Press releases providing information about the flood threat levels, conditions, evacuation routes, and preparedness actions will be posted on the City's website. The proposed projects are included in the City's Comprehensive Flood Management Plan.

Project Description: Develop a pre-flood plan for public information projects that will be implemented during and after a flood. The plan will include a collection of outreach projects templates including key messages that need to be disseminated before, during, and after a flood. The plan will also include written procedures that explain how the materials will be disseminated and when the information should be released.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Program for Public Information Committee

Responsible Office/Partners: City of Sacramento, Department of Utilities and City of Sacramento Office of Emergency Services

Project Priority: High

Cost Estimate: Staff Time

Benefits (Losses Avoided): Quicker flood warning response, better quality of information to the public during a flood event, coordinated disaster recovery information

Potential Funding: City of Sacramento, Department of Utilities and City of Sacramento Office of Emergency Services Budgets

Timeline: 2017

Action 19. Construction of a New Emergency Operation Center (EOC)

Hazards Addressed: Multi Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: The city of Sacramento's EOC is the central location of authority and information, and allows for face-to-face coordination among personnel who must make policy-level emergency decisions. The EOC can be activated and staffed to the extent deemed necessary to deal with the existing or impending emergency. The current size of the City EOC is inadequate for personnel needs and disrupts the face-to-face coordination necessary during an emergency situation.

Project Description: Build and equip a new Emergency Operations Center, to replace the inadequate EOC currently located in the city of Sacramento's dispatch center. The new facility would be developed to FEMA 361 standards. Grant funding would be used to supplement normal construction costs with the additional cost for increasing the armoring of the facility to meet the FEMA 361 standards for Community SafeRooms.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: City of Sacramento Office of Emergency Services

Project Priority: Medium

Cost Estimate: $10,000,000

Benefits (Losses Avoided): More space for operations & upgraded information technology systems

Potential Funding: City of Sacramento Emergency Services Budget, Grants

Timeline: 2020

Action 20. Emergency Operation Center (EOC) Expansion and Information Technology Upgrade

Hazards Addressed: Multi Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: The city of Sacramento's EOC is the central location of authority and information, and allows for face-to-face coordination among personnel who must make policy-level emergency decisions. The EOC can be activated and staffed to the extent deemed necessary to deal with the existing or impending emergency. The current size and information technology infrastructure of the City EOC is inadequate for personnel needs during an emergency situation.

Project Description: Improvements to the City current EOC is necessary to meet the demands of a large scale natural disaster. The facility has size limitations that will restrict the amount of personnel located in the same room. Potentially unit will have to operate in separate rooms or building which would reduce real-time communications. Also, the facility need improvements on the usability of the information technology infrastructure. A network separate from the police dispatch's system is needed. Currently there is a shared network which has high security restrictions. The security restrictions make it difficult for a city employee to sign in at the EOC and be fully functional.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Department of Information Technology's updates and maintenance schedule for the EOC.

Responsible Office/Partners: City of Sacramento Office of Emergency Services

Project Priority: Medium

Cost Estimate: $3,000,000

Benefits (Losses Avoided): More space for operations & upgraded information technology systems, facilitates a more effective emergency response

Potential Funding: City of Sacramento Emergency Services Budget, Grants

Timeline: 2020

Action 21. Protection of Transportation Infrastructure

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City's roadway network consists of a combination of Federal interstates, a United States highway, California State highways, and city streets. This roadway network is used extensively for personal vehicle travel. Approximately 86 percent of all city residents travel from home to work by automobile.

Project Description: Retrofit all bridges in the city of Sacramento to current seismic standards. Elevate roads and bridges above the base flood elevation to maintain dry access. In situations where flood waters tend to wash roads out, construction, reconstruction, or repair can include not only attention to drainage, but also stabilization or armoring of vulnerable shoulders or embankments.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: Department of Transportation Capital Improvement Project Planning Process

Responsible Office/Partners: City of Sacramento Department of Transportation

Project Priority: High

Cost Estimate: Estimated $200,000,000

Benefits (Losses Avoided): Enhanced bridge safety, increased evacuation routes possibilities, shorter disaster recovery timeline

Potential Funding: Grants, Capital Improvement Project Funding

Timeline: 2021

Action 22. Public Education Campaign for Everbridge System

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: The County Office of Emergency Services has replaced the Reverse 911 system with "Everbridge", a faster system than Reverse 911. Residents must register for this system in order to received emergency alerts.

Project Description: Outreach will be performed using a variety of methods to inform residents about the City emergency alert system, Everbridge. The campaign will direct resident to sign up for emergency alerts.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Neighborhood Services and Emergency Services Efforts

Responsible Office/Partners: City of Sacramento Office of Emergency Services

Project Priority: High

Cost Estimate: $100,000

Benefits (Losses Avoided): Avoided Loss of Life, More Evacuation Time

Potential Funding: Possible Grants, Emergency Services

Timeline: 2017

Action 23. Regional Emergency and Disaster Preparedness Exercises to Test Operational & Emergency Plans

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento has an Emergency Operation Plan that addresses the City's planned response to extraordinary emergency situations associated with natural disasters, technological incidents, and nuclear defense operations. The City of Sacramento has adopted the Standardized Emergency Management System for managing response to multi-agency and multi-jurisdiction emergencies and to facilitate communications and coordination between all levels of the system and among all responding agencies. Additionally, Sacramento is part of the State's mutual aid system and can give or receive support in an emergency situation.

Project Description: Conduct regional, multi-agency emergency and disaster preparedness exercises to test operational and emergency plans. Tests will include levee or dam failure and other natural hazards.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Emergency Services Training Program

Responsible Office/Partners: City of Sacramento Office of Emergency Services, City of Sacramento Department of Utilities

Project Priority: High

Cost Estimate: $10,000

Benefits (Losses Avoided): Identify weaknesses in current plans and communications, better prepared for a disaster

Potential Funding: Training Budgets, Grants

Timeline: Ongoing

Action 24. Special Needs and Critical Facilities Database and Advanced Warning System

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: Public alert and warning systems are necessary to increase public awareness of an impending threat and provide clear instructions. In the city of Sacramento, existing systems include the Emergency Alert System, fire and law enforcement vehicle loudspeakers, Everbridge, and agency websites. The Emergency Alert System is designed to provide emergency information via radio and

television. The city of Sacramento's Everbridge system can send pre-recorded messages to individuals who sign up for the service. However, an advanced warning system for special needs populations and critical facilities has not been developed.

Project Description: Through outreach activities, develop a database of vulnerable population groups and critical facilities in need of advance warning or evacuation assistance. Development and implementation of an advanced warning procedure. Successful programs have been developed in Houston, San Antonio and Florida and could serve as a model for implementation and personnel training.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Emergency Action Plan

Responsible Office/Partners: Office of Emergency Services

Cost Estimate: $200,000

Benefits (Losses Avoided): Avoid loss of life and critical facilities. Faster & more coordinated emergency response times.

Potential Funding: Grants or Emergency Services Budget

Timeline: Short-Term

Project Priority: High

Action 25. Asset Inventory

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: A current detailed list of city assets itemized by facility is needed in the case of disaster recovery. In the event that a city facility was damaged a during a natural disaster a detailed list of the assets impact would be needed.

Project Description: Development of a list of all city assets with specific location information that can be easily maintained by all departments. The list will include information technology equipment, communication equipment, machinery, office furniture, etc. The list will also indicate which facilities and assets are located in a hazard area.

Other Alternatives: Current Inventory Lists

Existing Planning Mechanism(s) through which Action Will Be Implemented: Each department within the City has asset tracking methods.

Responsible Office/Partners: City of Sacramento Asset Management

Project Priority: Medium

Cost Estimate: $200,000

Benefits (Losses Avoided): Identification of assets in hazard area may prompt relocation or protection of assets. Also, quick assessment of what city assets have been damaged or lost during a disaster which will allow for a quicker recovery period.

Potential Funding: City of Sacramento and Grants

Timeline: 2021

Action 26. Protection of City Assets from Cyber Terrorism

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3

Issue/Background: Due to the massive amount of destruction that can be caused by cyber terrorism it is vital to protect the City's network from attacks. Cyber-attacks can weaken and potentially disable the City's ability to respond to a natural disaster.

Project Description: Develop a system to withstand cyber terrorism and train users for prevention efforts, manage the use of privileged accounts, have antivirus software conduct regular scans, back up data, etc.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Information Technology's emergency training exercises.

Responsible Office/Partners: City of Sacramento Department of Information Technology

Project Priority: High

Cost Estimate: Unknown

Benefits (Losses Avoided): Protection of the city's ability to operate vital systems during emergency events and the protection of technical infrastructure and data.

Potential Funding: Department of Information Technology Budget, Possible Grants

Timeline: Ongoing

Action 27. Protection of City Information Technology Infrastructure

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3, 4

Issue/Background: Due to the massive amount of destruction that can be caused by cyber terrorism it is vital to protect the City's network from attacks. Disruption of the City's information technology infrastructure will weaken and potentially disable the City's ability to respond to a natural disaster.

Project Description: Develop a system to withstand the variety of natural disaster the City is vulnerable to, such as, flooding, fire, and severe storms and wind.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Information Technology's maintenance and upgrade schedule.

Responsible Office/Partners: City of Sacramento Department of Information Technology

Project Priority: High

Cost Estimate: Unknown

Benefits (Losses Avoided): Protection of the city's ability to operate vital systems during emergency events and the protection of technical infrastructure and data.

Potential Funding: Possible Grants, Department of Information Technology Budget

Timeline: Ongoing

Action 28. Cell Booster

Hazards Addressed: Multi-Hazard

Goals Addressed: 1, 2, 3

Issue/Background: The Department of Utilities' (DOU) Operation Control Center (OCC) is the prime communication for DOU during an emergency. During an activation, the cellular signal that is transmitted becomes intermittent. The problem appears to lie within the makeup of the building and that an external antenna (or cell phone booster) that is mounted on the building would keep a signal solid during high volume usage.

Project Description: Cellular Phone Booster for DOU's OCC.

Other Alternatives: Small internally mounted antennas which provide limited boost to the current signal

Existing Planning Mechanism(s) through which Action Will Be Implemented: Emergency Action Planning

Responsible Office/Partners: Department of Utilities

Project Priority: High

Cost Estimate: Approximately $4,000

Benefits (Losses Avoided): Strong transmission of cellular signal during high volume usage. Avoids failure in communication system during activation.

Potential Funding: FEMA Grant or Department of Utilities

Timeline: 1 year

Action 29. Travel Time Model for Lower American and Sacramento Rivers and their Major Tributaries

Hazards Addressed: All

Goals Addressed: 1, 2, 3, 4

Issue/Background: Drinking water source water is potentially vulnerable to watershed spills, which can be caused or contributed to by natural disaster events. It is important to be able to estimate the travel time from the location of the spill to the water treatment plant intakes. The City of Sacramento has developed a rough river travel time estimating tool for the Lower American River and Sacramento River using model information obtained from the National Oceanic and Atmospheric Administration (NOAA) CA/NV River Forecast Center. The travel time tool was developed to allow a rough estimate for the amount of time it will take for water to move downstream from selected locations on the rivers to the City's water treatment plant intakes. The existing tool is shared with the other Lower American and Sacramento River water utilities, but the information is not developed for other intake locations. The current river model has limitations, including locations modelled and other features that an updated model may be able to address. To our best knowledge, there is no information available on travel time for major tributaries to the Lower American River and Sacramento Rivers within or proximate to Sacramento County.

Project Description: Provide resources for improved travel time modeling of the Lower American and Sacramento Rivers, and develop model for travel time on major tributaries and other water bodies of interest. Translate model results into resource(s) that is readily available for Lower American and Sacramento River water treatment plant operators and water utility management to use as a tool for preparedness, response, and recovery for watershed hazardous material spill events. There is potential to include water quality modeling in the model capabilities, or develop the model for future expansion to include water quality.

Other Alternatives: Continue to use current rough estimating tool for river travel time and networking with NOAA for other opportunities.

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Source Water Protection Program\Potentially through Lower American River and Sacramento River Joint Source Water Protection Programs

Responsible Office/Partners: City of Sacramento Department of Utilities, Engineering and Water Resources Division, Environmental and Regulatory Compliance Section or Potential for other Responsible Office/Other Drinking Water Utilities that Treat Lower American River and Sacramento River Water/Potential for Partnership with National Oceanic and Atmospheric Administration (NOAA)

Project Priority: High

Cost Estimate: $500,000-$3,000,000

Benefits (Losses Avoided): Protection of public health, reducing cost emergency response or other alternate water supplies.

Potential Funding: Grant, to be determined

Timeline: 2-5 years

Action 30. Watershed Spill Contamination to Drinking Water Quality: Preparedness for Events and Recovery

Hazards Addressed: All

Issue/Background: When utilizing surface water as a source of drinking water, the source water is potentially vulnerable to watershed spills that can enter the supply. Watershed spills can be caused or contributed to by natural hazards. Spills have the potential to impact source water quality and therefore water treatment plant operations. Changes in source water quality may necessitate a response action at a drinking water treatment plant, such as implementing an increased level of treatment, alternate treatment, or avoiding diversion altogether. Both during a spill and after a watershed spill has ended, it is important to determine if there is residual contamination in the surface water and if the water treatment plant intakes and treatment facilities have been impacted. There could be a wide range of contaminants released in watershed spills, including petroleum products from fuel spills, a wide range of synthetic chemicals, and those associated with wastewater such as bacteria, viruses, and protozoa. The contamination may constitute a hazard to public health for regulated and unregulated water quality contaminants.

Project Description: Provide resources to support water utility preparedness and recovery planning for chemical and wastewater hazardous spills in the watersheds upstream of water treatment plant intakes caused or contributed to by natural disaster events. This includes development of information and resources to identify the potential impacts of the spill, conduct of emergency exercises, planning coordination with emergency response agencies regarding environmental mitigation and cleanups, and preparing information and resources for water treatment facilities and treatment recovery. The project

may also include providing supplies to support spill containment and watershed/surface water clean-up and water treatment intake and plant clean-up and restoration.

Other Alternatives: Continue to support and develop resources to support City of Sacramento Water Treatment Plant Operations, and continue to share information with other Sacramento and American River water utilities. Continue to coordinate and manage the Lower American River and Sacramento River Water Utilities Voluntary Spill Notification Program including potential opportunities to develop additional preparedness resources together. Continue to coordinate with and participate in the American River Water Utilities Voluntary Spill Notification Program.

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Source Water Protection Program/Potentially through Lower American River and Sacramento River Joint Source Water Protection Programs

Responsible Office/Partners: City of Sacramento Department of Utilities, Engineering and Water Resources Division, Environmental and Regulatory Compliance Section or Potential for other Responsible Office/Other Local Drinking Water Utilities that Treat Lower American River and Sacramento River water.

Project Priority: High

Cost Estimate: $250,000-$500,000

Benefits (Losses Avoided): Protection of public health, reducing cost for emergency response or other alternate water supplies.

Potential Funding: Grant, to be determined

Timeline: 1-2 years

Action 31. Purchase Drones for Use in Disaster Preparedness, Mitigation, and Response

Hazards Addressed: Multi-hazard. (Compromised or failing structural integrity that would cause a critical facility to not withstand a hazard or disaster event as designed or as expected/anticipated. Earth movement or subsidence, or a change in earth properties which jeopardizes an area's intended purpose or gives rise to unanticipated negative consequences. Levee deterioration, damage and failure. Loss of protective banks (barriers/constraints) over time.)

Goals Addressed: 1, 2, 3, 4

Issue/Background: Critical facilities are assessed and a determined to be able to withstand hazards/events at a certain level. As the structural integrity of a facility deteriorates, its ability to perform as anticipated is compromised, possibly leading to increased damages/costs. A primary California hazard is earthquake activity, which can result in liquefaction. Due to its location, the City of Sacramento relies heavily on its levee system for flood control/ protection. The City of Sacramento area has numerous creeks/channels with a bank network that serves as barriers or water constraints.

Project Description:

- Integrate the use of drones into the City's scheduled facility inspection program. Implement inspection of areas that may have been impossible and/or very difficult to inspect in the past, with a program goal to increase efficiency, comprehensiveness, and frequency of inspections as a best practices measure.
- Integrate the use of drones in establishing a program (if one does not already exist) to (1) document the position of baseline land markers in areas identified as being susceptible to liquefaction and (2) verify/ update the positions of the land markers on a scheduled basis. Following a seismic event, use drones to conduct a priority re-check of land mark locations over a designated time span to determine whether a susceptible area is demonstrating signs of liquefaction and at what rate in order to take mitigating action.
- Integrate the use of drones in the regulatory inspection process in order to capture, retain, and utilize imagery/GPS coordinates for geospatial analysis. The geospatial analysis would provide information and/or changes in condition of levees and banks not readily detectible by the human eye, and can be used to visually demonstrate the changes over time and potentially project out a timeline that could predict critical failure. This information can then be used by Operations & Maintenance to conduct proactive high-level maintenance and spot repair activities and by Engineering/Asset Management to analyze changes in noted anomalies in order to determine areas where large scale rehabilitation/reinforcement and/or CIP needs should be addressed to ensure levee and bank integrity. The drones can also be used to inspect levees from the water-side potentially increasing the safety of City staff as well as the efficiency with which they are conducted. Because of the numerous environmental regulatory guidelines in place, drones can be used to view areas where protected species are habituating, greatly increasing our ability to leave them as undisturbed as possible while conducting operations.

Other Alternatives: None.

Existing Planning Mechanism(s) through which Action Will Be Implemented: The current facility maintenance program is scheduled in Maintenance Connections and is performed visually by experienced City staff. Inspections are currently scheduled in CityWorks and conducted visually by experienced City staff.

Responsible Office/Partners: City of Sacramento, Department of Utilities, Drainage Levee Inspection Section

Project Priority: High

Cost Estimate: $35,000 - $45,000 per drone

Benefits (Losses Avoided): The benefits are as noted above the Project Description.

Potential Funding: FEMA Grant or Department of Utilities

Timeline: 1-3 years

Climate Change Actions

Action 32. Map and Assess Vulnerability to Sea Level Rise

Hazards Addressed: Climate Change

Goals Addressed: 1, 2, 3, 4

Issue/Background: The Sacramento and American Rivers are affected by sea level rise. When originally constructed, the majority of the City's drainage and levee systems did not account for future sea level rise. This rise may impact the City's levee freeboard and the drainage capacity.

Project Description: Model various "what-if" scenarios to estimate potential vulnerability in order to develop sea level rise mitigation priorities. Develop an inventory of critical facilities and infrastructure that may be particularly vulnerable to sea level rise.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento, Department of Utilities Capital Improvement Planning

Responsible Office/Partners: City of Sacramento, Department of Utilities

Project Priority: Medium

Cost Estimate: Unknown

Benefits (Losses Avoided): This study would allow the City of Sacramento to proactively safeguard development and improve systems to accommodate the Sea Level Rise.

Potential Funding: Possible grants and capital improvement funds

Timeline: 5 years

Action 33. Emission Study of City Sump and Pump Stations

Hazards Addressed: Climate Change

Goals Addressed: 1, 2, 3

Issue/Background: During the last 200 years the atmospheric concentrations of greenhouse gases (GHGs) have been increasing. Human activities such as agriculture, industry, waste disposal, deforestation, and especially fossil fuel have been producing increasing amounts of GHGs.

Project Description: Determine the level of emissions from all 94 sumps and pumps operated by the City of Sacramento Department of Utilities. Provide recommendations for mitigation and reduction of emissions.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Capital Improvement Plans

Responsible Office/Partners: City of Sacramento Department of Utilities

Project Priority: Medium

Cost Estimate: $200,000

Benefits (Losses Avoided): Reduction in greenhouse gases. Improvement of air quality.

Potential Funding: City of Sacramento Wastewater and Stormwater Drainage Fund and Grants

Timeline: 2 years

Action 34. Climate Change Mitigation Actions/Climate Change Adaptation Plan for Drinking Water Quality

Hazards Addressed: Drought, Severe Weather

Goals Addressed: 1, 2, 3, 4

Issue/Background: Studies and evaluations by US EPA and others indicate that climate change may result in long-term significant changes to watersheds, watershed management, and drinking water source water quality. Changes can include snowpack, timing of storms and runoff, reservoir operations, and wildfires. The result of such changes can have a significant impact on drinking water source water quality, which can result in the need to modify water treatment operations and treatment facilities.

Project Description: Develop a City of Sacramento Climate Change Adaptation Plan for Drinking Water Quality. (Or potentially Multiple Jurisdiction Plan/Resources for some components). Project could include development/preparation of tools and long-term water quality data review and analysis on selected constituents.

Other Alternatives: Continue general tracking of climate change potential impacts to Sacramento and Lower American River water quality through the Lower American River Joint Source Water Protection Program, watershed sanitary survey reports, and other tracking of water industry information.

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Engineering and Water Resources Division

Responsible Office/Partners: City of Sacramento Department of Utilities, Engineering and Water Resources Division

Project Priority: High

Cost Estimate: $100,000-$750,000 (Large range to provide range of resources for developing a plan to also provide support for plan implementation including setting up tools and resources, long-term review/evaluations, etc.)

Benefits (Losses Avoided): Protection of public health, planning ahead for potential future changes to water treatment plant processes and facilities for cost efficiency, and potentially avoiding costs for response to impacted water quality from watershed emergencies that are linked to climate change.

Potential Funding: Grant, to be determined

Timeline: 2 years

Action 35. Harmful Algal Bloom (HAB) Surveillance and Response Planning

Hazards Addressed: Climate Change (Drought and Severe Weather)

Goals Addressed: 1, 2, 3

Issue/Background: A harmful algal bloom (HAB) can occur in water bodies and can affect those who use these water bodies for recreation, agricultural, or drinking. People can be exposed to a HAB or HAB toxins when they swim, wade, or play in or near contaminated water; eat contaminated fish or shellfish; or use contaminated drinking water. The severity of illness and symptoms can vary depending on the type of exposure and the type of HAB toxin.

The main routes of exposure to HAB toxins are:

- Skin contact (through activities like swimming)
- Inhalation (by breathing in tiny airborne droplets or mist contaminated with HAB toxins)
- Ingestion (by eating or drinking food or water contaminated with HAB toxins)

Reference: http://www.cdc.gov/habs/exposure-sources.html

In June 2015, USEPA issued drinking water health advisories (HA) for two cyanotoxins – microcystin and cylindrospermopsin. Health advisories are non-regulatory values that serve as informal technical guidance to assist federal, state and local officials, and managers of public or community water systems to protect public health from contaminants.

Health effects including gastroenteritis, and liver and kidney damage have been reported in humans following short-term exposure to cyanotoxins in drinking water. Recreational exposure to cyanobacterial blooms has been reported to lead to allergic reactions including hay fever-like symptoms, skin rashes, and gastrointestinal distress. Animal studies have shown that long-term health effects from cyanotoxins include liver and kidney damage. However, more research is needed to quantify these effects.

Cyanobacteria blooms have occurred throughout California, and drought and extreme heat events can contribute to the factors that can lead to HAB events.

Project Description: Develop a County-wide (preferred) or City of Sacramento plan for surveillance and response planning for Harmful Algal Bloom events that may impact drinking water source waters and/or

water bodies with recreational use. The project could be used to support monitoring. The project could also be used to identify new technologies and develop opportunities to support national, state, regional, or local programs that may provide early warning and other environmental indicators to help local agencies prepare for HABs and mitigate their effects.

Other Alternatives: Continue City of Sacramento tracking and response efforts, which includes lead efforts by the Department of Utilities Engineering and Water Resources Division Water Quality Lab and R&D Section for preparedness and coordination with other local water utilities, as well as tracking information on source water surveillance programs and the latest drinking water industry research.

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Engineering and Water Resources Division to provide initial coordination to help identify the best fit for the lead role in the Sacramento County area.

Responsible Office/Partners: City of Sacramento Department of Utilities, Engineering and Water Resources Division /Potentially Sacramento County Environmental Health Department/Potentially Other Drinking Water Utilities that Treat Lower American River and Sacramento River Water

Cost Estimate: $100,000-$3,000,000 (large range to show range for potential efforts from Plan only to Plan plus supporting technical programs to provide monitoring, surveillance and early warning, and other ideas/technologies to protect public health.)

Benefits (Losses Avoided): Protection of public health, reducing cost for emergency response or other alternate water supplies.

Potential Funding: Grant, to be determined

Timeline: 2 -3 years

Project Priority: High

Drought and Water Shortage Actions

Action 36. Aquifer Storage

Hazards Addressed: Drought & Water Shortage

Goals Addressed: 1, 2, 3, 4

Issue/Background: There are two aquifer systems: an upper unconfined system consisting of the Victor, Fair Oaks, Laguna, Modesto Formations, and a lower, semi-confined system in the Mehrten Formation. These geologic formations are composed of lenses and layers of inter-bedded sand, silt, and clay with coarse-grained stream channel deposits. The groundwater contained in the upper aquifer system of the Victor, Fair Oaks, Laguna, Modesto, Riverbank, and Turlock Lake Formations along with Arroyo Seco and South Fork Gravels is of superior quality compared to that in the lower semi-confined system, mainly because the water in the Mehrten Formation is higher in iron and manganese, and requires more treatment. The upper unconfined system only requires chlorination treatment to be potable.

Project Description: Implement aquifer storage and recovery program that uses direct injection technique in areas identified as appropriate.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Department of Utilities Water Treatment

Responsible Office/Partners: Department of Utilities

Project Priority: Medium

Cost Estimate: $600,000

Benefits (Losses Avoided): Increased Water Supply

Potential Funding: Grant, Department of Utilities

Timeline: 2021

Action 37. Preform a Groundwater Recharge Feasibility Study

Hazards Addressed: Drought & Water Storage

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City currently operates 27 active municipal groundwater supply wells within the city limits. Twenty-five of these wells are located north of the American River in the communities of North Sacramento, South Natomas and Arcade-Arden. The City wells supply the City with a maximum total capacity of about 20.7 mgd. In 2010, the groundwater supply wells pumped approximately 21.1

mgd. The City also operates 14 wells for the irrigation of parks. Although the City relies predominantly on surface water as its primary source of water supply, the groundwater well system provides flexibility in providing domestic water to the City, especially in years when there are low river flows, as well as providing water that can be delivered on a retail or wholesale basis outside the area authorized to receive delivery of the City's surface water supply.

Project Description: Preform a groundwater recharge feasibility study to determine the most cost-effective way to replenish groundwater resources within Sacramento.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Department of Utilities Water Treatment

Responsible Office/Partners: City of Sacramento Department of Utilities

Project Priority: Medium

Cost Estimate: $80,000

Benefits (Losses Avoided): Increased water supply

Potential Funding: Grants

Timeline: 2020

Earthquake Actions

Action 38. Map and Assess Community Vulnerability to Earthquakes

Hazards Addressed: Earthquake

Goals Addressed: 1, 2, 3, 4

Issue/Background: Although all of California is typically regarded as seismically active, the city of Sacramento does not commonly experience strong groundshaking resulting from earthquakes along known or previously unknown active faults. There are, however, isolated areas within the city that have soils and other conditions which could result in structural damage induced by seismic activity. Seismic hazards that may affect portions of the City during, or in the aftermath of, a major seismic event may include minor groundshaking and liquefaction.

Project Description: Develop an inventory of public and commercial buildings that may be particularly vulnerable to earthquake damage. Collect geologic information on seismic sources, soil conditions and related potential hazards. Identify potential damages and existing vulnerabilities within the community to develop mitigation priorities.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Unknown

Responsible Office/Partners: City of Sacramento Community Development Department

Project Priority: Medium

Cost Estimate: $250,000

Benefits (Losses Avoided): Better understanding of vulnerabilities which will lead to better disaster planning as well as prioritized mitigation projects.

Potential Funding: State Programs, Seismic Hazards Mapping Act, Grants

Timeline: Short-term

Action 39. Seismic Vulnerability Assessment on Sacramento Levees, Infrastructure & Buildings

Hazards Addressed: Earthquake

Goals Addressed: 1, 2, 3, 4

Issue/Background: Sacramento has aging infrastructure, roads, highways, bridges and light rail system that may not be able to survive a seismic event. Being located in a geographical region that may be impacted by seismic activity it is important to test the vulnerability of the levees protecting the region as well as aging infrastructure.

Project Description: Perform a levee and infrastructure specific, structural seismic vulnerability assessment of the levees and aging infrastructure surrounding the Sacramento region. Included in the assessment will be mitigation alternatives and measures to be taken for improved protection.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City Operation and Maintenance Funding

Responsible Office/Partners: City of Sacramento Department of Transportation, Community Development Department, Sacramento Transportation Authority

Project Priority: High

Cost Estimate: $250,000-1,000,000

Benefits (Losses Avoided): Life Safety, Avoided EMS Costs, Loss-of-Function Costs & Reduced Physical Damages

Potential Funding: FEMA/State grants, Department Budgets

Timeline: Short-term

Action 40. Retrofit Historical Buildings

Hazards Addressed: Earthquake

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento has many older structures that are not protected against earthquakes because they were designed and constructed according to current building standards. These types of buildings are the single biggest contributor to seismic risk in the United States today. Seismic retrofitting of vulnerable structures is critical to reducing risk, protection of life and property, and preservation of historical points of interest.

Project Description: Evaluating older buildings and retrofitting structural and non-structural components.

Other Alternatives: Retrofit buildings when major improvement are made to structure.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Building Permit Process and Code Enforcement

Responsible Office/Partners: City of Sacramento Community Development Department

Project Priority: Medium

Cost Estimate: $3,000,000-$20,000,000

Benefits (Losses Avoided): Protection of life and assets. Increased resilience after an earthquake. Preservation of historical structures within the City.

Potential Funding: City of Sacramento Community Development Department and Grants

Timeline: 2021

Extreme Cold and Heat Actions

Action 41. Heating Centers in High Priority Locations

Hazards Addressed: Extreme Cold

Goals Addressed: 1, 2, 3, 4

Issue/Background: Cold weather does not occur in Sacramento as severely as it does in other regions of Northern California as well as the rest of the United States. The average lowest temperature in Sacramento during December is 38°F. However, for the vulnerable populations, especially the homeless this cold weather can be harsh for them resulting in the need of heating centers.

Project Description: This project entails the identification of the locations of the most vulnerable populations too extreme cold and working with recreational and faith based centers to provide a refuge from the harsh weather to keep them warm throughout the night when temperatures drop to the lowest. This can be achieved by providing a stipend for every night the center is in use to cover the costs of heat generation. Centers would be placed in locations closest to populations in need.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: This will be implemented through current offerings of cooling centers by the City, faith-based, and recreational facilities and can be upgrade to include city owned facilities not in use.

Responsible Office/Partners: City of Sacramento – Homeless Coordination

Project Priority: High

Cost Estimate: $10,000

Benefits (Losses Avoided): Homeless assistance, health & safety of vulnerable populations

Potential Funding: City of Sacramento, Grants

Timeline: Winter 2017

Action 42. Cooling Centers in High Priority Locations

Hazards Addressed: Extreme Heat

Goals Addressed: 1, 2, 3, 4

Issue/Background: With increasing temperatures every summer at risks residents of Sacramento including, the homeless population need a place to escape the harsh weather. It is at this time that the at-risk populations such as low income, homeless and the elderly are at risk for heat exhaustion, heat stroke

and dehydration among other illnesses. Heat related deaths rose in 2015 compared to 2014 where they were up to 45 from 20 deaths.

Project Description: This project includes the opening of cooling centers in high priority locations throughout the City where these at risk populations are centered as well as high population areas where the general public may need to cool down. This can be an incentive for recreational centers and faith-based centers that can receive stipends for every day they are in use.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: This will be implemented through current offerings of cooling centers by the City, faith-based, and recreational facilities and can be upgrade to include city owned facilities not in use.

Responsible Office/Partners: City of Sacramento

Project Priority: High

Cost Estimate: $25,000

Benefits (Losses Avoided): Health & safety of residents, reduced emergency service calls

Potential Funding: City of Sacramento, Grants

Timeline: Summer 2017

Action 43. Extreme Weather Outreach Strategy

Hazards Addressed: Extreme heat/cold

Goals Addressed: 1, 2, 3, 4

Issue/Background: Extreme heat and cold weather are no stranger to the Sacramento region. In July of 2016 we saw the temperature mark hit over 100F for five days straight. And during the winter months some residents of Sacramento are used to seeing their pipes freezing overnight. The biggest group of people affected by this come from the homeless population and low-income areas around Sacramento who do not have adequate resources to keep themselves warm or cool during these harsh times.

Project Description: This project is meant to serve as an outreach to the population in Sacramento. It will be completed mainly by providing social media toolkits for the general population with access to internet. For more at-risk populations such as the homeless the outreach will be completed in person by targeting the areas of Sacramento where the homeless population tends to stay. Outreach will also be completed via food banks and homeless assistance centers.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Public Information Office

Responsible Office/Partners: City of Sacramento – Homeless Coordination, Sacramento Steps Forward

Project Priority: High

Cost Estimate: $5,000 + Staff Time

Benefits (Losses Avoided): Reduced calls for emergency services, health & safety of Sacramento's population

Potential Funding: City of Sacramento, Grants

Timeline: Summer 2017

Action 44. Severe Weather Action Plan

Hazards Addressed: Extreme heat/cold

Goals Addressed: 1, 2, 3, 4

Issue/Background: Extreme heat and cold weather are no stranger to the Sacramento region. In July of 2016 the City saw the temperature mark hit over 100F for five days straight. During the winter months some residents of Sacramento experience pipes freezing overnight and low temperatures. There are individuals in the community who do not have adequate resources to keep themselves warm or cool during these harsh times. The largest group of people affected by Sacramento's severe weather is the homeless population and low-income areas around Sacramento.

Project Description: The Severe Weather Action Plan will outline key triggers, such as, when to begin weather monitoring and cooling/warming centers activations. The Plan would also outline media and boots-on-the-ground outreach to the populations in need. The Plan will also identify community partners who will provide shelter and/or services during severe weather events.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Office of Emergency Services Planning Process

Responsible Office/Partners: City of Sacramento – Homeless Coordination, Sacramento Steps Forward

Project Priority: High

Cost Estimate: $50,000

Benefits (Losses Avoided): Reduced calls for emergency services, health & safety of Sacramento's population

Potential Funding: Local Funding, Grants

Timeline: Summer 2017

Flood, Localized Flooding, and Levee Failure Actions

Action 45. Coordinate with Stakeholder on Proposed Flood Control Project on Magpie Creek

Hazards Addressed: Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Since the early 1990s, SAFCA has been working with USACE and CVFPB to improve the Magpie Creek Diversion Channel (MCDC) and levee to reduce the risk of overflow into the historic Magpie Creek floodplain downstream of the diversion channel. This effort has focused on a combination of floodplain storage and levee rehabilitation improvements that would be carried out as part of the American River Common Features General Reevaluation Report (ARCF GRR). This is a low priority on SAFCA's list.

Project Description: The project would raise approximately 2,100 feet of the MCDC left bank levee and extending the levee south along the west side of Raley Boulevard to Santa Ana Avenue, with floodgates at two driveways.

Other Alternatives: Increase pumping capacity at Magpie Creek and the NEMDC

Existing Planning Mechanism(s) through which Action Will Be Implemented: US Army Corps of Engineers, Sacramento District, General Reevaluation Report (GRR)

Responsible Office/Partners: Sacramento Area Flood Control Association, US Army Corps of Engineers, County of Sacramento, Department of Water Resources, City of Sacramento, Department of Utilities

Project Priority: Medium

Cost Estimate: Unknown

Benefits (Losses Avoided): Protects the safety of residents and their structures. Flood insurance relief to residents in the Historic Magpie Creek floodplain.

Potential Funding: SAFCA/Grants/City

Timeline: Unknown

Action 46. Adopt Additional Floodplain Development Standards

Hazards Addressed: Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City has created a Development Services Task Force that meets on a regular basis to discuss the City's floodplain development standards. Additional regulations may include

evacuation and rescue requirements, additional freeboard, elevation of utilities, and 200-year level of protection.

Project Description: The Development Services Task Force will discuss the adoption of additional development standards related to floodplain management and best practices.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Development Service Task Force would implement necessary action.

Responsible Office/Partners: City of Sacramento, Department of Utilities and Community Development Department

Project Priority: Medium

Cost Estimate: Staff time

Benefits (Losses Avoided): New and substantially improved structures will be better protected from flooding.

Potential Funding: City of Sacramento, Department of Utilities and Community Development Department

Timeline: 1 year

Action 47. Drainage Projects for Repetitive Loss Properties

Hazards Addressed: Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City has set a goal to remove at least four repetitive loss (RL) structures from FEMA‟s Repetitive Loss List within the City by September 2018. A lot of the RL structure have flooded because undersized local drainage issues.

Project Description: Many potential drainage projects that have been identified in the City's Drainage Master Plans. These projects include upsizing pipelines, adding detention basins, adding bypass pipelines, retrofitting pump stations, and land acquisition. These projects will be ranked and grant funding will be pursued.

Other Alternatives: Promote flood insurance.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Mitigation of repetitive loss properties is a mitigation measure in the City's Corrective Action Plan approved by FEMA.

Responsible Office/Partners: City of Sacramento, Department of Utilities

Project Priority: Medium

Cost Estimate: $0.2 million - $15 million per project

Benefits (Losses Avoided): No more structural damage and flood insurance claims

Potential Funding: FEMA grants, Corrective Action Plan funding, and DOU

Timeline: August 2017-September 2019

Action 48. Emergency Notification and Evacuation Planning

Hazards Addressed: Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: As part of a corrective action plan approved by FEMA, the City of Sacramento in conjunction with the Sacramento Office of Emergency Services has committed to upgrading and improving emergency notification and evacuation planning systems and processes using the current Reverse 911 system, which is administered by the Sacramento Police Department, as the primary method.

Project Description: Enhancements to the existing Reverse 911 system to more effectively notify mass populations of evacuation orders and routes, consistent with FEMA guidelines, identifying special needs communities and transportation providers, targeted outreach to maximize the capabilities of Reverse 911, and strategic training to assure effective deployment of the enhanced capabilities.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The multi-hazard response plan and ongoing training programs administered by Sacramento Office of Emergency Services (SOES).

Responsible Office/Partners: SOES

Project Priority: High

Cost Estimate: Approximately $350,000

Benefits (Losses Avoided): Early notification times, better prepared evacuations, preventing loss of life and property

Potential Funding: $350,000 appropriated from the City's Community Development Department as part of the City's Corrective Action Plan to FEMA

Timeline: Full deployment, outreach and training completed by October 2016

Action 49. Historic Magpie Creek

Hazards Addressed: Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: For years, the City has used floodplain maps and data from the City's Drainage Master Plan and a Corps of Engineers study for development purposes in the Historic Magpie Creek floodplain. The City would like to have this area studied and have the actual current floodplain and BFEs incorporated into FEMA's DFIRMs. FEMA is in the process of restudying this area.

Project Description: FEMA to complete a restudy of the Historic Magpie Creek Floodplain.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: FEMA is in the process of restudying historic Magpie Creek.

Responsible Office/Partners: City of Sacramento, DOU

Project Priority: Medium

Cost Estimate: $0

Benefits (Losses Avoided): Base Flood Elevations provided for development will be more accurate, and the correct data will be on the DFIRMs. Structures that will be put into the floodplain will be required to carry flood insurance, which will protect those structures.

Potential Funding: $0 (Funded by FEMA)

Timeline: End of 2017

Action 50. Natomas Internal Drainage Canals/Levees

Hazards Addressed: Flooding and Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: Based on the hydrology and hydraulics modeling, the majority of the area greater than 3 feet in the 200-year Natomas interior floodplain is confined to the drainage basins, parks, and street flooding. Contrarily, the internal levees along the canals were last certified to the 100-year in 1989. Once the exterior levee work around the Natomas Basin is complete (approx. 10 years), the internal levees will need to be recertified. The recertification will need to be submitted to FEMA. Also, while in the process of recertifying to the 100-year, the internal levees should be certified to the 200-year (meet the State ULDC requirements).

Project Description: Certify the Natomas Internal Drainage Canals/Levees to the 100-year and 200-year Level.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The regional coordination process facilitated through Sacramento Area Flood Control Association (SAFCA).

Responsible Office/Partners: SAFCA, USACE, City of Sacramento Department of Water Resources, City of Sacramento Department of Utilities, Reclamation District 1000, Sutter County

Project Priority: High

Cost Estimate: $800,000

Benefits (Losses Avoided): Once completed the protection level of the Natomas Internal Basin will be verified. Weakness within the system will be identified and addressed. This will also allow residents to purchase PRP flood insurance and development will be protected.

Potential Funding: City of Sacramento Department of Utilities, County of Sacramento Department of Water Resources, Sutter County, Reclamation District 1000, Grants

Timeline: 2021

Action 51. Drainage Projects from the City's Priority Drainage Project List

Hazards Addressed: Local Flooding, Severe Rain and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City is continually improving the local drainage system and the combined sewer and storm water system.

Project Description: Many potential drainage projects that have been identified in the City's Drainage Master Plans and have been prioritized on a Basin Master Planning and Improvement Projects priority list. These projects include upsizing pipelines, adding detention basins, adding pipelines, retrofitting pump stations, and land acquisition. These projects are ranked by priority.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Department of Utilities has a Drainage CIP Group

Responsible Office/Partners: City of Sacramento, Department of Utilities

Project Priority: Medium

Cost Estimate: $200,000 to 15,000,000 per project

Benefits (Losses Avoided): Eliminate structural damages and flood insurance claims, avoid economic loss from flooded streets, and life safety

Potential Funding: FEMA grants and DOU CIP funds

Timeline: August 2016-September 2020

Action 52. Projects Identified in the Combined Sewer System Improvement Plan Update

Hazards Addressed: Localized Stormwater Flooding and Severe Rain and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento (City) owns and operates a combined sewer system (CSS) that conveys residential and commercial wastewater and storm water runoff from approximately 11.7 square miles in downtown Sacramento, East Sacramento, Oak Park, and the Land Park area. There are 5.8 square miles of separated areas of the City north, east, and south of the CSS that contribute sanitary flows to the CSS. The City also includes approximately 76 square miles of separated areas that are not served by the CSS. The CSS serves approximately 205,000 people. The CSS includes four key facilities to manage the collected flow: Sumps 1/1A, Sumps 2/2A, Pioneer Reservoir, and the Combined Wastewater Treatment Plant (CWTP). Sumps 1/1A and 2/2A pump up to 60 million gallons per day (mgd) of flows to the Sacramento Regional County Sanitation District's Regional Wastewater Treatment Plant (SRWTP). Pioneer Reservoir and CWTP provide additional storage and, when needed, primary treatment, and disinfection of combined sewage prior to discharge to the Sacramento River. The CSS is regulated under the August 2015 National Pollutant Discharge Elimination System (NPDES) waste discharge permit, No. CA0079111. The permit allows for CSS discharge to the Sacramento River at six locations: two for primary treated (plus disinfection) effluent, and four that can discharge untreated combined sewage. The secondary treated effluent from SRWTP is discharged to the Sacramento River at a permitted location under a separate NPDES permit.

The Combined Sewer System Improvement Plan outlines improvement projects and programs to reduce flooding, constructability and cost/benefit analysis, and project prioritization for implementation.

Project Description: Identified projects were categorized into storage and conveyance. The storage projects are located upstream or downstream of local flooding areas, and are intended to detain flows until the CSS has re-generated capacity (i.e., peak of the storm has passed and HGL in the system has receded from peak conditions) and the storage facilities can be dewatered. The storage projects can be linear or parcel based.

Conveyance projects would generally be located in proximity to or just downstream of localized flooding areas. Their objective would generally be to convey peak flows from and through the flood-prone areas to points downstream with greater capacity. The analysis carefully considered whether the increased conveyance had the potential to cause or exacerbate downstream flooding. If that was determined to be true, the conveyance project(s) were combined with upstream or downstream storage projects to mitigate

the downstream flood exacerbation risk. Conveyance projects included upsizing existing pipes or constructing new pipes. Where baseline flooding occurred in a location with no opportunities for storage, a new pipe was sized to convey the 10-year storm design peak flows to the downstream system. Factors such as ground cover requirements, right-of-way width, and existing system pipe invert elevations (to which linear storage facilities must connect) were factored into the storage configurations

Other Alternatives: No improvements to the system.

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Wastewater & Storm Drain Engineering Program

Responsible Office/Partners: City of Sacramento Department of Utilities Wastewater & Storm Drain Engineering Program

Project Priority: High

Cost Estimate: Projects range from $510,000 to $22,000,000.

Benefits (Losses Avoided): Reduced of localized flooding. Increased system resiliency and capacity.

Potential Funding: City of Sacramento Department of Utilities and Grants

Timeline: 2021

Action 53. Easements for Open Land Along Levees

Hazards Addressed: Flood and Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: The Urban Levee Design Criteria (ULDC) requires fee title or an easement for the entire levee prism extending to a minimum of 20 feet beyond the landside toe of the flood protection system needs to be acquired. This is needed to provide adequate room for maintenance, inspection, flood-fighting and protection of the levees.

Project Description: Analysis of current levee easements and setback to determine where additional and future easements will be needed. Develop a method and funding source to acquire the needed easements and open space to meet the ULDC standards.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Development Review

Responsible Office/Partners: City of Sacramento, Department of Utilities and Community Development Department, Sacramento Area Flood Control Agency

Project Priority: High

Cost Estimate: $2,000,000

Benefits (Losses Avoided): Quicker detection of levee distress during high water events, higher level of flood projection, the ability to widen the levee in the future, if needed.

Potential Funding: City of Sacramento and Grants

Timeline: 2021

Action 54. Emergency Management Planning and Levee Security

Hazards Addressed: Flood

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento focuses its emergency management activities within the City on four phases: preparedness, response, recovery, and mitigation. Public outreach, warning systems, post-flood building entry, levee security, and EOC operations are examples of the City's extensive emergency management system.

Project Description: Implementation of the emergency management and levee security action items outlined in the City of Sacramento's Comprehensive Flood Management Plan. Highlighted projects include continued National Incident Management System (NIMS) and Standardized Emergency Management System (SEMS) exercises and training, creation of a disaster housing plan, increased public education and alerts efforts, development of an intergovernmental flood management and control standards, annual review of the Levee Security Plan, and improvement of flood warning systems.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implementation of the Comprehensive Flood Management Plan

Responsible Office/Partners: City of Sacramento, Department of Utilities, Office of Emergency Services, and other maintaining agencies responsible of levee systems within the region.

Project Priority: High

Cost Estimate: $100,000 and staff time

Benefits (Losses Avoided): These projects would decrease the loss of life and property and establishes clear guidelines for recovery from a flood.

Potential Funding: City of Sacramento Department Budgets, Grants

Timeline: 2019-2021

Action 55. Flood Fighting Equipment

Hazards Addressed: Flood and Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: During high water events an effort will be made to prevent the effects of flood waters. The City of Sacramento currently has to barrow necessary equipment from neighboring agencies to conduct levee repair and flood fighting operations.

Project Description: Purchase flood fighting equipment such as a utility landing craft, long reach excavator, and the tuck (tractor) trailer.

Other Alternatives: Barrow equipment from neighboring agencies.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Operations and Maintenance equipment budgetary and procurement process.

Responsible Office/Partners: City of Sacramento Department of Utilities Operations and Maintenance

Project Priority: High

Cost Estimate: $550,000

Benefits (Losses Avoided): Shortened response time to flood hazards and more efficient repair and maintenance of the levee system.

Potential Funding: City of Sacramento Operations and Maintenance and Grants

Timeline: 2017

Action 56. Flood Management Land Use Planning and Development

Hazards Addressed: Flood

Goals Addressed: 1, 2, 3, 4

Issue/Background: Both land use planning and development guidelines are implemented using the City's zoning, building, and subdivision codes. The City is currently implementing various federal, state, and local mandates for land use planning and development.

Project Description: Implementation of the land use planning and development action items outlined in the City of Sacramento's Comprehensive Flood Management Plan. Highlighted projects include 200-year floodplain ordinance and projection plan, development guidelines for rescue and evacuation areas, City Code update for new development adjacent to levees.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implementation of the Comprehensive Flood Management Plan

Responsible Office/Partners: City of Sacramento, Department of Utilities and Community Development Department

Project Priority: High

Cost Estimate: Staff time

Benefits (Losses Avoided): Decrease the number of structures at risk from flooding and an increased in levee and structure protection measures.

Potential Funding: City of Sacramento Department Budgets, Grants

Timeline: 2018

Action 57. Florin Creek Pump at Pomegranate Avenue

Hazards Addressed: Localized Flooding, Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: The U.S. Army Corps of Engineers (Corps) is constructing improvements to the Florin Creek Channel Project from Highway 99 to Franklin Boulevard. In addition, Sacramento Area Flood Control Agency (SAFCA) is constructing a multi-use detention basin upstream. These improvements will increase the channel capacity and enable the conveyance of 100-year event flood flows within the channel. This public safety improvement project will reduce the risk of flooding in the area during extreme storm events and ultimately provide financial relief to several-hundred property owners currently subject to mandatory, high-cost flood insurance. To provide additional flood protection in this area a pump station at Pomegranate Avenue would be necessary.

Project Description: Construction of a Florin Creek pump station at Pomegranate Avenue.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: SAFCA's South Sacramento County Streams Project

Responsible Office/Partners: City of Sacramento Department of Utilities

Project Priority: High

Cost Estimate: $800,000

Benefits (Losses Avoided): Increased flood protection to local residence. Decrease in property damage and insurance claims.

Potential Funding: City of Sacramento Department of Utilities Stormwater Drainage Fund and Grants

Timeline: 1 year

Action 58. Internal Drainage System Improvements

Hazards Addressed: Flood

Goals Addressed: 1, 2, 3, 4

Issue/Background: In addition to the risk of flooding from levee failure, a considerable flood risk exists due to aging internal drainage infrastructure. Although levee failure may result in much more catastrophic damage than flooding from internal drainage, most of the City's flood damage since 1955 has resulted from drainage deficiencies. In 1995, for instance, approximately 100 homes in four south area drainage basins incurred flood damage due to internal drainage system failure during a particularly intense storm.

Project Description: Implementation of the internal drainage system improvement action items outlined in the City of Sacramento's Comprehensive Flood Management Plan. Highlighted projects include development of a grant program for drainage improvements, develop an Engineering Services efficiency plan, work on the passage of Proposition 218 drainage fee increase, and drainage master planning.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implementation of the Comprehensive Flood Management Plan

Responsible Office/Partners: City of Sacramento, Department of Utilities

Project Priority: High

Cost Estimate: Range from staff time to $800,000

Benefits (Losses Avoided): These projects would decrease property damage and the number of flood insurance claims. Drainage system improvements will also increase the City's resiliency after a large scale weather event.

Potential Funding: City of Sacramento, Department of Utilities, and Grants

Timeline: 2021

Action 59. Levee and Structural Flood Management Improvements

Hazards Addressed: Flood

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento works alongside the Sacramento Area Flood Control Agency, US Army Corps of Engineers, Central Valley Flood Protection Board, Reclamation District No. 1000, Maintaining Agency 9, American River Flood Control District, and others to implement and maintain flood control projects that protect the City.

Project Description: Implementation of the levee and structural improvement action items outlined in the City of Sacramento's Comprehensive Flood Management Plan. Highlighted projects include support of local efforts to improve flood facilities, plan and implement modernization phase of levee accreditation and ULDC, and participate in the Regional Flood Management Plan.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implementation of the Comprehensive Flood Management Plan

Responsible Office/Partners: City of Sacramento, Department of Utilities, Community Development Department, SAFCA

Project Priority: High

Cost Estimate: Range from staff time to $1,000,000

Benefits (Losses Avoided): These projects would decrease the loss of life and property and decrease the number of flood insurance claims.

Potential Funding: City of Sacramento, SAFCA, and possible grants

Timeline: 2021

Action 60. Master planning to identify facilities needed to prevent 10-year event street flooding and 100-year event structure flooding

Hazards Addressed: Localized Stormwater Flooding and Severe Rain and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: The majority of the City has master plans in place, however with additional development needs and infrastructure projects master planning is needed in portions of the City.

Project Description: Develop master plans to identify facilities needed to prevent 10-year event street flooding and 100-year event structure flooding in areas of the City that do not currently have master planning. Prioritize the projects and formulate timeline for the identified projects. Execute the projects to provide protection from flooding.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Wastewater & Storm Drain Engineering Program

Responsible Office/Partners: City of Sacramento Department of Utilities Wastewater & Storm Drain Engineering Program

Project Priority: High

Cost Estimate: $900,000

Benefits (Losses Avoided): Protection of life and property and reduced flooding on roadways

Potential Funding: City of Sacramento Department of Utilities and Grants

Timeline: 2021

Action 61. Retrofit Pumping Plants with Discharge Monitoring Devices

Hazards Addressed: Localized Stormwater Flooding and Severe Rain and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: All our drainage master plans recommend retrofit of our pumping plants with discharge measuring/monitoring devices. The average test capacity of pumps is approximately 75 percent of Rated Capacity.

Project Description: Retrofit pumping plants to measure discharge and monitor devices. Identify pumps that are underperforming and raise Reliable Capacity to 90 percent service factor.

Other Alternatives: Check pumping capacity when issues arise or develop a testing schedule.

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Operations and Maintenance Procedures

Responsible Office/Partners: City of Sacramento Department of Utilities Operations and Maintenance

Project Priority: High

Cost Estimate: $500,000

Benefits (Losses Avoided): Protection of life and property, increased pumping capacity, and early identification of device fatigue.

Potential Funding: City of Sacramento Department of Utilities Capital Improvement Funds and Grants

Timeline: 2020

Action 62. Risk Communication and NFIP/CRS Projects

Hazards Addressed: Flood

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento residents hold over 40,000 National Flood Insurance Program (NFIP) policies and the City has a Class 5 standing in FEMA's Community Rating System (CRS). In coordinate with these two programs, the City has also established a Program of Public Information (PPI) Committee which develops communication strategies related to flood and flood insurance information.

Project Description: Implementation of the risk communication and NFIP/CRS action items outlined in the City of Sacramento's Comprehensive Flood Management Plan. Highlighted projects include implementation of the City's Program of Public Information, develop a Flood Response PPI projects, increase freeboard development to two feet, write a Levee Failure Response Plan for Critical Facilities, and sign a Memorandum of Agreement with the County of Sacramento for flood control planning of the South Sacramento County Streams.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Implementation of the Comprehensive Flood Management Plan

Responsible Office/Partners: City of Sacramento, Department of Utilities, Community Development Department, Office of Emergency Services

Project Priority: High

Cost Estimate: Projects range from $10,000 to $200,000

Benefits (Losses Avoided): Increased public awareness and preparedness which would decrease the amount of property damage and loss of life. Also, increase awareness of flood risk areas and impacts of development.

Potential Funding: City of Sacramento and Grants

Timeline: 2019

Action 63. Steamers and Rio City Café Floodwalls

Hazards Addressed: Flood and Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: The Sacramento River floodwall is a vertical concrete wall along the Embarcadero. The top elevation of the wall is 34.5' msl. The face and top of the concrete wall has a wood fascia board

to match the wood boards along the walking surface of the Embarcadero. There are existing openings in the floodwall, such as the entrance to the Delta King, where flood control is provided using stoplogs that slip into steel rails and cover the opening and stored in non-flood periods adjacent to the opening. The top of the stoplogs are at the elevation of the top of the concrete floodwall. There are areas on the perimeter of the precast concrete decks where the floodwall is constructed of a wood timber.

Project Description: Ensure the floodway elevation and materials are maintained. The repair will include removal of the existing wood fascia boards on both sides and top of the existing flood wall, and replacement with new wood on the easterly (land) side, and new wood on the top of the floodwall to match the existing height. The westerly (river) side of the wall will remain exposed concrete. The bolts will be cut or ground to be flush with the face of wall and existing blemishes patched to match the adjacent concrete surface. Low-profile ground-illuminating lights will be placed in the wood veneer on the easterly (land) side of the floodwall. The lights will be fed from new conduit which will be run behind the new wood, where there are currently existing conduits for other feeds.

On the elevated sections of the embarcadero and around the buildings, the floodwall is comprised of a timber beam bolted to the concrete slab under the embarcadero.

Other Alternatives: No Action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Repair and maintenance schedule for Old Sacramento floodways.

Responsible Office/Partners: City of Sacramento, Department of Utilities, Operations and Maintenance and Department of Public Works

Project Priority: High

Cost Estimate: $400,000

Benefits (Losses Avoided): Increased flood protection. Decrease in the loss of life and property.

Potential Funding: City of Sacramento, Department of Public Works and Grants

Timeline: 2017

Action 64. Trash Racks and Debris Cages

Hazards Addressed: Localized Stormwater Flooding and Severe Rain and Storms

Goals Addressed: 1, 2, 3

Issue/Background: The City relies heavily on our pumping stations and other drainage facilities to reduce our localized flooding risk. Trash rack and debris cages prevent debris from entering the intake of a pumping station or water conveyance system while still allowing water to flow though.

Project Description: Identify high impact locations in need of trash racks or debris cages. Install devices and develop maintenance schedule.

Other Alternatives: No improvements to the system.

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Wastewater & Storm Drain Engineering Program

Responsible Office/Partners: City of Sacramento Department of Utilities Wastewater & Storm Drain Engineering Program

Project Priority: Medium

Cost Estimate: $1,250 to $4,000 per rack or cage

Benefits (Losses Avoided): Loss of life and property avoided. Increased system resiliency and capacity.

Potential Funding: City of Sacramento Department of Utilities and Grants

Timeline: 2019

Action 65. Multi-Jurisdictional Modeling for Drainage Watersheds Greater Than 10 Square Miles

Hazards Addressed: Flooding and Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: The City of Sacramento encompasses several streams, creeks and associated watersheds. The majority of these watersheds drain into the City from the County of Sacramento. Some of the major drainage watersheds in the City are identified as Natomas Area Stream Group, American River Stream Group, Sacramento Stream Group, and Natural Stream Groups. These groups are identified in the County of Sacramento Watershed Management Plan (2011).

Project Description: Development of a unified model for each watershed that extends over jurisdictional lines. The model would be maintained to reflect changes to the watershed, including development.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Sacramento Area Flood Control Agency Coordination Group

Responsible Office/Partners: Sacramento Area Flood Control Agency, County of Sacramento Department of Water Resources, City of Sacramento Department of Utilities

Project Priority: High

Cost Estimate: $350,000, plus annual fee to maintain the model

Benefits (Losses Avoided): Accurate modeling of development impacts and flood control planning

Potential Funding: Cost Share Between Sacramento Area Flood Control Agency, County of Sacramento Department of Water Resources, City of Sacramento Department of Utilities

Timeline: 2020

Action 66. Post-Flood Water Treatment Facility Recovery

Hazards Addressed: Flood, Local Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Flood waters may impact drinking water system infrastructure such as wells, intakes, and treatment plants by transporting contaminants carried by surface waters or saturated soil. There could be a wide range of contaminants, depending on the severity of the flood and its impacts to the surrounding area. Contaminants may include bacteria, viruses, protozoa, petroleum products from fuel spills, and other known or unknown synthetic chemicals. The contamination may constitute a hazard to public health for regulated and unregulated water quality contaminants.

Project Description: Provide resources for planning and implementing facility cleaning, monitoring, and actions to restore water treatment services.

Other Alternatives: No action.

Existing Planning Mechanism(s) through which Action Will Be Implemented: City of Sacramento Department of Utilities Water Quality Incident Response Planning

Responsible Office/Partners: City of Sacramento Department of Utilities, Engineering and Water Resources, Water Quality Laboratory and R&D

Project Priority: High

Cost Estimate: $100,000-900,000,000 (large range includes planning, cleanup, monitoring and potential costs for repair/replacement of facilities for full recovery)

Benefits (Losses Avoided): Protection of public health, reducing cost for continuing emergency or other alternate water supplies.

Potential Funding: Grant, to be determined

Timeline: 1-2 years with updates on a to be determined frequency

Wind and Tornado Actions

Action 67. Tree Trimming & Debris Removal

Hazards Addressed: Severe Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Dead branches fall very easily during high winds or a severe storm. These falling branches are a threat to nearby power lines. Trimming of trees treat diseases that can weaken the tree and make it susceptible to toppling during severe winds and storms.

Project Description: This project includes the year-round pruning of trees throughout the City that can pose a threat to power lines.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Department of Public Works Operations & Maintenance

Responsible Office/Partners: Department of Public Works, SMUD, PG&E

Project Priority: High

Cost Estimate: $80,000-100,000

Benefits (Losses Avoided): Reduced power outages, cost savings

Potential Funding: Department of Public Works Maintenance Budget

Timeline: Ongoing

Action 68. Upgrading Overhead Utility Lines & Burying Critical Power Lines

Hazards Addressed: Severe Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Northern California is no stranger to winds and in recent history severe weather & winds have cause many power outages in the Sacramento region. The power outages come in the form of a fallen power line or pole not strong enough to withstand the force or trees and limbs that break and hit the power lines.

Project Description: Project would entail the identification and burial of critical powerlines, and the upgrading of ageing utility poles that can withstand the force put out by severe winds and weather.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Unkown

Responsible Office/Partners: Department of Utilities, SMUD, PG&E

Project Priority: Medium

Cost Estimate: $40,000,000

Benefits (Losses Avoided): Reduction in power outages during severe weather

Potential Funding: Increase in utility rates, Grants

Timeline: 2022

Action 69. Install Redundancies and Loop Feeds for Power Lines & Infrastructure

Hazards Addressed: Severe Wind

Goals Addressed: 1, 2, 3

Issue/Background: During times of severe wind and weather Sacramento sees an increase in power outages. These outages have at times lasted up to 2-3 days, such as the winter storm of 2008. A need to redundancies and loop feeds is needed to reduce power outages and provide residents a means of communication should they have an emergency during such an event.

Project Description: This project involves reducing the deficiencies in the electrical transmission lines and the electrical transmission system radial feeds to substations. High voltage lines will be installed that allow the energy to travel longer distances and then be dropped for consumption at distribution transformers.

Other Alternatives: Increased inspection and maintenance on the system

Existing Planning Mechanism(s) through which Action Will Be Implemented: SMUD Infrastructure

Responsible Office/Partners: Department of Utilities, SMUD, PG&E

Project Priority: Low

Cost Estimate: $175,000/mile

Benefits (Losses Avoided): Reduction of power outages, community resiliency

Potential Funding: Possible Grants, SMUD Capital Improvements

Timeline: 2021

Streambank Erosion Actions

Action 70. Stabilization of Erosion Hazard Areas

Hazards Addressed: Streambank Erosion

Goals Addressed: 1, 2, 3, 4

Issue/Background: Bank erosion is a critical concern in Sacramento River because the eroding stream banks threaten levee integrity. Over 50% of the rivers 193 miles have been riprapped in the last 40 years according to the US Fish and Wildlife Service and over a hundred erosion sites have been identified along the river in recent years. It is critical to mitigate these sites to reduce their threats to the integrity of Sacramento's levee system.

Project Description: This project will include the identification and mitigation of erosion sites along the Sacramento river and other rivers in the region that pose a threat to levees and raise flooding concerns.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The US Army Corp of Engineers has headed the Sacramento River Bank protection Project and this mitigation action will be channeled through them as an expansion to their ongoing efforts.

Responsible Office/Partners: California Department of Water Resources, Army Corps of Engineers, City and County of Sacramento

Project Priority: High

Cost Estimate: $1,000,000

Benefits (Losses Avoided): Preventing levee failure and flooding, reduced risk to life and nearby structures

Potential Funding: Grants

Timeline: 2021

Wildfire Actions

Action 71. Implement a Fire Education and Information Program

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: Sacramento is a developed city that has relatively few remaining wildland areas. Areas of the city that have been identified as fairly susceptible to an urban wildfire are generally along the American River Parkway from Watt Avenue to the Sacramento River and along the Garden Highway in the Natomas area. The American River Parkway is a stretch of dense trees and brush on both sides of the American River. The property is owned by the State of California, maintained by the Sacramento County Parks Department, and protected from fire by the Sacramento City Fire Department. The area consists of natural habitat with no fire break areas. Fire equipment access is difficult and limited to the paved stretches of the bicycle path. Some of the potential fire areas are not accessible to vehicular traffic.

Project Description: Implement an urban-wildfire safety program using materials for the community. Train educators and inspectors, identifies high risk neighborhoods and buildings, and develop agreed-upon, area specific solutions to fire issues.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Add to the Sacramento City Fire Department's current outreach activities.

Responsible Office/Partners: Sacramento City Fire Department

Project Priority: Medium

Cost Estimate: $10,000

Benefits (Losses Avoided): Educated and more prepared community, increased defensible space for at risk structures

Potential Funding: FEMA & State Grants, Community Wildfire Planning Grant

Timeline: 2019

Action 72. Fuels Reduction on the American River Parkway

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: The American River Parkway is identified as a State Recognized Fire Hazard. The vegetation along the parkway would be a source of fuel to any fire that could burn due to its wild

interface. In addition, an invasive series of plants and weeds growing in the area would allow the fire to burn and spread rapidly.

Project Description: The goal of the project would be to maintain the vegetation growing along the parkway and rid the area of the invasive species which are a greater source of fuel for fires.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Sacramento Regional Conservation Corp works on fuel reduction projects and their work will be expanded to cover areas at risk along the American River Parkway.

Responsible Office/Partners: Sacramento City Fire District

Project Priority: High

Cost Estimate: $80,000-$100,000

Benefits (Losses Avoided): Reduced risk to nearby homes and structures.

Potential Funding: Grants

Timeline: Summer 2017

Action 73. Outreach on the Effects of Smoke on Air Quality

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: The Sacramento region is surrounded by a large number to locations that have recently caught ablaze over the last several years. The Northern California fire season has been highly active with large scale wildfires. These fires have affected Sacramento's air quality. Winds will carry the smoke from fires a significant distance into Sacramento.

Project Description: The purpose of the project is to educate Sacramento residents on the effects of smoke in the air and provide resources to check the air quality in their area. This will be carried out via social and network media. The city will utilize its social media pages and radio advertisements to convey knowledge and resources residents can use to know when to use precaution. The project will also provide helpful tips to decrease the impacts of poor air quality in their homes and through the daily routines.

Other Alternatives: No Action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Existing city webpages, Spare the Air Sacramento Region

Responsible Office/Partners: Sacramento City Fire Department, City of Sacramento Public Information Office, Spare the Air Sacramento Region

Project Priority: Medium

Cost Estimate: $5,000 + Staff time

Benefits (Losses Avoided): Greater public awareness, health risks reduced

Potential Funding: Local Funding

Timeline: Summer 2017

Annex G Delta Annex

G.1 Introduction

This Delta Annex details the hazard mitigation planning elements specific to that portion of the Sacramento-San Joaquin River Delta located within unincorporated Sacramento County. This portion of the Delta includes six (6) unincorporated communities, known as legacy communities, and the City of Isleton (also defined as a legacy community). The purpose of this Annex is to provide an umbrella document that includes descriptions, data, and information on the Delta common to all LHMP participating jurisdictions from this region. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Plan document. As such, all sections of the Plan, including the planning process and other procedural requirements apply to and were met by the all participating jurisdictions included in this Delta Annex. This Annex provides information specific to Delta jurisdictions, with a focus on risk assessment and mitigation strategy.

G.2 Participating Jurisdictions

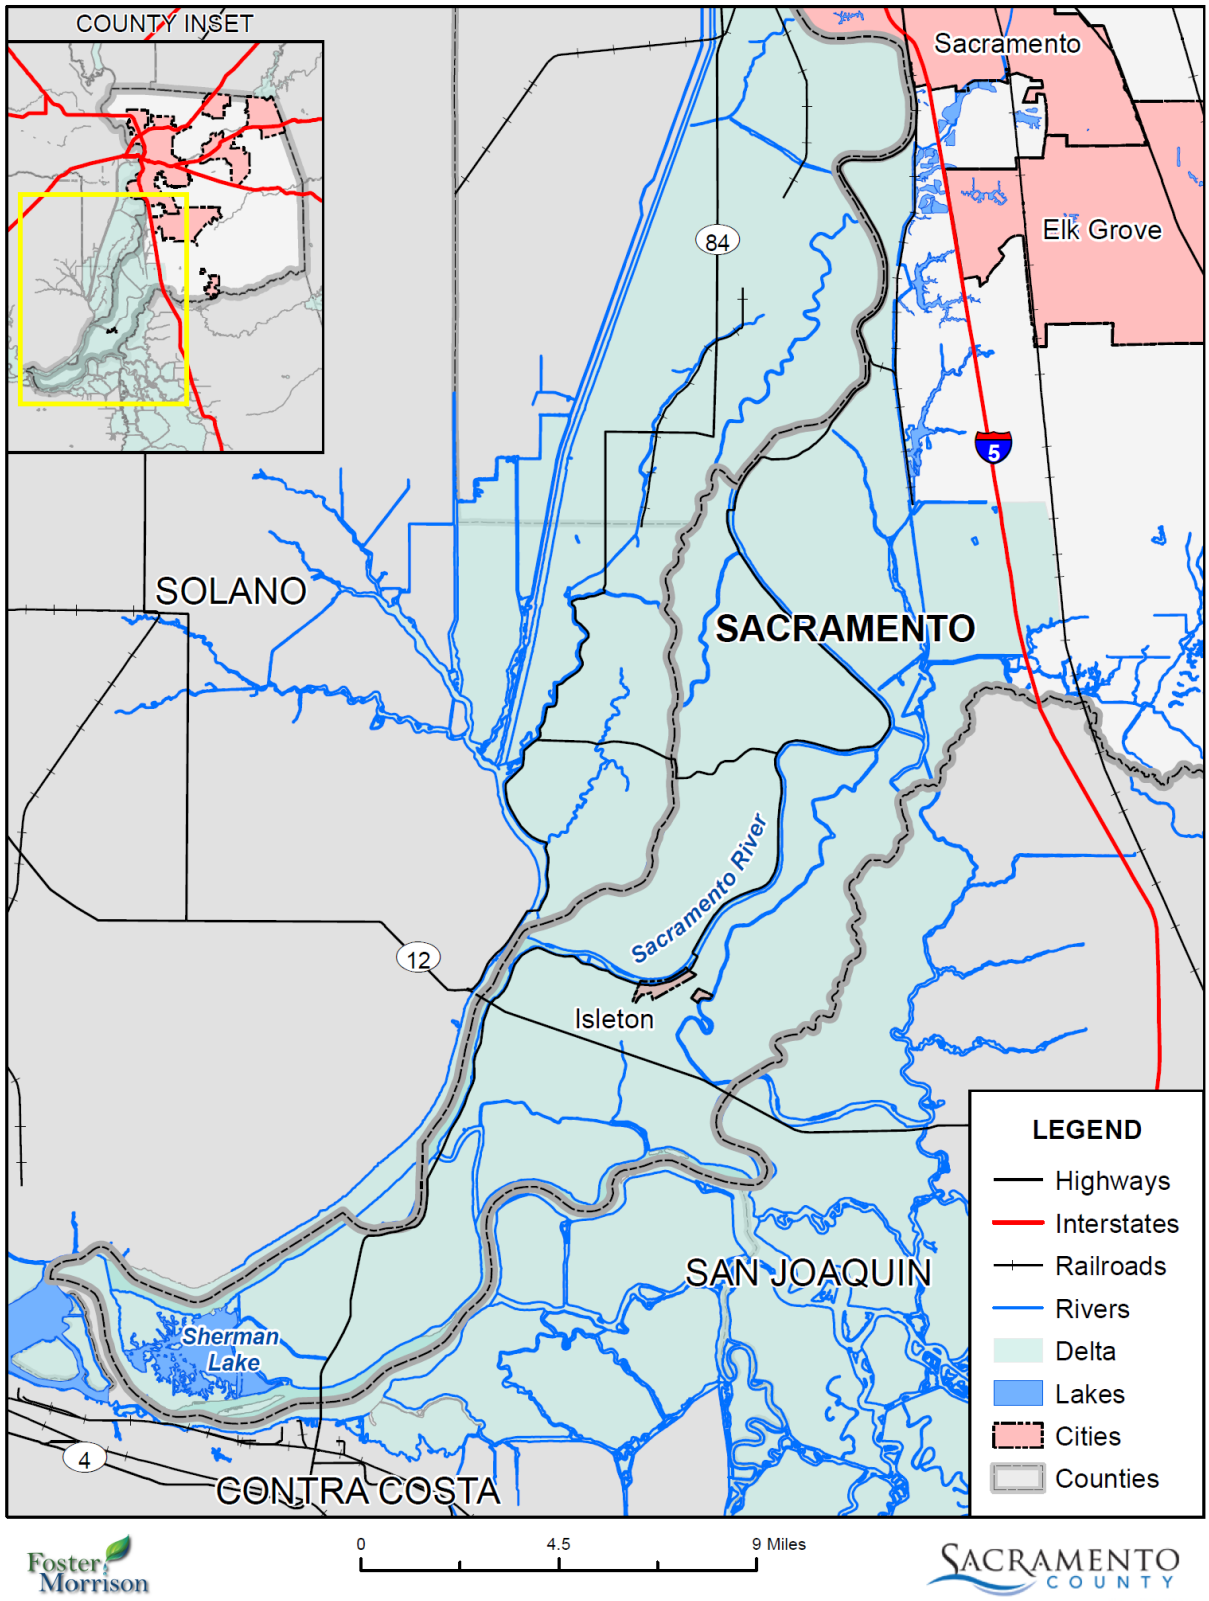
As described in the Base Plan document, the 2016 Sacramento LHMP Update is a multi-jurisdictional plan that geographically covers the entire area within Sacramento County's jurisdictional boundaries (i.e. the Sacramento County Planning Area). This Delta Annex provides a framework for the region's participating jurisdictions to this 2016 LHMP Update. The following agencies/organizations participated in the overall planning process and are seeking FEMA approval of this 2016 LHMP Update:

- City of Isleton
- Brannan Andrus Levee District (Reclamation Districts #317, #407, #2067)
- Reclamation District #3
- Reclamation District #341
- Reclamation District #551
- Reclamation District #554
- Reclamation District #556
- Reclamation District #563
- Reclamation District #1002
- Reclamation District #1601
- Reclamation District #2111

G.3 Community Profile

The community profile for the Sacramento Delta is further detailed in the following sections. Figure G-1 displays a map and the location of the Delta within Sacramento County.

Figure G-1 Sacramento County Delta Area



Data Source: Sacramento County GIS, Cal-Atlas; Map Date: 05/2016.

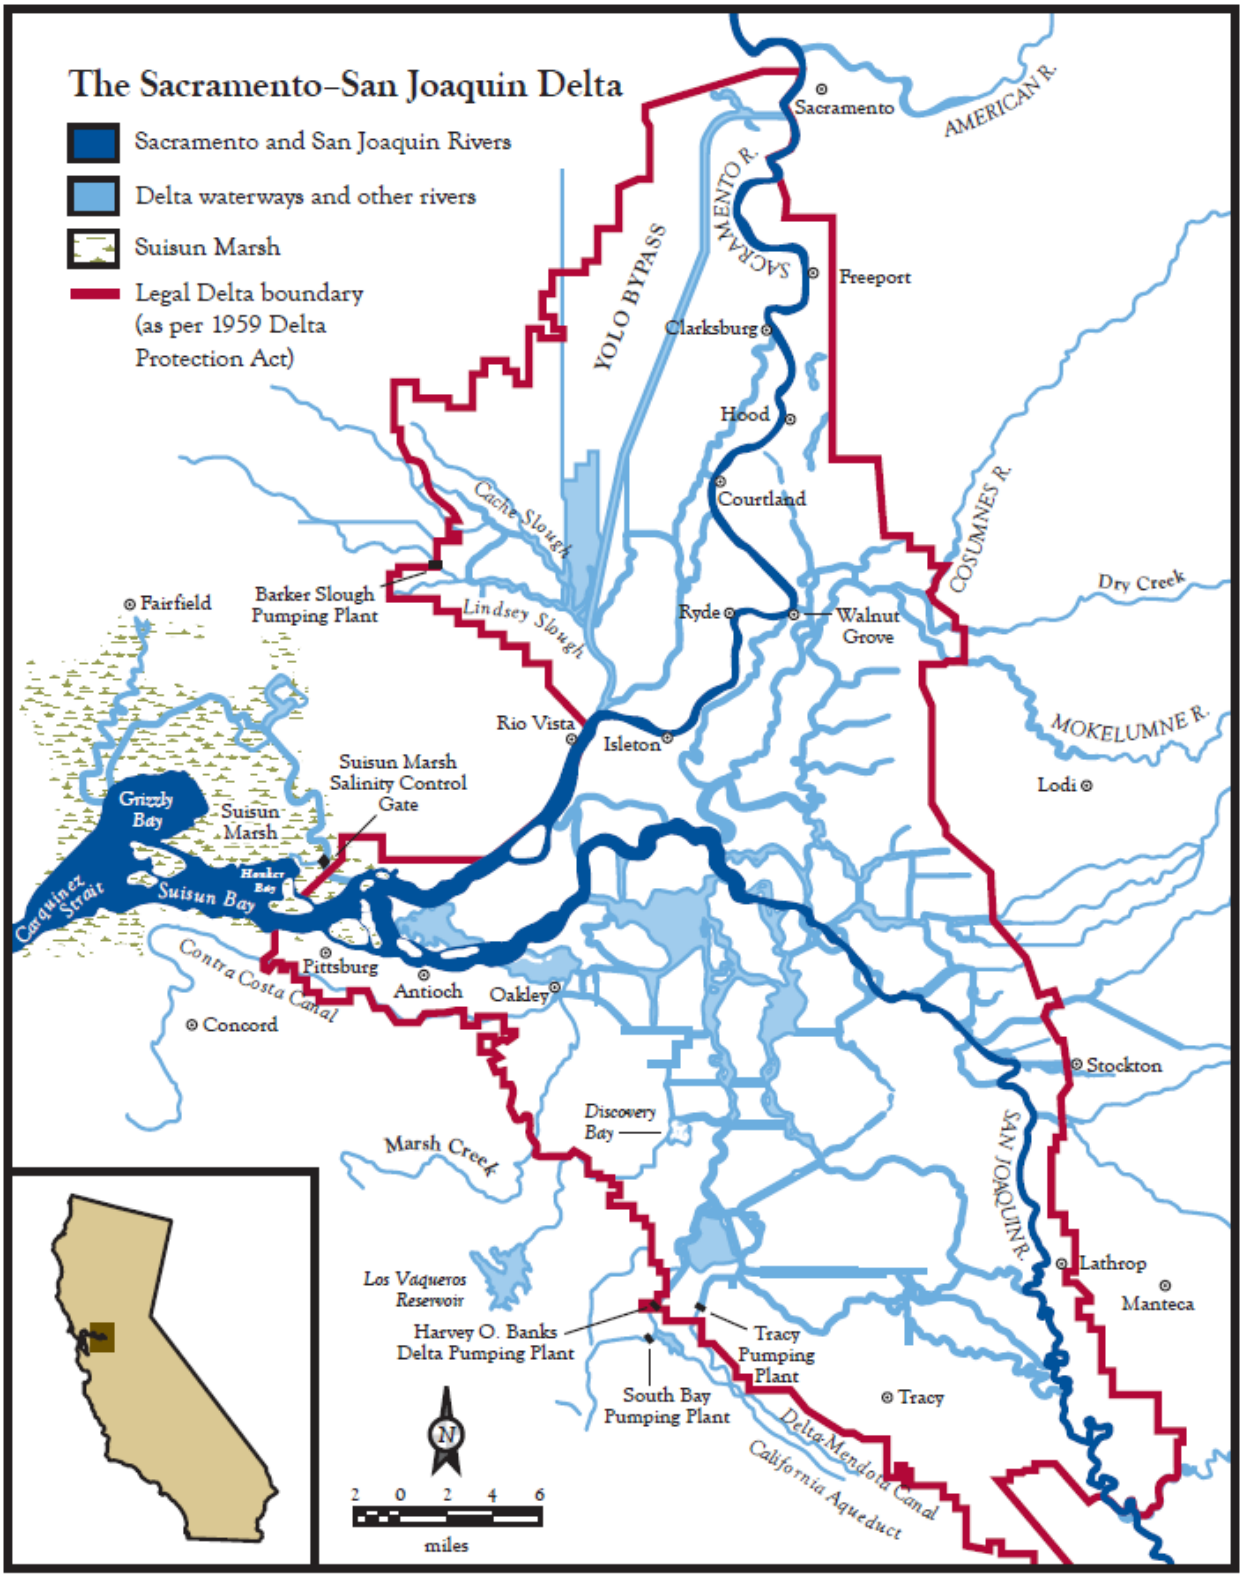
G.3.1. Geography and Location

The Sacramento River Delta, in the southwest corner of Sacramento County, is interlaced with numerous tidal sloughs that include a number of peat islands reclaimed for agriculture by an extensive levee system. These waterways provide important fisheries and aquatic ecosystems, water for Delta farms and are important recreational areas.

The Delta is located in Northern California, inland of the San Francisco Bay going towards Sacramento. Highways 80 and 5 run north-south, bordering the Delta and Highway 12 runs east to west crossing the Delta about midway. The Delta boundaries were legislatively defined by the Federal and State governments as part of the "New Deal" Central Valley Project after the Depression. The Primary and Secondary Zones of the legal Delta include land in six counties, including although one area in Alameda County is very small), and portions of the cities of, Sacramento, West Sacramento, Stockton and Antioch along the periphery of the Delta. The smaller cities of Rio Vista and Isleton along with unincorporated communities of Byron, Ryde, Hood, Locke, Walnut Grove, Freeport, Clarksburg, and Courtland are located in the heart of the Delta... Comprising over 700,000 acres, this region includes 62 major named islands and hundreds of smaller islands. (see Figure G-2).

As described in the County's floodplain management ordinance, that portion of the Delta located within unincorporated Sacramento includes: that area south of the City of Sacramento to the tip of Sherman Island protected from flooding by levees as bound by Reclamation District numbers: 3, 317, 341, 349, 369, 407, 551, 554, 556, 563, 744, 746, 755, 813, 1002, 1601, 2067, 2110, and 2111. This legal boundary is the Delta region used throughout this Annex.

Figure G-2 Sacramento–San Joaquin Delta Legal Boundaries



Source: Delta Protection Commission

The Delta region is one of the County's most fertile areas and accounts for much of the $470 million in agricultural production in the County. The Delta communities have a quiet rural lifestyle and is unique as a getaway from the hurried pace of much of the remainder of Sacramento County. This 162 square mile area is crisscrossed by numerous waterways, which divide the land into distinct islands or tracts which includes the incorporated City of Isleton and the legacy communities of Locke, Ryde, Courtland, Freeport, Hood and Walnut Grove where roughly 6,000 residents live.

G.3.2. History

Originally, the Delta was a shallow wetland with water covering the area for many months of the year. Natural levees, created by deposits of sediment, allowed some islands to emerge during the dry summer months. Salinity would fluctuate, depending on the season and the amount of precipitation in any one year, and the species that comprised the Delta ecosystem had evolved and adapted to this unique, dynamic system.

The federal Swamp Land Act of 1850 set the stage for property ownership in the Delta. State legislation followed in 1861, which is approximately the same period in which the 1,000+ mile levee system began to take shape.

In 1933, the Legislature approved the California Central Valley Project Act, which relied upon the transfer of Sacramento River water south through the Delta and maintenance of a more constant salinity regime by using upstream reservoir releases of freshwater to create a hydraulic salinity barrier. As a result of the operations of state and federal water projects, the natural salinity variations in the Delta have been altered.

Fast forward to the November 2009 enactment of the Sacramento-San Joaquin Delta Reform Act. The Act resulted in a lengthy list of changes to the Delta's regulatory and governance framework and specifically identified a key statutory objective of ensuring for a safe and reliable water supply for the State, while preserving and enhancing the Delta's ecosystem. These "coequal" goals are now defined in California Water Code section 85054.

Today

The Delta, at 1,300 square miles, is the largest estuary and wetland ecosystem on the west coasts of both North and South America, and home to more than 500,000 people and 200,000 jobs. Further, the economic health of California, to the tune of $400B, is heavily reliant on existing communications, energy, and transportation facilities/infrastructure that are located in and traverse the Delta.

In spite of acknowledged water system and ecosystem degradation, the Delta remains a unique and critically important natural resource for California, as well as the entire nation. It serves as the hub of California's water supply system, which plays a vital role in supporting the basic economies of several major regions within the State, which are dependent on the ability of water exporters to access and transport water from the Delta watershed. This is evidenced by the fact that more than two-thirds of the State's residents (25 of 39 million) and more than three million acres of highly productive farmland receive water exported from the Delta watershed.

G.3.3. Current Delta Issues

As stated previously, the enactment of the 2009 Delta Reform Act resulted in a "re-set" of the Delta's regulations and governance. As an example, the Delta Stewardship Council (DSC) and the Sacramento-San Joaquin Delta Conservancy Board (SSJDCB) were created, and Delta Protection Commission (DPC) membership was reduced in size. However, without question the proposed CA WaterFix (formerly the Bay Delta Conservation Plan) has the greatest potential to result in immitigable and irreversible impacts to/on the Delta. The "California Water Fix" is now essentially a massive public works project. The "preferred alternative" continues to consist of an isolated water conveyance facility similar in design and operation to the "preferred alternative" described in the draft BDCP. The basic system design and operational protocol remains unchanged from the draft BDCP's preferred alternative. As a result, approval and implementation of the projects could result in a long list of significant and unavoidable impacts including, but not limited to, impacts to land use, water management and water quality, transportation, and socioeconomics.

G.3.4. Assets at Risk

This section identifies the Sacramento Delta's assets at risk, including values, populations, critical facilities and infrastructure, cultural and historic assets, and growth and development trends.

Values at Risk

The following is from the Sacramento County Assessor's Office 2015 database. The methodology used to derive property values is the same as in Section 4.3.1 of the Base Plan. This data has limitations and should only be used as a guideline to overall values in the County.. The most significant limitation is created by Proposition 13. Instead of adjusting property values annually, the values are not adjusted or assessed at fair market value until a property transfer occurs. As a result, overall value information is most likely low and does not reflect current market value of properties within the County. Additionally, values include both land and improvements for each parcel, whereas during disasters generally it is only the improvements at risk. Table G-1 shows the 2015 Assessor's values (e.g., the values at risk) broken down by property type for the Delta (both the City of Isleton and unincorporated areas). Table G-2 shows the 2015 Assessor's values (e.g., the values at risk) broken down by property type for the Delta (the unincorporated area). A break down by property type for the City of Isleton is included in its Chapter to this Delta annex.

Table G-1 Sacramento Delta Total Values at Risk by Jurisdiction

Jurisdiction	Total Parcel Count	Improved Parcel Count	Total Land Value	Improved Structure Value	Total Value
Delta (Isleton)	525	334	$16,873,341	$28,552,704	$45,426,045
Delta (Unincorporated)	2,618	1,602	$294,367,492	$316,964,796	$611,332,288
Grand Delta Total	**3,143**	**1,936**	**$311,240,833**	**$345,517,500**	**$656,758,333**

Source: Sacramento County 2016 Parcel/2015 Assessor's Data

Table G-2 Sacramento Delta – Unincorporated Delta Total Values at Risk by Property Use

Property Use	Total Parcels	Improved Parcel Count	Total Land Value	Improved Structure Value	Total Value
Agricultural	747	469	$167,734,672	$147,225,848	$314,960,520
Care / Health	2	0	$777	$0	$777
Church / Welfare	9	6	$94,451	$432,635	$527,086
Industrial	41	31	$4,043,879	$6,716,660	$10,760,539
Miscellaneous	123	5	$228,567	$12,426	$240,993
Office	18	16	$1,433,428	$2,182,226	$3,615,654
Public / Utilities	281	0	$56,826	$0	$56,826
Recreational	62	46	$13,902,452	$14,501,921	$28,404,373
Residential	1,004	920	$89,710,332	$131,681,695	$221,392,027
Retail / Commercial	78	75	$3,900,930	$9,273,692	$13,174,622
Vacant	253	34	$13,261,178	$4,937,693	$18,198,871
No Data	0	0	$0	$0	$0
Total	**2,618**	**1,602**	**$294,367,492**	**$316,964,796**	**$611,332,288**

Critical Facilities and Infrastructure

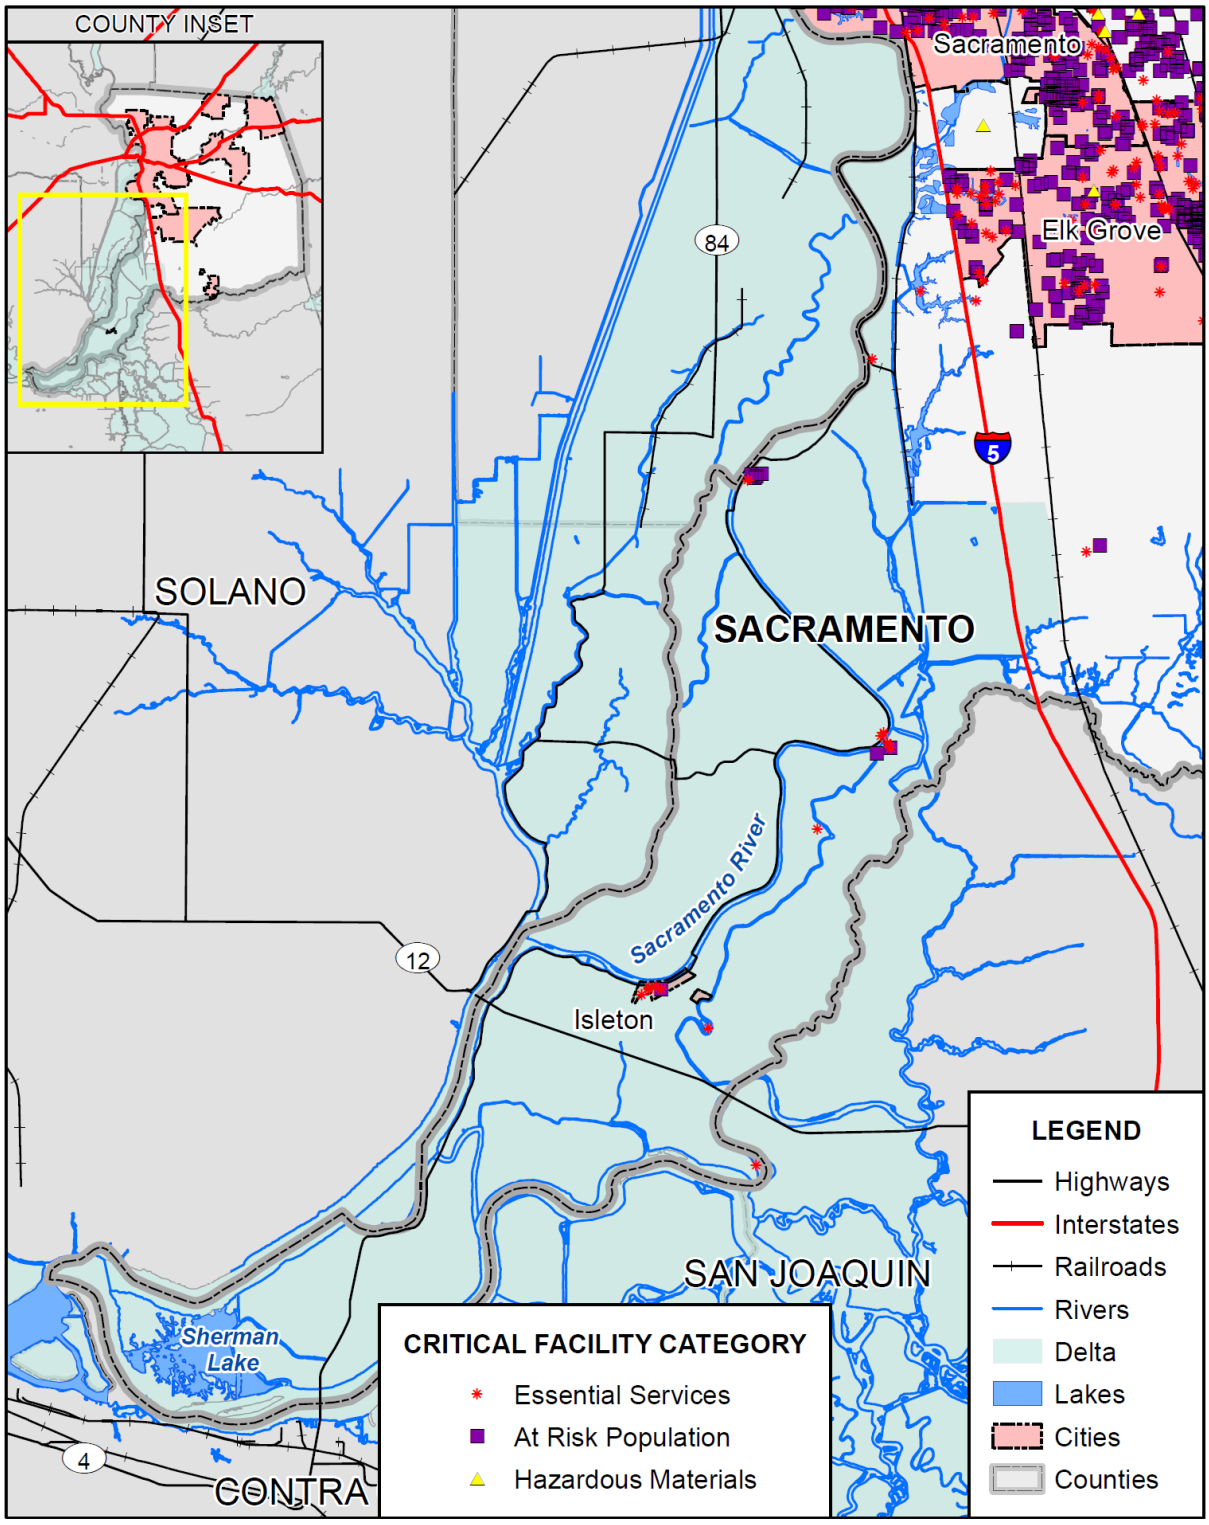
For purposes of this plan, a critical facility is defined as:

> *Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.*

This definition was refined by separating out three classes of critical facilities, that include Essential Services Facilities, At Risk Population Facilities, and Hazardous Materials Facilities, as further described in Section 4.3.1 of the Base Plan.

An inventory of critical facilities in the Delta from Sacramento County GIS is shown on Figure G-3 and detailed in Table G-3. Details of critical facility definition, type, name, address, and jurisdiction by hazard zone are listed in Appendix E.

Figure G-3 Sacramento County Delta– Critical Facilities



Data Source: Sacramento County GIS, Cal-Atlas; Map Date: 05/2016.

Table G-3 Sacramento County Delta– Critical Facilities Inventory

Critical Facility Category	Facility Type	Facility Count
Essential Services Facilities	Airport	1
	Emergency Evacuation Shelter	5
	Fire Station	4
	Government Facilities	2
	Police	3
	Total	**15**
At Risk Population Facilities	Community Day School	1
	Day Care Center	2
	Public Continuation High School	1
	Public Elementary School	3
	Total	**7**
Hazardous Materials Facilities	–	0
	Total	**0**
Grand Total		**22**

Natural Resources

The Delta ecosystem is the lower drainage area of the vast Central Valley of California. It is inextricably linked to the Sacramento and San Joaquin River watersheds as a recipient of flows and constituents from natural and man caused activities and events upstream. It is distinguished by various aquatic ecosystems that host rare native fish, and by several distinct terrestrial and wetland habitats that support abundant bird and animal life. These key habitats include tidal marshes, managed freshwater wetlands, in-channel fresh and brackish water habitats, open water habitats, seasonal wetlands, riparian forest, and grasslands, among others. In all of these habitats there exist both resident and migratory species of great conservation value. This means that Delta ecosystem management must consider not only localized contexts but also the way that Delta habitats fit within regional, watershed, and even continental-scale ecosystems.

Importantly, some Delta agricultural lands also provide rich seasonal wildlife habitat. Thousands of acres are shallowly flooded after harvest and provide feeding and resting areas for resident and migratory birds and other wildlife. This practice of seasonal flooding is one example of a management practice that supports both the Delta ecosystem and the economy.

The Delta is also the single most important link in California's water supply system. Two of the state's biggest water projects – the State Water Project and the federal Central Valley Project – depend on Delta waterways to convey water from Northern California rivers to pumping facilities in the southern Delta. Delta levees play a critical role in preventing salty water from San Francisco Bay from intruding into critical parts of the Delta and contaminating the fresh water that supplies communities and farms.

While the California WaterFix includes ecosystem/habitat mitigation measures for the severe environmental impacts it causes the habitat restoration component of the prior habitat conservation plan (i.e., the BDCP) has been divorced from the project. Proposed mitigation, termed "environmental commitments" in the revised documents, include 2,100 acres of habitat repair along the footprint of the conveyance project,

"California EcoRestore" now proposes the creation/enhancement of approximately 30,000 acres of habitat; significantly reduced from the 153,000 acres previously identified in the draft BDCP. As proposed, EcoRestore will restore these 30,000 acres to habitat, primarily floodplain and tidal marsh, by 2020. As part of this effort EcoRestore will develop an adaptive management program (aka: the EcoRestore Adaptive Management Program) to achieve its habitat restoration goals and increase restoration success for the benefit of the long-term health of the Sacramento-San Joaquin Delta and Suisun Marsh's native fish and wildlife species.

In addition, the California Department of Fish and Wildlife is developing the "Delta Conservation Framework" that will work in tandem with EcoRestore. As proposed, the Framework will identify a 25-year vision for Delta-wide ecosystem conservation consistent with and in the context of the Delta as a place, and act to backfill the conservation measures) lost (or significantly eroded) when BDCP morphed into the Cal WaterFix and EcoRestore.

Historic and Cultural Resources

There is rich historic and cultural heritage in the Delta. It is home to several historically significant legacy communities, including Bethel Island, Clarksburg, Courtland, Freeport, Hood, Isleton, Knightsen, Locke, Rio Vista, Ryde, and Walnut Grove. Locke, the largest remaining town built by early Chinese immigrants to the United States, is a National Historic Landmark District. More information can be found in the Base Plan, as well as in the City of Isleton's and each reclamation district's chapter of this Annex.

Growth and Development Trends

Major planning activities are occurring in the Delta by the State and Federal Governments related to water supplies and environmental issues. This effort's co-equal goals are water reliability and habitat restoration while still protecting, enhancing and sustaining the unique cultural, historical, recreational, agricultural and economic values of the Delta, and addressing flood protection, continued socio-economic sustainability of agriculture and its infrastructure, and legacy communities in the Delta. The outcomes of these planning actions are likely to shape the future of the County's Delta community.

Future Development

The 2030 Sacramento County General Plan estimated future populations for the Delta Area of the County. These are shown below.

- 2005 – 6,109
- 2010 – 6,442
- 2015 – 6,789

- 2020 – 7,023
- 2025 – 7,250

G.4 Hazard Identification

Based on information provided by the participating jurisdictions within the Delta Area, in conjunction with input from Sacramento County, hazards that affect the Delta are summarized, including information on their frequency of occurrence, spatial extent, potential magnitude, and significance specific to the Delta Area (see Table G-4). Additional hazard information specific to each of the participating Delta jurisdictions is included in the Chapter to this Annex.

Table G-4 Sacramento County Delta—Hazard Identification Assessment

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Limited	Likely	Limited	Medium
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Significant	Likely	Significant	Medium
Dam Failure	Limited	Unlikely	Negligible	Low
Drought and Water Shortage	Significant	Likely	Significant	Medium
Earthquake	Significant	Occasional	Limited	Low
Earthquake: Liquefaction	Limited	Occasional	Critical	High
Flood: 100/200/500-year	Limited	Unlikely	Critical	High
Flood: Localized Stormwater Flooding	Significant	Likely	Critical	Medium
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Significant	Unlikely	Critical	High
River/Stream/Creek Bank Erosion	Extensive	Highly Likely	Limited	Medium
Severe Weather: Extreme Temperatures Cold and Freeze	Extensive	Occasional	Critical	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Likely	Critical	Low
Severe Weather: Fog	Extensive	Likely	Critical	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail/Lightning)	Extensive	Likely	Limited	Medium
Severe Weather: Wind and Tornadoes	Limited	Occasional	Negligible	Medium
Subsidence	Significant	Likely	Critical	Medium
Volcano	Limited	Unlikely	Negligible	Low
Wildfire	Limited	High	Limited	Low

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

G.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile the Delta's hazards and assess the region's vulnerability separate from that of the Planning Area as a whole, has already been assessed in Sections 4.2 Hazard Profiles and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the Base Plan discuss overall impacts to the Planning Area and describe the hazard, the geographic extent of the hazard, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the Delta as an area is included in this Annex (specific risks and vulnerabilities to each reclamation district and the City of Isleton can be found in their chapters to this Annex). This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked from medium to high significance and also includes a vulnerability assessment to the flood, levee failure, and wildfire. An inventory of critical facilities in the Delta Area was also performed. For more information about how hazards affect the entire Sacramento County Planning Area, see Chapter 4 Risk Assessment in the main plan.

G.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section G.5.2, includes a description as to how the hazard affects the Delta and information about past occurrences. The intent of this section is to provide Delta specific information on hazards and further describe how the hazards and risks affect the Delta and differ across the entire Sacramento County Planning Area.

G.5.2. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table G-4 as low, medium or high significance hazards and primary hazards in the State of California. Impacts of past events and vulnerability of the Delta to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area) and also in the chapters specific to the City of Isleton and the Reclamation Districts. Methodologies for calculating loss estimates are the same as those described in Section 4.3 of the Base Plan.

An estimate of the vulnerability of the Sacramento Delta area to each identified priority hazard, in addition to the estimate of risk of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.

- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Agricultural Hazards

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Agricultural production in Sacramento County remains a significant contributor to the local economy. In addition to the almost $470 million in 2015 annual production value (much of it in the Delta), there are hundreds of jobs directly tied to agricultural production and thousands more that are impacted indirectly in the production, processing, transportation, and marketing of those commodities. Thus hazard impacts to the agricultural industry could potentially result in impacts on the local Delta and larger County economy in excess of the $470 million in ag production values.

Past Occurrences

Agricultural hazards occur on a yearly basis, with varying degrees of damage caused each year.

Vulnerability to Agricultural Hazards

According to the US Department of Agriculture (USDA), every year natural disasters, such as droughts, earthquakes, extreme heat and cold, floods, fires, earthquakes, hail, landslides, and tornadoes, challenge agricultural production. Because agriculture relies on the weather, climate, and water availability to thrive, it is easily impacted by natural events and disasters. Agricultural impacts from natural events and disasters most commonly include: contamination of water bodies, loss of harvest or livestock, increased susceptibility to disease, and destruction of irrigation systems and other agricultural infrastructure. These impacts can have long lasting effects on agricultural production including crops, forest growth, and arable lands, which require time to mature. Specific impacts to Delta assets are listed below:

- Drought's most severe effects on agriculture include water quality and quantity issues. Other impacts include decreased crop yields, impact to feed and forage, and altered plant populations.
  - ✓ The County has been in a drought for the last 5 years. The County Agricultural Commissioner has written a "Letter of Loss" to the USDA/FSA (USDA/Farm Services Agency) for the Livestock Forage Disaster Program, every year since 2011 due to losses in pasture or forage areas. The FSA has various ag insurance programs to assist growers. Growers can enroll in crop insurance programs for all natural causes of loss listed in their policies (such as fire, flood, extreme temperatures). For those without insurance, NAP (the Non-insured Crop Disaster Assistance Program) managed by USDA's Farm Service Agency provides financial assistance to producers of non-insurable crops when low yields, loss of inventory or due to natural disasters. The county agricultural commissioners can write a "Letter of Ag Loss", identifying the crop & % of loss, to allow growers to receive either low cost loans or monetary compensation.

- Earthquakes can strike without warning and cause dramatic changes to the landscape of an area that can have devastating impacts on agricultural production and the environment. These impacts could include loss of harvest or livestock and destruction of irrigation systems and other agricultural infrastructure.
- Extreme cold may result in loss of crops, livestock, downed power lines, and increased use of generators.
- Hot weather and extreme heat can worsen ozone levels and air quality as well as leading to drought conditions. Excessive heat and prolonged dry or drought conditions can impact agriculture by creating worker safety issues for farm field workers, severely damaging crops, and reducing availability of water and food supply for livestock.
- Wildfires can spread quickly and devastate thousands of acres of land, which may include agricultural lands. This devastation could lead to large losses in crops, livestock, and agricultural infrastructure.
- Flooding causes many impacts to agricultural production, including water contamination, damage to crops, loss of livestock, increased susceptibility of livestock to disease, flooded farm machinery, and environmental damage to and from agricultural chemicals.
  - ✓ Reclamation Districts and Flood Control Districts are responsible for maintenance of levees. There are also private levees maintained by the landowners. Vegetation and vertebrates (ground squirrels) are controlled to maintain the integrity of the levees. There are permanent crops and winter crops which may be affected during the times of year when flooding is most likely to occur. Permanent crops such as vineyards and orchards can withstand temporary flooding, such as 1-2 days, before permanent damage may begin to occur. Winter wheat and young plantings may be washed away in a flood event.
- High Winds and microbursts can appear without much warning and have the potential to devastate an area very quickly. This devastation can impact agriculture by contaminating water and destroying crops, livestock, and other farm property.

In addition to impacts from natural hazards, the County noted that invasive pests can cause economic damage, affecting the ability to ship agricultural commodities oversees, inter-state and intra-state. Trade can be impacted significantly. The California Department of Food & Agriculture (CDFA) is responsible for managing invasive pests statewide. CDFA works closely with the CAC's to manage the pests through quarantines, detection and eradication programs. USDA is also responsible for managing invasive pests which have the potential to impact agriculture nationally. USDA works in partnership with CDFA and the CACs to manage pests.

The County also noted that there are possible threats of bioterrorism. Bioterrorism threats to agriculture would be handled by the USDA, in cooperation with CDFA and the CAC's.

Future Development

Future development in the County is not likely to have an impact on agricultural hazards in the Delta Area of Sacramento County.

Climate Change

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

The California Adaptation Planning Guide (APG) prepared by California OES and CNRA was developed to provide guidance and support for local governments and regional collaboratives to address the unavoidable consequences of climate change. This is discussed in more detail in Chapter 4 the Base Plan.

Past Occurrences

The Planning Team noted no past occurrences of climate change impacts.

Vulnerability to Climate Change

The APG: Understanding Regional Characteristics identified the following impacts specific to the Bay-Delta region in which the Sacramento County Planning Area is part of:

- Temperature increases
- Reduced precipitation
- Sea level rise
- Flooding – increased flows in areas below sea level, exacerbated by levee failure
- Reduced agricultural productivity
- Reduced water supply
- Public health – heat & air pollution
- Decline in Biodiversity

Future Development

Sacramento County in general could see population fluctuations as a result of climate impacts relative to those experienced in other regions, and these fluctuations are expected to impact demand for housing and other development. For example, sea level rise may disrupt economic activity and housing in affected communities, resulting in migration to inland urban areas like the Sacramento region. While there are currently no formal studies of specific migration patterns expected to impact the Sacramento region, climate-induced migration was recognized within the UNFCCC Conference of Parties Paris Agreement of 2015 and is expected to be the focus of future studies. More information can be found in Section 4.3.5 of the Base Plan. Future development may be affected by climate change as follows:

- Climate change, coupled with shifting demographics and market conditions, could impact both the location of desired developments and the nature of development.
  - ✓ Higher flood risks, especially if coupled with increased federal flood insurance rates, may decrease market demand for housing and other types of development in floodplains, while increased risk of wildfires may do the same for new developments in the urban-wildland interface.
- Climate change will stress water resources.

- Similarly protecting and enhancing water supply will also need to be addressed. California's Sustainable Groundwater Management Act (SGMA) will contribute to addressing groundwater and aquifer recharge needs.
- Climate Change will affect Transportation. The transportation network is vital to the county and the region's economy, safety, and quality of life. While it is widely recognized that emissions from transportation have impacts on climate change, climate will also likely have significant impacts on transportation infrastructure and operations.
- Climate change will affect land uses and planning., Climate change coupled with shifting demographics and market conditions, could impact both the location of desired developments and the nature of development.
- Climate change will affect Utilities. California is already experiencing impacts from climate change such as an increased number of wildfires, sea level rise and severe drought. Utility efforts to deal with these impacts range from emergency and risk management protocols to new standards for infrastructure design and new resource management techniques.
- Addressing Urban Heat Islands and Heat Events. New development will contribute to urban heat island (UHI) impacts and will need to incorporate urban greening methods into all aspects of development; interior and exterior of buildings, surrounding environment and beyond.

Drought and Water Shortage

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Drought is a gradual phenomenon. Although droughts are sometimes characterized as emergencies, they differ from typical emergency events. Most natural disasters, such as floods or forest fires, occur relatively rapidly and afford little time for preparing for disaster response. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Water districts normally require at least a 10-year planning horizon to implement a multiagency improvement project to mitigate the effects of a drought and water supply shortage.

Past Occurrences

The past occurrences of drought to the Delta are the same as those of the County, as drought is a regional phenomenon. A list of past occurrences can be found in Section 4.2.11 of the Base Plan.

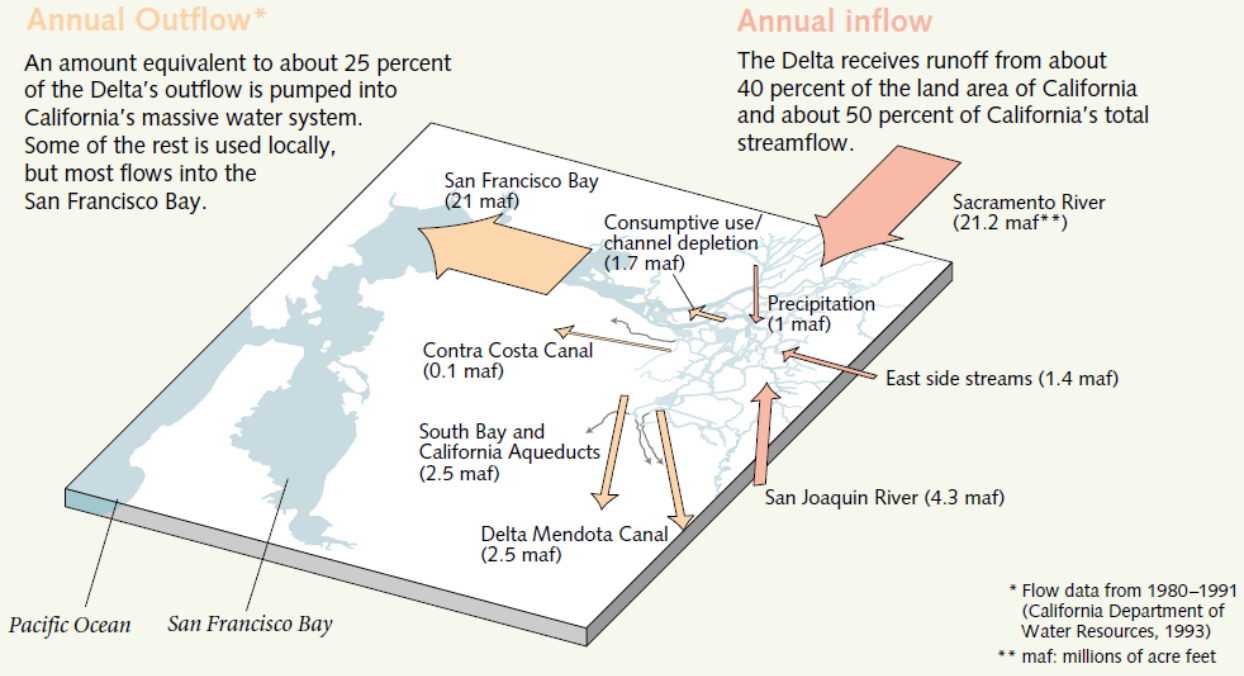
Vulnerability to Drought and Water Shortage

In the Delta, drought has multiple effects. It has an economic effect on the agricultural industry, as high value crops are raised on many of the Delta islands. Prolonged drought can also exacerbate subsidence in the Delta.

There are also issues posed to the State of California from drought in the Delta. The Delta receives runoff from about 40 percent of the land area of California and about 50 percent of California's total streamflow, as shown in Figure G-4. It is the heart of a massive north-to-south water-delivery system whose giant engineered arterials transport water southward. State and Federal contracts provide for export of up to 7.5 million acre-feet per year from two huge pumping stations in the southern Delta near the Clifton Court

Forebay. About 83 percent of this water is used for agriculture and the remainder for various urban uses in central and southern California. Two-thirds of California's population (more than 20 million people) gets at least part of its drinking water from the Delta.

Figure G-4 The Delta and California's Water System



Source: USGS Publication "Sacramento-San Joaquin Delta: The Sinking Heart of the State." Report FS-005-00

Future Development

According to the 2010 Urban Water Management Plan, Sacramento County, through the Sacramento County Water Agency, has access to large quantities of water through surface water, groundwater, and recycled water. However, population growth in the County will add additional pressure to water companies during periods of drought and water shortage.

Earthquake: Liquefaction

Likelihood of Future Occurrence–Occasional
Vulnerability–Very High

Hazard Profile and Problem Description

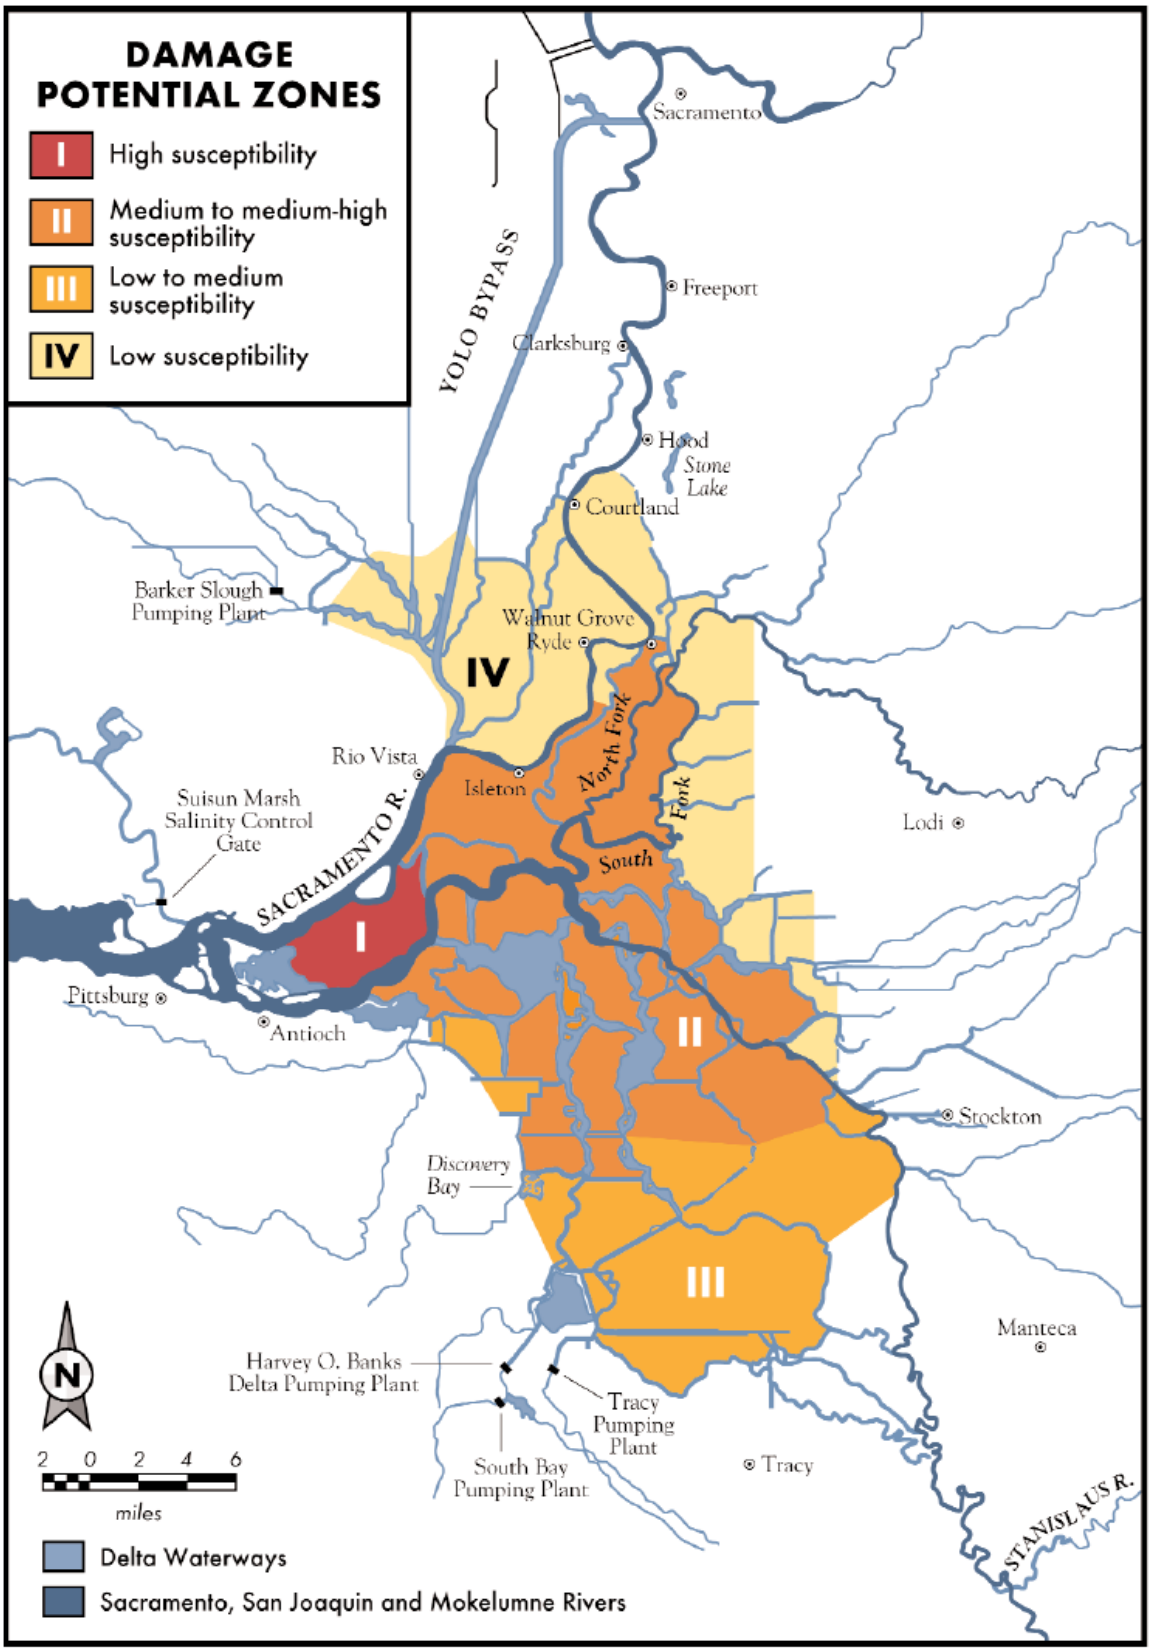
The Delta sits atop a blind fault system on the western edge of the Central Valley. Moderate earthquakes in 1892 near Vacaville and in 1983 near Coalinga demonstrate the seismic potential of this structural belt. The increasing height of the levee system has prompted growing concern about the seismic stability of the levees. The concern is based on the proximity of faulting, the nature of the levee foundations, and the materials used to build the levees. Many levees consist of uncompacted weak local soils that may be

unstable under seismic loading. The presence of sand and silt in the levees and their foundations indicates that liquefaction is also a possibility.

Although there have been no significant quakes in or closely adjacent to the Delta since high levees were originally constructed, there are at least five major faults within the vicinity of the Delta capable of generating peak ground acceleration values that would likely lead to levee failures.

A preliminary analysis of the risk of levee failure due to seismicity was prepared for the CALFED Levee System Integrity Program. Based on standard methods and local expertise, it was estimated the magnitude and recurrence intervals of peak ground accelerations throughout the Delta. Two competing fault models were evaluated for this study, producing a wide range of potential accelerations. Then, based on local knowledge and limited geotechnical information, Damage Potential Zones were established for the Delta (Figure G-5). The zones of highest risk lie in the central and west Delta where tall levees are constructed on unstable soils that are at high risk of settling or liquefaction during an earthquake.

Figure G-5 Delta Area – Potential Damage Due to Liquefaction and Levee Collapse



This report estimated recurrence intervals for ground accelerations and the number of potential levee failures in each Damage Potential Zone. It is useful to examine their estimates of the number of failures that might occur during a 100-year event, or an event with a 0.01 probability of being equaled or exceeded in any given year. Based on their estimates, it is a roughly 50-50 chance that 5 to 20 levee segments will fail during a 100-year event in the Delta. This does not imply that 5 to 20 islands will flood, but just that 5 to 20 levee segments will fail. The loss of 5 to 20 levee segments in the Delta constitutes considerable and abrupt landscape change, since island flooding is likely to be widespread and persistent for a long period of time.

In sum, liquefaction may pose a serious threat to levees, especially as levees are built larger and higher to deal with continuing island subsidence. Levee failure, depending on the extent, could have disastrous effects on agriculture, natural gas supply, fisheries, and salt water intrusion of the San Francisco Bay. Water supply to California could be affected for years.

Past Occurrences

Although no historic examples of seismically induced levee failure are known in the Delta, the modern levee network has not been subjected to strong shaking. Levees were either smaller or non-existent in 1906 when the region was strongly shaken by the great San Francisco earthquake.

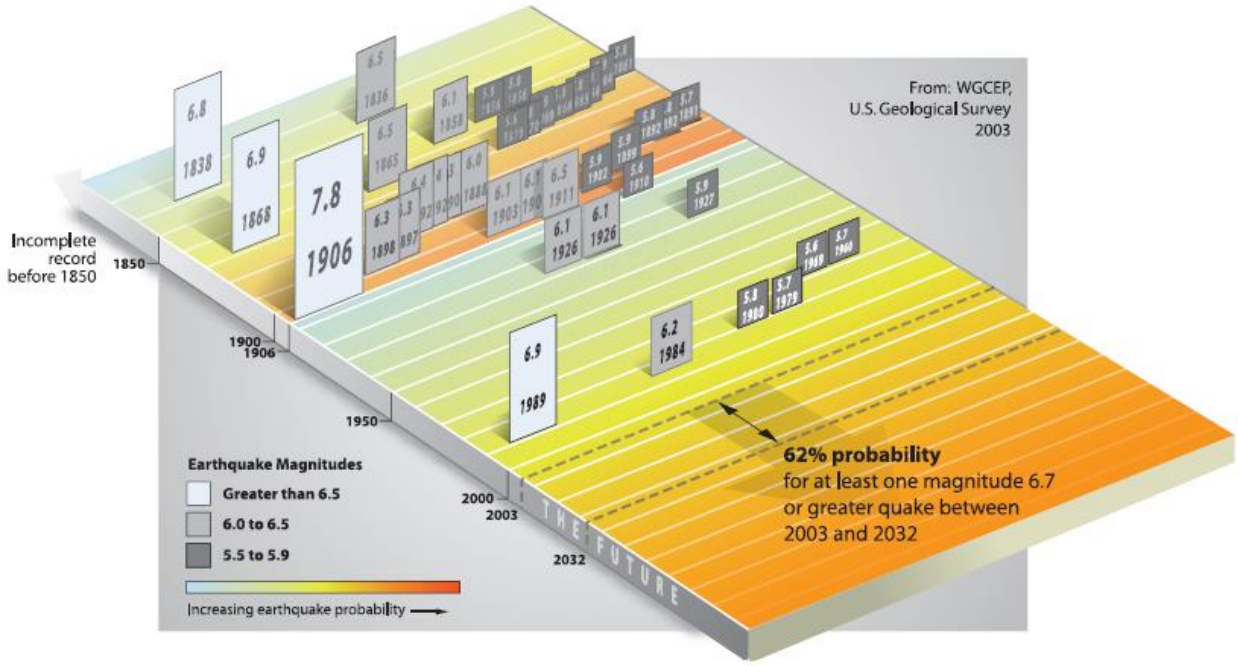
Vulnerability to Earthquake: Liquefaction

Historically, there have been 165 Delta and Suisun Marsh flood-induced levee failures leading to island inundations since 1900. Most of these failures occurred prior to 1990. Also, many of these failures were outside of Sacramento County. Since that time, there have been few levee failures due to improvements on the levee system in Sacramento as a whole.

No reports could be found to indicate that seismic shaking had ever induced significant damage or were the cause of the levee failures mentioned above. However, the lack of historical damage is not a reliable indicator that Delta levees are not vulnerable to earthquake shaking. Furthermore, the present-day Delta levees, at their current size, have not been significantly tested by moderate to high seismic shaking.

The U.S. Geological Survey estimates that an earthquake of magnitude 6.7 or greater has a 62 percent probability of occurring in the San Francisco Bay Area between 2003 and 2032 (see Figure G-6). Such an earthquake is capable of causing multiple levee failures in the Delta Region which could result in fatalities, extensive property damage and the interruption of water exports from the Delta for an extended period of time. Potential earthquakes on the Hayward, Calaveras or San Andreas faults pose the highest risk to Delta Region levees.

Figure G-6 Past and Future Earthquakes in the San Francisco Bay Area and the Delta



Source: DRMS Risk Report (URS/JBA 2008c) Figure 13-8

The largest earthquakes experienced in recent history in the region include the 1906 Great San Francisco Earthquake and the 1989 Loma Prieta Earthquake. The 1906 earthquake occurred while the levees were in their early stages of construction. They were much smaller than they are today, and were not representative of the current configuration. The epicenter of the 1989 Loma Prieta earthquake was too distant and registered levels of shaking in the Delta too small to cause perceptible damage to the levees. In 2009, the California Department of Water Resources, in their document titled Delta Risk Management Strategy, performed a special simulation analysis of the 1906 Great San Francisco Earthquake to evaluate the potential effects of that event on the current levees.

In addition to the simulation of these largest regional earthquakes, recent smaller and closer earthquakes were also evaluated. They include: the 1980 Livermore Earthquake (M 5.8) and the 1984 Morgan Hill Earthquake (M 6.2). Except for the 1906 earthquake, which would have caused deformations of some of the weakest levees, the other earthquakes were either too small or too distant to cause any significant damage to the Delta levees. These results are consistent with the seismic vulnerability prediction model developed for this study.

General seismic performance observations were:

- The areas most prone to liquefaction potential are in the northern region and the southeastern region of the Delta. The central and western regions of the Delta and Suisun Marsh show discontinuous areas of moderate to low liquefaction potential.
- The vulnerability classes 1 through 4 are the most vulnerable levees to seismic loading. These include islands with liquefiable levee fill, and peat/organic soil deposits and potentially liquefiable

sand deposits in the foundation. Such islands include but are not limited to Sherman, Brannan-Andrus, Twitchel, Webb, Venice, Bouldin, and many others.

- The majority of the islands have at least one levee reach in vulnerability classes 1 to 4,
- Levees composed of liquefiable fill are likely to undergo extensive damage as a result of a moderate to large earthquake in the region.
- The median probabilities of failure for classes with no liquefiable foundation sand and no liquefiable levee fill increase with peat thickness under the levee. When peat is absent, generally the probabilities of failure are small (less than 22 percent) for the largest ground motions of 0.5g. However, the probabilities of failure at the locations of the thickest peat (more than 25 feet) range from 30 percent to 60 percent for a PGA of 0.5g.
- Levees founded on liquefiable foundations are expected to experience large deformations (in excess of 10 feet) under a moderate to large earthquake in the region.

Flooding Risk

A major earthquake can cause extensive damage to large sections of levees on multiple islands at the same time. As a result, many islands could be flooded simultaneously. For example, the DRMS report indicated that there is a 40 percent probability of a major earthquake causing 27 or more islands to flood at the same time in the 25-year period from 2005 to 2030. It is not specified which islands in Sacramento County would be included in this flooding.

The duration and cost of levee repairs increases with the number of islands that are flooded due to an earthquake, as shown in Table G-5. This is not only due to the extensive amount of repairs required, but also to the availability of labor and materials to make the repairs. These numbers from the DRMS report are applicable to Sacramento County.

Table G-5 Duration and Cost of Repairs for Earthquake-Induced Levee Failures

Number of flooded islands	Estimated range of cost of repair and dewatering	Estimated range of time to repair breaches and dewater [days]
1	$43,000,000 – $240,000,000	136 – 276
3	$204,000,000 – $490,000,000	270 – 466
10	$620,000,000 – $1,260,000,000	460 – 700
20	$1,400,000,000 – $2,300,000,000	750 – 1,020
30	$3,000,000,000 – $4,200,000,000	1,240 – 1,660

Source: DRMS Risk Report [URS/JBA 2008c], Table 13-9

In addition to dewatering costs, the Delta contains improved parcels at risk to flooding. More information about the Delta and its risk may be found in the Delta annex to this plan.

Water Quality Risk

Earthquake damage to levees and to the islands they protect could take years to repair following a major earthquake. One significant impact of levee failures would be to the state's water supply. For example, if 20 islands were flooded as a result of a major earthquake, the export of fresh water from the Delta could

be interrupted for about a year and a half. Water supply losses of up to 8 million acre-feet would be incurred by State and federal water contractors and local water districts.

If subsided Delta islands are flooded due to levee breaches, significant amounts of dissolved organic carbon [DOC] would be released into Delta waters from the highly organic peat soils on these islands. Disinfectants used during the drinking water treatment process react with DOC to produce disinfection byproducts in treated water. Many of these chemical byproducts can increase cancer risks or cause other health effects.

Other water quality problems resulting from island flooding include increased algae blooms. Algae blooms can complicate drinking water treatment processes and can adversely affect some aquatic species.

Some soils in the Delta Region contain moderate levels of mercury due, among other things, to historical gold mining activities that occurred upstream of the Delta during the Gold Rush. Mercury in soils can, under certain circumstances, be converted to the highly toxic methylated form when islands are flooded. Methylated mercury can accumulate in the food chain potentially affecting fish. Humans and animals that consume fish contaminated with methylated mercury are at risk of poisoning.

Natural Resources at Risk

In all seismic levee failure scenarios, the area of vegetation impacted increases with the area flooded. The degree of impact depends on the type of vegetation flooded. Results of the DRMS Project indicate potential losses of up to 39 percent of herbaceous wetland, seasonal grasses and low-lying vegetation, 29 percent of non-native trees, and 24 percent of shrub wetland due to an event where multiple islands are flooded. In addition, in Sacramento County, the Delta Area at risk to liquefaction contains highly productive farmland. Should a levee fail, loss of crops would have a large economic impact. Information specific to the losses in Sacramento County were not available.

Population at Risk

The Delta levees most likely to fail due to earthquakes and earthquake liquefaction are generally located in the central-west area of the Delta, some of which is likely to be in the Sacramento County portion of the Delta. Their failure will cause rapid flooding and leave little time for evacuation.

The greatest immediate public safety concern is for the people working and living on Delta islands, and for people traveling through the Delta on various roads and highways. According to the DRMS report, there is a 40 percent probability of 90 or more fatalities in the Delta from levee failures due to a seismic event in the 25-year period from 2005 through 2030. The expected fatalities from earthquake-related island flooding is high due to the lack of warning for earthquakes and because of the rapid rate of flooding likely to occur after an earthquake. It should be noted that these fatality figures are for the Delta as a whole, and not limited to those areas of the Delta lying within Sacramento County.

Future Development

The consequences of a major earthquake in the Delta Region will also increase with time. Because of increasing water demand and the state's growing population and economy, the economic consequences of

an interruption in Delta water supply operations due to an earthquake will increase. Consequences to the Delta Region will also increase due to additional development. According to the DRMS report, total expected economic losses are anticipated to increase by about 200 percent by 2050 and by about 500 percent by 2100. The risk of fatalities is expected to increase, on average, by about 250 percent from 2005 to 2050. It should be noted that these economic figures are for the Delta as a whole, and not limited to those areas of the Delta lying within Sacramento County.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional (100-year), Unlikely (200- and 500-year)
Vulnerability–High

Hazard Profile and Problem Description

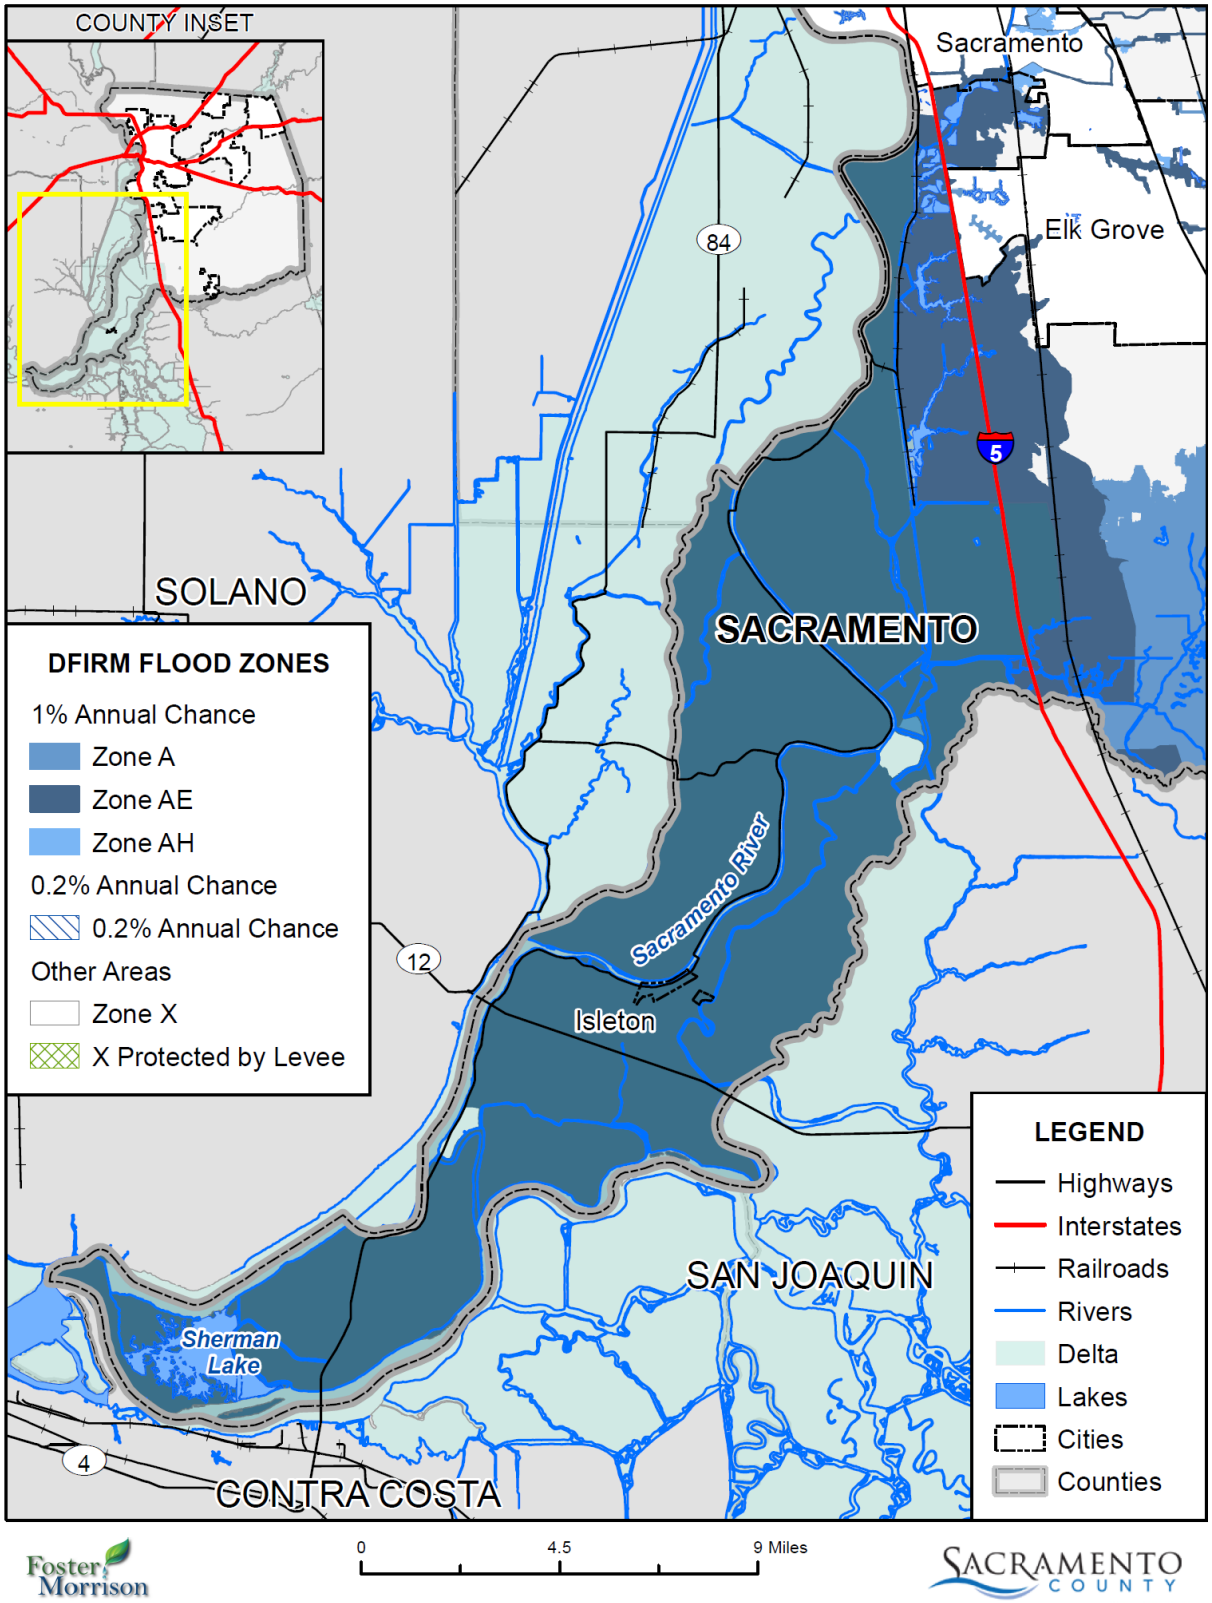
Flooding is the rising and overflowing of a body of water onto normally dry land. History clearly highlights floods as one of the most frequent natural hazards impacting Sacramento County. Floods are among the most costly natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. A car will float in less than two feet of moving water and can be swept downstream into deeper waters. This is one reason floods kill more people trapped in vehicles than anywhere else. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures, such as dam spillways. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits.

The Delta Region lies within a floodplain and is faced with a major flooding problem because of inadequate levee construction and maintenance, subsidence, seepage, erosion and seismicity. Flooding has occurred in some part of the Delta on the average of once every three and one-half to four years. While construction of upstream reservoirs has reduced the threat of overtopping, Delta levee failures continue to be a serious problem. Since 1950, levee failures have been twice as likely to be caused by foundation or levee instability than by overtopping. The condition of Delta levees had been continually worsening and flooding frequency increasing. Although there are currently efforts to improve, flood protection is generally inadequate except for those areas protected by federally built or "project" levees.

Flood Zones

Most of the Delta falls in Zone AE. This is seen in Figure G-7.

Figure G-7 Sacramento County Delta – FEMA DFIRM Flood Zones



Data Source: Sacramento County GIS, Cal-Atlas, FEMA NFHL 04/16/2016; Map Date: 05/2016.

Past Occurrences

Due to the levees in the Delta Area, flooding past occurrences are discussed in the Past Occurrence section in the Flood:100-/200/500-year section below.

Vulnerability to Flood

Values at Risk

GIS was used to determine the possible impacts of flooding within the Delta. The methodology described in Section 4.3.10 of the Base Plan was followed in determining structures and values at risk to the 1% (100-year) and 0.2% (500-year) annual chance flood event. Table G-6 is a summary table of parcels and values in the Delta Area by flood zone. Table G-7 shows the property use, improved parcel count, improved values, estimated contents, total values and estimated loss of parcels that fall in a floodplain in the unincorporated Delta. A detail table for the City of Isleton can be found in its Chapter of the Delta Annex.

Table G-6 Sacramento County Delta – Count and Improved Values Summary by Flood Zone

Source: FEMA 4/16/2016 DFIRM, Sacramento County 2016 Parcel/2015 Assessor's Data

Table G-8 summarizes Table G-7 above and shows Delta loss estimates and shows improved values at risk by FEMA 1% and 0.2% annual chance flood zones.

Table G-8 Sacramento County Delta – Flood Loss Summary

Flood Zone	Improved Parcel Count	Improved Structure Value	Estimated Contents Value	Total Value	Loss Estimate	Loss Ratio
1% Annual Chance	1,743	$327,582,149	$254,649,398	$582,231,547	$116,446,309.40	12.59%
0.2% Annual Chance	0	$0	$0	$0	$0	0.00%

Source: FEMA DFIRM, Sacramento County 2015 Parcel/Assessor's Data

According to Table G-7 and Table G-8, the Delta has 1,743 improved parcels and structures and contents valued at roughly $582 million in the 1% annual chance floodplain. Applying the 20 percent damage factor as previously described in Section 4.3.10 of the Base Plan, there is a 1% chance in any given year of a flood event causing roughly $116.4 million in damage in the Delta. A loss ratio of 12.59% indicates that losses in the Delta to flood would be relatively major, as an eighth of the total values in the Delta would be damaged by the 1% annual chance floods.

Population at Risk

The DFIRM flood zones were overlayed on the parcel layer. Those residential parcel centroids that intersect the severity zones were counted and multiplied by the 2010 Census Bureau average household factors for the Delta. According to this analysis, there is a total population of 2,827 residents of the Delta at risk to flooding, all in the 1% annual chance floodplains, respectively. This is shown in Table G-9.

Table G-9 Sacramento Delta – Count of Improved Residential Parcels and Population by Flood Zone

	1% Annual Chance		0.2% Annual Chance	
Jurisdiction	**Improved Residential Parcels**	**Population***	**Improved Residential Parcels**	**Population***
Isleton	244	593	0	0
Unincorporated Delta	876	2,374	0	0
Total	**1,120**	**2,967**	**0**	**4,087**

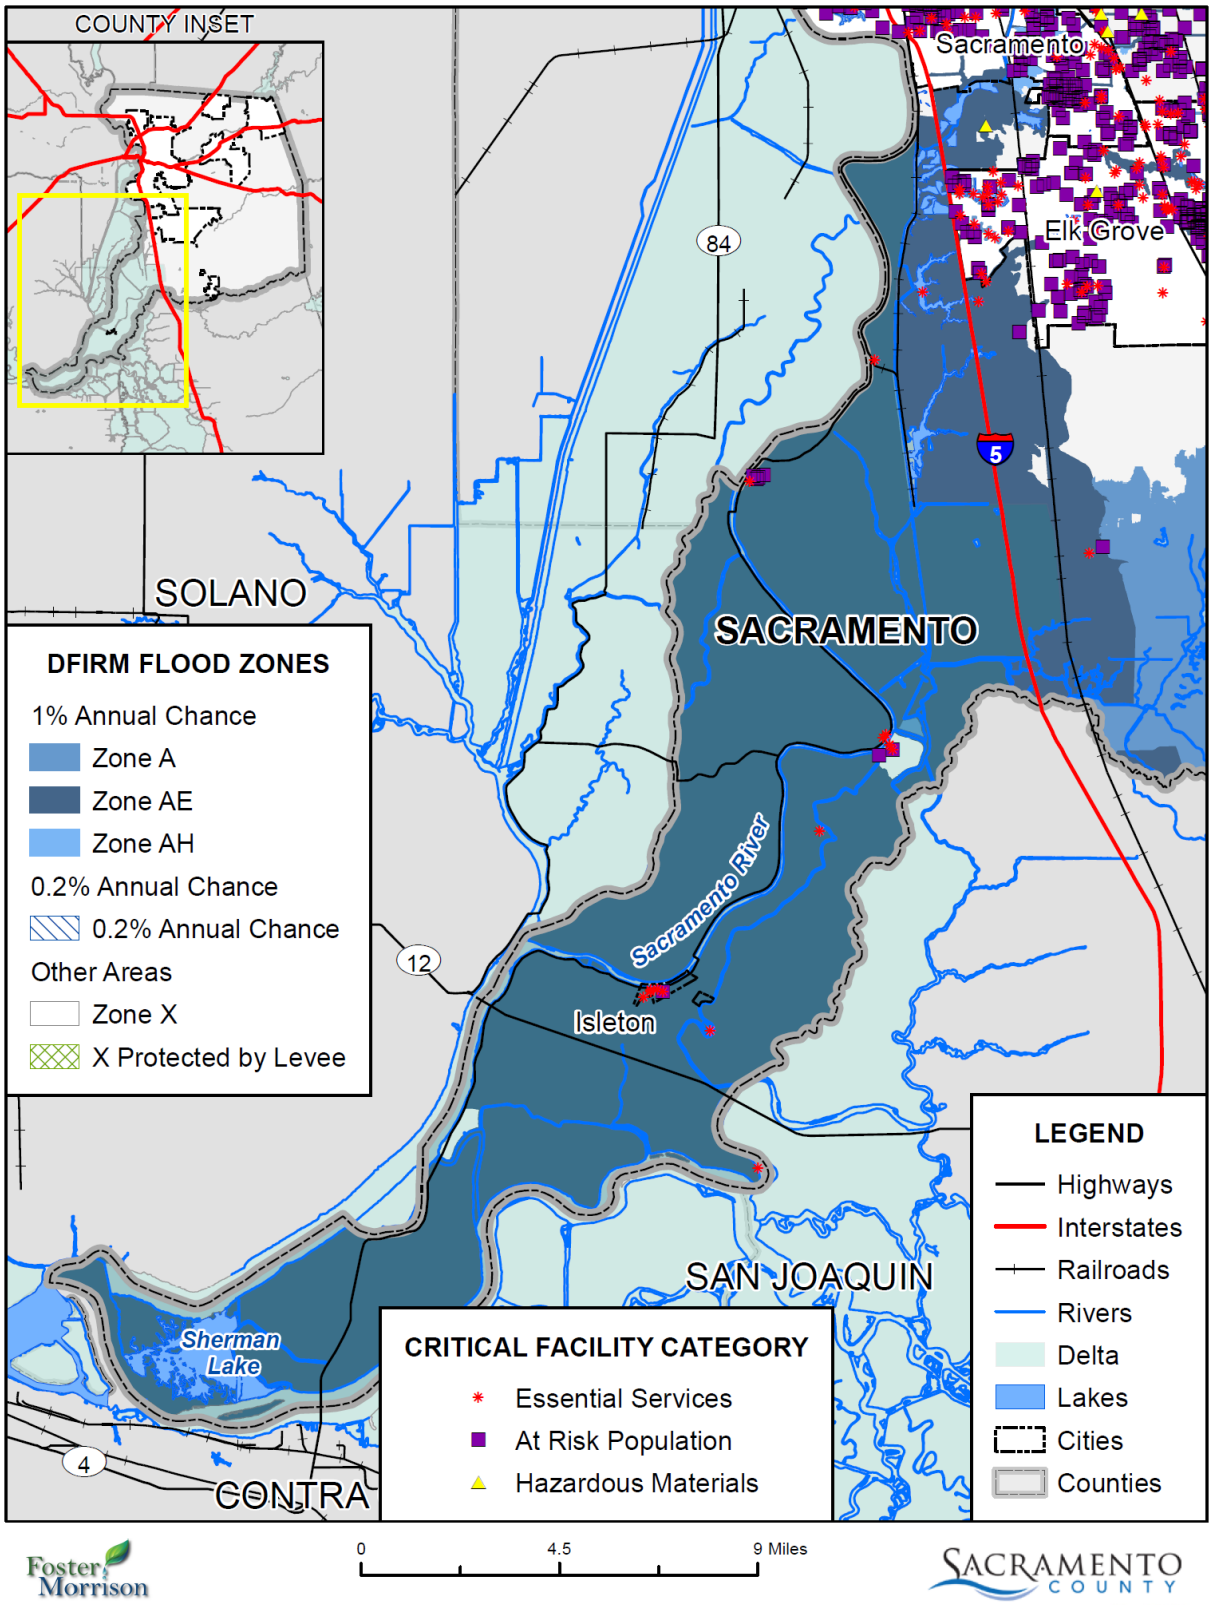
Source: FEMA 6/16/2015 DFIRM, Sacramento County 2016 Parcel/2015 Assessor's Data, US Census Bureau

* Average household populations from the 2010 US Census were used: Delta – 2.71, Isleton – 2.43

Critical Facilities at Risk

An analysis was performed on the critical facility inventory in the Delta in identified FEMA DFIRMs. GIS was used to determine whether the facility locations intersects a DFIRM flood hazard areas, and if so, which zone it intersects. Critical facilities in the floodplain in the Delta are shown in Figure G-8. Details of critical facility definition, type, name and address and jurisdiction by flood zone are listed in Appendix E.

Figure G-8 Sacramento Delta – Critical Facilities



Data Source: Sacramento County GIS, Cal-Atlas, FEMA NFHL 04/16/2016; Map Date: 05/2016.

Natural Resources at Risk

If a levee failure due to flooding were to occur within the Delta it would cause flooding inside the levees. All natural resources would be at risk.

Historic and Cultural Resources at Risk

If a levee failure due to flooding were to occur within the Delta it would cause flooding inside the levees. All historical buildings would be at risk.

Future Development

The County enforces the floodplain ordinance in the unincorporated County. The City of Isleton enforces their floodplain ordinance. If development is to occur in the floodplain, it is required to conform to the standards of these floodplain ordinances.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Localized flooding occurs at various times throughout the year and there are several areas of concern unique to the Delta. Historically, the Delta Area has been at risk of flooding primarily during severe weather storms when the waterway systems swell with heavy rainfall. This may produce localized flooding due to high water in the drainage systems of Isleton and each reclamation district.

Past Occurrences

Past occurrences to localized flooding varies by area. Specific past occurrences for Isleton and the reclamation districts can be found in their Chapters to this annex.

Vulnerability to Localized Flooding

Vulnerability to localized flooding varies by area. Specific vulnerabilities for Isleton and the reclamation districts can be found in their Chapters to this annex.

Future Development

The risk of localized flooding to future development can also be minimized by accurate recordkeeping of repetitive localized flooding. Mitigating the causes of the localized stormwater flooding will reduce future risks of losses.

Levee Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–Extremely High

Hazard Profile and Problem Description

Floods can threaten the Delta from several sources. Usually, the possibility of flooding can be anticipated from 8 to 20 hours before the "Emergency Period" is reached. However, as demonstrated in nearby Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse can occur very quickly with relatively little warning. Such a failure could occur where a levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

Approximately 1,115 miles of levees in the Delta and 230 miles of levees in Suisun Marsh define the configuration of the waterways and landforms of the area. Most of these levees hold back water (i.e., prevent water from flowing onto the adjacent land) for 365 days per year, not just during floods. Over the years, many state and federal agencies and stakeholders have voiced concern over the condition of the Delta and Suisun Marsh levees and the consequences should they fail.

Past Occurrences

There have been two FEMA disaster declarations in Sacramento County related to levee failure. Both were federal and state declared disasters.

- 1980 Delta Levee Break (Disaster EM-3078 declared on 1/23/1980)
- 1972 Andrus Island Levee Break (Disaster DR-342 declared on 6/21/1972)

The FIS reported the following regarding levee failure flooding.

Past flooding in the City of Isleton area has been due to levee failures caused by the separate or coincidental occurrence of very high tides and high stream outflow through the delta region, or from unexplained levee failures apparently not related from high tides and/or high stream outflow can reasonably be expected, such failures cannot be reliably predicted. A detailed field inspection of levees protecting Andrus, Brannan and Twitchell Islands, was made to determine levee conditions insofar as it is possible to do so without subsurface exploration. The report on the inspection identifies problem areas susceptible to failure and requires exploratory borings and testing of core materials to definitively

determine levee stability (USACE, 1976). Because 2-percent annual chance flooding would overtop levees, stability analysis was deemed unnecessary, and this study is concerned only with levee overtopping and disintegration of levee sections subsequent to overtoppings.

The Delta has a long history of flooding, but little definitive data on specific flood events are available. Andrus, Brannan and Twitchell Islands, have all experienced historical floods. Large areas of the delta were inundated during floods, and it is probable that the City of Isleton was damaged or seriously threatened.

The 1950 and 1955 floods were outstanding in peak outflows through the delta and several islands were flooded. The City of Isleton, however, was not affected. In December 1965 and January 1965, the coincidental occurrence of very high tides and heavy inflow resulted in unusually high stages on all delta waterways. Concurrent strong onshore winds generated high waves that created very perilous conditions for many islands. Levees protecting Twitchell Island were seriously threatened by erosion and overtopping, but a massive flood fighting effort prevented overflow, destruction of levees and inundation of the City of Isleton.Several hundred acres were flooded and damages, mainly flood fighting and repair of levees and levee roads, were a little less than $1 million. In January and February 1969, high tides and adverse wave action in the delta, combined with large river inflow and rain-soaked levees, caused the flooding of several islands and the endangerment of many other islands. Approximately 11,400 acres were inundated and flood damages amounted to about $9.2 million. The levee separating Andrus Island and the San Joaquin River failed from unknown causes in June 1972, resulting in the flooding of Andrus and Brannan Islands (including the City of Isleton). High winds had occurred prior to the break, but there had been no antecedent rainfall and the tidal cycle was not on the higher side. About 15,000 acres were inundated and flood damages for the event approximated $30 million.

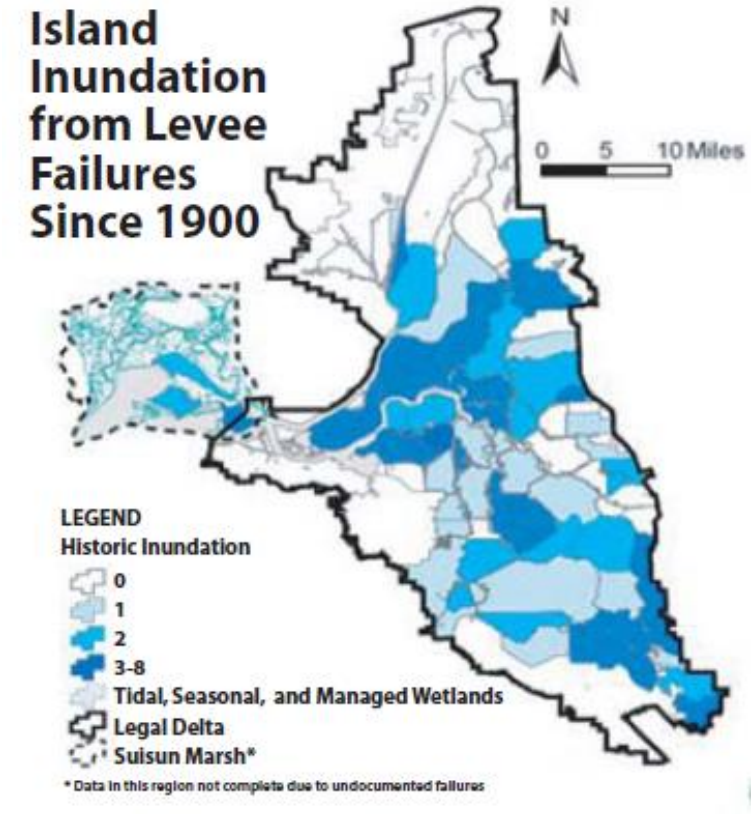
The most devastating and recent flooding of the City of Isleton resulted from failure of a levee at the southern end of Andrus Island. The levee failed from unknown causes during the night of June 21, 1972. There had not been any antecedent rainfall and the tidal cycle was not on the higher side, but high winds had been occurring prior to the break. Approximately 200,000 acre-feet of water from the San Joaquin River inundated Andrus and Brannan Islands. Activities to fight floods to protect the City of Isleton proved to be a losing battle, and almost all of the city was flooded. The entire population was evacuated, with some residents not being able to return to their homes for 4 months. Approximately one-half of the housing units in the city were damaged or destroyed. Damage from the flood event on the islands and in the City of Isleton totaled approximately $30 million.

Due to the size of the delta region, and the complexity of its stream and tidal regimen, flood frequency varies from location to location. In general, the 1950, 1955 and 1964 tidal stages in the central delta, had frequencies of 10, 30 and 5 years, respectively. Stage during the 1955 and 1964 flood periods was strongly influenced by onshore winds. The 1972 flood event cannot be assigned a frequency because the levee failure that caused the flooding cannot be attributed to tidal stage or streamflow conditions.

There have been about 100 levee failures and 163 levee breaches since the early 1900. However, most of these failures occurred in the Delta Area and are not specific to portions of the Delta located inside of Sacramento County. Due to overall improvements in the levee systems throughout the Delta, only 14

failures and 17 breaches occurred since 1990.. These historic numbers are not representative of future occurrences within the County. Figure G-9 shows the levee failures since 1900.

Figure G-9 Island Inundation from Levee Failures from 1900-Present



Source: DRMS

Some islands have been flooded and recovered multiple times. A few islands, such as Franks Tract in San Joaquin County, have never been recovered. Some of the more major levee breaks in Sacramento County are detailed below.

June 21, 1972 – A levee in the Brannan-Andrus Levee Maintenance District broke. 35% of the City of Isleton was inundated. A national disaster was declared June 27, and the breach was closed on July 26. Estimated damages in 2011 dollars were $234 million. The USACE repaired the break.

February 19, 1986 – Heavy rains and flooding affected Sacramento County and the surrounding area. 6 months of precipitation fell in 10 days in mid-February. High water content caused multiple levee failures. Two levee breaks in the same general area occurred on the 8,800 acre Tyler Island in Sacramento County. These two levee breaks were approximately 300 feet in length (see Figure G-10). A FEMA disaster declaration was declared on February 21. The approximate cost to repair the breaks was $6 million in 2011 dollars. Details on damages to structures and crops on the islands was not available.

Figure G-10 1986 Tyler Island Levee Breach

Source: California Department of Water Resources

December 1996 was one of the wettest Decembers on Record. Watersheds in the Sierra Nevada were already saturated by the time three subtropical storms added more than 30 inches of rain in late December 1996 and Early January 1997. The third and most severe of these storms lasted from December 31, 1996 through January 2, 1997. Rain in the Sierra Nevada caused record flows that stressed the flood management system to capacity in the Sacramento River Basin and overwhelmed the system in the San Joaquin River Basin. Levee failures due to breaks or overtopping in the Sacramento River Basin resulted in extensive damages. In the San Joaquin River Basin, dozens of levees failed throughout the river system and produced widespread flooding. The Sacramento-San Joaquin River Delta also experienced several levee breaks and levee overtopping. Affected Delta islands within Sacramento County included McCormack-Williamson Tract, Dead Horse Island and Glanville Tract.

Vulnerability to Levee Failure

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee

overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters. On the Sacramento River system, depending on which dams are releasing the flows, advance warning of river stages may be as much as 24 hours.

Values at Risk

GIS was used to determine the possible impacts of flooding within the Delta. The methodology described in Section 4.3.12 of the Base Plan was followed in determining structures and values at risk to parcels in the X Protected by Levee zone. Table G-10 is a summary table of parcels and values in the Delta Area by flood zone. Table G-11 shows the property use, improved parcel count, improved values, estimated contents, total values and estimated loss of parcels that fall in a X Protected by Levee Zone in the unincorporated Delta. A detail table for the City of Isleton can be found in its Chapter of the Delta Annex.

Table G-10 Sacramento County Delta – Count and Improved Values Summary by X Protected by Levee Flood Zone

Jurisdiction	Total Parcel Count	Improved Parcel Count	Improved Structure Value
Isleton	0	0	$0
Unincorporated Sacramento County Delta	257	182	$16,289,485
Total	**257**	**182**	**$16,289,485**

Table G-11 Sacramento County Delta – Count and Improved Values by Property Use and X Protected by LeveeFlood Zone

Property Use	Total Parcel Count	Total Land Value	Improved Parcel Count	Improved Structure Value	Total Value*
Agricultural	4	$904,221	4	$651,423	$1,555,644
Care / Health	2	$777	0	$0	$777
Church / Welfare	2	$41,705	2	$17,678	$59,383
Industrial	9	$664,692	8	$945,575	$1,610,267
Miscellaneous	6	$13,277	0	$0	$13,277
No Data	0	$0	0	$0	$0
Office	12	$866,549	11	$1,822,030	$2,688,579
Public / Utilities	18	$0	0	$0	$0
Recreational	4	$862,806	2	$653,913	$1,516,719
Residential	126	$3,868,513	120	$8,870,284	$12,738,797
Retail / Commercial	32	$1,772,985	31	$3,314,588	$5,087,573
Vacant	42	$1,882,980	4	$13,994	$1,896,974
Total	**257**	**$10,878,505**	**182**	**$16,289,485**	**$27,167,990**

Source: FEMA 4/16/2016 DFIRM, Sacramento County 2016 Parcel/2015 Assessor's Data

Population at Risk

The DFIRM X Protected by Levee flood zones was overlayed on the parcel layer. Those residential parcel centroids that intersect the identified zone was counted and multiplied by the 2010 Census Bureau average household factors for the Delta. According to this analysis, there is a total population of 341 residents of the Delta in an X Protected by Levee zone.

Table G-12 Sacramento Delta – Count of Improved Residential Parcels and Population in X Protected by Levee Zone

Jurisdiction	Improved Residential Parcels	Population*
Isleton	0	0
Unincorporated Delta	126	341
Total	**126**	**341**

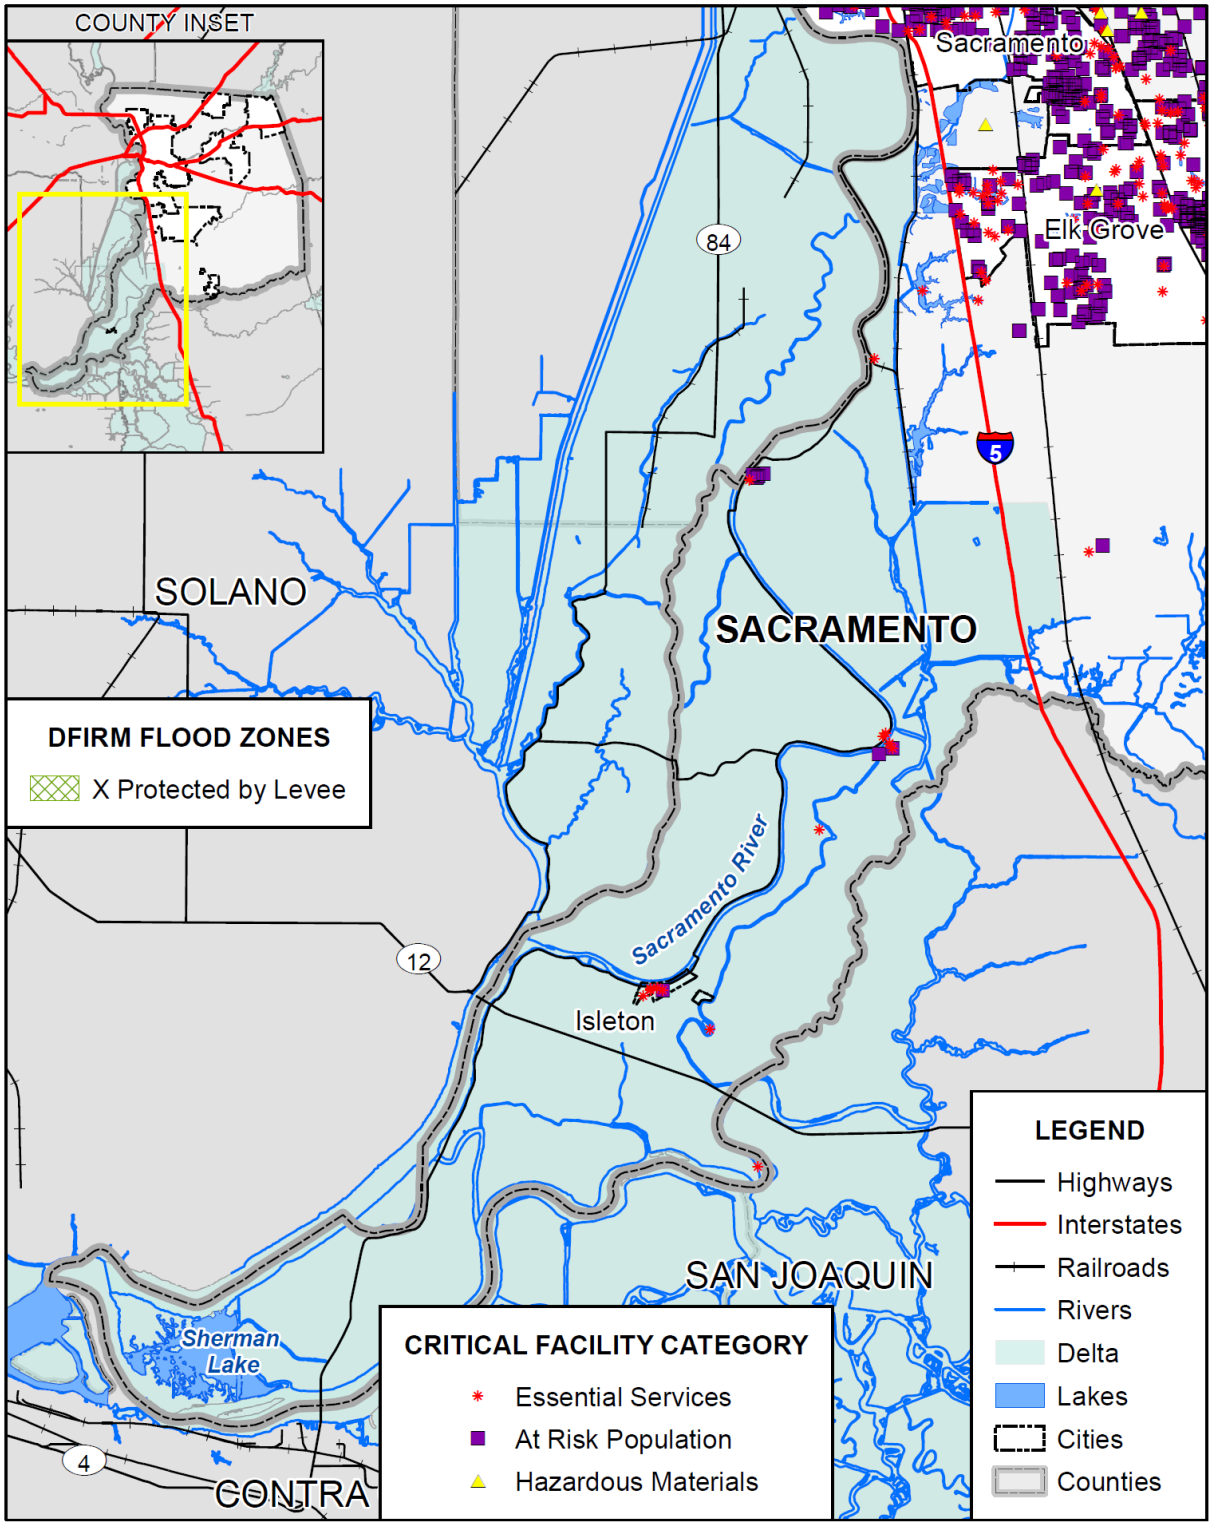
Source: FEMA 4/16/2016 DFIRM, Sacramento County 2016 Parcel/2015 Assessor's Data

* Average household populations from the 2010 US Census were used: Delta – 2.71, Isleton – 2.43

Critical Facilities at Risk

An analysis was performed on the critical facility inventory in the Delta in identified FEMA DFIRM X Protected by Levee Zone. GIS was used to determine whether the facility locations intersects the X Protected by Levee Zone. Critical facilities in the X Protected by Levee Flood Zone in the Delta are shown in Figure G-11. Details of critical facility definition, type, name and address and jurisdiction are listed in Appendix E.

Figure G-11 Sacramento County Delta – Critical Facilities in X Protected by Levee Zone



Data Source: Sacramento County GIS, Cal-Atlas, FEMA NFHL 04/16/2016; Map Date: 05/2016.

Natural Resources at Risk

If a levee failure were to occur within the Delta it would cause flooding inside the levees. All natural resources would be at risk.

Historic and Cultural Resources at Risk

If a levee failure were to occur within the Delta it would cause flooding inside the levees. All historical buildings would be at risk.

Future Development

Planned developments should take levee failure areas into account during the construction of new homes and commercial properties. The County will continue to enforce the zoning, subdivision, and development ordinances in the unincorporated Delta Area. The City of Isleton will also enforce the development ordinances that exist in the City.

River/Creek/Stream Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion, including levee erosion, is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. Stream bank erosion processes, although complex, are driven by two major components in the Delta: stream bank characteristics (erodibility) and hydraulic/gravitational forces. Many land use activities can affect both of these components and lead to accelerated bank erosion. The vegetation rooting characteristics can protect banks from fluvial entrainment and collapse, and also provide internal bank strength. When riparian vegetation is changed from woody species to annual grasses and/or forbs, the internal strength is weakened, causing acceleration of mass wasting processes. Stream bank aggradation or degradation is often a response to stream channel instability. Since bank erosion is often a symptom of a larger, more complex problem, the long-term solutions often involve much more than just bank stabilization. Numerous studies have demonstrated that stream bank erosion contributes a large portion of the annual sediment yield.

Past Occurrences

Stream bank and levee erosion occurs annually at different levels throughout the Delta. Information on specific past occurrences of erosion in the City of Isleton or the reclamation districts can be found in their respective Chapters to this Annex.

Vulnerability to Erosion

Levees in the Delta are at risk to erosion, due to the channelization due to narrow river channels, high water levels, and wave action from boating. The annual costs of repairs to the banks of rivers and levees varies. Information on specific vulnerabilities and costs from erosion in the City of Isleton or the reclamation districts can be found in their respective Chapters to this Annex.

Future Development

Planned developments should take erosion risk areas into account during the construction of new homes and commercial properties. Enforcement of leveed setback areas may also prevent erosion due to encroachment activities. The County will continue to enforce the zoning, subdivision, and development ordinances in the unincorporated Delta Area. The City of Isleton will also enforce the development ordinances that exist in the City.

Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail/Lightning)

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Storms in the Delta are generally characterized by heavy rain often accompanied by strong winds and sometimes lightning and hail. Approximately 10 percent of the thunderstorms that occur each year in the United States are classified as severe. A thunderstorm is classified as severe when it contains one or more of the following phenomena: hail that is three-quarters of an inch or greater, winds in excess of 50 knots (57.5 mph), or a tornado. Heavy precipitation in the Sacramento County Delta Area falls mainly in the fall, winter, and spring months.

Past Occurrences

Heavy rains and storms often occur over large areas. As such, events that affected the County have affected the Delta. Past occurrences for the County are detailed in Section 4.2.5 of the Base Plan. Events that had larger effects on individual Delta Reclamation Districts can be found in their respective Chapters of this Delta Annex.

Vulnerability to Heavy Rains and Storms

According to historical hazard data, severe weather is an annual occurrence in the Sacramento County Delta. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future. Heavy rain and thunderstorms are the most frequent type of severe weather occurrences in the Delta. Wind and lightning often accompany these storms and have caused damage in the past. However, actual damage associated with the primary effects of severe weather has been limited. It is the secondary hazards caused by weather, such as floods, fire, and agricultural losses that have had the greatest impact on the Delta.

Future Development

New critical facilities should be built to withstand heavy rains, hail damage, and lightning. While minimal damages have occurred to critical facilities in the past due to lightning, hail, or heavy rains, there still remains future risk. With development occurring in the region, future losses to new development may occur.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

High winds, often accompanying severe thunderstorms, can cause significant property and crop damage, threaten public safety, and have adverse economic impacts from business closures and power loss. Winds also cause wave action, which is discussed in the vulnerability section below. Tornadoes are not a wind hazard that the Delta is generally at risk of.

The Delta Breeze is the local name for a wind coming from the southwest, off of the Delta of the Sacramento River and San Joaquin River. This wind carries with it cooler, more humid air from off of the Pacific Ocean. The effects of this wind are very noticeable during the summer, as this seabreeze can cool the air by more than 10°F. According to the National Weather Service, the wind is primarily driven by a sea breeze circulation, which can often become coupled with a mountain breeze to form one large (mesoscale) circulation of air from the Farallon Islands up into the Sierra Nevada.

Past Occurrences

Winds events, especially those accompanying severe thunderstorms, are generally larger events. As such, events that affected the County have affected the Delta. Past occurrences for the County are detailed in Section 4.2.6 of the Base Plan. Often the issue related to high winds within the Delta are related to increase wave action on the levees. Events that had larger effects on individual Delta Reclamation Districts and the City of Isleton can be found in their respective Chapters of this Delta Annex.

Vulnerability to Wind and Tornadoes

In the Delta, levees are vulnerable to wave action from both thunderstorm winds and from the Delta Breeze that causes excess erosion, and can threaten the levee integrity in each Reclamation District. Wind action, especially when coupled with high water events, leads to scour and high bank erosion, which creates wave induced erosion at the levee toe.

Future Development

New critical facilities should be built to withstand thunderstorm winds. While minimal damages have occurred to critical facilities in the past due to high winds and tornadoes, there still remains future risk. With development occurring in the region, future losses to new development may occur. Reclamation

Districts will need to continue to armor levees against wind induced wave action that causes excess erosion.

Subsidence

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Subsidence is the gradual settling or sinking of the earth's surface over manmade or natural underground voids with little or no horizontal motion. Subsidence occurs naturally and also through man-driven or technologically exacerbated circumstances. In Sacramento County, the Delta in the southeast portion of the County is highly at risk to subsidence. In the Delta, subsidence affects the islands as well as the levees.

Past Occurrences

Past occurrences for subsidence in Isleton or the reclamation districts are detailed in their respective Chapters to this Annex.

Vulnerability to Subsidence

The costs of levee construction and maintenance are generally borne by the State of California and the Federal government, as well as by local reclamation districts. These costs also increase as subsidence progresses, forcing levees to be built higher and stronger. In 1981 to 1986 the total amount spent on emergency levee repairs related to flooding was about $97 million, and in 1981 to 1991 the amount spent on routine levee maintenance was about $63 million. Thus the annual cost of repair and maintenance of Delta levees in the 1980s, from subsidence and other factors, averaged about $20 million per year. Note that these costs reflect the larger Delta Area. Repair and maintenance costs for the Delta Area located in Sacramento County would be proportionately less.

Much larger costs might be incurred if land subsidence indirectly affects the north-to-south water-transfer system, which is predicated on acceptable water quality in the southern Delta. The western Delta islands, in particular, are believed to effectively inhibit the inland migration of the salinity interface between Bay and Delta. If these are flooded, the water available to the massive pumping facilities near the Clifton Court Forebay might become too saline to use.

The statewide water-transfer system in California is so interdependent that decreased water quality in the Delta might lead to accelerated subsidence in areas discussed elsewhere in this document. Both the Santa Clara and San Joaquin Valleys rely, in part, on imported water from the Delta to augment local supplies and thereby reduce local ground-water pumpage and arrest or slow subsidence. Degradation of the Delta source water could well lead to increased ground-water use, and renewed subsidence, in these and other areas in California.

The management issues raised by land subsidence range in scale from those faced by individual farmers to the possible global-scale issue posed by the carbon-dioxide flux, with its possible link to climate change. At the most local level, individual farmers or reclamation districts must maintain drainage networks on the islands and pump the agricultural drainage back into waterways. These costs increase gradually as subsidence progresses.

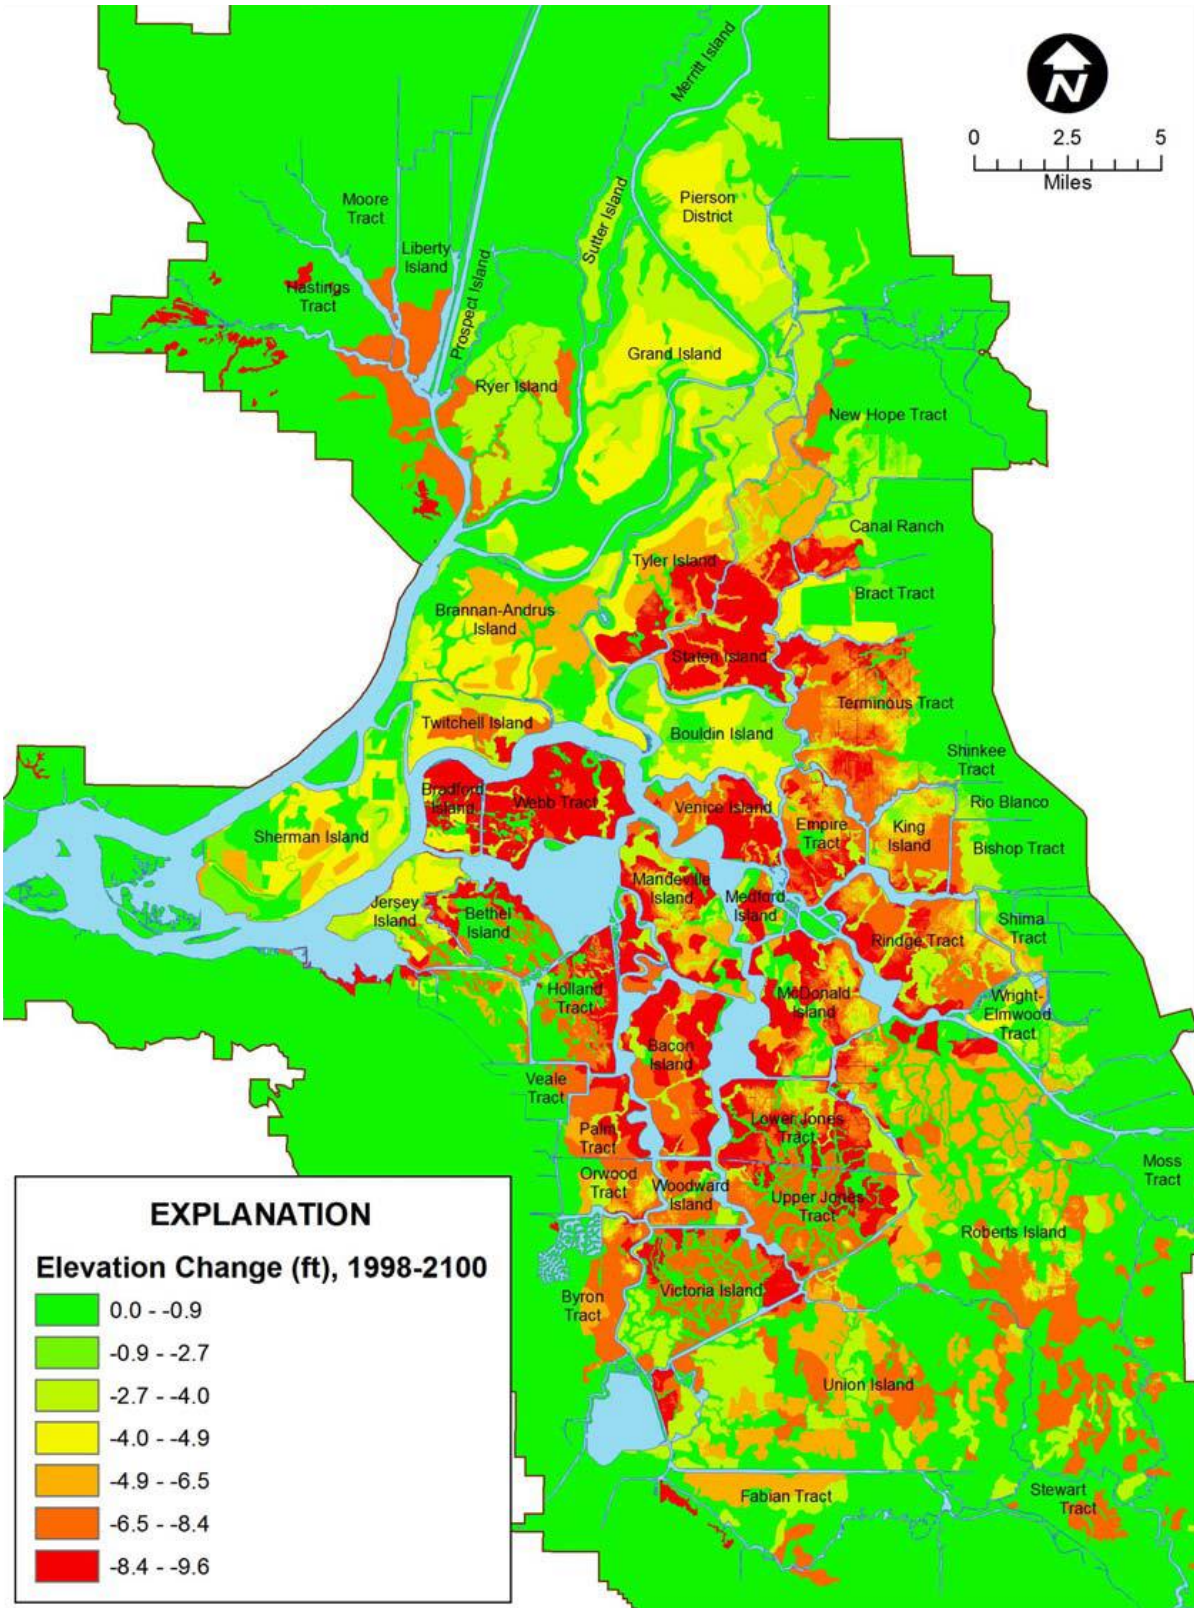
Members of the HMPC did note that although tremendous subsidence of islands has occurred since their original reclamation, recent LiDAR survey data indicates that very few areas of the Delta are actively subsiding. In addition, surveys and geotechnical evaluations show that subsidence rarely occurs close enough to a levee to cause instability. In the few areas that this may be a problem, the "toe berm" design, used to meet the Federal PL 84-99 and State Bulletin 192-82, caps the peat and effectively stops subsidence.

Local farmers have changed farming practices to help limit and mitigate the issues related to subsidence. This is especially true in the Delta Area.

Future Development

As subsidence progresses (see Figure G-12), the levee system will likely become increasingly vulnerable to catastrophic failure during floods and earthquakes. Areas for future development will become more limited. The interrelated issues of Delta land subsidence, water quality, and wildlife habitat will continue to pose a major dilemma for California water managers.

Figure G-12 Additional Expected Subsidence from 1998 to 2100



Source: Delta Risk Management Strategy, 2009

Wildfire

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Low

Hazard Profile and Problem Description

The threat of wildfire to the Delta is generally considered to be low. All of the Delta is located in a zone that CAL FIRE considers to be of little or no threat of wildfire. However, many of the reclamation districts within the Delta consider wildfire to be a significant concern to the area, should an out of control wildfire occur in the area. Because of this and its significance in the State of California, wildfire vulnerability is profiled here.

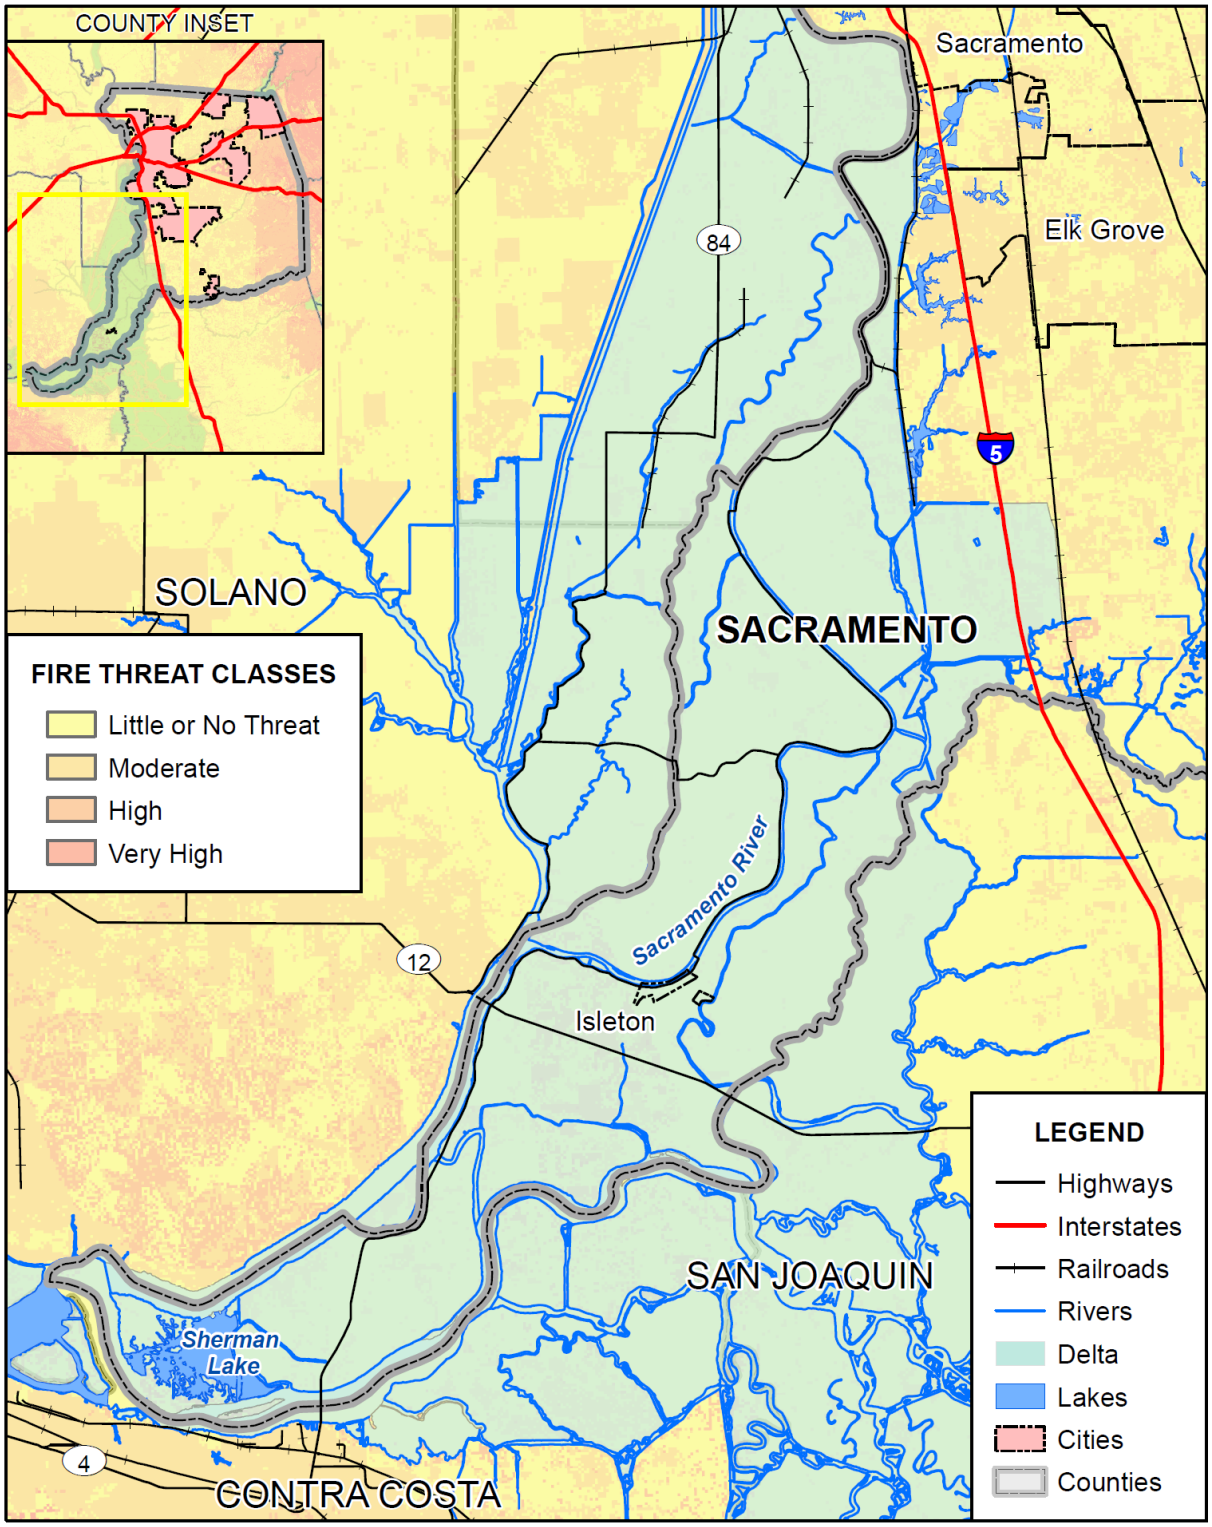
Past Occurrences

Past occurrences for wildfire in Isleton or the reclamation districts are detailed in their respective Chapters to this Annex.

Vulnerability to Wildfire

Following the methodology described in Section 4.3.17, a wildfire map for the Delta was created (see Figure G-13).

Figure G-13 Sacramento Delta's Fire Threat Zones



Data Source: Sacramento County GIS, Cal-Atlas, Cal-Fire 2004 Fire Threat Data; Map Date: 05/2016.

Values at Risk

all properties in the Delta as shown in Table G-1 in the Total Assets at Risk discussion would have little or no risk to wildfire, according to Cal Fire's data.

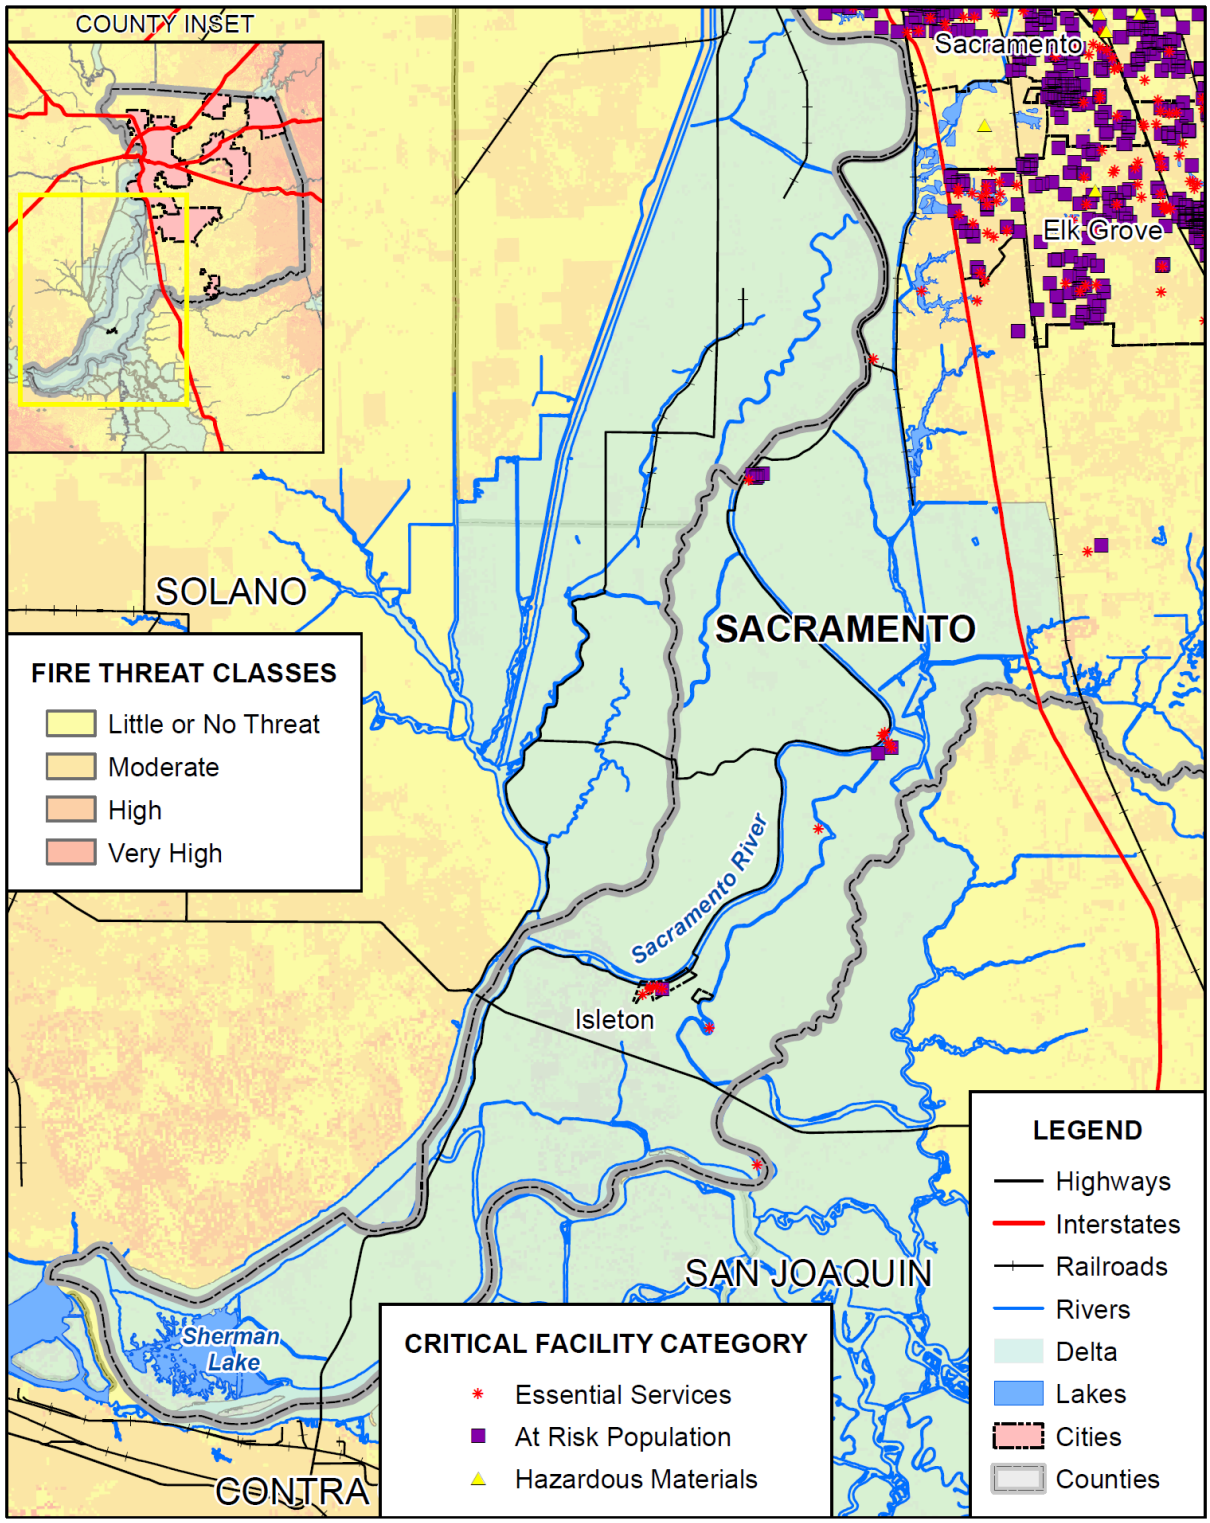
Population at Risk

The Fire Threat Zone dataset was overlayed on the parcel layer. Those residential parcel centroids that intersect the severity zones were counted and multiplied by the 2010 Census Bureau average household factors for the Delta. According to this analysis, there is are no residents of the Delta at risk to moderate or higher wildfire risk.

Critical Facilities at Risk

Wildfire analysis was performed on the critical facility inventory in the Sacramento County Delta. This is shown on Figure G-14. Details of critical facility definition, type, name, address, and jurisdiction by fire threat zone are listed in Appendix E.

Figure G-14 Sacramento County Delta – Critical Facilities in Fire Threat Zones



Data Source: Sacramento County GIS, Cal-Atlas, Cal-Fire 2004 Fire Threat Data; Map Date: 05/2016.

Natural Resources at Risk

The Planning Team noted no natural resources in the Delta at risk to wildfire.

Historic and Cultural Resources at Risk

The Planning Team noted no historic or cultural resources in the Delta Area at risk to wildfire.

Future Development

Development may occur in the Delta, as it is in a little or no threat wildfire threat. Existing building codes further lower the risk of future development to wildfire.

G.6 Delta Annex Chapters

G.6.1. Introduction

This Delta Annex contains separate Chapters that presents data specifically related to each Delta Area entity – the City of Isleton or each reclamation district that is a participating jurisdiction to this LHMP Update. Each Delta Annex Chapter is structured with the same format. The intent of the Chapters is to demonstrate how the risk varies across the Delta and specific to each participating jurisdiction, beyond that provided above in this umbrella Delta Annex. The following is an explanation of the format and what each data set represents.

District or City Planning Committee

This section begins with a list of the jurisdictions that participated in the planning process. A table of names, positions, and how each person participated are included in each Chapter.

Community Profile

A general description, overview, background, and history for each Delta Area jurisdiction. Maps of each jurisdiction's location in the Delta are included, if available.

Hazard Identification and Summary

Each Planning Team identified the hazards that affect the City/Reclamation District and summarized their geographic extent. frequency of occurrence, special extent, and significance specific to Isleton or the Reclamation District. This information is presented in a table in each Chapter.

Hazard Profile and Vulnerability Assessment

The intent of this section is to assess each entity's vulnerability separate from that of the planning area as a whole, which has already been assessed in Section 4.3 Vulnerability Assessment in the main plan and also within this Delta Annex. This vulnerability assessment analyzes the population, property, and other

assets at risk to hazards ranked of medium or high significance that may vary from other parts of the planning area. Each hazard contains the following items, to the extent data is available:

- Past Occurrences
- Assets at Risk
- Populations at Risk (in mapped hazard areas)
- Critical Facilities at Risk (in mapped hazard areas)
- Natural Resources at Risk (in mapped hazard areas)
- Historic and Cultural Resources at Risk (in mapped hazard areas)
- Future Development

Capability Assessment

The purpose of this section of the planning process is to determine what policies, programs, regulations, and other mechanisms Isleton or the reclamation districts, already have in place that either contribute to, or hinder the ability to mitigate the effects of natural hazards.

Mitigation Strategy and Actions

The final section of each Chapter acknowledges concurrence with the overall 2016 LHMP Goals and Objectives and puts forth the recommended actions of all participating Delta jurisdictions: Isleton and Reclamation Districts.

Delta Annex Chapter 1 City of Isleton

1.1 Introduction

This chapter of the Delta Annex details the hazard mitigation planning elements specific to the City of Isleton, a new participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the City. This chapter of the Delta Annex provides additional information specific to the City of Isleton, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this community.

1.2 Planning Process

As described above, the City of Isleton followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC) and Steering Committee, the City formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 1-1. Additional details on plan participation and City representatives are included in Appendix A.

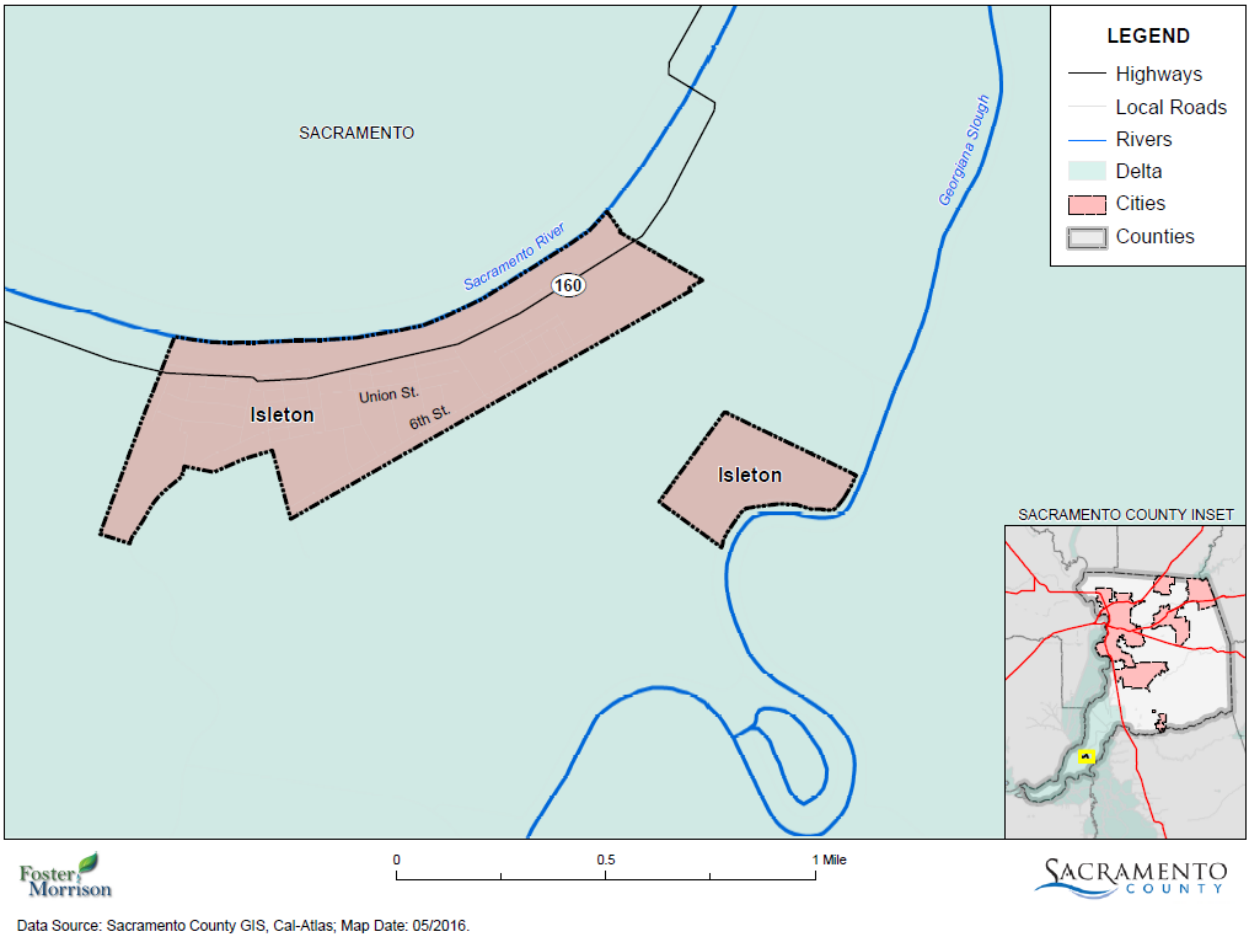
Table 1-1 City of Isleton Planning Team

Name	Position/Title	How Participated
Romi Balbini	Director of Public Works	Attended meetings and provided all the information supplied within this annex
Sandra Rutledge	Assistant City Manager	Coordination of data

1.3 Community Profile

The community profile for the City of Isleton is detailed in the following sections. Figure 1-1 displays a map and the location of the City of Isleton within Sacramento County.

Figure 1-1 City of Isleton



1.3.1. Geography and Climate

According to the United States Census Bureau, the city has a total area of 0.5 square miles, of which, 0.4 square miles of it is land and 0.05 square miles of it is water. According to the Köppen Climate Classification system, Isleton has a warm-summer Mediterranean climate.

1.3.2. History

The small town on Isleton is located in southern Sacramento County in the Delta Region along the banks of the Sacramento River. The Delta is a land of rivers, agriculture, boating, fishing, and rich history. Isleton was once referred to as the "Little Paris on the Delta."

Josiah Pool founded Isleton in 1874. Isleton, like many other communities in Sacramento County, benefited from gold fever. Its location on the river brought commerce and trade since the river was the primary source of transport. Improving the waterways for deeper channels that would permit year round travel brought about levee construction. The levees remain though the town has since dwindled from its boom days

Isleton's resident population is currently 820. The town hosts several festivals, including the Spam Contest, which originated as a direct result of the floods of 1996. Displaced families during the flood were given shelter at the Hotel Del Rio, owned by Ralph and Charli Hand. When people visited their homes, they remarked that the labels on the Spam cans were the only labels that survived. Charli decided to make some fun of it and the Spam Contest was created. Contestants cook Spam, carve Spam, dress Spam up in costumes and even appoint a "Captain Spam."

1.3.3. Economy and Tax Base

US Census estimates show economic characteristics for the City of Isleton. These are shown in Table 1-2 and Table 1-3. Mean household income in the City was $49,704. Median household income in the City was $30,900. Major employers in the vicinity are shown below the tables.

Table 1-2 City of Isleton Civilian Employed Population 16 years and Over

Industry	Estimated Employment	Percent
Agriculture, forestry, fishing and hunting, and mining	24	8.3%
Construction	60	20.8%

*Homeowners' Exemption

1.3.4. Population

The California Department of Finance estimated the January 1, 2015 total population for the City of Isleton was 820.

Select demographic information from the 2014 US Census American Community Survey (the most recent data available) is shown in Table 1-6.

Table 1-6 City of Isleton Demographic Information

Demographic Characteristic	Number	Percent
Race		
White	327	41.3%
Black or African American	8	1.0%
American Indian or Alaska Native	3	0.4%
Asian	58	7.3%

Demographic Characteristic	Number	Percent
Hawaiian or Pacific Islander	391	48.6%
Two or more races	5	0.6%
Total Households	331	–
Average Household Size	2.43	–

1.4 Hazard Identification

Isleton's planning team identified the hazards that affect the City and summarized their frequency of occurrence, spatial extent, potential magnitude, and significance specific to Isleton (see Table 1-7).

Table 1-7 City of Isleton—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards				
Bird Strike				
Climate Change	Significant	Likely	Limited	Medium
Dam Failure				
Drought and Water Shortage	Extensive	Likely	Limited	High
Earthquake				
Earthquake: Liquefaction				
Flood: 100/200/500-year	Significant	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Limited	Highly Likely	Limited	Medium
Landslides				
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion				
Severe Weather: Extreme Temperatures – Cold/Freeze				
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Limited	Medium
Severe Weather: Fog	Extensive	Highly Likely	Critical	Medium
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Significant	Highly Likely	Critical	Medium
Severe Weather: Wind and Tornadoes				
Subsidence	Significant	Highly Likely	Limited	Low
Volcano	Limited	Unlikely	Limited	Low
Wildfire:(Burn Area/Smoke)	Limited	Unlikely	Limited	Low

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

1.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile Isleton's hazards and assess the City's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 Hazard Profiles and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the City of Isleton is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the City of Isleton and also includes a vulnerability assessment to the three primary hazards to the State of California: earthquake, flood, and wildfire. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

1.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 1.5.3, includes a description as to how the hazard affects the City and information on past occurrences. The intent of these section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

1.5.2. Vulnerability Assessment and Assets at Risk

This section presents the vulnerability assessment for the City and identifies Isleton's total assets at risk, including values at risk, critical facilities and infrastructure, natural resources, and historic and cultural resources. Growth and development trends are also presented for the community. This data is not hazard specific, but is representative of total assets at risk within the community.

Assets at Risk

The following data from the Sacramento County Assessor's Office is based on the 2015 Assessor's data. The methodology used to derive property values is the same as in Section 4.3.1 of theBase Plan. This data should only be used as a guideline to overall values in the County, as the information has some limitations. The most significant limitation is created by Proposition 13. Instead of adjusting property values annually, the values are not adjusted or assessed at fair market value until a property transfer occurs. As a result, overall value information is most likely low and does not reflect current market value of properties within the County. It is also important to note, in the event of a disaster, it is generally the value of the infrastructure or improvements to the land that is of concern or at risk. Generally, the land itself is not a loss. Table 1-8 shows the 2015 Assessor's values (e.g., the values at risk) broken down by property type for the City of Isleton.

Table 1-8 City of Isleton – Total Assets at Risk by Property Use

Property Use	Total Parcel Count	Improved Parcel Count	Total Land Value	Improved Structure Value	Total Value
Agricultural	1	0	$10,642	$0	$10,642
Care / Health	0	0	$0	$0	$0

Property Use	Total Parcel Count	Improved Parcel Count	Total Land Value	Improved Structure Value	Total Value
Church / Welfare	8	8	$126,424	$725,325	$851,749
Industrial	8	7	$648,069	$872,264	$1,520,333
Miscellaneous	14	0	$8,417	$0	$8,417
Office	5	4	$375,240	$592,391	$967,631
Public / Utilities	35	1	$832,422	$30,000	$862,422
Recreational	0	0	$0	$0	$0
Residential	251	247	$8,765,278	$20,390,509	$29,155,787
Retail / Commercial	63	61	$2,093,003	$5,909,252	$8,002,255
Vacant	140	6	$4,013,846	$32,963	$4,046,809
No Data	0	0	$0	$0	$0
Total	**525**	**334**	**$16,873,341**	**$28,552,704**	**$45,426,045**

Critical Facilities and Infrastructure

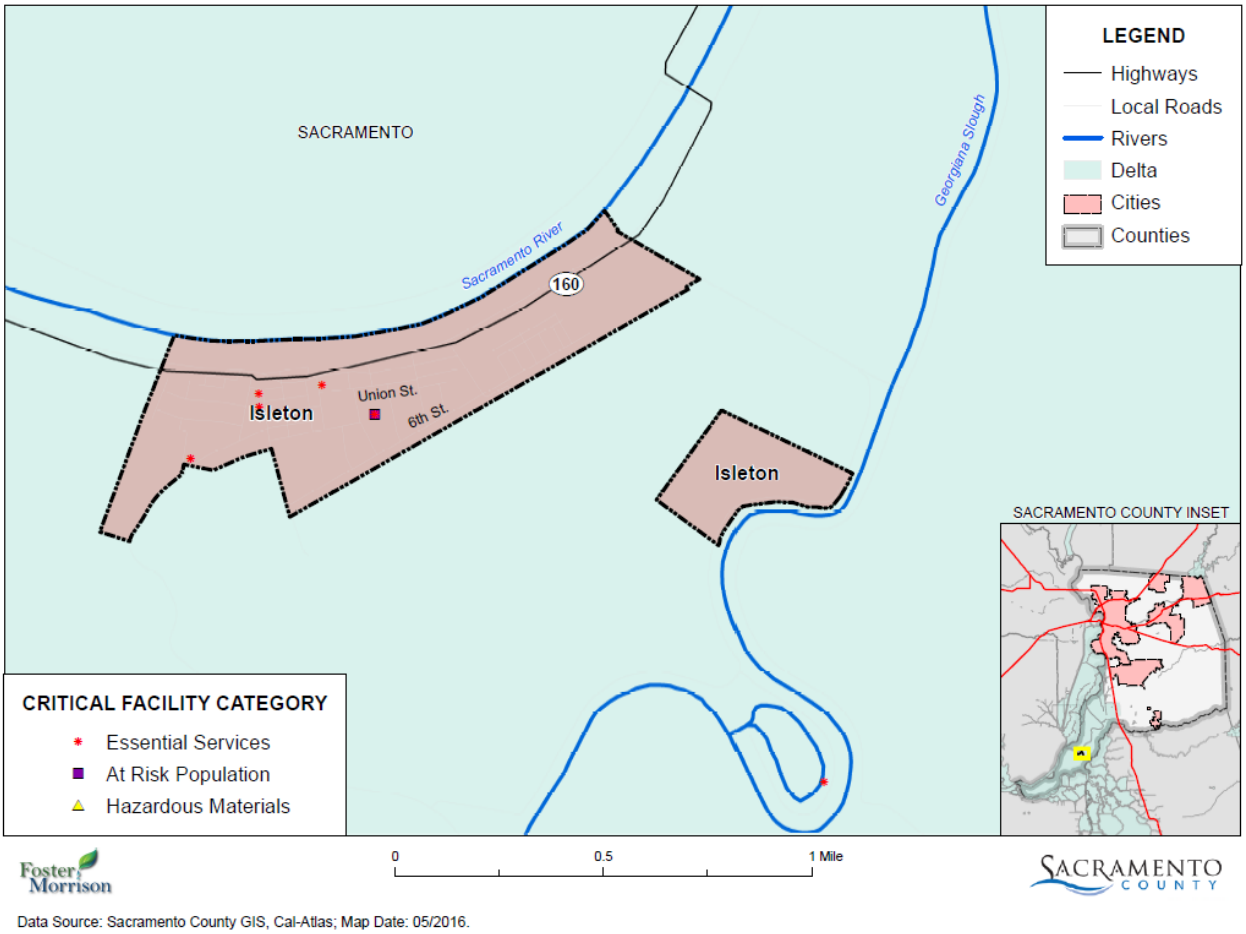
For purposes of this plan, a critical facility is defined as:

> *Any facility, including without limitation, a structure, infrastructure, property, equipment or service, that if adversely affected during a hazard event may result in severe consequences to public health and safety or interrupt essential services and operations for the community at any time before, during and after the hazard event.*

This definition was refined by separating out three classes of critical facilities, that include Essential Services Facilities, At Risk Population Facilities, and Hazardous Materials Facilities, as further described in Section 4.3.1 of the Base Plan.

An inventory of critical facilities in the City of Isleton from Sacramento County GIS is shown on Figure 1-2 and detailed in Table 1-9. Details of critical facility definition, type, name, address, and jurisdiction by hazard zone are listed in Appendix E.

Figure 1-2 City of Isleton – Critical Facilities



Data Source: Sacramento County GIS, Cal-Atlas; Map Date: 05/2016.

Table 1-9 City of Isleton – Critical Facilities Inventory

Critical Facility Category	Facility Type	Facility Count

Natural Resources

There are ample natural resources in and around the City of Isleton.

Vegetation occurring throughout the urban areas includes nonnative annual grasses such as Italian ryegrass, Ripgut brome, and Bermuda grass. Nonnative herbaceous species such as Yellow star-thistle, Wild radish, Field mustard, Peppergrass, and Pampas grass are also present. Stands of Northern California black walnut are located along Hwy. 160, on the east side of the Sacramento River.

A number of irrigation canals occur within the agricultural lands and are vegetated with species adapted to wet habitats (e.g. Cattail, Bulrush, Cocklebur, and Waterpepper).

Riparian woodland vegetation occurs along the Sacramento River. The riparian corridors are dominated by Valley and Coast live oaks, Narrow-leaved willow, Fremont cottonwood, California buckeye, and Himalayan blackberry. Jackson Slough serves as an agricultural drainage canal within the Plan area. Vegetation along the slough includes Narrow-leaved willow, Valley and Coast live oak, Himalayan

blackberry, Giant reed, and emergent vegetation such as cattails. Several clumps of Blue elderberry shrubs were observed on the banks of the slough on the east side of Jackson Slough Road.

Wildlife habitats in the Plan area provide foraging and/or breeding habitat for wildlife species including amphibians, reptiles, birds, and mammals. Amphibian species that could occur in the City include bullfrog, Pacific treefrog, and Western toad. Reptile species that may occur in the study area include Western terrestrial garter snake *(Thamnophis elegans*), Western fence lizard (*Sceloporus occidentalis*), and Western pond turtle (*Clemmys mannorata mannorata*). Habitat for Giant garter snakes (Thamnophis gigas) occurs in Jackson Slough.

The riparian habitats along the Sacramento River and Jackson Slough provide nesting and foraging habitat for numerous bird species. The agricultural lands provide foraging habitat for bird species such as Brewer's blackbird (*Euphagus cyanocephalus*), brown-headed cowbird (*Molothrus ater*), killdeer (*Charadrius vociferus*), and Western meadowlark (*Sturnella neglecta*). Raptors (birds of prey) known to forage in the vicinity of the Plan area include blackshouldered kite, Northern hanier (*Circus cyaneus*), and Swainson's hawk (*Buteo swainsoni*). Birds species that could forage in agricultural ditches and sloughs include American coot (*Fulica americana*), mallard (*Anas platyrhynchos*), and red-winged blackbird (*Agelaius phoeniceus*).

Small terrestrial mammals that could inhabit the Plan area include Botta' s pocket gopher (*Thomomys bottae*) and various species of mice, rats, and squirrels. Larger terrestrial mammals that could inhabit or transit through the Plan area include Beaver, Opossum, Skunk, Raccoon, and River otter. Several species of bats could occur within the Plan area. These species forage on insects over open fields, above tree canopies, and over open water. Bats could use man-made structures and spaces under bark of large trees for day roosts.

Invertebrate species of concern in the plan area include the Valley elderberry longhorn beetle *(Desmocerus californicus dimorphus*). The Valley elderberry longhorn beetle is a federally listed threatened species dependent on elderberry shrubs for its life cycle. Blue elderberry shrubs were observed along Jackson Slough near Jackson Slough Road. The Antioch dunes anthicid beetle and the Sacramento anthicid beetle require loose, sandy soils. Potential habitat for anthicid beetles in the plan area is very marginal and limited to small patches of sandy soils along the Sacramento River levee.

The Sacramento River supports important sport and commercial fisheries. Warmwater game fish found in the Sacramento River include channel *(Ictalurus punctatus*) and white catfish *(lctalurus catus*); largemouth, smallmouth, and spotted bass (*Micropterus salmonides, Micropterus dolomieui,* and *Micropterus punctulatus*); carp and various sunfishes (*Centrarchidae*). Native freshwater fish occurring in the Sacramento River include Sacramento perch, Sacramento roach, River lamprey, etc., as well as special-status species such as Delta smelt, Longfin smelt, Sacramento splittail, chinook salmon, and green sturgeon. The Delta smelt is a resident fish in the Delta around the City as well.

Historic and Cultural Resources

The City has registered federal historic sites, State landmarks and points of interest. These are shown in Table 1-10.

Table 1-10 Registered Historic Sites in the City of Isleton

Name (Landmark Plaque Number)	National Register	State Landmark	California Register	Point of Interest	Date Listed
Isleton Chinese And Japanese Commercial Districts (N1674)	X				3/14/1991

Source: California Office of Historical Preservation

The National Park Service administers two programs that recognize the importance of historic resources, specifically those pertaining to architecture and engineering. While inclusion in these programs does not give these structures any sort of protection, they are valuable historic assets.

The Historic American Buildings Survey (HABS) and Historic American Engineering Record (HAER) document America's architectural and engineering heritage. The HABS and HAER structure in the City are listed below:

- Sacramento River Bridge, Spanning Sacramento River South of Locke, Isleton, Sacramento, CA

Growth and Development Trends

Past populations for the City of Isleton are shown in Table 1-11.

Table 1-11 Population History for City of Isleton

Year	Population	Increase	% Change From Prior Year
1970	909	–	–
1980	910	1	0.1%
1990	850	-60	-6.6%
2000	828	-22	-2.6%
2010	804	-24	-2.9%

Source: California Department of Finance

Land Use

The environmental setting of the Isleton Planning Area is dominated by the Sacramento River on the north, Georgiana Slough on the south and agricultural lands which border the City on the south, east, and west. The primary land use (108.6 acres) in the City is developed (urban and residential) land in the City of Isleton. Urban land covers most of the City. Urban habitat is concentrated along Tyler Island Bridge Road. Agricultural lands exist within the western part of the community immediately south of the City limits, and between the community and Georgiana Slough to the southeast and State Route 12 to the south and southwest. The first location involves approximately 37 acres all north of the extended westerly alignment of 6th Street. The second location involves several thousand acres outside of the City in productive

agricultural use and with much of the acreage under Williamson Act contracts with Sacramento County. Riparian woodland vegetation occurs along the Sacramento River.

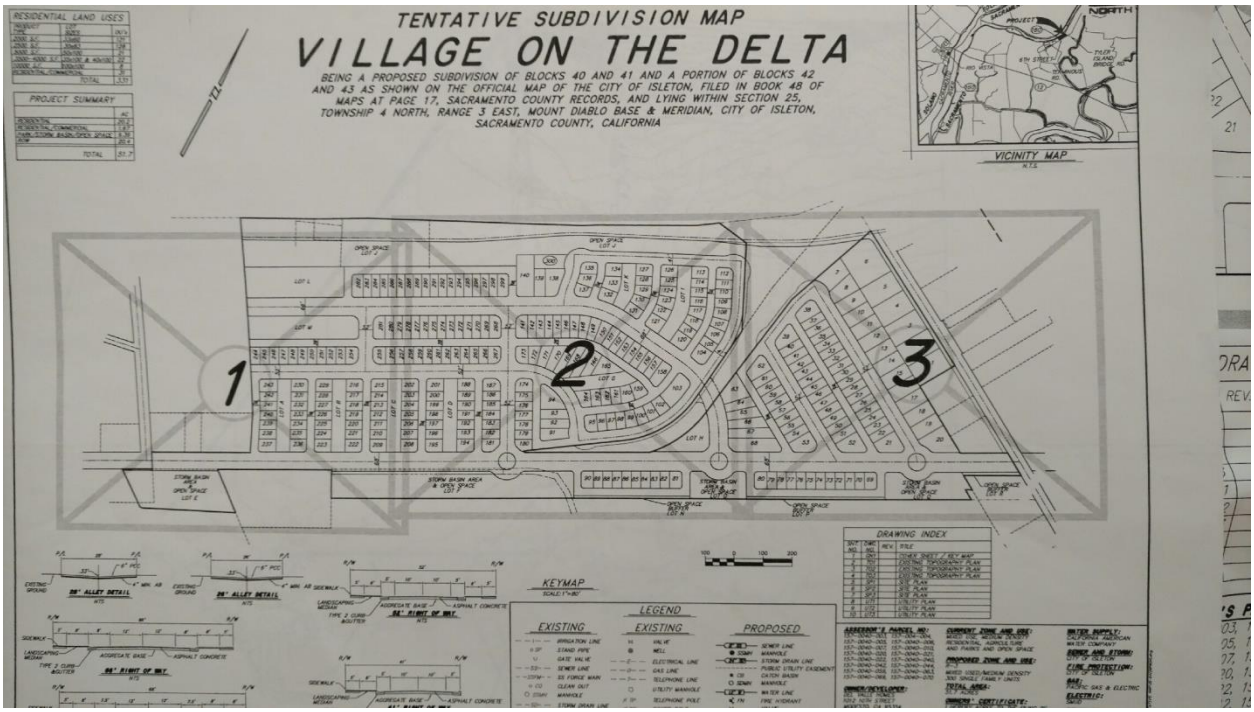
Isleton is a historical community, founded in 1874 by John Poole and Incorporated May 23, 1923. Many of the buildings within the City's old town are on the National Historical register, but are in need of repair. A new housing development area began construction in 2009, but has not been completed due to the recession and change of ownership hands. There are currently two city parks, a Central Park in old town and a softball complex and park on the Northwest side of town, both are in need of repair. There is an elementary school in Isleton. After elementary school, the children of Isleton are bussed to Walnut Grove. A privately owned trailer park within the city limits primarily houses elderly and very low-income persons. Agriculture, blue-collar service workers and food service are the primary industry; however, tourism is a significant economic driver for the community due to the location on the Delta loop and proximity to the waterways between Sacramento and the Pacific Ocean. There are many artists, writers and musicians within the community Isleton.

Future Development

The Sacramento Council on Governments (SACOG) modeled population projections for the City of Isleton and other areas of the region in 2012 for a Metropolitan Transportation Plan/Sustainable Communities Strategy report. This forecast uses a 2008 base year estimate with projections to 2020 and 2035 for population, housing units, households and employment. SACOG estimated the City population in 2020 and 2035 to be 730 and 894 respectively.

There is a new development that has been in the works since 2005. This development is called Village on the Delta. There is a proposed mixed used/medium density 300 single family units. The total area of the project is 51.7 acres.

Figure 1-3 Village on the Delta Subdivision Map



Source: City of Isleton

1.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 1-7 as high or medium significance hazards and primary hazards in the State of California. Impacts of past events and vulnerability of the City to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the same as those described in Section 4.3 of the Base Plan. In general, the most vulnerable structures are those located within the flood risk areas, unreinforced masonry buildings, and buildings built prior to the introduction of modern building codes.

An estimate of the vulnerability of the City to each identified priority hazard, in addition to the estimate of risk of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.

- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Climate Change

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Climate change will require the City of Isleton to prepare for warmer and more extreme temperatures, decreased water supply, drought, flooding, increasing energy and water demand, and public health risks. In California average temperatures are projected to rise as much as 9 degrees Fahrenheit by 2100.

Past Occurrences

- 1973-47: La Nina
- 1975-76: La Nina
- 1982-83: El Nino
- 1988-89: La Nina
- 1997-98: El Nino
- 2006: California Heat Wave
- 2012-15: North American Drought
- 2015-16: El Nino

Vulnerability to Climate Change

The City's population, resources, and economy are vulnerable to climate change impacts, particularly those associated with flooding and extreme heat. Without reduction strategies in place, county-wide greenhouse gases (GHG) emissions are anticipated to increase based on the Planning Area's anticipated growth.

Future Development

The City of Isleton is committed to meeting State standards for the reduction of greenhouse gas emissions to achieve sustainable land use. The places we live, the methods used to construct our homes, and where we work dictate how far and by what means we travel and how much energy we use. The City will evaluate the use of sustainable land use and growth principals when considering future development.

Drought and Water Shortage

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Drought is a gradual phenomenon. Although droughts are sometimes characterized as emergencies, they differ from typical emergency events. Most natural disasters, such as floods or forest fires, occur relatively rapidly and afford little time for preparing for disaster response. Droughts occur slowly, over a multi-year period, and it is often not obvious or easy to quantify when a drought begins and ends. Water districts normally require at least a 10 year planning horizon to implement a multiagency improvement project to mitigate the effects of a drought and water supply shortage.

Past Occurrences

The past occurrences of drought to the City are the same as those of the County. A list of past occurrences can be found in Section 4.2.11 of the Base Plan.

Vulnerability to Drought and Water Shortage

The City of Isleton receives its drinking water from a well. With the drought and water shortage there is the likelihood of shortages of drinking water to the City's residents if groundwater tables lower beyond the depth of the well.

The main asset at risk due to water shortage would be the cities' Wastewater Treatment Plant. Water is the conveyance method used to expel the waste from the cities' sewer system. During a water shortage or drought restrictions could be put in place that would not supply the adequate water supply necessary to keep the waste suspended long enough to reach the wastewater plant. If the solids fall out of the stream waste could possibly build up in the sewer lines causing a plug. This could lead to backups into homes onto the streets and create a health hazard.

Critical Facilities at Risk

Drought typically does not affect structures, therefore no critical facilities are at risk to drought and water shortage.

Future Development

As the population in the area continues to grow, so will the demand for water. Water shortages in the future may be worsened by drought, as the City relies on surface water for its water source. Increased planning will be needed to account for population growth and increased water demands.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–Very High

Hazard Profile and Problem Description

General rain floods emanating from the Sacramento and San Joaquin River basins results from prolonged heavy rainfall over tributary areas, and is characterized by high peak flows of moderate duration and by a large volume of runoff. Flooding is more severe when antecedent rainfall has resulted in saturated ground conditions, when the ground in tributary areas is frozen and infiltration is minimal, or when rain or snow in the high elevations adds snowmelt to rain-flood runoff.

Snowmelt floods on the Sacramento and the San Joaquin Rivers and their higher elevation tributaries can be expected to occur during the period from April through June. Although snowmelt flooding is of much larger volume and longer duration than flooding from rain, it does not have the high peak flows characteristic of floods from rain. Snowmelt flood runoff is sometimes augmented by late spring rains on the snowfields or lower elevation tributary watersheds.

More information on flooding in the City can be found in the Levee Failure section below.

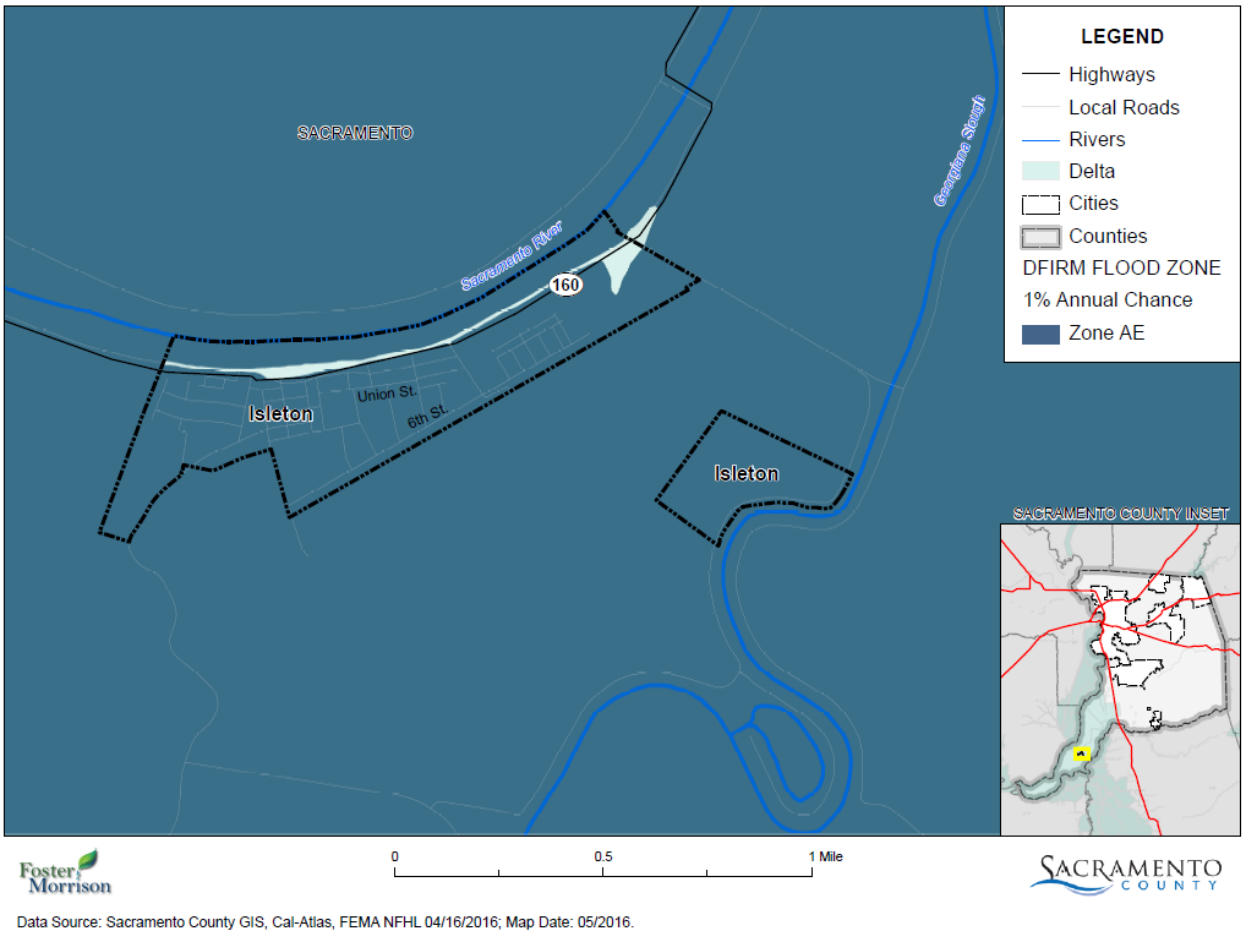
Past Occurrences

Past flooding in the City of Isleton area has been due to levee failures caused by the separate or coincidental occurrence of very high tides and high stream outflow through the delta region, or from unexplained levee failures apparently not related to these phenomena. As such, the past occurrences of flood in the City of Isleton can be found in the Levee Failure section below.

Flood Zones

The City is almost entirely located in an AE Zone (1% annual chance). A small area of the City is located outside designated flood zones in the X Zone. This is seen in Figure 1-4.

Figure 1-4 City of Isleton – FEMA DFIRM Flood Zones



Data Source: Sacramento County GIS, Cal-Atlas, FEMA NFHL 04/16/2016; Map Date: 05/2016.

Vulnerability to Flood

The lower reaches of the Sacramento and San Joaquin Rivers and the entire Delta area are under the influence of the tides. The most severe flood conditions in the City of Isleton area would result when very high tide and large volume of stream outflow occur coincidentally, and strong onshore winds generate wave action.

Values at Risk

GIS was used to determine the possible impacts of flooding within the City of Isleton. The methodology described in Section 4.3.10 of the Base Plan was followed in determining structures and values at risk to the 1% (100-year) and 0.2% (500-year) annual chance flood event. Table 1-12 shows the property use, improved parcel count, improved values, estimated contents, total values and estimated loss of parcels that fall in a floodplain in the City.

*This parcel count only includes those parcels in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all parcels in the 1% annual chance floodplain.

Table 1-13 summarizes Table 1-12 above and shows City of Isleton loss estimates and shows improved values at risk by FEMA 1% and 0.2% annual chance flood zones. As shown in this table, there is no 500-year flood risk in the City.

Table 1-13 City of Isleton – Flood Loss Summary

Flood Zone	Improved Parcel Count	Total Improved Value	Estimated Contents Value	Total Improved/ Contents Value	Loss Estimate	Loss Ratio
1% Annual Chance	325	$27,074,049	$17,551,196	$44,625,245.00	$8,925,049	13.90%
0.2% Annual Chance *	0	$0	$0	$0	$0	0.0%

Source: FEMA 6/16/2015 DFIRM, Sacramento County 2016 Parcel/2015 Assessor's Data

*This parcel count only includes those parcels in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all parcels in the 1% annual chance floodplain.

According to Table 1-12 and Table 1-13, the City of Isleton has 325 improved parcels and $60,232,373 of structure and contents value in the 1% annual chance floodplain. These values can be refined a step further. Applying the 20 percent damage factor as previously described in Section 4.3.7 of the Base Plan, there is a 1% chance in any given year of a flood event causing roughly $8,925,049 in damage in the City of Isleton. A loss ratio of 13.9% indicates that losses in Isleton to flood would be relatively major, as almost a seventh of the total values in the City would be damaged.

Flooded Acres

Also of interest is the land area affected by the various flood zones. The following is an analysis of flooded acres in the City in comparison to total area within the City limits. The same methodology, as discussed in Section 4.3.7 of the Base Plan, was used for the City of Isleton as well as for the County as a whole. Table 1-14 represents a detailed and summary analysis of total acres for each FEMA DFIRM flood zone in the City.

*This parcel count only includes those parcels in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all parcels in the 1% annual chance floodplain.

Population at Risk

The DFIRM flood zones were overlayed on the parcel layer. Those residential parcel centroids that intersect the severity zones were counted and multiplied by the 2010 Census Bureau average household factors for Isleton. According to this analysis, there is a total population of 593 residents of the City at risk to flooding, all in the 1% annual chance floodplain. This is shown in Table 1-15.

Table 1-15 City of Isleton – Count of Improved Residential Parcels and Population by Flood Zone

* Average household populations from the 2010 US Census were used: Isleton– 2.43.

**This parcel count only includes those parcels in the 0.2% annual chance floodplain, exclusive of the 1% annual chance floodplain. The 0.2% annual chance flood will also include all parcels in the 1% annual chance floodplain.

Critical Facilities at Risk

An analysis was performed on the critical facility inventory in Isleton in identified FEMA DFIRMs. GIS was used to determine whether the facility locations intersects a DFIRM flood hazard areas, and if so, which zone it intersects. Details of critical facilities in the floodplain in the City of Isleton are shown in Figure 1-5 and Table 1-16. As shown on the table and figure, Isleton has 6 critical facilities located in 1% annual chance and no critical facilities in the 0.2% annual chance DFIRM flood zones. Details of critical facility definition, type, name and address and jurisdiction by flood zone are listed in Appendix E.

Insurance Coverage, Claims Paid, and Repetitive Losses

The City of Isleton joined the National Flood Insurance Program (NFIP) on December 1, 1978. The City does not participate in the CRS program. NFIP data indicates that as of February 19, 2016, there were 124 flood insurance policies in force in the City with $23,489,300 of coverage. Of the 124 policies, 117 were residential (single-family homes) and 7 was non-residential; 122 of the policies were in A zones (the remaining 2 were in B, C, and X zones). The GIS parcel analysis detailed above identified 325 parcels in

the 100-year flood zone. 122 policies for 325 parcels in the 100-year floodplain equates to insurance coverage of 37.5 percent. There have been 13 historical claims for flood losses in the City, totaling $457,108.20 in losses. 10 of these losses were pre-FIRM, 2 were post-FIRM, and 1 was unknown. 6 of these losses were considered substantial damage claims. There are no repetitive loss or severe repetitive loss buildings in the City.

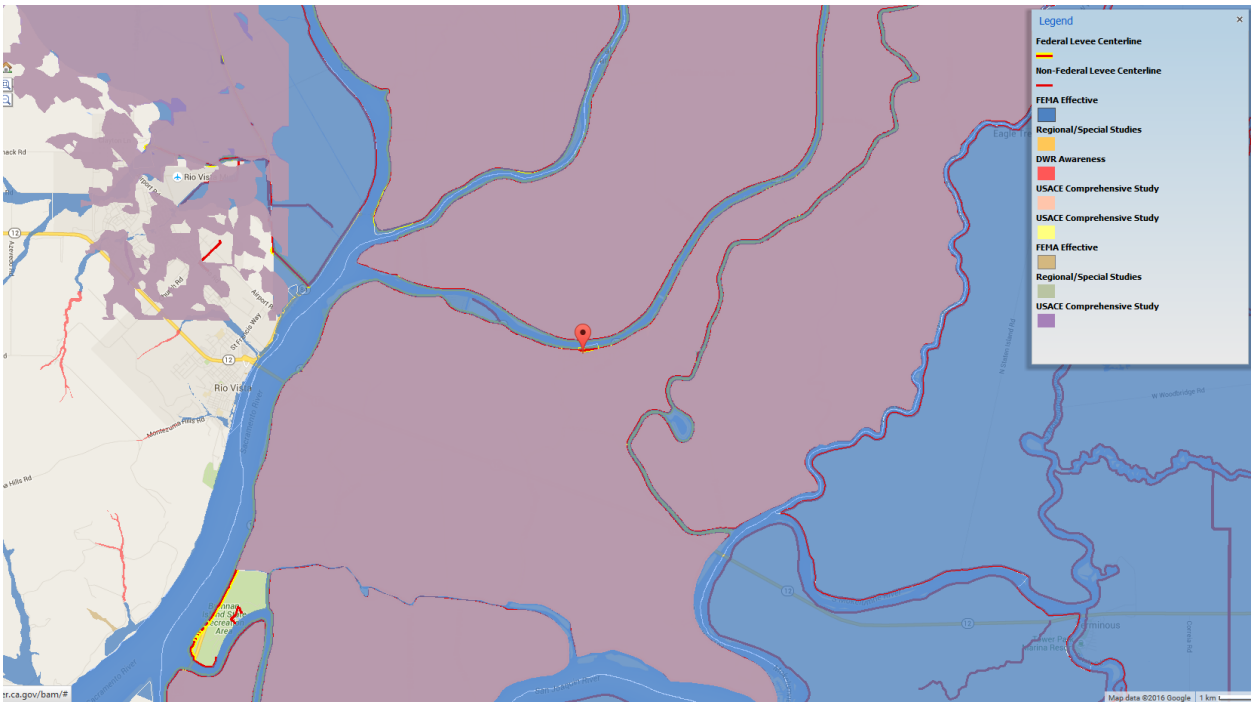
California Department of Water Resources Best Available Maps (BAM)

The FEMA regulatory maps provide just one perspective on flood risks in Sacramento County. Senate Bill 5 (SB 5), enacted in 2007, authorized the California DWR to develop the Best Available Maps (BAM) displaying 100- and 200-year floodplains for areas located within the Sacramento-San Joaquin (SAC-SJ) Valley watershed. SB 5 requires that these maps contain the best available information on flood hazards and be provided to cities and counties in the SAC-SJ Valley watershed. This effort was completed by DWR in 2008. DWR has expanded the BAM to cover all counties in the State and to include 500-year floodplains.

Different than the FEMA DFIRMs which have been prepared to support the NFIP and reflect only the 100-year event risk, the BAMs are provided for informational purposes and are intended to reflect current 100-, 200-, and 500-year event risks using the best available data. The 100-year floodplain limits on the BAM are a composite of multiple 100-year floodplain mapping sources. It is intended to show all currently identified areas at risk for a 100-year flood event, including FEMA's 100-year floodplains. The BAM are comprised of different engineering studies performed by FEMA, Corps, and DWR for assessment of potential 100-, 200-, and 500-year floodplain areas. These studies are used for different planning and/or regulatory applications. They are for the same flood frequency, however, they may use varied analytical and quality control criteria depending on the study type requirements.

The value in the BAMs is that they provide a bigger picture view of potential flood risk to the City than that provided in the FEMA DFIRMs. This provides the community and residents with an additional tool for understanding potential flood hazards not currently mapped as a regulated floodplain. Improved awareness of flood risk can reduce exposure to flooding for new structures and promote increased protection for existing development. Informed land use planning will also assist in identifying levee maintenance needs and levels of protection. By including the FEMA 100-year floodplain, it also supports identification of the need and requirement for flood insurance. The BAM map for Isleton is shown in Figure 1-6.

Figure 1-6 City of Isleton Best Available Map



Source: California DWR

Legend explanation: Blue - FEMA 100-Year, Orange – Local 100-Year (developed from local agencies), Red – DWR 100-year (Awareness floodplains identify the 100-year flood hazard areas using approximate assessment procedures.), Pink – USACE 100-Year (2002 Sac and San Joaquin River Basins Comp Study), Yellow – USACE 200-Year (2002 Sac and San Joaquin River Basins Comp Study), Tan – FEMA 500-Year, Grey – Local 500-Year (developed from local agencies), Purple – USACE 500-Year (2002 Sac and San Joaquin River Basins Comp Study).

Natural Resources at Risk

Due to the expected nature of the flooding that could occur in the City, all natural resources are at risk to flood.

Historic and Cultural Resources at Risk

Due to the expected nature of the flooding that could occur in the City, all historic and cultural resources are at risk to flood.

Future Development

The City enforces the floodplain ordinance. If any development is to occur in the floodplain, it would have to conform to the elevation standards of the floodplain ordinance. Village on the Delta is a 51.7 acre planned subdivision that was started in 2004. There is a total of 51.7 acres with 20.2 acres designated residential 1.67 acres designated residential/commercial 9.39 acres designated park/storm basin/open space and 20.4 acres designated R.O.W. The subdivision conforms to the floodplain ordinance.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Localized flooding occurs at various times throughout the year and there are several areas of concern unique to the City. Historically, the City has been at risk of flooding primarily during the spring months when the waterway/creek systems swell with heavy rainfall. This may produce local street flooding due to high water in the waterway/creek systems causing outfalls to back-up into the drainage inlets.

To some extent, drainage from roofs and private properties has in the past been allowed to be funneled into the sewage collection system, adding to problems of sewage treatment during wet weather. Fortunately, much of the latter problem has been corrected by City inspection and notice to owners.

Past Occurrences

The East Isleton area/rural region has localized flooding which is widespread but generally minor; the flat land causes floodwaters to spread out reducing threats to life. These areas of potential concern are included in Table 1-17. In this area, roadside ditches and culverts lack capacity and are prone to blockages from debris.

During heavy rainfall, Isleton has three areas of concern. At Jackson and 4th, there is a drainage inlet that gets overwhelmed with runoff and causes ponding that reaches into the intersection. At Highway 160 and A St. there is another drainage inlet that gets overwhelmed with rain water that causes 160 to flood. On Union St. between D St and E St the City has problems with ponding due to excessive runoff.

Vulnerability to Localized Flooding

Assets at Risk

Table 1-17 identifies known and past occurrences of such areas and the associated problems encountered. This list is an initial inventory of key problem areas and is not intended to be a complete inventory of all problems and locations associated with severe weather events and localized flooding in the City of Isleton.

Table 1-17 City of Isleton's Road List of Localized Flooding Problem Areas

Road Name	Flooding	Pavement Deterioration	Washout	High Water	Landslide/ Mudslide	Debris	Downed Trees
Jackson Blvd	X			X			
Hwy 160	X	X		X			
Union St	X	X		X			

Source: City of Isleton

Future Development

Future development in the City will add more impervious surfaces and need to drain those waters. The City will need to be proactive to ensure that increased development has proper siting and drainage for stormwaters. The risk of localized flooding to future development can also be minimized by accurate recordkeeping of repetitive localized storm activity. Mitigating the root causes of the localized stormwater flooding will reduce future risks of losses.

The City of Isleton has taken measures to prevent storm water flooding by doing the following:

- Replaced damaged and crushed culvert pipes to help the flow of storm water to the reclamation ditches
- Removed and cleared all debris from storm water drainage ditches.

On an annual basis we bring in a vacuum truck and clean out all storm water collection basins throughout the city. We have replaced or repaired the drainage basins grates to help prevent debris clogs. During the fall the city employees temp help to sweep leaves and all other debris from gutters to prevent this material from causing drain blockages.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–Very High

Hazard Profile and Problem Description

Floods can threaten the City from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

The City has participated in FEMA's Map Modernization Project and the requirements of Title 44 of the Federal Code of Regulations (CFR), Section 65.10 of the National Flood Insurance Program (NFIP) regulations to certify the Laguna West levee system. The Laguna West levee system meets the design, operation and maintenance criteria set forth 44 CFR Section 65.10.

The City's implements levee operation and maintenance activities which provide maintenance recommendations and requirements for specific levee inspections and maintenance operations. Levee inspections and maintenance activities include vegetation control, rutting/depressions, erosion control, slope stability, cracking, rodent control, encroachments/excavation, riprap revetments/banks, closure structures, underseepage relief wells/toe drainage system, seepage/sand boils, debris removal, roadway crown, utilities, minor structures, and mosquito abatement.

Past Occurrences

The 1950 and 1955 floods were outstanding in peak outflows through the delta and several islands were flooded. The City of Isleton, however, was not affected. In December 1965 and January 1965, the coincidental occurrence of very high tides and heavy inflow resulted in unusually high stages on all delta waterways. Concurrent strong onshore winds generated high waves that created very perilous conditions for many islands. Levees protecting Twitchell Island were seriously threatened by erosion and overtopping, but a massive flood fighting effort prevented overflow, destruction of levees and inundation of the City of Isleton.

The HMPC noted that in 1972, a levee break flooded areas of the City. The levee separating Andrus Island and the San Joaquin River failed from unknown causes in June 1972, resulting in the flooding of Andrus and Brannan Islands (including the City of Isleton). High winds had occurred prior to the break, but there had been no antecedent rainfall and the tidal cycle was not on the higher side. Approximately 200,000 acre-feet of water from the San Joaquin River inundated Andrus and Brannan Islands. Activities to fight floods to protect the City of Isleton proved to be a losing battle, and almost all of the city was flooded. The entire population was evacuated, with some residents not being able to return to their homes for 4 months. Approximately one-half of the housing units in the city were damaged or destroyed. About 15,000 acres were inundated and flood damages for the event approximated $30 million. Specific damages values for the City were unavailable.

Vulnerability to Levee Failure

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters. On the Sacramento River system, depending on which dams are releasing the flows, advance warning of river stages may be as much as 24 hours.

Due to the low-lying tidal nature of the delta and low elevation of the City of Isleton (just above 5 feet), the entire community must be considered to be in a floodplain. Flood conditions in the City of Isleton are influenced by Pacific Ocean tides and strong onshore winds, as well as high outflow from streams originating in the foothills or higher areas of the Sierra Nevada. Specifically, the City of Isleton may flood when the levees protecting Andrus, Brannan and Twitchell Islands, are either overtopped or fail, as a result of the separate or coincidental occurrence of higher high tides and high outflow through the delta. The waterways surrounding the islands are the Mokelumne, Sacramento and San Joaquin Rivers, and

Georgiana, Sevenmile and Threemile Sloughs. The levees within the City of Isleton are maintained by the levee district.

Values at Risk

GIS was used to determine the possible impacts of levee failure flooding within the City of Isleton. The methodology described in Section 4.3.12 of the Base Plan was followed in determining structures and values at risk to a levee failure. **Error! Reference source not found.** shows the property use, improved parcel count, improved values, estimated contents, total values and estimated loss of parcels that fall in a X Protected by Levee Flood Zone in the City. It should be noted that there are levees that protect the City, but these levees have not been accredited by FEMA as providing 100-year levels of flood protection.

Population at Risk

The DFIRM flood zones were overlayed on the parcel layer. Those residential parcel centroids that intersect the X Protected by Levee Zone was counted and multiplied by the 2010 Census Bureau average household factors for Isleton. According to this analysis, there is a total population of 0 residents of the City in an X Protected by Levee zone. This number reflects the decertification of the levees in the area.

Critical Facilities at Risk

An analysis was performed on the critical facility inventory in Isleton in identified FEMA DFIRMs. GIS was used to determine whether the facility locations intersects a DFIRM X Protected by Levee area. Due to levee decertification, there are no critical facilities in X Protected by Levee Areas. Details of critical facility definition, type, name and address and jurisdiction by flood zone are listed in Appendix E.

Natural Resources at Risk

There are no natural resources at risk.

Historic and Cultural Resources at Risk

There are no historic and cultural resources at risk.

Future Development

Until the levees are recertified, no development will happen in X Protected by Levee zones, as these zones will not exist until the levees are recertified.

Severe Weather: Extreme Temperatures – Heat

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to information provided by FEMA, extreme heat is defined as temperatures that hover 10 degrees or more above the average high temperature for the region and last for several weeks. Heat kills by taxing the human body beyond its abilities. Heat emergencies are often slower to develop, taking several days of continuous, oppressive heat before a significant or quantifiable impact is seen. Heat waves do not strike victims immediately, but rather their cumulative effects slowly take the lives of vulnerable populations. Heat waves do not cause damage or elicit the immediate response of floods, fires, earthquakes, or other more "typical" disaster scenarios. While heat waves are obviously less dramatic, they are potentially more deadly. According to the 2013 California State Hazard Mitigation Plan, the worst single heat wave event in California occurred in Southern California in 1955, when an eight-day heat wave resulted in 946 deaths.

Past Occurrences

Past occurrences of extreme heat were shown in Section 4.2.3 of the Base Plan. Those instances affected the whole County, including Isleton.

Vulnerability to Heavy Rains and Storms

Extreme heat happens in Sacramento County each year. Limited data on temperature extreme impacts per County was available during the development of this hazard's profile. Extreme heat normally does not impact structures as there may be a limited number of days where the temperatures stay high which gives the structure periodic relief between hot and cool temperature cycles. Areas prone to excessively high temperatures are identified normally on a nation-wide assessment scale, which doesn't allow detailed results on specific structures.

Critical Facilities at Risk

Extreme heat does not often affect structures, so no critical facilities are considered to be at risk to extreme heat.

Future Development

As the City shifts in demographics, more residents will become senior citizens. The residents of nursing homes and elder care facilities are especially vulnerable to extreme temperature events. It is encouraged that such facilities have emergency plans or backup power to address power failure during times of extreme heat.

Severe Weather: Fog

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

The Sacramento Valley can produce some extremely dangerous fogs in the winter and early spring months. These are a type of radiation fog called "tule fog." Tule fog forms on cold and clear nights, when the ground is moist and there is very little wind. Under such conditions the ground cools quickly and thus cools the air above it as well. The moisture in this cooled air condenses and can create extremely dense fog. Since the air may be stagnant and there is little evaporative effect from the sun in winter months, tule fogs can last for several days and, in some instances, over a week. Under these conditions, visibility is often reduced to 600 feet, but can drop to less than 10 feet.

Past Occurrences

Since tule fog often covers large areas of the County, past occurrences of fog in the City are considered to be the same as the past occurrences of fog for the County listed in Section 4.2.4 of the Base Plan.

Vulnerability to Fog

When tule fog forms, a severe risk is posed to traffic with the potential for multi-car pileups, especially on highways such as Highway 160. This may have an economic impact on the City due to delays in transportation times or even the shutting-down of the highway. This poses a problem during emergencies where residents with medical issues have difficulty leaving the City. The same dense and lingering fog can also produce adverse health effects in those with respiratory ailments.

Critical Facilities at Risk

Fog does not often affect structures, so no critical facilities are considered to be at risk to fog.

Future Development

Fog is unlikely to affect future development in the City of Isleton.

Severe Weather: Heavy Rain and Storms

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the City. Damage related to severe weather has occurred and will continue to occur in the future. Heavy rain and thunderstorms are the most frequent type of severe weather occurrence in the City. Wind and lightning often accompany these storms and have caused damage in the past.

Past Occurrences

Every year the City experiences a few storms that rolls through causing localized flooding by overwhelming the City of Isleton's storm water runoff system. Also during heavy storms, the City's wastewater treatment plants inflows triple due to infiltration.

Vulnerability to Heavy Rains and Storms

The vulnerability is high due to the outdated and aging stormwater runoff system. The stormwater drainage was put in many years ago. In the years since, the City has covered more land with impermeable surfaces such as asphalt and concrete. During heavy rain the storm water drainage system gets overwhelmed very quickly. With the City's new development and infiltration increases during heavy storms there is a possibility of overwhelming the City's wastewater facility.

Problems associated with the primary effects of severe weather include flooding, pavement deterioration, washouts, high water crossings, landslide/mudslides, debris flows, and downed trees. Table 1-17 presented above provides details of those areas within the City that are most often affected during these heavy storm events and have localized flooding issues.

Critical Facilities at Risk

The City of Isleton's Wastewater Treatment Plant, and City Hall are at risk. All of the City's operations are based out of these buildings. These storms also cause increases of infiltration that triples the inflow to the wastewater treatment plant. With the new development, Village on the Delta, these storms could cause amounts of water to be treated to exceed the amount of daily flow the wastewater plant can handle.

Future Development

The City enforces the state building code and other ordinances, which regulate construction techniques that minimize damage from heavy storms and rain. Future development in the City is subject to these building codes. New critical facilities such as communications towers should be built to withstand hail damage, lightning, and heavy rains.

Wildfire

Likelihood of Future Occurrence–Unlikely
Vulnerability–Low

Hazard Profile and Problem Description

Although a low risk hazard, due to its significance in the County and the State of California, wildfire is profiled here.

Past Occurrences

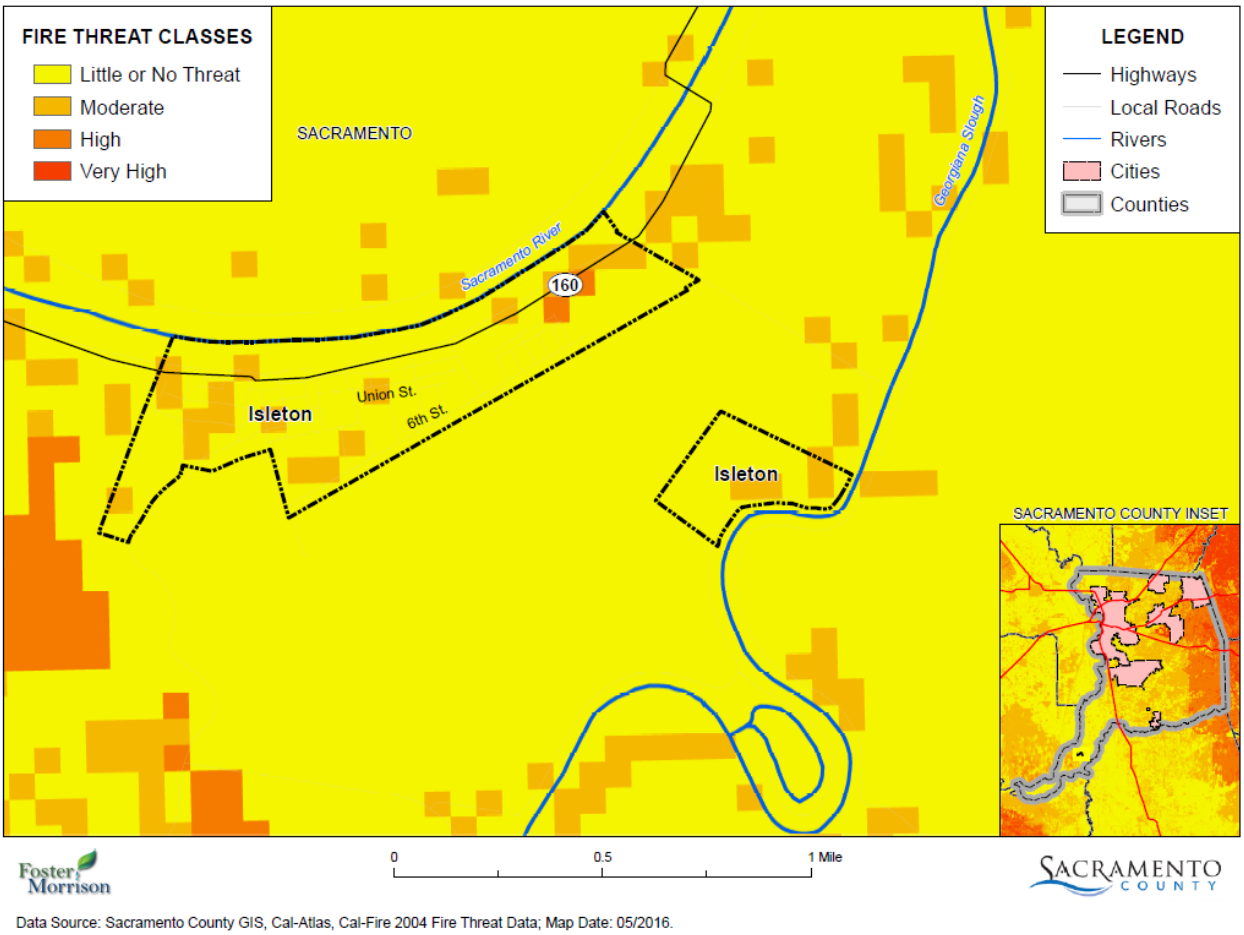
There have been no past occurrences of wildfire in the City.

Vulnerability to Wildfire

Values at Risk

Following the methodology described in Section 4.3.2 Vulnerability of Sacramento County to specific hazards, a wildfire map for the City of Isleton was created (see Figure 1-7). Wildfire threat within the City ranges from low to high.

Figure 1-7 City of Isleton's Fire Severity Zones



Data Source: Sacramento County GIS, Cal-Atlas, Cal-Fire 2004 Fire Threat Data; Map Date: 05/2016.

Assets at Risk

Analysis results for Isleton are shown in Table 1-18, which summarizes total parcel counts, improved parcel counts and their structure values by occupancy type of parcels affected by fire.

Table 1-18 City of Isleton – Count and Value of Parcels by Property Use and Fire Threat Zone

Property Use	Total Parcel Count	Total Land Value	Improved Parcel Count	Improved Structure Value	Total Value
Little or No Threat					

Property Use	Total Parcel Count	Total Land Value	Improved Parcel Count	Improved Structure Value	Total Value
Agricultural	1	$10,642	0	$0	$10,642
Church / Welfare	6	$117,506	6	$662,538	$780,044
Industrial	8	$648,069	7	$872,264	$1,520,333
Miscellaneous	11	$363	0	$0	$363
Office	5	$375,240	4	$592,391	$967,631
Public / Utilities	31	$832,422	1	$30,000	$862,422
Residential	174	$6,151,691	171	$14,431,650	$20,583,341
Retail / Commercial	55	$1,861,475	53	$5,644,870	$7,506,345
Vacant	121	$2,693,917	6	$32,963	$2,726,880
Total	**412**	**$12,691,325**	**248**	**$22,266,676**	**$34,958,001**
Moderate					
Church / Welfare	2	$8,918	2	$62,787	$71,705
Miscellaneous	3	$8,054	0	$0	$8,054
Public / Utilities	4	$0	0	$0	$0
Residential	77	$2,613,587	76	$5,958,859	$8,572,446
Retail / Commercial	8	$231,528	8	$264,382	$495,910
Vacant	17	$1,109,886	0	$0	$1,109,886
Total	**111**	**$3,971,973**	**86**	**$6,286,028**	**$10,258,001**
High					
Vacant	2	$210,043	0	$0	$210,043
High Total	**2**	**$210,043**	**0**	**$0**	**$210,043**
Grand Total	**525**	**$16,873,341**	**334**	**$28,552,704**	**$45,426,045**

*Land and structure values

Population at Risk

The Fire Threat Zone dataset was overlayed on the parcel layer. Those residential parcel centroids that intersect the fire threat zones were counted and multiplied by the 2010 Census Bureau average household factors for the City. According to this analysis, there is a total population of 185 residents of Isleton at risk to moderate or higher wildfire risk. This is shown in Table 1-19.

Table 1-19 City of Isleton – Count of Improved Residential Parcels and Population by Fire Threat Zone

Fire Severity Zone	Improved Residential Parcels	Population*
Little or No Threat	171	415
Moderate	76	185
High	0	0
Very High	0	0
Total	**247**	**600**

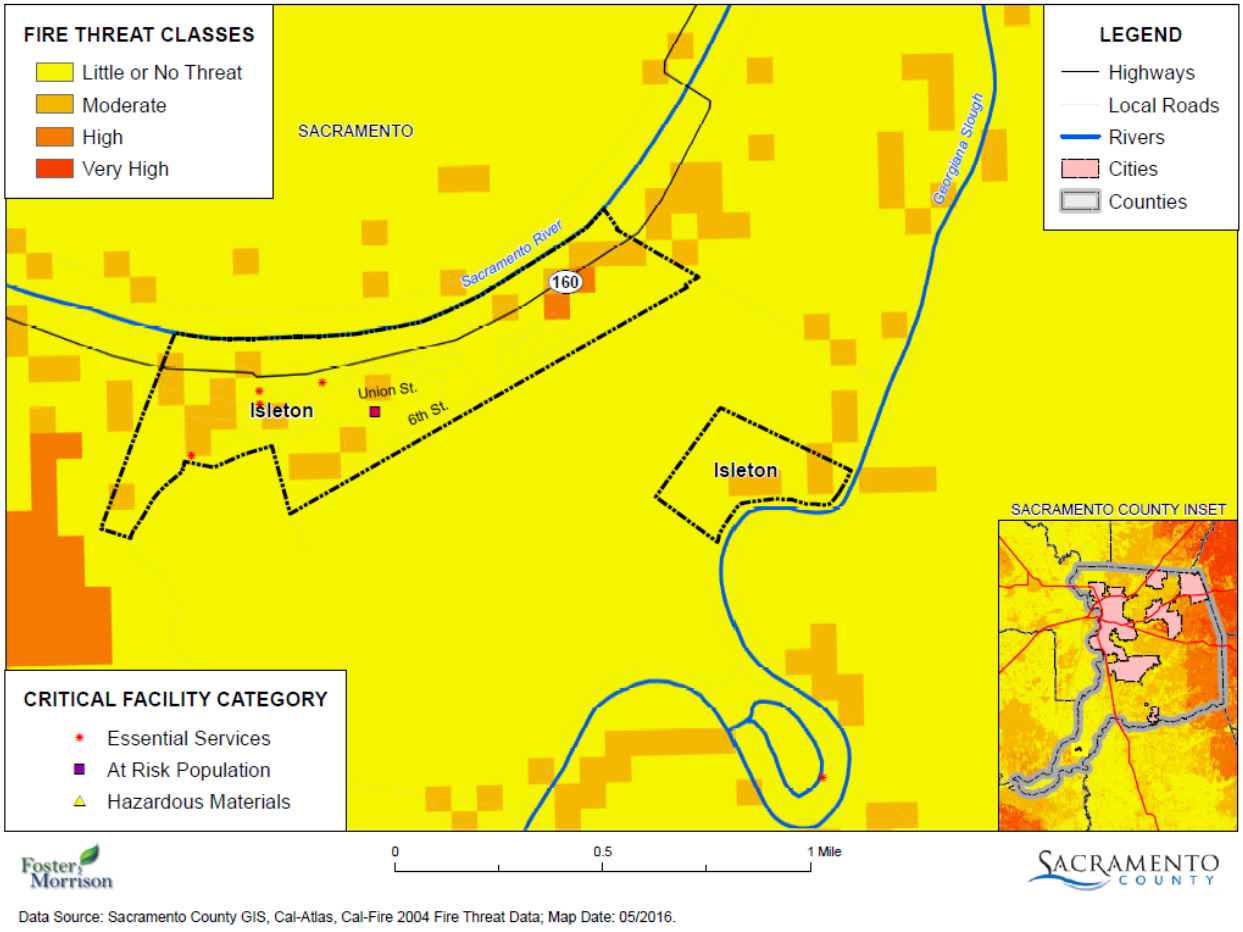
Source: Sacramento County 2015 Parcel/Assessor's Data, CAL FIRE

* Average household populations for Isleton (2.43) from the 2010 US Census were used

Critical Facilities at Risk

Wildfire analysis was performed on the critical facility inventory in Sacramento County and all jurisdictions. GIS was used to determine whether the facility locations intersect a fire threat zone provided by CAL FIRE, and if so, which zone it intersects. There is one facility in the moderate or higher fire threat zone in the City. This is shown in Figure 1-8 and detailed in Table 1-20. Details of critical facility definition, type, name and address and jurisdiction by fire threat zone are listed in Appendix E.

Figure 1-8 City of Isleton – Critical Facilities in the Fire Threat Zone



Data Source: Sacramento County GIS, Cal-Atlas, Cal-Fire 2004 Fire Threat Data; Map Date: 05/2016.

Table 1-20 City of Isleton – Critical Facilities in the Fire Threat Zones

Fire Threat Zone	Critical Facility Definition	Facility Count
Little or No Threat	Essential Services Facilities	4
	At Risk Population Facilities	1
	Hazardous Materials Facilities	0
	Total	**5**
Moderate	Essential Services Facilities	1
	At Risk Population Facilities	0
	Hazardous Materials Facilities	0
	Total	**1**
High	Essential Services Facilities	0
	At Risk Population Facilities	0

Fire Threat Zone	Critical Facility Definition	Facility Count
	Hazardous Materials Facilities	0
	Total	**0**
Very High	Essential Services Facilities	0
	At Risk Population Facilities	0
	Hazardous Materials Facilities	0
	Total	**0**
Grand Total		**166**

Source: CAL FIRE, Sacramento County GIS

Natural Resources at Risk

Depending on the nature and extent of any wildfire, natural resources in the area are potentially at risk.

Historic and Cultural Resources at Risk

Depending on the nature and extent of any wildfire, any historic and cultural resources in the area are potentially at risk.

Future Development

Population growth and development in the City has been relatively minor and is predicted to remain so in the future. Additional growth and development within the moderate or higher fire threat areas of the City would place additional assets at risk to wildfire.

1.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

1.6.1. Regulatory Mitigation Capabilities

Table 1-21 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the City of Isleton.

Table 1-21 City of Isleton's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y 2000	Yes it address hazards and mitigation measures to address such hazards. Yes it may be implemented
Capital Improvements Plan	Y In process	The capital improvement plan is in development
Economic Development Plan	Y In Process	Yes to all aspects of the questions above
Local Emergency Operations Plan	Yes	The City of Isleton follows the State of California's Plan
Continuity of Operations Plan	No	
Transportation Plan	Yes	Only identifies mitigation strategy and actions
Stormwater Management Plan/Program	Y In Process	It will address all aspects of above requirements
Engineering Studies for Streams	N	No streams inside city limits
Community Wildfire Protection Plan	No	City's fire dept doesn't cover any SRA or wildland coverage
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year: 2015 IBC
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	Y	Rating: 5/9 (urban/rural)
Site plan review requirements	Y	Through the building official.
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	Y	Yes through the planning commission and building official
Subdivision ordinance	Y	
Floodplain ordinance	Y	Yes through the building dept
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	Yes through the building dept
Flood insurance rate maps	Y	Yes
Elevation Certificates	Y	Yes
Acquisition of land for open space and public recreation uses	Y	Yes through the planning commission

Erosion or sediment control program	N
Other	
How can these capabilities be expanded and improved to reduce risk?	
With education incentives for employees and furthering education we can make sure that we improve in all aspects concerning the above departments. The planning commission is now fully appointed; they have started working with staff to improve in these fields.	

Source: City of Isleton

City of Isleton General Plan (2000)

Under the body of statutory and case law which has evolved in California, including Guidelines issued by the State Office of Planning and Research, the General Plan for Isleton functions as a "constitution" in much the same way as a state or national constitution. The Plan reflects the City's long-range aspirations of physical form and amenity and provides guidance to the substance of development regulations such as zoning and subdivision ordinances, and to other programs approved by the City, such as the Redevelopment Program, which combine as the package of tools necessary to carry out the General Plan over time.

Mitigation related goals and policies from the General Plan are:

- Inventory all buildings which are unsound under conditions of "moderate" seismic activity; buildings having questionable structural resistance ·should be considered for either rehabilitation or demolition. Structures determined by the City's Building Official to be structurally unsound are to be reported to the owner and recorded with the County Recorder to ensure that future owners are made aware of hazardous conditions and risks.
- All new building construction shall conform to the latest seismic requirements of the Uniform. Building Code as a minimum standard. A building height limit of 50 feet shall be maintained, with a maximum of four stories.
- Soil compaction tests, and geotechnical analysis of soil conditions and behavior under seismic conditions shall be required of all subdivisions and of all commercial, industrial and institutional structures over 6,000 square feet in area (or in the case of institutional structures, those which hold 100 or more people).
- The City should adopt an Earthquake Disaster Plan in coordination with Sacramento County and local special districts (school, levee maintenance, reclamation and irrigation). The Plan should identify hazards that may occur as the result of an earthquake of major magnitude, and should designate evacuation routes and means to coordinate all local government agencies in assisting local residents in the event of a major earthquake, fire or explosion, or hazardous chemical spill or release of hazardous air-borne gas.
- All lines which are part of the domestic water distribution system should be looped to assure adequate pressure in the event of major fire, earthquake, or explosion. Emergency standby power generation capability should be available at all water wells to assure water availability in the event of a major power failure.
- The City will continue to give high priority to the support of police protection, and to fire suppression and prevention functions of the Isleton Fire Department.
- The City will work to maintain a fire flow standard of 3,000 gpm for all commercial and industrial areas of the community, and 1,000 gpm for residential areas, to assure the capability to suppress urban fires.
- The City will maintain a street system which is capable of providing access to any fires that may develop within the urban area, and which is capable of providing for the adequate evacuation of residents in the event of an emergency condition of magnitude.

- In the event that any part of the levee system protecting Isleton was to fail, the most expedient evacuation routes would be east and north along the Sacramento River levee roads toward Walnut Grove, and then east toward Interstate 5.

City of Isleton Municipal Codes and Policies

The City has many Municipal Codes and policies related to mitigation. These codes and policies can be primarily or secondarily focused on mitigation.

- Zoning Ordinance (Title 12)
- Subdivision Ordinance (Title 11)
- Flood Damage Prevention Ordinance (Title 5, Chapter 5.52)
- Building and Construction Ordinances (Title 10)

1.6.2. Administrative/Technical Mitigation Capabilities

Isleton is governed by a Strong City-Manager form of government. There are 4 council members elected at large who serve 2 year terms. The Mayor is the 5th member of the governing body and also serves for a 2-year term. The Mayor presides at all Council meetings and retains the power of veto, however, the Mayor votes only to break ties. The Isleton Planning and Zoning Committee consist of five members. Their purpose is to regulate land use; play an advisory role for plan approval; and be an advisory board to the City Council. Table 1-22 identifies the City department(s) responsible for activities related to mitigation and loss prevention in Isleton.

Table 1-22 City of Isleton's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	Y	Effective
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Effective, through measure A funds and HUT funds work is done to reduce these risks
Mutual aid agreements	N	
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	PT	Yes
Floodplain Administrator	N	
Emergency Manager	N	
Community Planner	N	
Civil Engineer	Y/PT	Yes
GIS Coordinator	Y/PT	
Other	N	

Technical	
Warning systems/services (Reverse 911, outdoor warning signals)	N
Hazard data and information	Y
Grant writing	N
Hazus analysis	N
Other	
How can these capabilities be expanded and improved to reduce risk?	
With new people filling these positions we will ensure that we do everything possible within budgetary means to reduce all risks posed to the public within our jurisdiction. By working in conjunction with county services we can expand our capabilities to provide the best coverage.	

Source: City of Isleton

1.6.3. Fiscal Mitigation Capabilities

Table 1-23 identifies financial tools or resources that the City could potentially use to help fund mitigation activities.

Table 1-23 City of Isleton's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Measure A and HUT funds are used on a regular basis to mitigate all hazards posed to the City of Isleton
Authority to levy taxes for specific purposes	Y	Yes a special tax was just passed 2015 to buy new equipment for the fire dept. Yes
Fees for water, sewer, gas, or electric services	Y	Sewer income is used to mitigate hazards and can be used to fund future actions but is not adequate to cover all costs.
Impact fees for new development	Y	Very little impact fees are paid to the city due to limited building being done inside city limits
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	General Bonds were used to improve the sewer system. Due to the high costs and low revenue
Incur debt through private activities	N	
Community Development Block Grant	Y	No possibly could be used for mitigation actions
Other federal funding programs	Y	Depends on what funding was dispersed
State funding programs	Y	Depends on what funding was dispersed
Other		

Source: City of Isleton

1.6.4. Mitigation Education, Outreach, and Partnerships

Table 1-24 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information. More information can be found below the table.

Table 1-24 City of Isleton's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	This is handled through Cal_Am water and the cities fire dept. Yes could be possibly used to mitigate activities
Natural disaster or safety related school programs	Y	River Delta Unified School District
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		

1.6.5. Other Mitigation Efforts

The City has performed numerous mitigation projects citywide. One is the change out of old storm water grates that were causing localized flooding during heavy rain due to foliage clogging them. The City has also taken steps yearly to bring a vac truck to clean out the catch basins in the storm water drainage inlets to keep them from clogging the drainage pipes. The City has also taken steps to remove the brush from all stormwater drainage ditches that lead to the reclamation ditch in an effort to keep the flow unobstructed. Isleton has a leaf and branch collection program to prevent the clogging of drains.

1.7 Mitigation Strategy

1.7.1. Mitigation Goals and Objectives

The City of Isleton adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

1.7.2. NFIP Mitigation Strategy

As a participant of the National Flood Insurance Program (NFIP), the City of Isleton has administered floodplain management regulations that meet the minimum requirements of the NFIP. The management program objective is to protect people and property within the City. The City of Isleton will continue to comply with the requirements of the NFIP in the future.

The City's regulatory activities apply to existing and new development areas of the City; implementing flood protection measures for existing structures and maintaining drainage systems. The goal of the program is to enhance public safety, and reduce impacts and loses while protecting the environment.

The City of Isleton General Services Department provides public outreach activities which include map information services, public awareness, public hazard disclosure, and flood protection information. This information is readily available to the public and consists of current and accurate flood mapping. In addition, the General Services Department provides information about our stormwater management program and up-to-date information related to the maintenance of our drainage system.

The National Flood Insurance Program's (NFIP) Community Rating System (CRS) is a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed the minimum NFIP requirements. As a result, flood insurance premium rates are discounted to reflect the reduced flood risk resulting from the community actions meeting the three goals of the CRS which are to reduce flood losses, facilitate accurate insurance rating, and promote the awareness of flood insurance. The City of Isleton is currently evaluating joining the CRS.

More information about the floodplain administration in the City of Isleton can be found in Table 1-25.

Table 1-25 City of Isleton Compliance with NFIP

NFIP Topic	Comments
Insurance Summary	
How many NFIP policies are in the community? What is the total premium and coverage?	124 $220,188 $23,489,3000
How many claims have been paid in the community? What is the total amount of paid claims? How many of the claims were for substantial damage?	13 $457,108.20 6
How many structures are exposed to flood risk within the community?	325
Describe any areas of flood risk with limited NFIP policy coverage	
Staff Resources	
Is the Community Floodplain Administrator or NFIP Coordinator certified?	No
Provide an explanation of NFIP administration services (e.g., permit review, GIS, education or outreach, inspections, engineering capability)	Due to budgetary shortfalls, there is no staff for NFIP coordination.
What are the barriers to running an effective NFIP program in the community, if any?	Budgets for staff.
Compliance History	

NFIP Topic	Comments
Is the community in good standing with the NFIP?	Yes
Are there any outstanding compliance issues (i.e., current violations)?	No
When was the most recent Community Assistance Visit (CAV) or Community Assistance Contact (CAC)?	5/13/2010
Is a CAV or CAC scheduled or needed?	
Regulation	
When did the community enter the NFIP?	December 1, 1978
Are the FIRMs digital or paper?	Digital
Do floodplain development regulations meet or exceed FEMA or State minimum requirements? If so, in what ways?	The cities standards meet FEMA and state standards by applying all regulations in the permitting process.
Provide an explanation of the permitting process.	
Community Rating System	
Does the community participate in CRS?	No
What is the community's CRS Class Ranking?	N/A
What categories and activities provide CRS points and how can the class be improved?	N/A
Does the plan include CRS planning requirements?	N/A

1.7.3. Mitigation Actions

The planning team for the City of Isleton identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Integrate Local Hazard Mitigation Plan into Safety Element of General Plan

Hazards Addressed: All hazards

Goals Addressed: 1, 2, 3, 4

Issue/Background: Local jurisdictional reimbursement for mitigation projects and cost recovery after a disaster is guided by Government Code Section 8685.9 (AB 2140). Specifically, this section requires that each jurisdiction adopt a local hazard mitigation plan (LHMP) in accordance with the federal Disaster Mitigation Act of 2000 as part of the Safety Element of its General Plan. Adoption of the LHMP into the Safety Element of the General Plan may be by reference or incorporation.

Other Alternatives: No action

Existing Planning Mechanisms through which Action will be Implemented: Safety Element of General Plan

Responsible Office: City of Isleton Planning Department

Priority (H, M, L): High

Cost Estimate: Jurisdictional board/staff time

Potential Funding: Local budgets

Benefits (avoided Losses): Incorporation of an adopted LHMP into the Safety Element of the General Plan will help jurisdictions maximize the cost recovery potential following a disaster.

Schedule: As soon as possible

Action 2. Storm Water Runoff Rehabilitation Project

Hazards Addressed: Localized Storm water flooding due to inadequate drainage on aging storm water drainage system

Goals Addressed: 1, 2, 3, 4

Issue/Background: City of Isleton has several locations where the storm water causes ponding in the streets and along hwy 160. The drainage system we have drains on one side of the street and bubbles up across the street and drains down the gutter. These gutters get overwhelmed which causes debris from yards and streets to clog up downstream drains.

Project Description: To change the flow of the storm water from running down gutters along the street to creating drains that take the flow under the streets to the reclamation ditch.

Other Alternatives: No action

Existing Planning Mechanism(s) through which Action Will Be Implemented: Stormwater program

Responsible Office/Partners: City of Isleton Department of Public Works

Project Priority: High priority

Cost Estimate: To be determined

Benefits (Losses Avoided): The potential of car accidents due to heavy storm water ponding. The potential of flooding homes due to nowhere for the storm water to go.

Potential Funding: FEMA grants, Measure "A", or other grants

Timeline: As soon as funding is available

Action 3. Wastewater Treatment Plant Pond Levee Elevation Raise to 200-year Flood Standard

Hazards Addressed: The possible spillover of wastewater from the sewer ponds due to levee elevation under 200-year flood standard

Goals Addressed: 1, 2, 3, 4

Issue/Background: There is a possibility that if the City has a 200-year flood event that the levees around the wastewater treatment plant ponds will not be sufficient, due to the fact they were made to protect against a 100-year flood.

Project Description: Levee elevation increase around wastewater treatment plant ponds

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: Capital Improvement Projects for the City of Isleton Wastewater treatment plant

Responsible Office/Partners: City of Isleton Department of Public Works

Project Priority: High Priority

Cost Estimate: To be determined

Benefits (Losses Avoided): The benefit would be that if a flood happened there would be adequate protection to keep wastewater from contaminating drinking water and the public's health and safety

Potential Funding: FEMA grants, other grants, and impact fees from new homes built within the City of Isleton

Timeline: 0-1 years

Delta Annex Chapter 2 Brannan Andrus Levee Maintenance District; Reclamation Districts 317, 407, 2067

2.1 Introduction

This chapter of the Delta Annex details the hazard mitigation planning elements specific to the Brannan-Andrus Levee Maintenance District (BALMD) and Reclamation Districts (RD) 317, 407, and 2067, all new participating jurisdictions to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the BALMD. This chapter of the Delta Annex provides additional information specific to BALMD and RDs 317, 407, and 2067, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for these Districts.

2.2 Planning Process

As described above, the Districts followed the planning process detailed in Section 4 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), BALMD and RDs 317, 407, and 2067 formulated their own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 2-1. Additional details on plan participation and representatives from each District are included in Appendix A.

Table 2-1 BALMD and RDs 317, 407, and 2067 Planning Team

Name	Position/Title	How Participated
Emily Pappalardo	Project Manager	Attended meetings, collected data, drafted text, reviewed draft docs
Gilbert Labrie	District Engineer	Collected data, reviewed draft docs

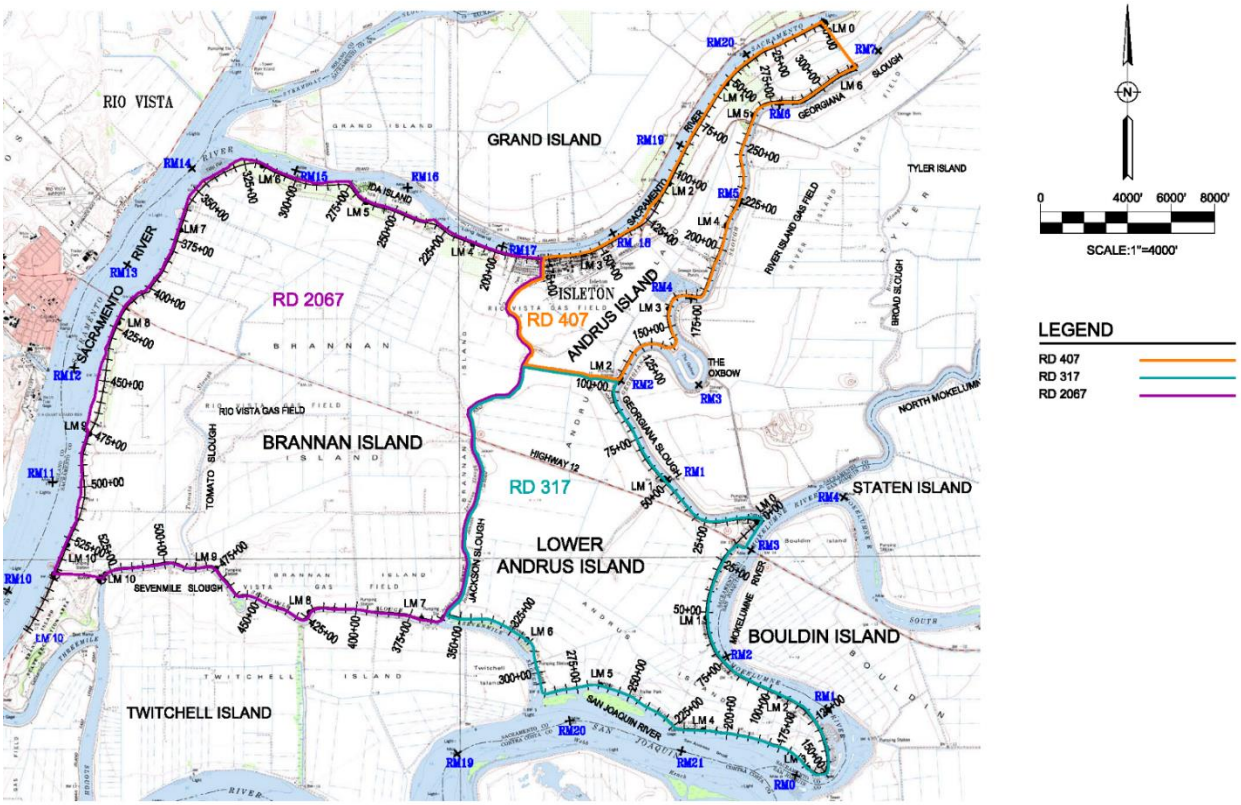
2.3 Community Profile

The community profile for BALMD and RDs 317, 407, and 2067 is detailed in the following sections. Figure 2-1 displays a map and the location of BALMD boundaries within Sacramento County.

Figure 2-1 BALMD and RDs 307, 407, and 2067 Map



Source: BALMD

2.3.1. BALMD and RDs 317, 407, and 2067 Overview, Background, and History

Brannan-Andrus Island is surrounded by 26.2 miles of levee, excluding the Brannan Island State Park, that protects about 13,000 acres of land, which is primarily in agricultural/rural use. It is bordered by the Sacramento River, Georgiana Slough, Mokelumne River, San Joaquin River, and Sevenmile Slough. The levees along the Sacramento River and Georgiana Slough are designated as project levees (16.2 miles). The remaining levees along the Mokelumne River, San Joaquin River and Sevenmile Slough are considered non-project levees (10.0 miles). Out of the 10 miles of non-project levee, 3.3 miles border the non-tidal, controlled section of Sevenmile Slough.

The BALMD monitors and maintains the levees on the island. Reclamation Districts 317, 407, and 2067 and maintain and control the operations of the seven pumping stations to keep the island dry. Five pumping stations are located along Sevenmile Slough, another is on Georgiana Slough, and a lift station is located on the main drainage canal in the northern part of the island.

The BALMD levee system protects an island population of approximately 1,837. This figure includes a major recreation contingent and the City of Isleton, with close to 900 residents. Approximately 379 acres are urbanized, with about 187 acres incorporated by the City of Isleton.

2.4 Hazard Identification

BALMD and RDs 317, 407, and 2067's planning team identified the hazards that affect the Districts and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to BALMD and RDs 317, 407, and 2067 (see Table 2-2).

Table 2-2 BALMD, RDs 317, 407, and 2067—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Significant	Occasional	Critical	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Limited	Occasional	Negligible	Low
Dam Failure	Extensive	Unlikely	Catastrophic	Medium
Drought and Water Shortage	Significant	Likely	Critical	Medium
Earthquake	Limited	Occasional	Limited	Low
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Limited	Highly Likely	Limited	High
Landslides	Limited	Unlikely	Limited	Low
Levee Failure	Limited	Occasional	Critical	High
River/Stream/Creek Bank Erosion	Limited	Highly Likely	Negligible	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Likely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Limited	Low
Severe Weather: Fog	Extensive	Highly Likely	Limited	Medium
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Critical	Medium
Severe Weather: Wind and Tornadoes	Extensive	Highly Likely	Limited	Medium
Subsidence	Significant	Likely	Negligible	Low
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Limited	Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 5540 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

2.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile BALMD and RDs 317, 407, and 2067's hazards and assess the Districts' vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.554 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to BALMD is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

2.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 2.5.3, includes a description as to how the hazard affects the BALMD and RDs 317, 407, and 2067 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

2.5.2. Vulnerability Assessment

This section identifies BALMD, RD 317, RD 407, and RD 2067's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the Districts' assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 2-3 lists critical facilities and other District assets identified by the BALMD and RDs 317, 407, and 2067's planning team as important to protect in the event of a disaster. BALMD, RD 317, RD 407, and RD 2067's physical assets, valued at over $244 million, consist of the buildings and infrastructure to support the BALMD, RD 317, RD 407, and RD 2067 operations.

Table 2-3 BALMD's Critical Facilities, Infrastructure, and Other District Assets

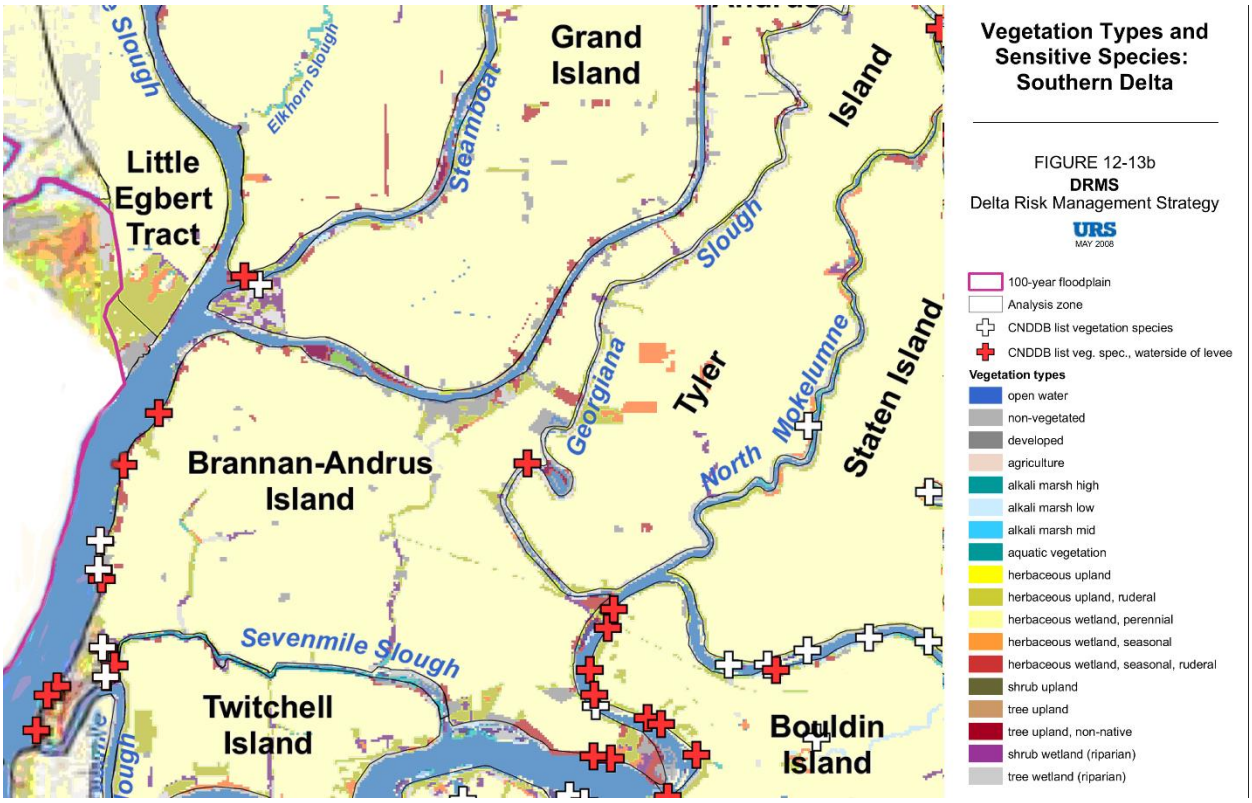
Natural Resources

The 5-Year Plan noted that in terms of natural resources, Brannan-Andrus Island has freshwater wetland, upland, and riparian habitats. Within the freshwater wetland category, there are 12.36 acres of herbaceous perennial wetland and 26.63 acres of herbaceous seasonal/ruderal wetland. Upland habitat consists of 724.74 acres of herbaceous ruderal, 10.13 acres of shrub, 47.61 acres of tree, and 292.56 of non-native tree upland. There is also approximately 142.31 acres of riparian habitat, with 96.88 acres of shrub wetland, and 45.43 acres of tree wetland.

Two small sloughs, Tomato Slough and Jackson Slough, in the interior of the island provide some riparian habitat. Refer to Figure 2-2 for specific habitat areas. According to the California Natural Diversity Database the sensitive species found on Brannan-Andrus Island are: Northern California Black Walnut, Swainson Hawk, Northwestern Pond Turtle, Delta Tule Pea, Suisun Marsh Aster, Mason Lilaeopsis, and Delta Mudwort.

Figure 2-2 BALMD and RDs 317, 407, and 2067 Vegetation Types and Sensitive Species



Source: BALMD 2012 5-Year Plan

Historic and Cultural Resources

The 5-Year Plan noted that BALMD, RD 317, RD 407, and RD 2067 protect the City of Isleton. The City has two nationally registered historic districts, the Isleton Chinese and the Japanese Commercial Districts.

Growth and Development Trends

The BALMD 2012 5-Year Plan noted that the standard island elevation is about -14' with a minimum elevation of -22' and a maximum of +9' per the 2007-2008 DWR Lidar Survey. With the adoption of the Delta Protection Act in 1992, about 40% of Brannan-Andrus Island was designated as a Secondary Zone of the legal Delta, extending from the northern edge of Highway 12 to Tyler Island Bridge Road, east of Isleton. The remainder of the island is in the Primary Zone, which was established to protect the area for agriculture, wildlife habitat, and recreation uses within the Delta. The BALMD levee system protects an island population of approximately 1,837. This figure includes a major recreation contingent and the City of Isleton, with close to 900 residents. Approximately 379 acres are urbanized, with about 187 acres incorporated by the City of Isleton.

Beyond the city limits of Isleton, Sacramento County zoning designates approximately 1,200 acres to recreational use along the southeast corner of Andrus Island. Scattered around Brannan-Andrus Island are a large contingent of the Delta resorts, including RV parks, boat launches, and marinas for local and public use. A majority of these recreational uses are located along the Delta Loop, a 7.2-mile drive with 40

recreational attractions bordering the Mokelumne and San Joaquin Rivers, and Sevenmile Slough. Overall, there are 5 large marinas (over 200 berths), 5 medium marinas (50 to 200 berths), and 8 small marinas (less than 50 berths) that account for a total of 2400 berths and 6 boat launching facilities. Twelve of the resorts also have RV/camping grounds totaling about 800 sites overall. Five of the resorts have cabins (approx. 300 total). About 40 acres total of dry storage is provided at eleven resorts. Four resorts are on their own island that bridges to Brannan-Andrus and may not be inundated by a flood but access could be compromised. Including marinas and resorts, there are approximately 148 businesses on the island.

There was a development of approximately 650 homes that failed in the housing crash of 2008. It is still developable land but many projects to revive the development have also failed. Development of that size is possible in the future given Isleton is in the Secondary Zone of the Delta which allows for some development. One hindrance is the levees are not certified by FEMA to protect against the 100-year flood. Thus homes will have to be elevated to protect from flooding. The failed development had accounted for that and designed the homes to be elevated with garages on the first story.

2.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 2-2 as high or medium significance hazards. Impacts of past events and vulnerability of the BALMD, RD 317, RD 407, and RD 2067 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are similar to those described in Section 4.3.1 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable District assets include the levees and pumping stations that the District owns. There are approximately 10.3 levee miles along the Sacramento River, 5.9 levee miles along Georgiana Slough, 3 levee miles along the Mokelumne River, 2.6 levee miles along the San Joaquin River and 4.6 levee miles along Sevenmile Slough. The levee system is subject to riverine flooding. The most vulnerable levees are those along Georgiana Slough, the San Joaquin River and the tidal areas along Sevenmile Slough due to low landside elevations and waterside bank erosion. However, it is unlikely the levee system will fail due to overtopping. A high water situation could increase the hydraulic gradient within the levee that could result in under or through seepage. Seepage, if left unchecked, can result in levee failure and subsequent flooding. Reclamation Districts 407, 2067 and 317 own numerous pumping stations that are critical for island drainage. If the drainage system becomes compromised the District could experience localized flooding. If the system becomes compromised in a flood situation, damages could be worse than anticipated.

An estimate of the vulnerability of BALMD and RDs 317, 407, and 2067 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.

- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–Medium

Hazard Profile and Problem Description

While unlikely, it is possible that dam failure can create a high water situation in the adjacent channels that could put the levee system at risk of failure from overtopping, under seepage, through seepage or debris impact. Given the distance from the dam system, a dam surge could dissipate prior to reaching this point in the Delta and result in a minor change in water elevation.

Past Occurrences

There are no past occurrences of dam failure.

Vulnerability to Dam Failure

Assets/Critical Facilities at Risk

The levees are at the highest risk to this hazard.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to erosive forces of high flows from dam failure.

Historic and Cultural Resources at Risk

The City has two nationally registered historic districts, the Isleton Chinese and the Japanese Commercial Districts that could be lost in the event of a flood due to dam failure.

Future Development

While future development may occur in the areas protected by levee, the Districts do not control this development. The Districts only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Drought and Water Shortage

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

This hazard could disrupt crop irrigation. Prolonged disruption could result in the loss of a crop that year. In the event that orchards or vineyards experience disruption in irrigation, they could be lost for multiple years until they are replanted and begin producing a crop between 3 to 5 years. Agriculture is the primary industry on the island. Agricultural users pay assessments for levee maintenance and improvements. If agriculture is lost the District will not be able to cover levee maintenance or make any necessary improvements.

Past Occurrences

Although California did recently experience an extended drought, agriculture in this District remained largely unaffected due to senior water rights and riparian water rights. Some farmers voluntarily cut water use by 25% in the Delta in response to the drought in the Summer of 2015.

Vulnerability to Drought and Water Shortage

Assets/Critical Facilities at Risk

The District Planning Team noted no facilities at risk to drought.

Future Development

Drought is not likely to affect future development in the area.

Earthquake: Liquefaction

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

In the event an earthquake is intense enough to result in shaking that could cause the sandy soils to liquefy, the levees could resettle, move off their foundations and possibly fail. Failure could compromise the levee system and result in flooding.

Past Occurrences

According to the Delta Risk Management Strategy, Brannan-Andrus Island levees have an estimated annual frequency of failure rating of 3% from flood risk and 5% from seismic risk. The annual frequency failure for a 100-year levee is 1%. However, there is no record of a levee failure caused by a seismic event in the entire Delta region.

Vulnerability to Liquefaction

Assets/Critical Facilities at Risk

The District Planning Team noted that the levees are at the highest risk to this hazard.

Future Development

While future development may occur in the areas protected by levee, the Districts do not control this development. The Districts only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

A 100/200/500-year flood event could cause flooding within the District. A high water event, depending on the water elevation, could cause failure due to overtopping but more realistically could increase hydraulic gradients within the levee section resulting in landside seepage or boils. Continued seepage, if left unaddressed, could erode the levee and result in failure. Heavy flows could also cause erosion and scour on the waterside bank that could undermine the levee and cause failure.

Past Occurrences

1986 was the closest the District came to experiencing a 100-year flood. The District has not experienced a 200 or 500-yr flood.

Vulnerability to Flood: 100/200/500-year

Assets/Critical Facilities at Risk

The levee system and pumping stations are vulnerable to a 100/200/500-year flood. Higher flows from such events could exceed the capacity of both the levee system and the pumping stations that are needed to drain the island.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to erosive forces of high flows from 100/200/500-year flows.

Historic and Cultural Resources at Risk

The District's two nationally registered historic districts, the Isleton Chinese and the Japanese Commercial Districts could be negatively impacted from inundation due to a 100/200/500-year flood. The marinas along the Delta Loop along Georgiana Slough, Mokelumne River and the San Joaquin River could also be damaged and possibly lost as a result of high flows from a 100/200/500 year flood event.

Future Development

While future development may occur in the areas protected by levee, that if failed, would cause flooding of the area, the Districts do not control this development. The Districts only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely
Vulnerability–High

Hazard Profile and Problem Description

Localized stormwater flooding can occur during heavy rains or seepage events that exceed the District's drainage capabilities. Lower areas around the island may be subject to minor flooding.

Past Occurrences

Some form of localized stormwater flooding occurs during most heavy rains. The most likely time this could have occurred in the past was during the wet year in 2006.

Vulnerability to Flood: Localized Stormwater Flooding

Assets/Critical Facilities at Risk

Localized flooding can overtax the Districts pumping system and create a more hazardous situation involving the levee system by limiting the ability for inspection.

Future Development

Future development should not be affected by local drainage issues.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Levee failure could result in inundation of the Districts and could also result in the flooding of Brannan and lower Andrus islands.

Past Occurrences

The 2012 5-Year Plan reported that since the creation of the BALMD in 1967, Brannan-Andrus Island has experienced one flood event on June 22, 1972. The levee failed on the southern end of the island along the San Joaquin River. The levee breach occurred after hours during a construction effort to raise the levee and address an instability problem. The elevation of the levee crown at the time was 10.8 feet. The subsequent water level on the inundated island reached 6.2 feet. To protect the town of Isleton, a bow levee was constructed by the US Army Corps of Engineers and volunteers. The bow levee only held for 36 hours. When it failed, 35% of the Isleton community was inundated.

The flood resulted in a "big gulp" effect, where the salt water from Suisun Bay moved into the central and southern Delta, decreasing the Delta's freshwater outflow. The salt water intrusion degraded water quality for central Delta farms and forced pumping to be cut back at the Central Valley Project pumping plant in Tracy. In order to push back the salinity gradient, a hydraulic barrier was created by increasing water releases from Folsom, Oroville, and Shasta reservoirs. Still, it took those releases several days to reach the affected Delta areas. After releasing over 150,000 acre feet of water, salinity levels were eventually restored to pre-flood levels. It took eight weeks of pumping to dewater the Brannan-Andrus Island.

The USACE spent $1.4 million to repair the breach with another $1.0 million used in federal disaster assistance totaling $2.4 million. In addition, numerous marinas and restaurants suffered from a loss of business and the flood's negative publicity. Crops were lost and intrastate commerce was disrupted. When adding up all of the flood's indirect costs, including the diversion of fresh water destined for CVP customers, it was estimated that the total economic impact of the 1972 Brannan-Andrus flood was approximately $40 million.

The BALMD became concerned about another levee failure during a high water event in 1997, when a section of the landside slope sloughed into a toe ditch along the Georgiana Slough levee. The USACE spent over $1.1 million to stabilize approximately 6,700 lineal feet of levee.

Vulnerability to Levee Failure

As previously stated, BALMD monitors and maintains the levees on the island. Reclamation Districts 407, 2067, and 317 maintain and control the operations of the seven pumping stations to keep the island dry. Five pumping stations are located along Sevenmile Slough, another is on Georgiana Slough, and a lift station is located on the main drainage canal in the northern part of the island.

The 5-Year Plan noted that to repair a levee breach the average cost has been estimated to be approximately $25 million. But the total cost truly depends on the accessibility, size and severity of the breach, the size of the island, volume of water to be pumped out, weather conditions, etc. The $25 million figure assumes costs of $5/yd^3 of on-island replacement fill, $15/yd^3 of off-island fill, 6% per foot of engineering costs, and $5/foot for rip rap. A summer levee breach occurred on Brannan-Andrus in 1972 (discussed above). The Jones Tract failure in 2004, the most recent levee failure, provides insight into determining what a levee breach could cost today. It has been publicized that this 500 foot breach cost approximately $90 million for repair, recovery, and associated damage. However, many knowledgeable locals consider that figure inflated by as much as a factor of two.

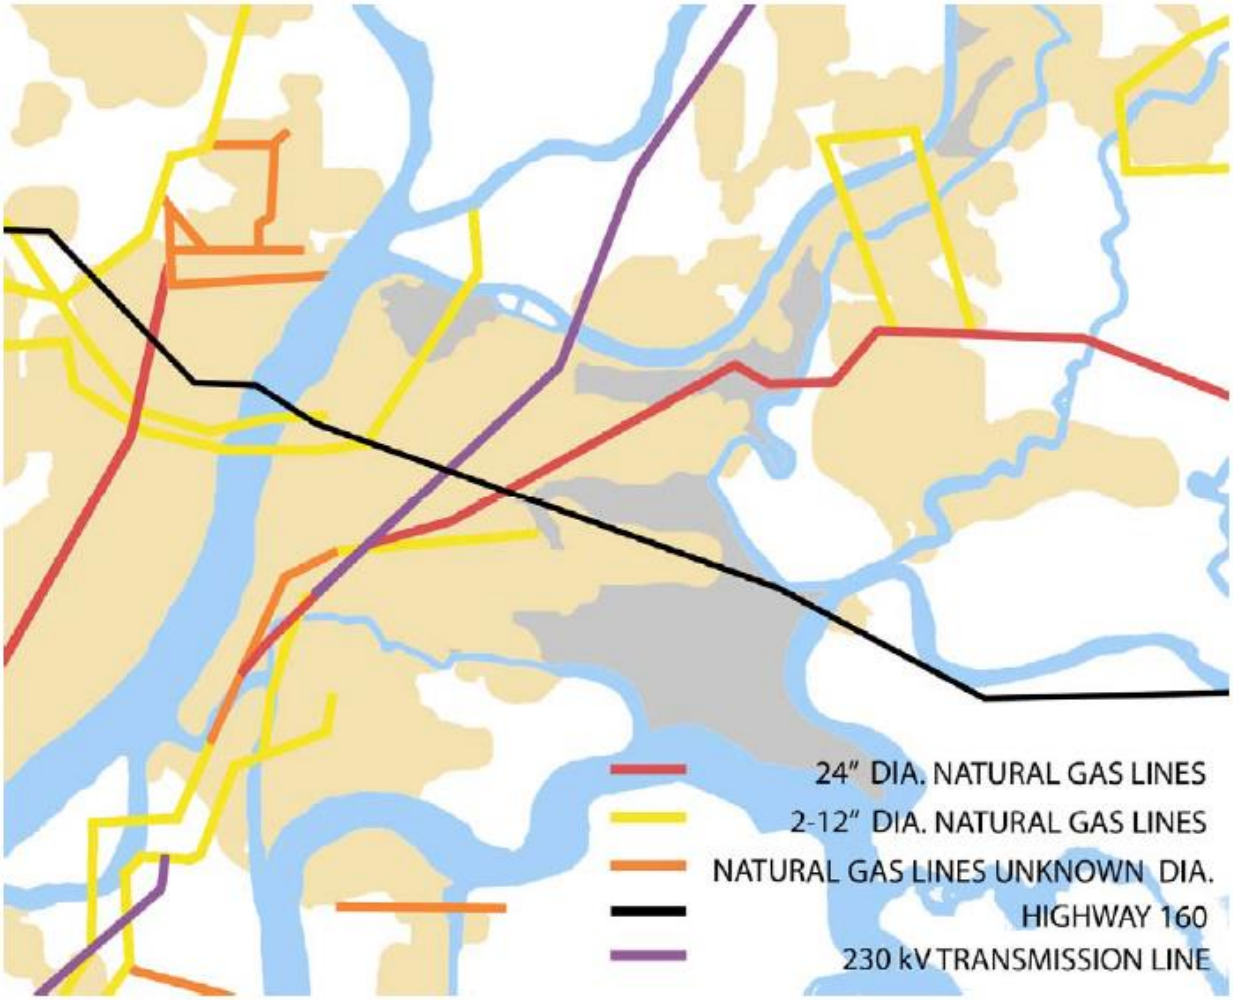
The 5-Year Plan broke down costs by land use type.

- **Residential** – The costs associated with inundation are taken from FEMA's method for estimating displacement. This includes a one-time cost of $500 per flooded household, a cost of $500 per month of inundation per household, and a monthly rental cost of $747. For Brannan-Andrus, it is estimated that there could be a one-time displacement cost of $182,400 for all occupied households along with an additional $15,600 per day to house these residents elsewhere. In addition to the residents, the various resorts on the island generate a transient population. To house this population in emergency shelters it could cost an estimated $85 per person per day. There are no reliable statistics covering that element of the population to determine a total cost per day for emergency housing, since the population fluctuates with the seasons. Flooding threats usually allow sufficient time to evacuate, so the costs to accommodate this unique group of part-time residents may not be significant.
- **Commercial** – Commercial structures will be adversely impacted from the time they are inundated through the time it takes to repair such damage and damage to surrounding infrastructure. For any business that is flooded FEMA assumes a one-time displacement cost of $1000, for a total of $148,000. Upon inundation, the businesses are assumed to have $77,500 of lost output value, $3,900 of lost profit, and $44,000 of lost value added per day on average. "Value added" is the sum of wages and salaries, proprietor's incomes, other property income, and indirect business taxes (URS 67). When a flood occurs, the island businesses could lose $140 million in sales for that year. Four-hundred seventy-one jobs could be lost per day over the duration of inundation. Overall, a flood could cost Brannan-Andrus Island businesses about $125,400 per day. Some businesses may be unable to recover from a flood and could possibly be lost as a result of such an event.
- **Agricultural** – Main crops grown on Brannan-Andrus Island are alfalfa, corn, wheat, pears, apples, cherries, and wine grapes. Brannan-Andrus Island has 10,517 acres of crops. Average cost for rehabilitation and field clean up is $235 per acre. This involves the removal of debris and sediment deposits after floodwaters have receded. Silt and debris can also clog drainage and irrigation ditches adding a variable cost to rehabilitation. The estimated total one-time cost for clean-up and rehabilitation is estimated to be $2.0 million. If inundation lasts longer than 14 days, it is assumed that the crops will be permanently lost. In 1972, it took eight weeks to pump out the island. Using that estimate, essentially all crops could be lost in a similar flood event. Any flood event that occurs between planting and harvest, could completely destroy the crops. Reestablishment of a lost crop dramatically increases economic losses. The inundation period is assumed to be five weeks on lower Tyler Island, meaning all crops on the lower end could potentially be lost in a flood event. However, due to the smaller size of RD 554 and an assumed inundation period of five days, not all crops may be lost. Not including clean-up costs, reestablishment of all crops on the island could total an estimated $23.9 million. In addition to reestablishment costs, a flood could also result in annual crop production losses. Annual crop production losses are incurred from the time of the flood and depend on how long inundation occurs, cleanup and the time required for the crops to produce a harvestable yield. If a flood occurs between planting and harvest, the crop will be lost for the year. Planting on Brannan-Andrus begins in

April and harvest ends by October. This report adds two months onto the planting season since it is estimated to take two months before the soils are dry enough for planting. As a result, the critical flood season for crops really occurs between February and October. If planting cannot occur within the same year as the flood event, annual production losses from orchards and vineyards could amount to about $17 million. If an event occurs between February and October, pushing planting to the following year, annual production losses will be about $26.8 million. Degraded water quality from salinity intrusion can also reduce crop yields.

The Brannan-Andrus Island levee system also protects several critical infrastructure components. There is an approximately 18-mile network of roads that include State Highway 12 (4.21 mi.) and Highway 160 (8 mi.) which provide east-west and north-south links with interstate corridors. A power transmission line, sized at about 230kV runs about 3.6 miles down the center of the island to the south end, through Brannan Island State Park. There are approximately 9,088 acres of underground gas fields and storage areas with a total of 33 natural gas wells and 157 gas/oil wells. The areas in beige represent the natural gas fields. A Lodi Gas' natural gas pipeline (24" diameter) runs west to east across the island feeding two 2-12" diameter pipelines. In total there are about 14.3 miles of PG&E pipeline with natural gas production at about 5,117,858 mcf. These are all shown on Figure 2-3.

Figure 2-3 PG&E Natural Gas Pipelines, Gas Fields, Storage Areas, and Transmission Lines



Source: 2012 5-Year Plan

Assets/Critical Facilities at Risk

Levees and district pumping plant. On island inundation can create an open water situation where a large fetch could develop and erode the interior of other levees within the District. Inundation of the drainage pumps and system can make them inoperable and require replacement. Other critical facilities at risk include two fire departments, Isleton city offices and an elementary school.

Natural Resources at Risk

The 5-Year Plan noted that many western Delta islands (Brannan-Andrus included) are vital for maintaining Delta water quality. If Brannan-Andrus was to flood, it would lower outflows and draw saline water from Suisun Bay into the Delta. The salinity gradient would migrate up to the southwest and southern Delta as it did in the summer flood of 1972. Also similar to 1972, the saline water would force the State Water Project pumps to shut down due to degraded water quality. This would compromise the water supply for the central and southern parts of the state until the salinity barrier is pushed back west. If the event were to

occur between August and December, when there is less fresh water run-off, drinking water treatment costs would increase significantly for jurisdictions that draw water out of the Delta.

According to the PPIC report, intentional permanent flooding of an island or a levee failure would create a "big gulp," bringing salt water in from the bay. This would have long-term effects on Delta water quality and factors in heavily when attempting to determine which islands should be reclaimed after failure.

Historic and Cultural Resources at Risk

The City of Isleton and its historic Chinese and the Japanese Commercial Districts could be devastated if it became flooded. In 1972, part of the town was inundated but due to its higher elevation, areas adjacent to the levees stayed relatively dry. The greatest risk of inundation from a levee break would be from a break along the Sacramento River, which is the strongest levee in the District with the least likelihood of failure.

The marinas along the Delta Loop along Georgiana Slough, Mokelumne River and the San Joaquin River could also be damaged and possibly lost as a result of a levee break.

Future Development

While future development may occur in the areas protected by levee, the Districts do not control this development. The Districts only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

River/stream/creek bank erosion could destabilize the levee slope and, if left unaddressed, cause levee failure through undercutting.

Past Occurrences

Bank erosion is currently occurring on the District levees, particularly Georgiana Slough and Sacramento River and must be remedied.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

The District Planning Team noted that the District's levees are at risk of erosion.

Future Development

While future development may occur in the areas protected by levee, which may be compromised by significant erosion issues, the Districts do not control this development. The Districts only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Fog

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Fog can make it difficult to perform levee inspections during high water due to lack of visibility.

Past Occurrences

Fog occurs annually but it has not occurred during high water events that require monitoring.

Vulnerability to Fog

Assets/Critical Facilities at Risk

The levees are at risk due to the inability to perform inspections.

Future Development

While future development may occur in the areas protected by levee, the Districts do not control this development. The Districts only can control whether the levees meet certification standards and the ongoing maintenance of these levees. However, fog is unlikely to affect future development of the area.

Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, Lightning)

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Heavy rains and storms can result in higher flood flows that could increase the hydraulic gradients within the levee section and result in seepage or if great enough, possibly overtopping. They can also increase flows and result in erosion of the waterside bank.

Past Occurrences

There are heavy storms that occur every year. The last heavy rain and storm event that raised river levels the District experienced was in 2006, 1997 and 1986. No significant damages occurred due to these high water events.

Vulnerability to Heavy Rain and Storms

Assets/Critical Facilities at Risk

The Planning Team for the District noted that the District levees and pumping plant are at risk of damage from heavy rains and storms.

Future Development

While future development may occur in the areas protected by levee, which may be compromised by severe storms, the Districts do not control this development. The Districts only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

In the event of high water, wind can create wave action that could cause erosion at the waterside bank of the District's levees.

Past Occurrences

Wind occurs on a regular basis. The hazard comes when high winds are coupled with high water, which happened in the winter of 2006. The District went on levee patrols during this time to monitor waves washing over the levee along the Mokelumne and San Joaquin River from the high winds coupled with high winter flows and high tide. No damages occurred as a result of the event.

Vulnerability to Wind and Tornadoes

Assets/Critical Facilities at Risk

The Planning Team for the District noted that the District levees and pumping plant are at risk of damage from winds and tornadoes.

Future Development

While future development may occur in the areas protected by levee, which may be compromised by high wind events, the Districts do not control this development. The Districts only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

A wildfire could destroy private property and other such structures on the island.

Past Occurrences

The District Planning Team noted no past occurrences.

Vulnerability to Wildfire

Assets/Critical Facilities at Risk

The District's pumping stations could be damaged in a fire. Furthermore the vegetation on the District levees could be burned leaving bare soil that could be subject to erosion.

Natural Resources at Risk

Riparian and shrub scrub vegetation could be lost in a wildfire.

Historic and Cultural Resources at Risk

Wildfire has the potential to irreparably destroy the historic Chinese and the Japanese Commercial Districts.

Future Development

It is unlikely that future development in the Districts will be affected by wildfire.

2.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

2.6.1. Regulatory Mitigation Capabilities

Table 2-7 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the BALMD and RDs 317, 407, and 2067.

Table 2-7 BALMD, RD 317, RD 407, and RD 2067's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	The plan addresses flooding hazards and can be used to implement mitigation actions
Continuity of Operations Plan	Y	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year: CBC 2013
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	Y	Sacramento County Zoning Code
Subdivision ordinance	N	
Floodplain ordinance	Y	Yes, Sacramento County Floodplain Ordinance restricts development in the floodplain
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	Y	AE Zone
Elevation Certificates	Y	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	Y	5-YEAR PLAN
Other	N	
How can these capabilities be expanded and improved to reduce risk?		

Source: BALMD

2.6.2. Administrative/Technical Mitigation Capabilities

Table 2-8 identifies the department(s) responsible for activities related to mitigation and loss prevention for BALMD and RDs 317, 407, and 2067.

Table 2-8 BALMD, RD 317, RD 407, and RD 2067's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Annual vegetation management
Mutual aid agreements	N	
Other	N	
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	Y	Determined via the Emergency Operations Plan
Emergency Manager	Y	Determined via the Emergency Operations Plan
Community Planner	N	
Civil Engineer	Y, FT	Staff is trained to coordinate with agencies and perform tasks in an emergency situation
GIS Coordinator	N	
Other	N	
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Phone tree, Reverse 911
Hazard data and information	Y	
Grant writing	N	
Hazus analysis	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
BALMD can develop an improved warning system among trustees, public and staff.		

Source: BALMD

2.6.3. Fiscal Mitigation Capabilities

Table 2-9 identifies financial tools or resources that the BALMD and RDs 317, 407, and 2067 could potentially use to help fund mitigation activities.

Table 2-9 BALMD, RD 317, RD 407, and RD 2067's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Delta Levees Subventions program to maintain levee system.
Authority to levy taxes for specific purposes	Y	Proposition 218 provides the District with the ability to raise assessments through a vote
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development		Unknown, would be dictated by Sacramento County
Storm water utility fee	Y	Assessments are developed for drainage
Incur debt through general obligation bonds and/or special tax bonds	N	
Incur debt through private activities	Y	Bonds are obtained from the Bank of Rio Vista
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	Y	Delta Levee Subventions Program and Delta Levee Special Projects, Proposition 84 and 1E
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
The involvement of Federal agencies funds would help in reducing risk as well as the removal of the sunset clause on the Delta Levees Subventions Program.		

Source: BALMD

2.6.4. Mitigation Education, Outreach, and Partnerships

Table 2-10 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 2-10 BALMD, RD 317, RD 407, and RD 2067's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		

2.6.5. Other Mitigation Efforts

The Districts do annual erosion repair and seepage abatement projects. There are currently two large projects in the planning stages that will address critical erosion sites on the Sacramento River and Georgiana Slough. The Districts are also updating their Five Year Plan with levee repair and enhancement projects to continue to maintain and improve the levee system.

2.7 Mitigation Strategy

2.7.1. Mitigation Goals and Objectives

BALMD and RDs 317, 407, and 2067 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

2.7.2. Mitigation Actions

The planning team for BALMD and RDs 317, 407, and 2067 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Implement Bioengineered Bank Stabilization techniques

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Scour due to high flows and channel meander has eroded and undercut the waterside bank. Rip rap is just one way to combat erosion but provides no habitat benefits. The use of bioengineered bank stabilization techniques will provide plantable media to provide riparian and Shaded Riverine Aquatic Habitat.

Project Description: The designs include using plantable geotextile bags in the place of rip rap within the tidal zone to protect against erosion and provide habitat.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Directors and District Engineer Gilbert Labrie

Project Priority: Medium

Cost Estimate: Adapted to different projects, difficult to estimate

Benefits (Losses Avoided): Reduction in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program and 2016 Multi Benefit PSP

Timeline: Summer 2018 to Summer 2023

Action 2. Development of Dredge Stockpile Site

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: This area is District owned and can provide an on-island mitigation site to offset impacts from levee improvement projects.

Project Description: Develop habitat for sensitive species such as freshwater marsh, riparian and shrub scrub.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Directors and District Engineer Gilbert Labrie

Project Priority: Medium

Cost Estimate: $500,000

Benefits (Losses Avoided): Ancillary to projects that reduce flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program and Special Projects funding

Timeline: Summer 2020 to Summer 2023

Action 3. Georgiana Slough Waterside Erosion Repair

Hazards Addressed: Dam Failure Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Scour due to high flows and channel meander has eroded and undercut the waterside bank. If left unaddressed, the slope may fail or result in underseepage that could ultimately cause levee failure and flood.

Project Description: The designs include filling voids at the waterside toe with rip rap and riparian bench will be enhanced with added fill. The levee slopes will be regraded and fill added to accommodate a Bulletin 192-82 critical levee section. Levee slopes will be a minimum of 2:1 landside and 3:1 water side where applicable.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Directors and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: Multi-Year effort, not available (current project in planning progress is 2 million for 0.3 miles)

Benefits (Losses Avoided): Reduction in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program and 2016 Multi Benefit PSP

Timeline: Summer 2018 to Summer 2023

Action 4. Hydrographic surveys and data collection

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: In order to reveal heavily eroded areas, hydrographic survey data must be obtained to inform repair and maintenance activities. It can also be used to develop designs and estimate costs to repair the levee system.

Project Description: Hydrographic surveys will be performed along Georgiana Slough, Mokelumne River, San Joaquin River, Sevenmile Slough, and potentially the Sacramento River to reveal deep waterside bank erosion.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Directors and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $300,000

Benefits (Losses Avoided): Aides in providing information for projects that will reduce in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: 2018 to 2025

Action 5. Mokelumne River Crown Raising

Hazards Addressed: Dam Failure Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Crown deficiencies have reduced the levees freeboard above the 100-year flood and has increased the levees vulnerability to flooding during a high water event.

Project Description: Crown raising will occur from District stations 115+00 to 127+00 and 135+00 to 145+00 to repair Bulletin 192-82 deficiencies

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Directors and District Engineer Gilbert Labrie

Cost Estimate: $500,000

Benefits (Losses Avoided): Reduction in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program and Special Projects funding

Timeline: Summer 2020 to Summer 2023

Project Priority: High

Action 6. San Joaquin River Waterside Erosion Repair

Hazards Addressed: Dam Failure Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Scour due to high flows and channel meander has eroded and undercut the waterside bank. If left unaddressed, the slope may fail or result in underseepage that could ultimately cause levee failure and flood.

Project Description: The designs include filling voids at the waterside toe with rip rap and riparian bench will be enhanced with added fill. The levee slopes will be regraded and fill added to accommodate a Bulletin 192-82 critical levee section. Levee slopes will be a minimum of 2:1 landside and 3:1 water side where applicable.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Directors and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: Multi-year effort, not available

Benefits (Losses Avoided): Reduction in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program and Special Projects funding

Timeline: Summer 2020 to Summer 2023

Action 7. Sevenmile Slough French Drain and Seepage Berm

Hazards Addressed: Dam Failure Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Seepage has been an issue at this levee stretch along Sevenmile Slough. This issue must be resolved to improve the levee stability.

Project Description: Project will remove existing toe drain and install a seepage berm and French drain to resolve seepage issues and facilitate proper drainage through the levee

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Directors and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $1,200,000

Benefits (Losses Avoided): Reduction in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program and Special Projects funding

Timeline: Summer 2020 to Summer 2023

Delta Annex Chapter 3 Reclamation District 3

3.1 Introduction

This chapter of the Delta Annex details the hazard mitigation planning elements specific to the Reclamation District 3 (RD 3), a new participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the RD 3. This chapter of the Delta Annex provides additional information specific to RD 3, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

3.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 3 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 3-1. Additional details on plan participation and RD 3 representatives are included in Appendix A.

Table 3-1 RD 3 Planning Team

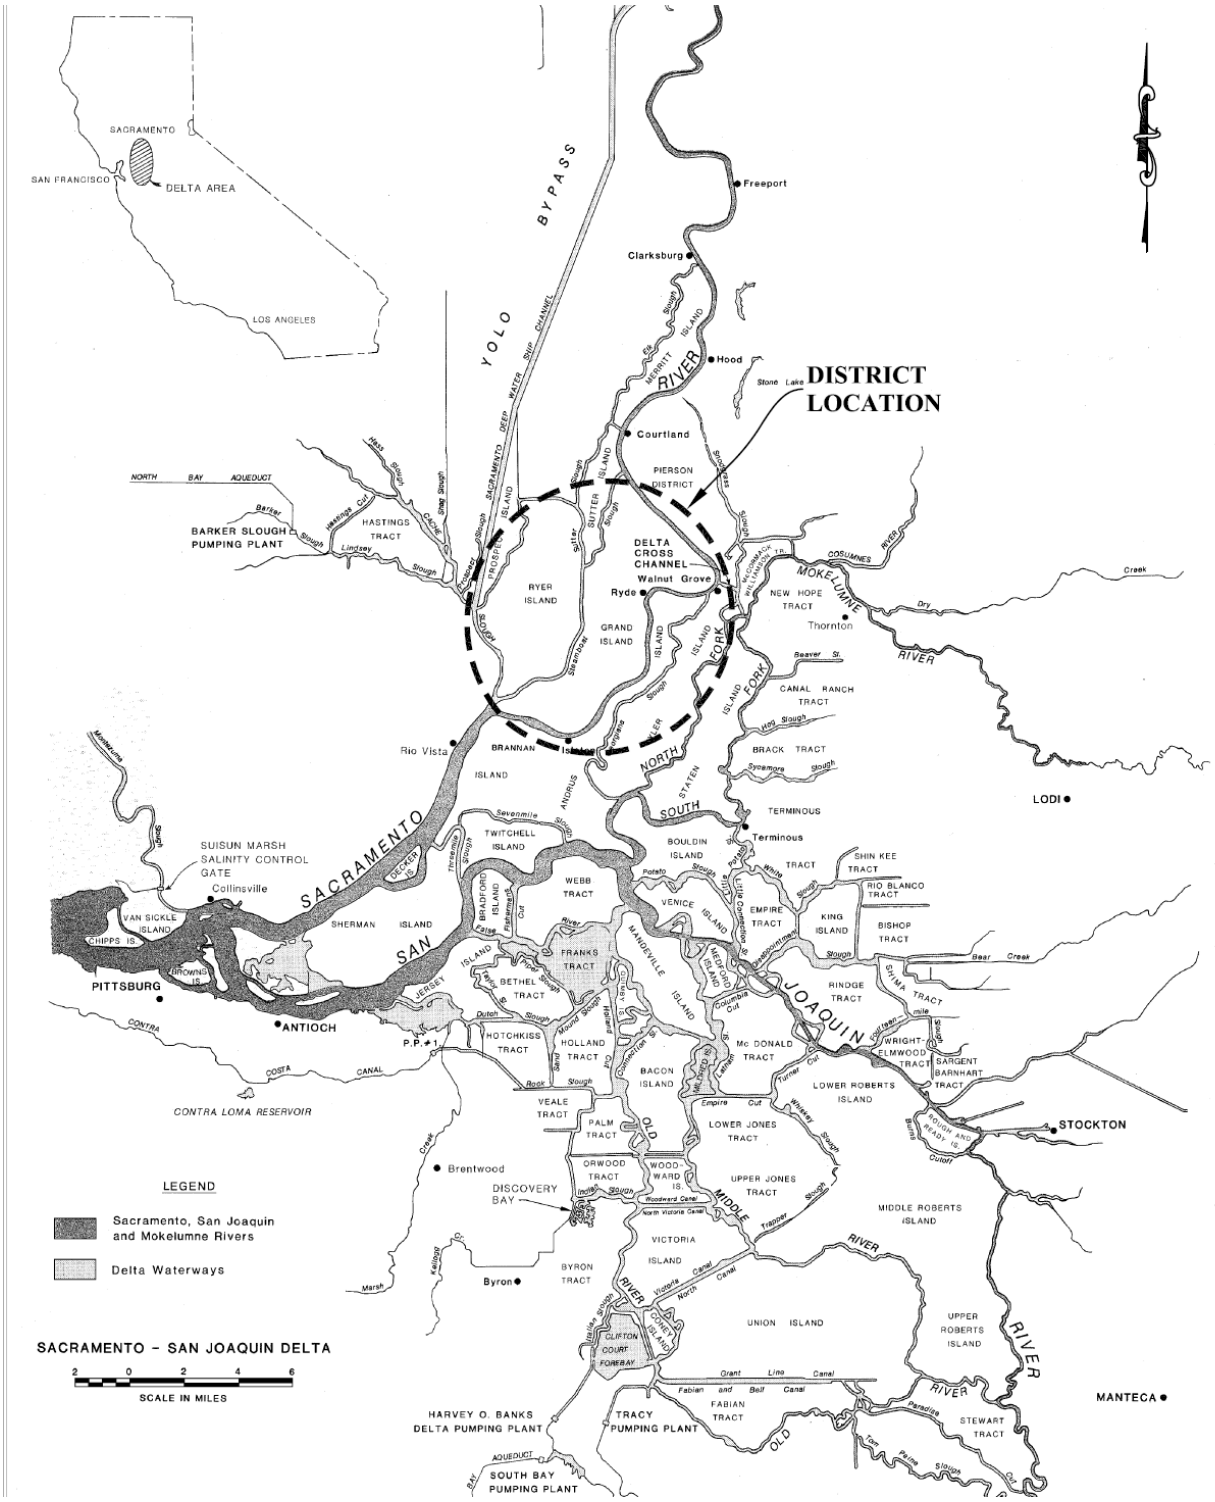
Name	Position/Title	How Participated
Gilbert Cosio	District Engineer	Attended meetings and workshops; reported to the District; compiled data for this annex; review draft documents
David Robinson	District Manager	Briefed in Sacramento County LHMP
Buddy Fonseca	President RD 3	Briefed in Sacramento County LHMP

Source: RD 3

3.3 Community Profile

The community profile for RD 3 is detailed in the following sections. Figure 3-1 displays a map and the location of RD 3 boundaries within Sacramento County.

Figure 3-1 Reclamation District 3 Map



3.3.1. RD 3 Overview, Background, and History

Reclamation District No. 3, Grand Island, is the local public entity that provides flood control and drainage services to the landowners of Grand Island. These functions are provided in the most economical and environmentally sound manner, with the greatest consideration of the areas rich agrarian culture and heritage.

As one of the first reclamation districts formed in 1861, Grand Island was given the number Reclamation District No. 3. The area protected by Reclamation District No. 3 has remained the same for essentially the entire time of its existence. As described in Division of Water Resources, (currently known as Department of Water Resources) Bulletin No. 37, which was published in 1930, the Reclamation District is described as protecting 17,100 gross acres, with a net protected area of 16,245 acres.

The Reclamation District No. 3 levees are part of the Federal Sacramento River Flood Control Project. This federally authorized project reconstructed the levees of Grand Island in the late 1950s. As part of a Federal project, the State of California is the local sponsor with Reclamation District No. 3 acting as the local maintaining agency. In order to verify that the District is maintaining its levees properly, the State inspects the levees two times a year (spring and fall) and Reclamation District No. 3 inspects its levees twice a year (summer and winter). The key inspection is the fall inspection performed by the State of California. This inspection, which occurs just prior to the flood season, is used by the Corps of Engineers to determine whether the levee is being properly maintained in order for Reclamation District No. 3 to qualify for Federal emergency funding through Public Law 84-99.

Reclamation District No. 3 provides flood protection in the form of levee maintenance and rehabilitation. The District also provides interior island flood protection and drainage. The District operates and maintains all the levees that protect the landowners of Grand Island. These 28.8 miles of levees border the Sacramento River and Steamboat Slough. The district also maintains 37.2 miles of ditches and canals, and 3 pumping plants to drain the properties of Grand Island. The protected area includes the communities of Walnut Grove and Ryde.

3.4 Hazard Identification

RD 3's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 3 (see Table 3-2).

Table 3-2 RD 3—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Extensive	Occasional	Limited	Low
Bird Strike				
Climate Change	Extensive	Occasional	Limited	Low
Dam Failure	Limited	Unlikely	Negligible	Low
Drought and Water Shortage	Extensive	Occasional	Critical	Low
Earthquake	Extensive	Occasional	Limited	Low
Earthquake: Liquefaction	Significant	Occasional	Limited	Low
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Significant	Likely	Critical	High
Landslides				
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Significant	Highly Likely	Catastrophic	High
Severe Weather: Extreme Temperatures – Cold/Freeze				
Severe Weather: Extreme Temperatures – Heat				
Severe Weather: Fog				
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Significant	Likely	Critical	Medium
Severe Weather: Wind and Tornadoes				
Subsidence	Significant	Likely	Limited	Low
Volcano				
Wildfire:(Burn Area/Smoke)				

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area
Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid
Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

3.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 3's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 3 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

3.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 3.5.3, includes a description as to how the hazard affects the RD 3 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

3.5.2. Vulnerability Assessment

This section identifies RD 3's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 3-3 lists critical facilities and other District assets identified by the RD 3's planning team as important to protect in the event of a disaster. RD 3's physical assets, valued at over $8 million, consist of the buildings and infrastructure to support the RD 3 operations. In addition, other assets protected by RD 3 have an estimated value of over $250,000,000.

Table 3-3 RD 3's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Pumping Plant – Sac. River	Drain Pump		$2,000,000	

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Pump Plant – Steamboat Sl (old)	Pump Plant		$2,000,000	
Pump Plant –Steamboat Sl (new)	Pump Plant		$2,000,000	
District owned Facilities	Home, Buildings & Equipment		$2,000,000	

Source: RD 3

Natural Resources

In the past, RD 3 has protected a number of natural gas wells. Currently, there are no wells in operation on Grand Island. RD 3's levees support vegetation that provide fish and wildlife habitat. Agricultural ground and ditches also support wildlife.

Historic and Cultural Resources

Since the land has been settled for over 150 years, there are many historic structures on Grand Island. These include the Ryde Hotel, the Grand Island Mansion and the Beaver Union School.

Growth and Trends

Grand Island is within the Primary Zone of the Delta. Therefore, in addition to Sacramento County, development is controlled by a State agency, the Delta Protection Commission. Therefore, there is little, if any, potential for growth beyond that allowed by agricultural zoning.

3.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 3-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 3 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee inundation areas, older facilities that may be constructed with unreinforced masonry and buildings built prior to the introduction of modern building codes. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

In general, the most vulnerable District assets include the levees and supporting structures that the District owns. As stated, above, the RD 3 levees provide protection to over $250,000,000 in assets as estimate by the Delta Risk Management Strategy.

An estimate of the vulnerability of RD 3 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on

past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Flood: 100/200/500 Year

Likelihood of Future Occurrence–Occasional
Vulnerability–Extremely High

Hazard Profile and Problem Description

Flooding on the Sacramento River has threatened the levees of RD 3 in the past. Flooding inside the leveed area would occur as a result of levee failure or overtopping. The flood elevations around Grand Island exceed the elevation of almost every acre of ground protected by RD 3 levees. Therefore, a levee breach under flood conditions would be catastrophic to the landowners. In addition, the Grand Island levees are not certified to protect against the 100-year flood.

Past Occurrences

Past river floods have damaged the RD 3 levees in the form of erosion. Some of this erosion was repaired by RD 3 under flood fight conditions. Restoration erosion repair has typically been performed by the Corps of Engineers as authorized under PL 84-99. Repair work under PL 84-99 was performed by the Corps of Engineers on Grand Island levees following the recent floods of 1986, 1997, 1998, and 2006. Erosion experienced in other years was repaired by RD 3.

Past floods have also required flood fighting by RD 3. This flooding fighting has consisted of seepage control and emergency erosion repair. Seepage control is critical in levee breach prevention. The levees and levee foundations of Grand Island are very porous and subject to flood water seeping through, and under, the levee. If left uncontrolled, this seepage could accelerate to the point that it has the force to move levee material. This phenomenon is called piping, or internal erosion of the levee. Once enough material is moved out of the levee section, a levee breach occurs.

Vulnerability to Flood

Assets/Critical Facilities at Risk

Flooding of Delta islands has the potential to negatively impact water quality both locally and statewide. The largest of California's drinking water sources is the Sacramento-San Joaquin Delta and its tributaries. The Delta provides water throughout the state via the State and Federal water projects. During a flood, there is a higher potential for the waters in the Delta to be exposed to chemicals, fuel, oil, and multiple other constituents of concern that can quickly degrade water quality. Flooding can also disturb soil and soil-borne materials such as mercury and organic matter that can degrade water quality. If the flood water rushing into a Grand Island levee breach is large enough in volume, the surge of water into the island will call saltwater to be pull from San Francisco Bay and into the Delta, thus impacting the water quality of the Delta and water users who export water out of the Delta.

Should a flood breach the levees, the entirety of the assets of RD 3 would be at risk. These assets include the small communities of Ryde and Walnut Grove. All of the RD 3 drain pumps would be flooded and therefore, RD 3 could not drain the flooded areas with their existing pumps; auxiliary pumps would have to be brought in.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

During high rainfall events, the drainage system is not capable to evacuate water from the interior of Grand Island without flooding some low lying properties. On properties that farm annual row crops, this is not a problem since crops are not normally planted until after the rainy season. However, winter wheat, perennial, or multi-year crops are susceptible to damage when water overflows the banks of the drain canals.

Past Occurrences

Stormwater flooding occurs every few years. In most years, it is not significant enough to be a problem. For the most part, past flooding has damaged alfalfa and winter wheat. However, in 2006 overbank flooding came very near to flooding homes along Highway 220 in Ryde. In addition, many acres of vineyards and orchards have been planted in the past few years, so it is anticipated that these recently planted permanent crops may be damaged by future canal bank flooding.

Vulnerability to Flood

Assets/Critical Facilities at Risk

As stated above, stormwater flooding has the potential to result in significant damage due to the increased acreage of permanent crops. In addition, residences in the lower elevations of Walnut Grove and Ryde are at risk.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, and possibly coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters

Past Occurrences

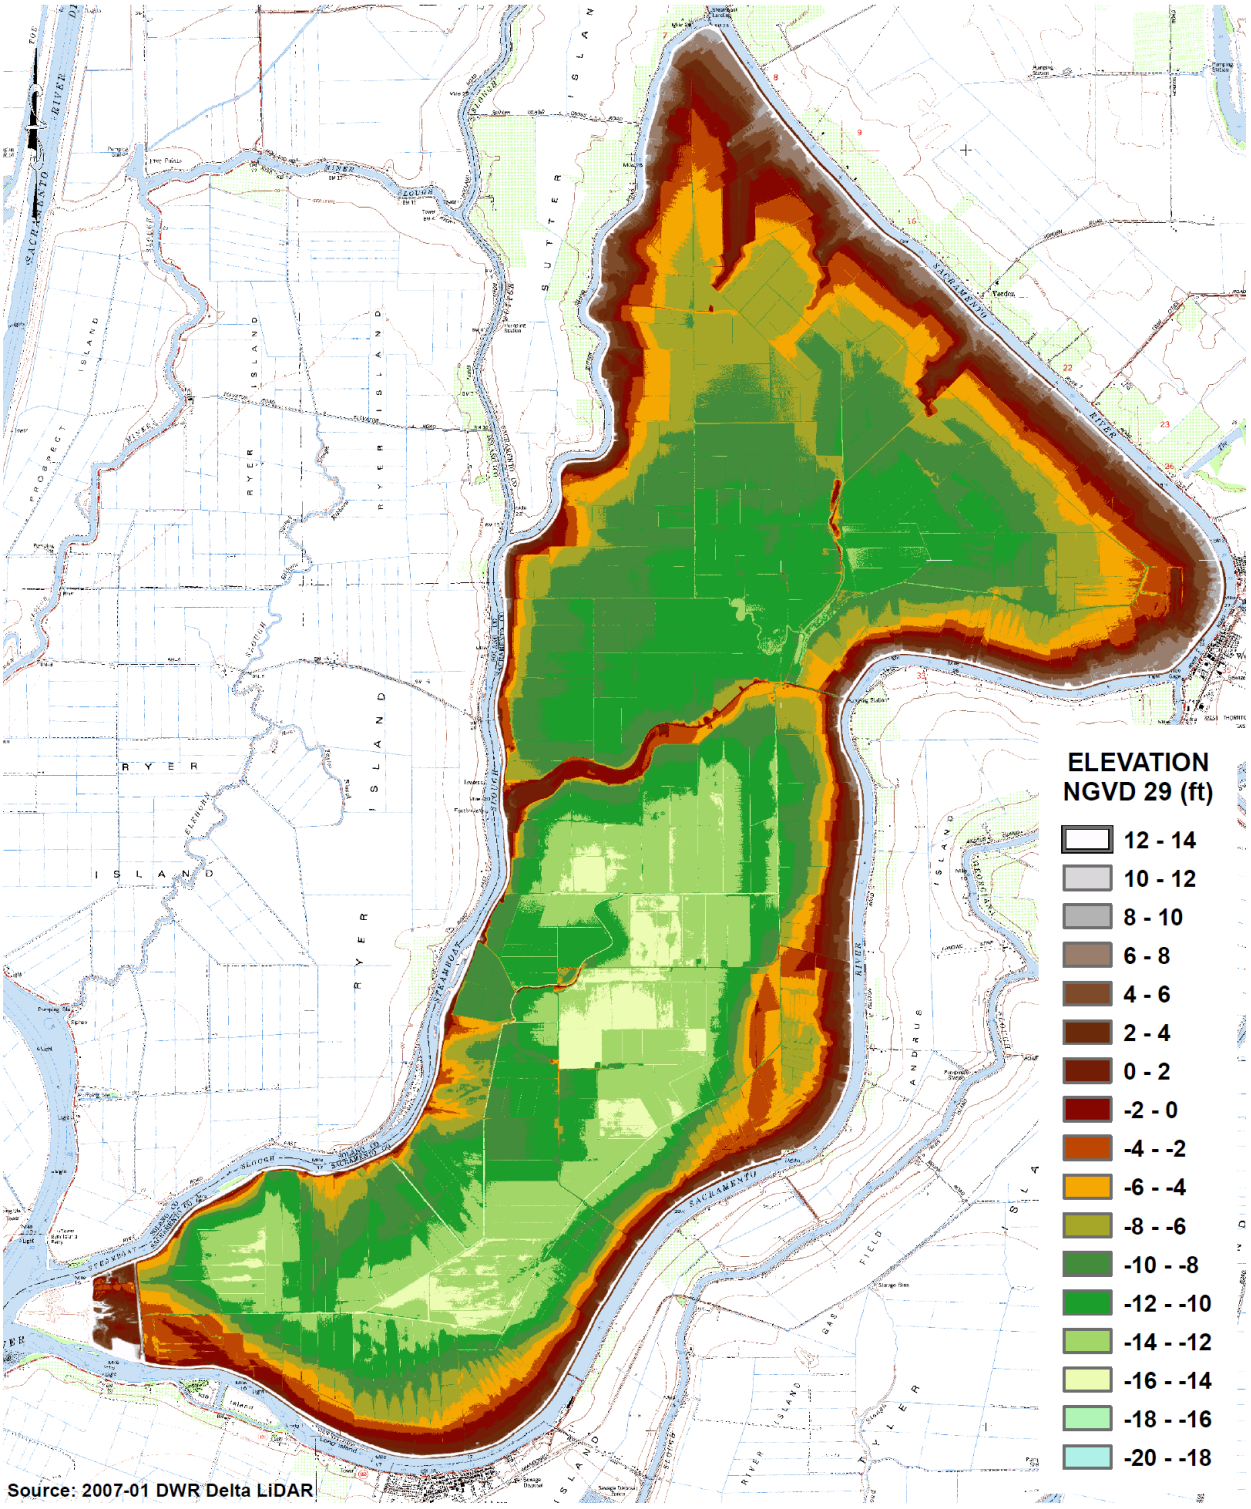
The RD 3 levees have not failed in over 100 years. Two floods over the past few decades (1986 & 1997) required extensive flood fighting by RD 3 forces in order to prevent a levee breach.

Vulnerability to Levee Failure

Assets/Critical Facilities at Risk

A levee failure would impact almost all the assets and critical facilities on Grand Island; including the small communities of Walnut Grove and Ryde. State Highways 160 and 220, as well as a number of county roads are at risk. Approximately 16,000 of agricultural land would be damaged and possibly rendered unfarmable for at least a year. There are many permanent crops on Grand Island, such as wine grapes, pears, apples and cherries that would be destroyed.

Figure 3-2 Elevation Map of Reclamation District 3



Source: Reclamation District 3

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–High

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800's, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

Past Occurrences

RD 3 experiences bank erosion essentially every year there is above normal precipitation. As part of the Corps of Engineers Sacramento River Flood Control Project, RD 3 erosion has been periodically repaired by the Corps of Engineers under PL84-99. In years when the Corps does not perform repair, RD 3 repairs the erosion with financial assistance from the state's Delta Levees Subventions Program. Since RD 3 has been recently deemed ineligible for PL84-99 assistance, the likelihood is that the Corps will not perform erosion repairs in the future.

Vulnerability to Erosion

Assets at Risk

Erosion by itself puts the levee and any structures on the levee at risk. These structures include irrigation and drainage systems, residential buildings, agricultural buildings, wildlife habitat, etc. If left unresolved, erosion would lead to a levee breach, imposing risk on all of the assets of Grand Island.

Severe Weather: Heavy Rain and Storms

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the District. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

Although water surface elevation is a major factor to levee seepage and overtopping, severe weather can cause significant damage, such as erosion, that puts the integrity of the Grand Island levee system at risk.

Vulnerability to Heavy Rain and Storms

Assets at Risk

Heavy rain and thunderstorms are the most frequent type of severe weather occurrence in the area. Wind and lightning often accompany these storms and have caused damage in the past. Problems associated with the primary effects of severe weather include erosion, flooding, pavement deterioration, washouts, landslide/mudslides, and downed trees. However, it is the secondary effects of heavy rain and storms that are of concern to RD 3. Heavy rains can cause flooding, levee failure, and stream bank erosion. Flooding, levee failure, and stream bank erosion can cost RD 3 millions in damages.

OTHER HAZARDS

Other hazards that affect RD 3 levees and the area they protect include earthquake and liquefaction. Although there has never been documented levee damage due to an earthquake, hypothetically damage can occur due to levee construction materials. The sands and gravels that comprise a large amount of the levee and its foundation are highly susceptible to liquefaction during an earthquake.

3.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

3.6.1. Regulatory Mitigation Capabilities

Table 3-4 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 3.

Table 3-4 RD 3's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y/2011	Five-year plan consisting of levee stability, seepage control and maintenance projects.
Capital Improvements Plan	N	
Economic Development Plan	N	

Local Emergency Operations Plan	Y/2017	Through a state grant, Sacramento County is funding development of an Emergency Action Plan for RD 3. The plan will be complete in early 2017
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	Y/Ongoing	RD 3 is evaluating flooding of low areas and the need for improvements in it drainage system
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y	Annual routine maintenance plans and participation in the state Delta Levees Subventions Program which assists in funding levee maintenance. RD 3 is also drafting a Letter of Intent to draft a System-Wide Improvement Framework to respond to maintenance and rehabilitation issues brought up by the Corps of Engineers 2103 Periodic Inspection Report
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts?** **Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	Y	Erosion control measures on levee and canal slopes as necessary. Sediment removal from drainage system canals as necessary.
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 3

3.6.2. Administrative/Technical Mitigation Capabilities

Table 3-5 identifies the department(s) responsible for activities related to mitigation and loss prevention for RD 3.

Table 3-5 RD 3's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	RD 3 annually performs over $500,000 in maintenance. In addition, it periodically constructs projects to repair deficiencies in the levee such as a $1.5 million seepage berm constructed in 2014.
Mutual aid agreements	N	
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	Y	David Robinson - District Manager
Community Planner	N	
Civil Engineer	Y	Gilbert Cosio and the staff at MBK Engineers has served as District Engineer for over 35 years and has participated in many flood fight actions.
GIS Coordinator	N	
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	N	
Hazard data and information	N	
Grant writing	N	
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 3

3.6.3. Fiscal Mitigation Capabilities

Table 3-6 identifies financial tools or resources that the RD 3 could potentially use to help fund mitigation activities.

Table 3-6 RD 3's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	RD 3's annual assessment includes funding for future anticipated capital projects
Authority to levy taxes for specific purposes	Y	Yes, RD 3 modified its benefit assessment roll in 1996 and it provides authority and flexibility
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	N	
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	RD 3 has the ability to levy special assessments
Incur debt through private activities	N	
Community Development Block Grant	Y	
Other federal funding programs		
State funding programs		
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 3

3.6.4. Mitigation Education, Outreach, and Partnerships

Table 3-7 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 3-7 RD 3's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	RD 3 maintains a web page with appropriate information to educate the public
Natural disaster or safety related school programs	N	
StormReady certification	Y	The RD 3 manager, trustees, and District Engineer have been, or soon will be, trained in SEMS and NIMS
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

3.6.5. Other Mitigation Efforts

As stated previously, RD 3 modified its benefit assessment roll in 1996, adding a tremendous amount of flexibility, while still complying with Proposition 218 legal requirements. In addition, RD 3 has been a very active participant in the state's Delta Levee Subventions Program for about 20 years. These 2 factors have proven useful and have enabled RD 3 to react financially if a non-routine cost arises.

3.7 Mitigation Strategy

3.7.1. Mitigation Goals and Objectives

RD 3 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

3.7.2. Mitigation Actions

The planning team for RD 3 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Levee Improvements

Hazards Addressed: EQ, EQ Liquefaction, Flood: 100/200/500-year, Flood: Localized Stormwater Flooding, Levee Failure, River/Stream/Creek Bank Erosion, Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning), Severe Weather (Wind and Tornadoes)

Goals Addressed: 1, 3

Issue/Background: The goal of this Mitigation Action is to improve the Grand Island levees over the next five years to a level of protection that repairs current deficiencies as noted in the state's Flood System Repair Project, and correct issues noted in the 2013 Corps of Engineers Periodic Inspection Report.

Other Alternatives: None proposed at this time

Existing Planning Mechanisms through which Action will be Implemented:

Responsible Office: Reclamation District No. 3 as the local maintaining agency and the State of California Flood Protection Board as the local sponsor of the federal flood control project.

Priority (H, M, L): High

Cost Estimate: $15 million

Potential Funding: Delta Levee Subventions Project currently funded by Propositions 1, 1E and 84. The state flood control deferred maintenance program (2016), the state Flood System Repair Program.

Benefits (avoided Losses): Preservation of the protection of nearly 17,000 acres. Most of this property is farmed and thus a contributing factor to the local, state and national economy. The assets on Grand Island have been estimated to exceed $250 million 10 years ago, and therefore are much larger today.

Schedule: 1 – 10 years depending on the availability of funds

Delta Annex Chapter 4 Reclamation District 341

4.1 Introduction

This chapter of the Delta Annex details the hazard mitigation planning elements specific to the Reclamation District 341 (RD 341), a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the RD 341. This chapter of the Delta Annex provides additional information specific to RD 341, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

4.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 341 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 4-1. Additional details on plan participation and RD 341 representatives are included in Appendix A.

Table 4-1 RD 341 Planning Team

Name	Position/Title	How Participated
Robert C. Wagner, P.E.	District Engineer	Reviewed Draft Documents
Patrick W. Ervin, P.E.	Engineer	Attended Meetings, Drafted Text
Martin Berber	Staff Engineer	Collected Data, Reviewed Draft Documents

Source: RD 341

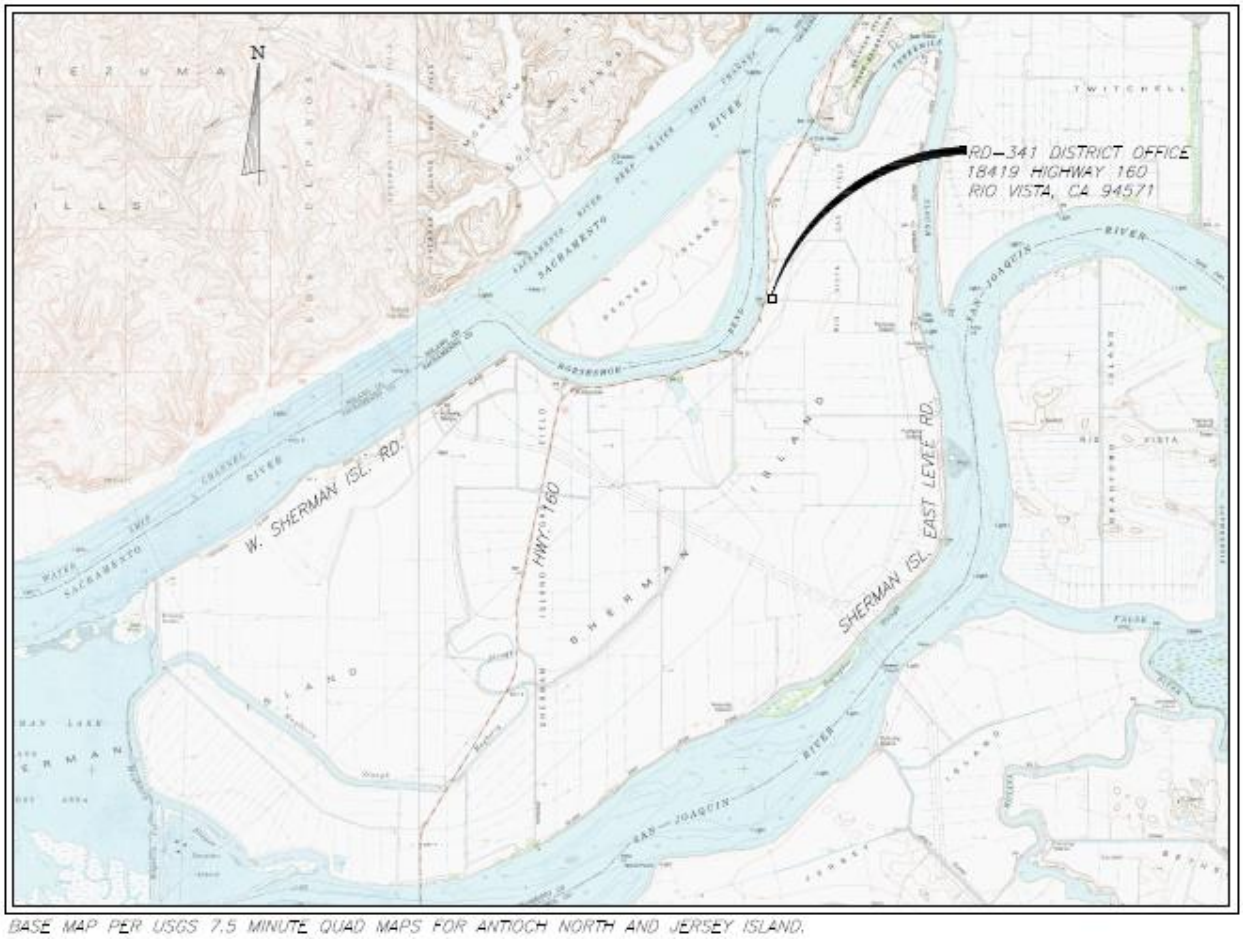
4.2.1. Coordination with Other District Planning Efforts

Coordination with other District planning efforts is paramount to the successful implementation of this plan. This section provides information on how the District integrated the previously-approved 2011 Plan into existing planning mechanisms and programs. The District Planning Team noted that they didn't exactly implement the LHMP document into any planning mechanisms. The District did however complete projects that were part of our strategy to improving mitigation and have ongoing projects as well. For example, the Scour Lake habitat restoration project has been completed and the District is working on the long term maintenance plan for the habitat. The Fish Release Sites project has begun construction and is expected to last through December 2017. The District also already completed Phase 1 of SH-10-1.0 that is listed on the strategies for this updated document.

4.3 Community Profile

The community profile for RD 341 is detailed in the following sections. Figure 4-1 displays a map and the location of RD 341 boundaries within Sacramento County.

Figure 4-1 Reclamation District 341 Map



4.3.1. RD 341 Overview, Background, and History

In the Delta, for the last 5,000 years to the 1850s, relative sea-level rise was balanced by vertical marsh growth through biomass accumulation and sediment deposition. A transition from deposition of organic silt-clay to peat formation in the Delta largely reflects the decline in inundation frequency and the maturation of the marsh plain towards mean higher high water elevations. The resulting freshwater tidal marshes developed because a relatively large freshwater inflow compared to the size of the tidal prism sustained a low salinity, which supported highly productive organic peat formation through tule growth. The large roots of the tule created an organic fabric that supported and aided rapid vertical growth. The living surface was maintained within the intertidal zone (natural habitat), and marsh organic accretion (injection of roots and rhizomes, and incorporation of surface litter) was able to sustain vertical growth at

rates in excess of relative sea-level rise. The gradual accumulation of the organic and inorganic sediment must have also offset the loss and compaction of existing peat.

The development of today's Delta began in late 1850 when the Swamp and Overflow Land Act conveyed ownership of tall swamp and overflow land, including Delta marshes from the federal government to the State of California. Reclamation of Sherman Island began shortly thereafter, and by 1859, local property owners had constructed small peat levees of three to four feet in height, with a base width of about eight feet, along the banks of the Sacramento River and Mayberry Slough.

Today, Sherman Island is protected by approximately 18-miles of levee which encompass approximately 9,937 acres of land, according to the 1995 Sacramento Delta San Joaquin Atlas. Approximately 9 miles of levee are project levees, constructed by the US Army Corps of Engineers, and approximately 9 miles of levee are non-project levees. The entire levee system is maintained by RD 341. RD 341 maintains and operates five modern pumping stations on Sherman Island: three on the San Joaquin River (south) side; one on the Sacramento River (north) side; and one on Sherman Island's northwest corner. The pumps are part of a larger system of pumps, siphons irrigation ditches and canals used to circulate water and drain the Island.

4.4 Hazard Identification

RD 341's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 341 (see Table 4-2).

Table 4-2 RD 341—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards				
Bird Strike				
Climate Change				
Dam Failure				
Drought and Water Shortage				
Earthquake				
Earthquake: Liquefaction				
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding				
Landslides				
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Significant	Likely	Critical	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze				
Severe Weather: Extreme Temperatures – Heat				
Severe Weather: Fog				
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)				
Severe Weather: Wind and Tornadoes				
Subsidence				
Volcano				
Wildfire:(Burn Area/Smoke)				

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

4.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 341's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 341 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

4.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 4.5.3, includes a description as to how the hazard affects the RD 341 and information on past occurrences. The intent of these section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

4.5.2. Vulnerability Assessment

This section identifies RD 341's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 4-3 lists particular critical facilities and other District assets identified by the RD 341's planning team as important to protect in the event of a disaster. RD 341's physical assets, valued at over $12.7 million (without the value of the levees), consist of the buildings and infrastructure to support the RD 341 operations.

Table 4-3 RD 341's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Agricultural	High Potential Loss Facilities		$6,764,520	Flood, Levee Failure
Agricultural-Irrigated from District Facilities	High Potential Loss Facilities		$4,415,800	Flood, Levee Failure
Marina-Recreation	High Potential Loss Facilities		$16,530	Flood, Levee Failure
Urban	High Potential Loss Facilities		$87,700	Flood, Levee Failure
Commercial	High Potential Loss Facilities		$8,300	Flood, Levee Failure
Utilities (Including easements)	Transportation and Lifeline		$615,810	Flood, Levee Failure

Source: RD 341

The District Planning Team noted that "Replacement Value" in the table above isn't accurate. In reality, the true replacement of damages caused by a levee breach will be a far greater cost. Pumping cost to dewater the island would be very expensive, salt intrusion up the Sacramento River would cause serious water supply and agricultural problems, etc.

Natural Resources

The District Planning Team noted no notable natural resources exist in the District boundaries.

Historic and Cultural Resources

The District Planning Team noted no historic or cultural resources exist in the District boundaries.

Growth and Development Trends

Sherman Island has seen little to no growth since 2011. The State of California owns a large portion of the island, limiting potential development, and there are very few economic drivers on-island.

Development since the 2011 Plan

The RD has not seen an increase in their service area population since the 2011 plan.

4.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 4-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 341 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those

described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee and dam inundation areas, such as older facilities that may be constructed with unreinforced masonry and buildings built prior to the introduction of modern building codes. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

In general, the most vulnerable District assets include the levees and supporting structures that the District owns.

An estimate of the vulnerability of the RD 341 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Flood: 100-/200-/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Through discussion of the visual inspections, the District Board members, District superintendent and District engineer have determined that Sherman Island levees are most vulnerable to failure cause by flooding.

Past Occurrences

The first significant flooding affecting Sherman Island agriculture occurred during the 1861/62 season and caused wide-spread damage throughout the delta's river islands, and Sherman Island farmers lost most of their livestock as a result when the Sacramento River breached the low levees constructed along its banks. After completion of the levee system in 1869, Sherman Island suffered several floods. Sherman Island levees failed during the winters of 1871/72, 1874/75, 1876, and 1878. Several crevasses cut through the north and south levees west of Mayberry Slough in the 1874 levee failure, resulting in the loss of all but 100 acres of cropland in the western portion of the island. The subsequent levee reconstruction featured a

12-foot high peat levee with 120 feet widths at the base. Even so, the 1876 flood covered the western portion of the island again. The flood of 1878 devastated the entire island.

Subsequent levee breaks on the San Joaquin River submerged most of the land and Sherman Island's 700 inhabitants fled to higher ground. The beleaguered reclamation districts were faced with underwriting thousands of dollars in assessments to replace most of the levee system. Landowners regrouped, and in March 1878, Reclamation District 252 formed out of a portion of RD 54. Sherman Island landowners reorganized again, and RD 54 and RD 252 combined to form Reclamation District No. 341 (RD 341) on June 17, 1879. Although reclamation efforts continued in RD 50 west of Mayberry Slough for several years after the 1879 floods, landowners eventually dropped reclamation efforts, and after the land flooded during the 1940s, ownership of the land reverted to the State for taxes.

By spring 1880, most of the new RD 341 was again under cultivation until high waters collapsed levee sections again in August later that year. Although an assessment of $13,141 was made for levee repair following the 1880 break, most of the land remained under water until 1894 when reclamation efforts were renewed.

In 1894, RD 341 encompassed 10,303.71 acres of land east of Mayberry Slough and the 3,000-foot cross-levee between Sacramento River and Mayberry Slough. The Sacramento and San Joaquin rivers are connected by Threemile Slough, which forms the eastern and northern boundary of the Island. The district included 24.76 miles of levee, much of it at the time destroyed by previous floods. At the time, much of Sherman Island had been underwater for fifteen years. Although some stretches of levee were intact, much of the levee had had sunk to the ground level of the island or below. The Horse Shoe Bend area of the Sacramento River had several breaks; one about 500 feet in width, with resulting scar holes measuring about 75 feet deep. The San Joaquin River levees on the south side of the island were essentially destroyed from Gallagher Slough, near the modern day location of Eddo's Resort, to the mouth of Mayberry Slough.

During the first decade of the twentieth century, RD 341 conducted frequent levee upgrading and restoration projects on Sherman Island. RD 341 leased four dredges in 1900 that worked in tandem around Sherman Island. Flooding occurred in some section of the Delta almost annually during the period from 1900 to 1910, and serious levee breaks and major flooding of RD 341 occurred during 1904 when a crevasse opened on Mayberry Slough, and in 1906 and 1909, when water again inundated the island. RD 341 trustees contracted with Franks Dredging Company for levee construction and repair work between 1908 and 1920.

The southern levee on the San Joaquin River side failed and flooded the Island on January 20, 1969 at approximate levee station 520+00. Upon finding the break, a large quantity of rock was placed on the upstream and downstream ends of the levee to protect against further erosion from high velocities into and out of the break due to tide. Without placement of the rock, the break which was approximately 275 feet wide and about 45 feet below mean sea level, would have been greatly enlarged. After the break, the water inside the island and in the San Joaquin River was at the same level. The flooding created a deep hole in the channel on the waterside and a deep lake on the landside toe of the levee at the site of the break. Pumps to dewater the Island were rented (District pumps were entirely submerged). Pumping with the rented equipment commenced February 28, 1969 and continued through August 9, 1969, at which point District pumps continued to remove the remaining water from the Island. All 93,000 feet of District drainage ditches were cleaned and/or excavated, primarily by drag line and ditcher operations before District ditches

were operable. The Corps of Engineers spent approximately $600,000 in emergency funds to repair, reslope, and regrade the levee break area after the 1969 break. Seepage and settlement in the area of the break have been ongoing issues requiring constant levee improvements.

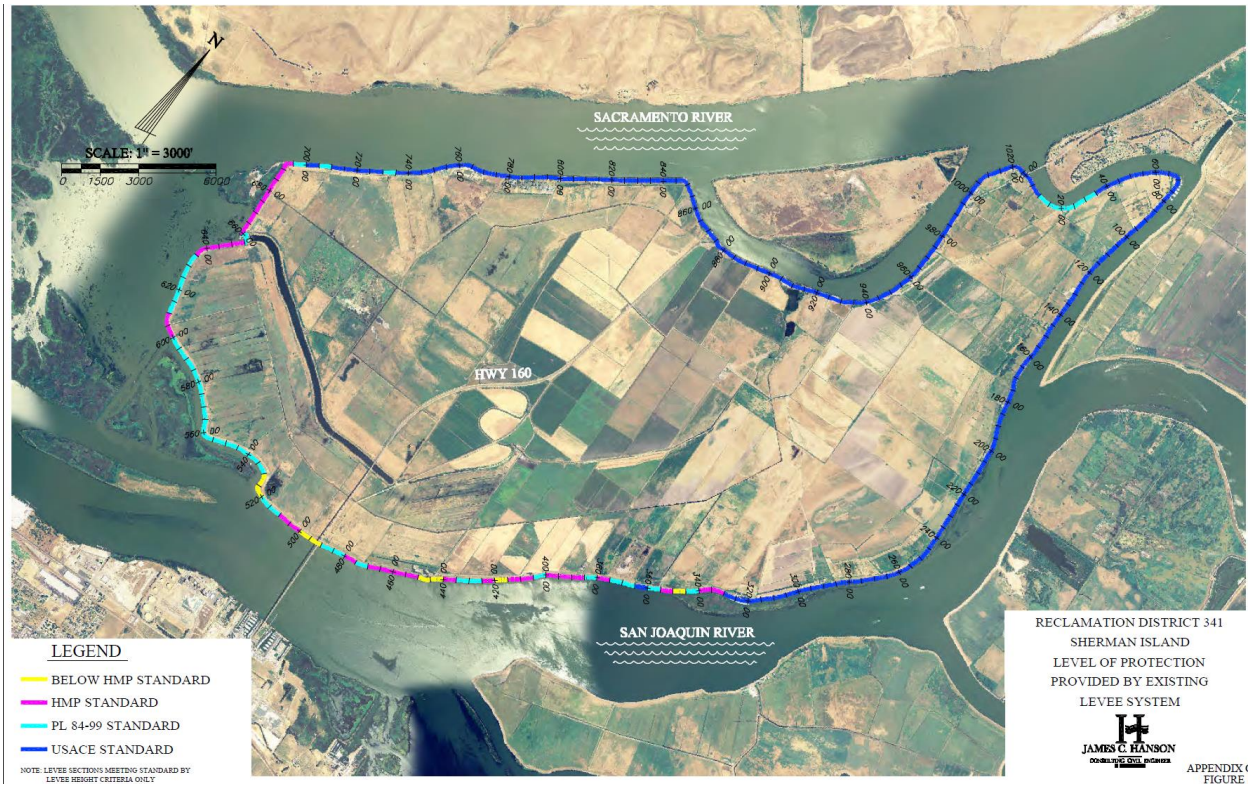
Vulnerability to Flood

Assets at Risk

Should a high water flood event cause levees to collapse, Sherman Island would be fully inundated, risking the $12.7 million in district assets discussed in Table 4-2.

Areas of the existing levee system most susceptible to overtopping are those which do not meet the PL 84-99 height standard. An inventory of levee sections and their respective heights is maintained by the District. Analysis of this inventory shows that the levee along the San Joaquin River from about levee station 330+00 to 450+00, the Sacramento River from about 720+00 to 750+00 and Three Mile Slough from about 20+00 to 40+00 contains stretches which are below the PL 84-99 height standard (1.5 feet above 1:100 year flood event) and therefore are susceptible to overtopping. Figure 4-2 depicts levee flood protection levels for each individual section of the Sherman Island levees.

Figure 4-2 Level of Levee Flood Protection in Reclamation District 341



Source: Reclamation District 341 Five Year Plan (2009)

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and can protect against floods. The District Planning Team noted that the State of California has purchased the majority of the land on Sherman Island over the last several years with the intent of not developing the island. It's leased as grazing land or being converted back to natural habitat.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters

Past Occurrences

See the flood section of this document for a history of flooding and levee failure.

Vulnerability to Levee Failure

Assets at Risk

In addition to the costs incurred to repair or replace the assets destroyed by Sherman Island levee failure, an immediate cost would be pumping out the Island. To estimate the cost of restoring Sherman Island, the 2004 failure of the Upper Jones Tract was considered, an Island of 6,259 acres which cost approximately $120 million to restore. This equates to about $19,100 per acre, and assuming inflation of 4% a year, would be about $22,200 in 2009. Accordingly, it would cost approximately $221 million to pump out and restore Sherman Island (9,937 acres X $22,200 per/acre). This estimate is conservative in that it does not account for the elevations on the interior of Sherman Island, which are up to 20 feet below sea level. Sherman will likely impound a greater volume of water per acre than Upper Jones Tract, and per acre restoration costs will therefore be greater.

Electrical Infrastructure Affected

In addition to the dewatering costs, three major electric transmission lines (greater then 500kV) cross Sherman Island: the California Oregon Transmission Project, operated by the Western Area Power Administration, the Pacific Gas and Electric Company (PG&E) Table Mountain-Tesla line, and the PG&E Vaca-Dixon-Tesla line. These lines work mainly to interconnect California loads and generation with loads and generation in the Pacific Northwest. The three lines through the Delta are operated as a coordinated grouping, with maximum imports or exports limited to provide some joint redundancy to help ensure reliability.

The combined load on these three lines is typically around 4,000 MW, though under some circumstances it can be as high as 4,800 MW (Mirzadeh 2006). This is approximately ten percent of statewide summer loads, which is less than the required planning reserve margin of 15 percent. However, other outages may occur at the same time as this disruption, so under some circumstances the loss of all three lines due to the failure of the Sherman Island levee system could cause operating problems.

PG&E also operates two other lines with less than 500kV capacity to provide local service to Sherman Island and nearby Delta Islands. Failure of the Sherman Island levee system would impact the ability of PG&E to serve the local delta community. The DRMS report estimates the cost of a two-month outage of two 500 kV lines to be $42,000,000, which equates to $46,300,000 in 2016 dollars.

Oil and Gas Production Affected

Sherman Island has 60 natural gas and oil wells, and approximately 1,082 acres of gas and oil production fields. In addition, the levees protect 145,514 feet of a natural gas pipeline which originates in Canada and crosses Sherman Island. Failure of the Sherman Island levee system would interrupt gas service through the pipeline and gas production and storage occurring on Sherman Island.

Civil Infrastructure Affected

Sherman Island levees also protect State Highway 160 and the drawbridge at Three Mile Slough. State Route 160 connects Sherman Island to the mainland Sacramento County on the northeast corner via

Threemile Slough Bridge (Bridge 24-0121), and to Contra Costa County on the island's west side, via the Antioch Bridge (Bridge 28-0009). Failure of the Sherman Island levee system and resulting loss of State Route 160 and access to the Antioch Bridge would severely impact truck and vehicular traffic relying on this roadway. The Sherman Island Five Year Plan (2009) estimated that the closure of State Highway 160 would cost approximately $70,000 per day.

Sherman Island levees also provide a public benefit by maintaining water quality and water supply reliability for cities and farms in the San Francisco Bay area, San Joaquin Valley, and Southern California. Sherman Island is situated where fresh river water and salty bay water meet and mix. Under typical summer salinity conditions in the lower Sacramento River, salinity rises sharply in the area of Sherman Island. Consequently, the island's levees are critical to controlling salinity intrusion to the interior Delta. A levee break would increase the rate and area of mixing and would allow the saline bay water to move further upstream, jeopardizing the fresh water supply taken from the Delta for the Central Valley Project water supply, the State Water Project and the Contra Costa intake.

The presence of the western Delta islands, Sherman Island in particular, is believed to effectively inhibit the inland migration of the salinity interface between the Bay and Delta. If Sherman Island were to become permanently inundated with saline water, the water available to the massive pumping facilities near the Clifton Court Forebay might become too saline to use. The timing of levee breaks and flooding is critical in this regard. Fortunately, most flooding occurs in winter and spring, when major saltwater intrusion is less likely. However, there are occasional levee failures under low-flow conditions. These failures can cause major short-term water-quality problems, even if the flooded areas are later reclaimed. During one such incident, which occurred in summer of 1972, the Andrus Island levee failed, flooding an area slightly larger than Sherman Island. Salt concentrations in the central and western Delta quickly showed an increase up to six hundred percent. It took a large volume of extra reservoir releases to flush the salty water from the west Delta. The Andrus Island levee break may also have been a contributing factor in high mortality of juvenile bass that year. Similar impact could occur if one of Sherman Island's levees were to fail under low flow conditions.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards. The District Planning Team noted that the State of California has purchased the majority of the land on Sherman Island over the last several years with the intent of not developing the island. It's leased as grazing land or being converted back to natural habitat.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers

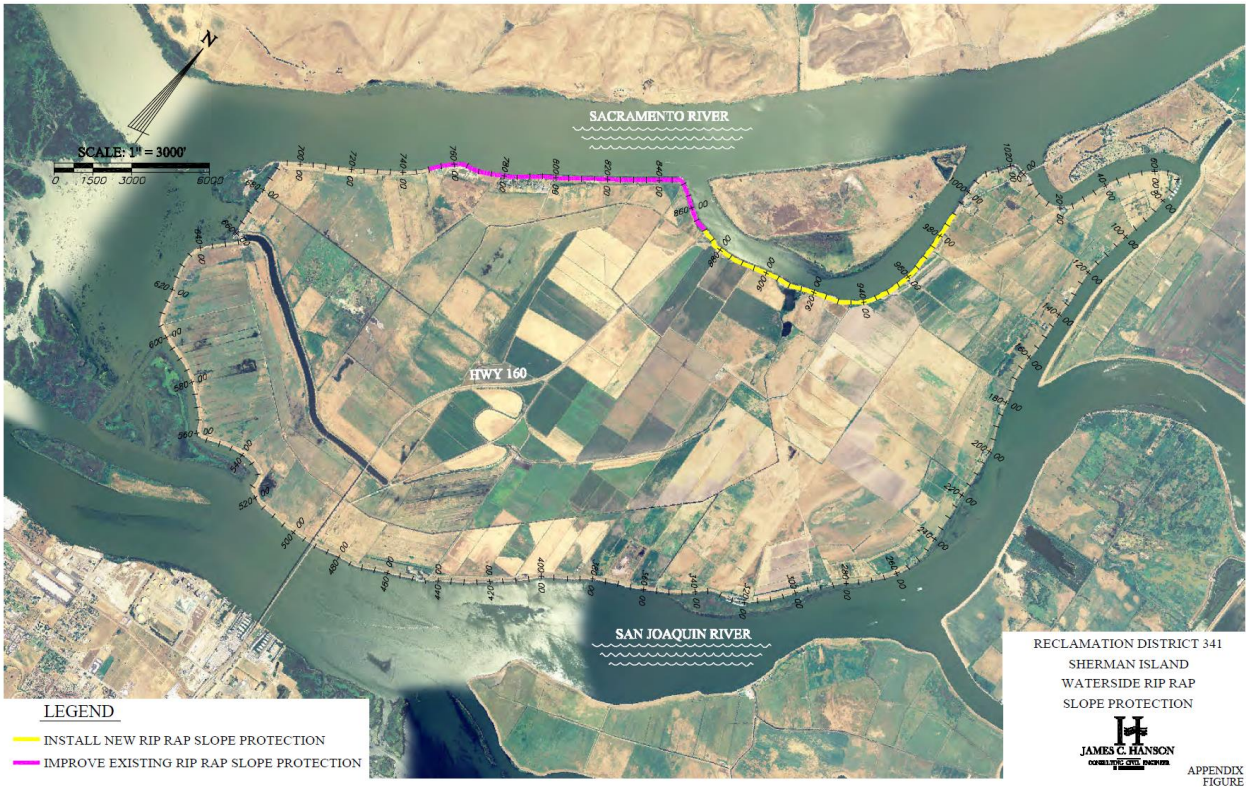
settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

Due to the public benefit provided by Sherman Island levees and the valuable local and non-local assets they protect, District employees conduct visual inspections of the Sherman Island levee system every day of the year. In addition, the superintendent, Board president and District engineer survey the levee a minimum of twice a month and participate in an annual inspection of the levee from the waterside. These inspections are invaluable for identifying issues such as seepage, cracking, erosion and lack of splash cap and riprap.

Past Occurrences

According to the District's Five Year Plan, levee erosion is an ongoing problem. Areas of the existing levee system most susceptible to failure due to flooding resulting from erosion are those areas with inadequate riprap protection. The large expanse of waterway of the Sacramento River adjacent to Sherman Island provides the necessary distance, or fetch, when accompanied by high winds can produce large waves. The existing rip rap protection lacks the required coverage of the waterside slope to protect the levee from wind generated waves. The existing large breakwater quarry stones and limited amount of rip rap are below the high tide level of the Sacramento River exposing the unprotected levee embankment material to wind generated erosion damage. High winds originating from the north during periods of high tide and/or high storm runoff will seriously erode the unprotected levee slope. Accordingly, the District feels that the lack of riprap slope protection is a critical issue which could affect the stability of the levee, should erosion damage occur.

Figure 4-3 Erosion Sites in Reclamation District 341 Levees



Source: RD 341 Five Year Plan (2009)

The District Planning Team noted that erosion is an ongoing issue, with varying levels of erosion occurring every year.

Vulnerability to Erosion

Assets at Risk

The entirety of the levee system in RD 341 is at risk to erosion.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and are protected from erosion. The District Planning Team noted that the State of California has purchased the majority of the land on Sherman Island over the last several years with the intent of not developing the island. It's leased as grazing land or being converted back to natural habitat.

4.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections:

regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

4.6.1. Regulatory Mitigation Capabilities

Table 4-4 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 341.

Table 4-4 RD 341's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	N	
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y	5-year plan, California DWR Emergency Safety Plan
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	

Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	Y	Erosion control measures on levee and canal slopes as necessary

4.6.4. Mitigation Education, Outreach, and Partnerships

Table 4-7 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 4-7 RD 341's Mitigation Education, Outreach, and Partnerships

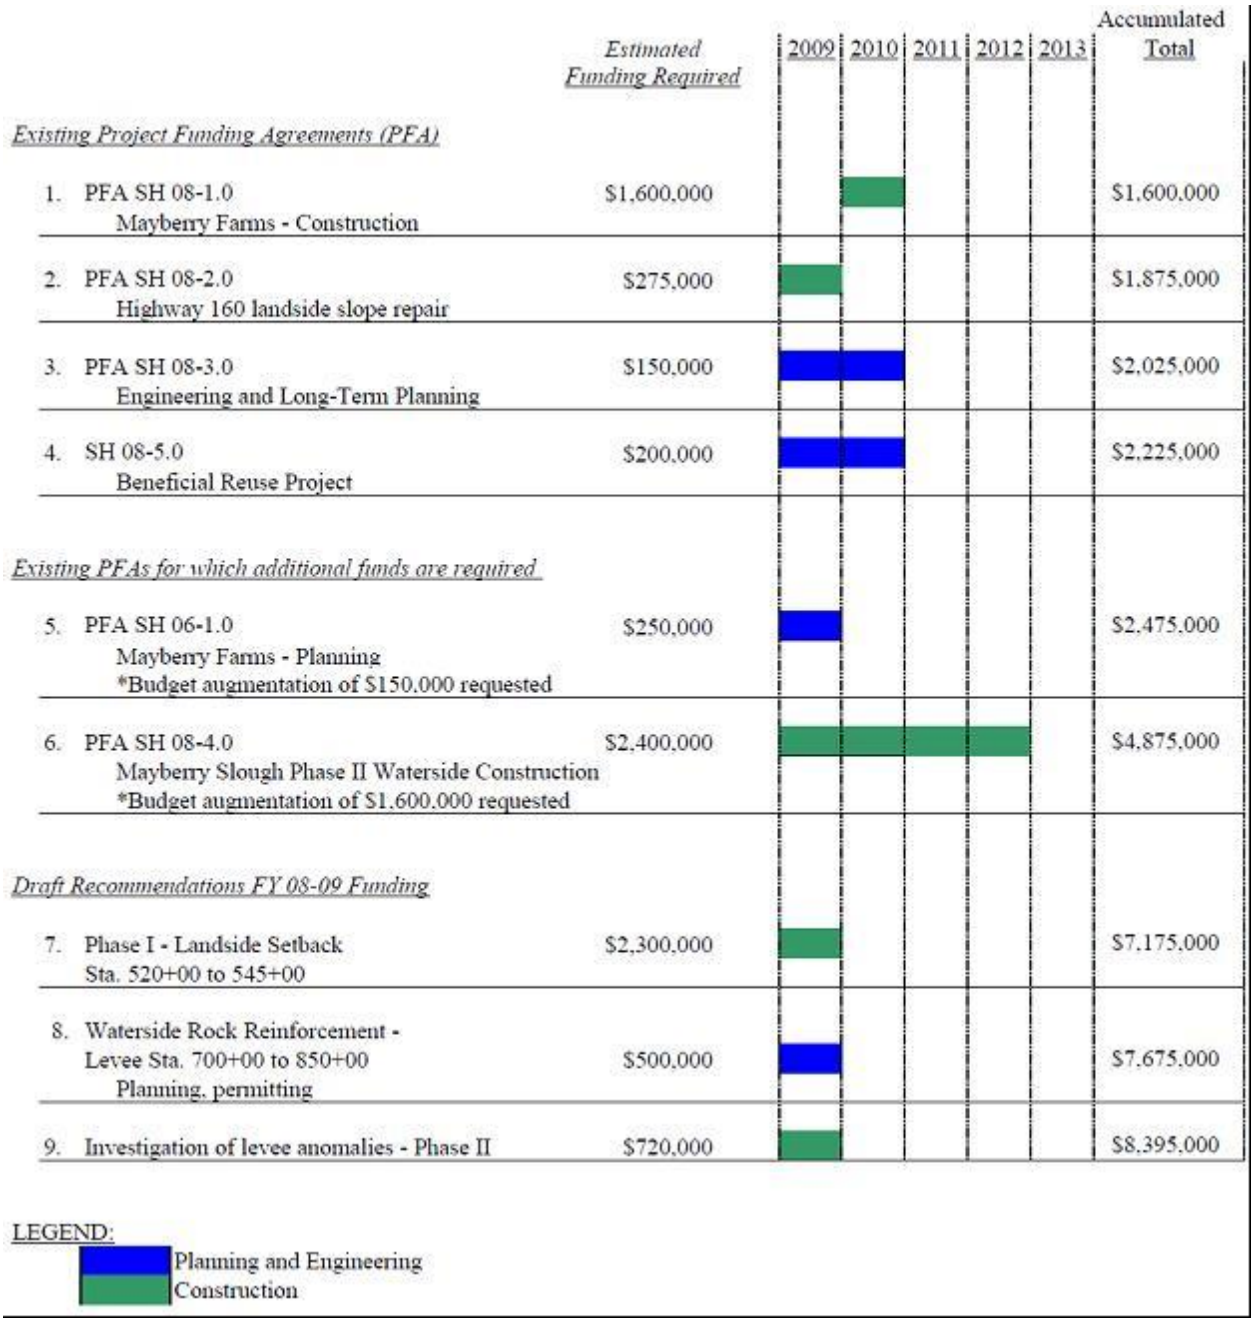
Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

4.6.5. Other Mitigation Efforts

RD 341 has completed the Scour Pond Habitat Enhancement and Levee Stability Project, Mayberry Farms Construction, both part of the District's Five Year Plan. The District has also continued its Levee Stability Monitoring Program.

The Reclamation District 341 5 Year Plan (2009) lists may mitigation projects and efforts. These are shown in Figure 4-4 and Figure 4-5.

Figure 4-4 Reclamation District 341 Strategy to Meet Desired Levels of Protection



Source: RD 341 Five Year Plan (2009)

Figure 4-5 Reclamation District 341 Strategy to Meet Desired Levels of Protection (cont.)

	Estimated Funding Required	2009	2010	2011	2012	2013	Accumulated Total
Projects Proposed for Consideration - 2010 and Beyond							
(Projects listed in order of priority)							
10 Waterside Rock Reinforcement - Levee Sta. 700+00 to 850+00 Construction, identification of mitigation requirements	$3,000,000						$11,395,000
11. Scour Pond Habitat Enhancement, Levee Stability Project, Planning/Permitting	$500,000						$11,895,000
Construction	$3,000,000						$14,895,000
12. Phase II - Landside Setback Sta. 520+00 to 535+00	$2,000,000						$16,895,000
13. San Joaquin River levee improvement and waterside habitat enhancement project	$10,600,000						$27,495,000
14. Waterside Rock Reinforcement - Levee Sta. 850+00 to 1027+00 and Sherman Lake habitat island Planning/permitting	$500,000						$27,995,000
Construction	$15,000,000						$42,995,000
15. Install Cross Levee Toe Berm Levee Sta. 660+00 - 690+00	$1,000,000						$43,995,000
16. Ecosystem Restoration - Expand Parcel 11 by 30 acres	$6,000,000						$49,995,000
17. Gather additional technical information Bathymetric surveys, geotechnical studies, lidar and commercial mapping.	$1,000,000						$50,995,000
18. Borrow Material Purchase Fund	$2,200,000						$53,195,000
19. Seepage Repair Program	$250,000						$53,445,000
20. Levee Stability Monitoring Program	$1,200,000						$54,645,000

4.7 Mitigation Strategy

4.7.1. Mitigation Goals and Objectives

RD 341 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

4.7.2. Mitigation Actions

The planning team for RD 341 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. San Joaquin River Setback Levee/Habitat Bench Multi-Benefit Project, Phase 1

Hazards Addressed: Levee Failure / Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: The existing levees on Sherman Island were constructed approximately 100 years ago, using sandy soil dredged out of the river. The construction of these historic levees were not engineered to modern standards and did not include concerted compaction efforts nor did it include screening out granular soils for the more preferred fine-grained soils. Historic boring logs show the levees to be comprised of sandy material over an organic silty/clayey foundation. Additionally, the levees were constructed adjacent to the river bank, limiting riparian and riverine habitat. Since the levees were constructed of sandy material and directly adjacent to the river, they are highly susceptible to seepage, erosion, and stability failures.

The setback levee will be designed and constructed to meet the minimum U.S. Army Corps of Engineers (USACE) Standard along with a 28-foot crest, 2H:1V waterside slope, 4H:1V landside slope. Prior to Project design, geotechnical investigations including borings and strength parameters will be performed to develop design criteria. The 28-foot crest will support a road built to required Sacramento County rural road standards which includes 12-foot travel lanes in each direction along with 2-foot shoulders.

Other Alternatives: None

Existing Planning Mechanisms through which Action will be Implemented: Delta Levees Program 2016 Projects Solicitation Package for Multi-Benefit Projects

Responsible Office: RD 341, RD 341 Engineer, California Department of Water Resources Delta Levees Program

Priority (H, M, L): High

Cost Estimate: $10,070,000

Potential Funding: Delta Levees Program

Benefits (avoided Losses): The Delta Risk Management Strategy (DRMS) July 16, 2008 Risk Analysis Report indicates that the Sherman Island levee system protects approximately $11,500,000 in local assets. Adjusted for inflation, the system currently protects $12,700,000 in local assets.

The levees also protect non-local assets which provide public benefit. Facilities which would be impacted by the failure of the levee system protecting Sherman Island are State Route 160, the water delivery systems for the State Water Project and the Central Valley Water Project, and utilities such as natural gas and major transmissions lines. The levee system also provides access to recreational resources such as fishing, windsurfing, and Sherman Island County Park. The proposed Project bolsters the Sherman Island levee system, thus providing benefit to local and non-local assets. In addition, Sherman Island is home to approximately 250 permanent residents. Levee system integrity protects the safety of these individuals and their property.

Schedule: Landside construction would occur during the 2018 construction season while awaiting issuance of the regularity permits. Waterside construction would occur during the 2019 construction season.

Action 2. Complete Projects from Regional Flood Management Plan

Hazards Addressed: Levee Failure, Flooding, Streambank Erosion

Goals Addressed: 1, 2, 3, 4

Issue/Background: Sherman Island has similar issues to the other communities in the region. Its primary issues however, are related maintenance activities.

Project Description: There are four erosion sites along the Sacramento River identified in the FSRP. These erosion sites can be improved through the construction of a bank protection project along Cache Slough. The project will rehabilitate the waterside bank from levee mile 4.12 and 6.09, a total rehabilitated length of 1,994 feet.

Other Alternatives: None

Existing Planning Mechanisms through which Action will be Implemented: Regional Flood Management Plan

Responsible Office: RD 341, RD 341 Engineer

Priority (H, M, L): High

Cost Estimate: $2,261,136

Potential Funding: Cal DWR Grant

Benefits (avoided Losses):

Schedule: As soon as funds are available.

Delta Annex Chapter 5 Reclamation District 369

5.1 Introduction

This new chapter to the Delta Annex details the hazard mitigation planning elements specific to the Reclamation District 369 (RD 369), a new 2016 participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by RD 369. This chapter of the Delta Annex provides additional information specific to RD 369, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

5.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 369 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 5-1. Additional details on plan participation and RD 369 representatives are included in Appendix A.

Table 5-1 RD 369 Planning Team

Name	Position/Title	How Participated
Clarence Chu	Landowner/Locke Town Board	Attended meetings, provided data and information, reviewed draft documents
Jeanine Foster	Foster Morrison Consulting, Principal	Interviewed Mr. Chu, developed Annex drafts, coordinated meeting attendance and input on draft documents with Mr. Chu
Chris Ferrari	GEI Consultants, Senior Engineer	Interviewed Mr. Chu for related ESP project, provided input to Annex, including text and maps

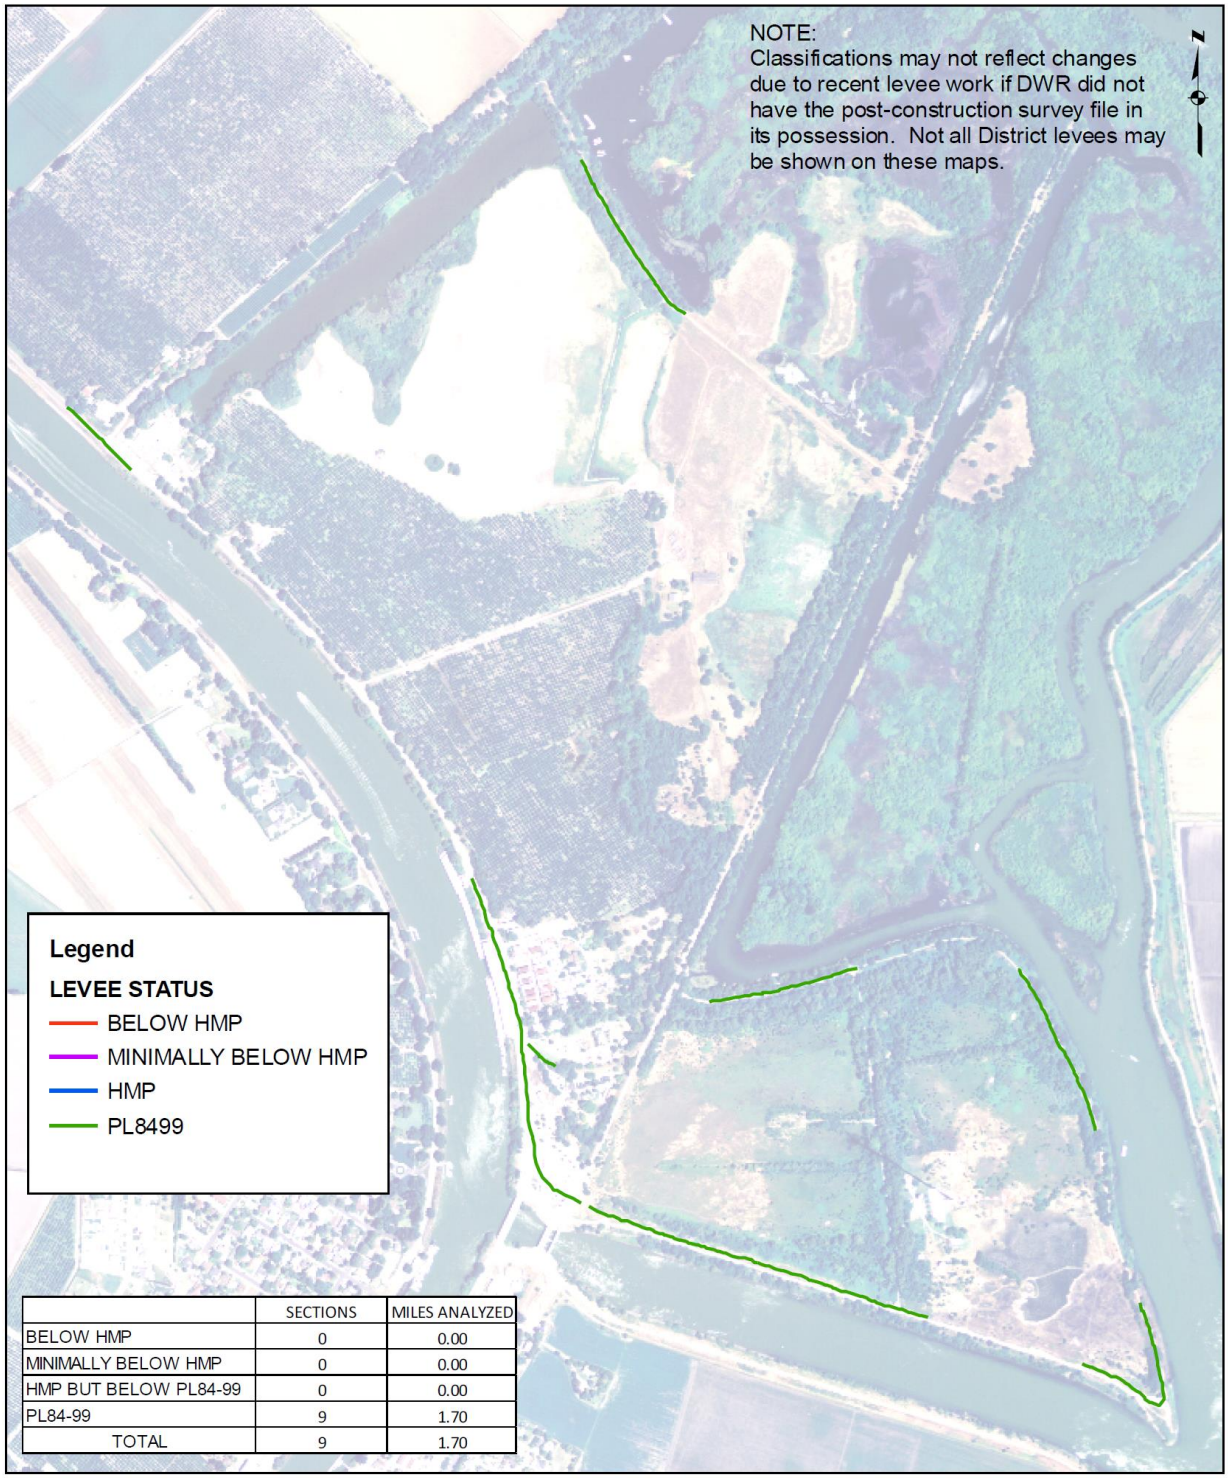
5.3 Community Profile

The community profile for RD 369 is detailed in the following sections. Figure 5-1 displays a map and the location of RD 369 boundaries within Sacramento County.

Figure 5-1 Reclamation District 369 Map



Source: RD 369

5.3.1. RD 369 Overview

Reclamation District No. 369 (RD 369), also known as Libby McNeil, is located in the Northern Delta, near the town of Walnut Grove and the Delta Cross Channel to the South, route 160 and the Sacramento River to the west, Snodgrass Slough to the east, and the Meadows waterway to the North.

The town of Locke is south on the edge of RD 369 border. The District staff consists of a landowner and a journey worker. The District is responsible for maintenance, repair, and improvements of Snodgrass Slough and Meadow Slough levees; Maintenance Area 9 (MA-9) is responsible for the levee maintenance, repair, and improvements along the left bank of the Sacramento River protecting the land under the District jurisdiction. Maintenance Areas take over in providing the maintenance on federal flood control levees. MA-9 is the only flood control Maintenance Area in the Sacramento County which the CVFPB governs. The district is also responsible for the drainage system providing flood protection. Additionally, the District maintains canals and ditches that provide drainage to the property owners. The levees protect about 586 acres of predominantly agricultural land from flooding; the primary orchard grown on the island is pear; there is also irrigated pasture for cattle and goats. According to the 2000 census, there are 20 households and with a population of 52 people. The island's current assets are estimated to be worth about $19.3 million.

According to Mr. Chu, the leveed area under the jurisdiction of RD 369 includes an approximate one mile stretch on the Sacramento River side, and a smaller area to the east of the District. RD 369's primary responsibility is to maintain the vegetation along the levee. This consists of using goats to eat down the vegetation and a semi-annual spraying. Cal DWR provides inspections to ensure adequate maintenance of vegetative areas.

5.3.2. District History and Background

Mr Clarence Chu, purchased the original 490 acres which housed the Town of Locke and RD 369 in the 1977 from the Locke heirs. Since then, approximately 200 acres was sold to the state for use as the Delta Meadows State Park and another 10 acres comprising the Lock Townsite was sold in 2002 to the Sacramento County Housing and Redevelopment Agency, which later sold the land back to the existing townsite building owners. Mr. Chu currently owns an approximate 280 acres which is primarily used for agricultural purposes, some of which is orchards, farmed by himself and some leased out for farming by others.

The Town of Locke, now the Locke Historic District, was built in 1915 by Chinese immigrants from Heungshan County in Guangdong Province, China. The Locke Historic District is the largest, most complete example of a rural, agricultural Chinese American community in the United States.

5.4 Hazard Identification

RD 369's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 369 (see Table 5-2).

Table 5-2 RD 369—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Significant	Highly Likely	Critical	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Extensive	Likely	Limited	Low
Dam Failure	Limited	Unlikely	Negligible	Low
Drought and Water Shortage	Extensive	Occasional	Critical	Medium
Earthquake	Extensive	Occasional	Limited	Low
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium
Flood: 100/200/500-year	Extensive	Occasional/Unlikely	Catastrophic	High
Flood: Localized Stormwater Flooding	Significant	Occasional	Limited	Low
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Extensive	Likely	Limited	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Significant	Highly Likely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Negligible	Low
Severe Weather: Fog	Extensive	Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Critical	Medium
Severe Weather: Wind and Tornadoes	Extensive	Likely	Limited	Medium
Subsidence	Extensive	Occasional	Limited	Low
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Significant	Likely	Critical	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

5.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 369's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 369 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

5.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 5.5.3, includes a description as to how the hazard affects RD 369 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

5.5.2. Vulnerability Assessment

This section identifies RD 369's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 5-3 lists particular critical facilities and other District assets identified by RD 369's planning team as important to protect in the event of a disaster. RD 369's physical assets consist of the buildings and infrastructure to support RD 369 operations.

Table 5-3 RD 369's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Locke Ranch Ag Buildings and Infrastructure			$300K	Most structures built on high ground

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
3 pumps (drinking water, water from river, water to river)			Unknown	
Locke Property Orchards and Open Farmlands			Unknown	
Assets owned by others				
Levees			Unknown	
Locke Town Assets: Residential and Commercial Buildings			$1M	

Source: RD 369

Natural Resources

According to the 2014 Lower Sacramento/Delta North Regional Flood Management Plan, this Region, which included RD 369, has significant natural resources such as: aquatic habitats, wetlands, riparian habitats, and wildlife foraging areas. Many of the more than 500 species of native plants and wildlife found in the Central Valley rely, to some extent, on habitat existing within the Region. Examples include the remnant riparian vegetation located along the banks of the Sacramento and American rivers, and along the tributaries of these major rivers. Agricultural areas within the Region also provide valuable habitat including wintering waterfowl within flooded rice fields and Swainson's hawk foraging habitat within alfalfa fields.

Also, within RD 369, the State of California operates the approximately 200 acre Delta Meadows State Park which contains valuable natural and habitat areas essential for many plant and wildlife species.

Historic and Cultural Resources

The Locke Historic District, which is comprised of the Town of Locke, was listed on the National Register of Historic Places on May 6,1971 and was further designated a National Historic Landmark District on December 14, 1990 due to its unique example of a historic Chinese American rural community.

Growth and Development Trends

From its purchase in 1977, RD 369 was predominantly owned by one landowner, until its sell of the Town of Lock to the County in 2002 and its sale of approximately 200 acres to the State for the Delta Meadows State Park. The Town was later sold by the County to the residents that had been living in the town. . Due to Lock's designation as a historic district, new development is not allowed. The District Planning Team notes that there has been no growth and/or development in the District in recent years with no planned development in the near future.

5.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 5-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 369 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable District assets include the pump stations that the District owns. Other important assets include the Town of Locke and the agricultural lands and structures.

An estimate of the vulnerability of RD 369 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Drought and Water Supply

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Severe and extended drought conditions could impact irrigation for agricultural operations which could affect the District's ability to finance the ongoing maintenance of District Levees. The residents and businesses could be impacted by drought but it is unlikely due to senior water rights and a prioritization system that puts municipal water at a higher priority than agriculture.

Past Occurrences

Although California did recently experience an extended drought, agriculture in this District remained largely unaffected due to senior water rights and riparian water rights. The District Planning Team also noted that even with recent drought conditions, no water conservation restrictions were implemented; water supply within the District has remained constant.

Vulnerability to Drought and Water Supply

Assets/Critical Facilities at Risk

The agricultural operations and orchards are at risk to a prolonged drought; however as mentioned water supply for all uses has not been an issue in the District

Natural Resources at Risk

All natural resources could be affected by severe drought conditions. Extended droughts can destroy habitat areas within the District.

Historic and Cultural Resources at Risk

The residents and businesses of the Locke Historic District is at potentially at risk to extended drought conditions. However, it is unlikely due to senior water rights and a prioritization system that puts municipal water at a higher priority than agriculture.

Future Development

No future development is planned for RD 361. Development in the Town of Lock is limited due to its historic district designation. There are no known development plans for the remaining agricultural land and operations and state park.

Earthquake Liquefaction

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Earthquake vulnerability is primarily based on population and the built environment. Urban areas in high seismic hazard zones are the most vulnerable, while uninhabited areas are less vulnerable.

Ground shaking is the primary earthquake hazard. Many factors affect the survivability of structures and systems from earthquake-caused ground motions. These factors include proximity to the fault, direction of rupture, epicenter location and depth, magnitude, local geologic and soils conditions, types and quality of construction, building configurations and heights, and comparable factors that relate to utility, transportation, and other network systems. Ground motions become structurally damaging when average peak accelerations reach 10 to 15 percent of gravity, average peak velocities reach 8 to 12 centimeters per

second, and when the Modified Mercalli Intensity Scale is about VII (18-34 percent peak ground acceleration), which is considered to be very strong (general alarm; walls crack; plaster falls).

In the event an earthquake is intense enough to result in shaking that could cause the sandy soils to liquefy, the levees could resettle, move off their foundations and possibly fail. Failure could compromise the levee system and result in flooding.

Past Occurrences

There is no known history of earthquake liquefaction in the District. The most recent Napa Earthquake in 2014 did not result in any damages to District Assets.

Vulnerability to Earthquake Liquefaction

Assets/Critical Facilities at Risk

The levees, pump stations and residential and commercial structures in the Town of Locke are potentially at risk to an earthquake.

Natural Resources at Risk

All natural resources could be affected by flooding resulting from an earthquake event that caused failure of the levees or pump stations. Flooding destroys habitat and kills most terrestrial species present.

Historic and Cultural Resources at Risk

The entire Locke Historic District is at risk to a damaging earthquake whether resulting from ground shaking alone or ground shaking combined with liquefaction. With much of the town being constructed in the early 1900's, there is little protection against a damaging earthquake event.

Future Development

No future development is planned for RD 361. Development in the Town of Lock is limited due to its historic district designation. There are no known development plans for the remaining agricultural land and operations and state park.

Flood: 100/200/500-year

Likelihood of Future Occurrence–100-year: Occasional; 200-/500-year: Unlikely
Vulnerability–High

Hazard Profile and Problem Description

RD 369 is surrounded by numerous waterways, including the Sacramento River, the Delta Cross Channel, Snodgrass Slough and the Meadows waterway. Flooding of any of these waterways could cause problems for the District.

Past Occurrences

The District Planning Team noted that there has been no historic flooding to District lands. The closet the District came to flooding was during the 1995/96 floods when nearby areas were impacted, but the District was spared.

Vulnerability to Flood

Assets/Critical Facilities at Risk

All of RD 369 is at risk to a significant flood event. Flooding of RD 369 could potentially impact the District owned assets, including agricultural operations, and the residential and commercial structures comprising the Town of Locke. Levee structures could also be damaged from flood waters and extensive flooding could create a life safety issue to area residents and visitors. The District Planning Team noted that if their pumps were damaged or failed during a flood, it would put the District at significant risk of substantial flooding.

Flooding of Delta islands also has the potential to negatively impact water quality both locally and statewide. The largest of California's drinking water sources is the Sacramento-San Joaquin Delta and its tributaries. The Delta provides water throughout the state via the State and Federal water projects. During a flood, there is a higher potential for the waters in the Delta to be exposed to chemicals, fuel, oil, and multiple other constituents of concern that can quickly degrade water quality. Flooding can also disturb soil and soil-borne materials such as mercury and organic matter that can degrade water quality.

Should a flood breach the levees, the entirety of the assets of RD 369 would be at risk. Levee failure is discussed later in this section. Flooding also causes erosion, which is also discussed later in this section.

Natural Resources at Risk

Flooding of the Delta region can destroy habitat, kill terrestrial animals caught in the flood zones, and can entrain and strand large populations of fish species.

Historic and Cultural Resources at Risk

The entire Locke Historic District is at risk to damaging floods.

Future Development

No future development is planned for RD 361. Development in the Town of Lock is limited due to its historic district designation. There are no known development plans for the remaining agricultural land and operations and state park.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–Extremely High

Hazard Profile and Problem Description

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters

Past Occurrences

Historically, flooding in the Delta has resulted from levee failures caused by the separate or coincidental occurrence of very high tides and high stream outflow through the delta region. Strong onshore winds associated with low pressure storms aggravate flood potential by causing an additional rise of the water surface elevations, and can cause severe erosion on levees in a short period of time. Flood events resulting from high tides and/or high stream outflow cannot be reliably predicted, but should be expected to occur in the future. Levee failures from collapse of rodent dens, seepage, falling trees, or some other mechanical failure are unpredictable and relatively uncommon. Routine levee inspections are the primary protection against these types of levee failure events. It should be noted that since 1986, significant portions of the levee system within the Legal Delta have been rehabilitated and improved, which has resulted in an overall reduction in the number of flooded islands during post-1986 Delta flood threats.

The District Planning Team noted that there have been no levee failures of RD 369 during his ownership since 1977.

Vulnerability to Levee Failure

The primary threats to Delta levees are high water surface elevations from floods or high tides, wave action due to high winds or boat wakes, and rodent damage, either as individual actions or in combination. Levees that may have structural issues involving poor foundations, inadequate geometry or other geotechnical issues can be at a higher risk of failure from any of the primary threats. Subsidence of Delta lands has been reported to be a major risk to Delta levees, however, subsidence is limited or non-existent under and adjacent to the levees as those areas have consolidated over the last fifty years and oxidation of the peat foundations is limited because it is not farmed. Subsidence in general is limited to a very small percentage of the delta. Seismic risk is always a factor for California, but it is generally thought by Delta engineers to have been overstated in the DRMS study, and therefore is not something that is currently designed for, although, any levee improvements will help to mitigate that risk. Climate change and sea level rise have also been identified as issues for levee vulnerability. Because these impacts will occur over long periods of time, it should not be an overwhelming problem to address them as they occur.

Assets/Critical Facilities at Risk

Should the levees fail, all District assets would be at risk.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

Should a levee failure occur, the Locke Historic District would be at risk.

Future Development

No future development is planned for RD 361. Development in the Town of Lock is limited due to its historic district designation. There are no known development plans for the remaining agricultural land and operations and state park.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous

amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

Past Occurrences

The District Planning Team was unaware of specific instances of erosion. However, it was noted that erosion is an ongoing occurrence and that repairs to the levee's rock slope protection areas are periodically made.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

The entirety of the levee system in RD 369 is at risk to erosion.

Natural Resources at Risk

Erosion within RD 369 should not have significant impacts to natural resources, except to the extent erosion leads to significant flooding.

Historic and Cultural Resources at Risk

The Locke Historic District should not be affected by erosion of the leveed areas, except to the extent erosion leads to significant flooding.

Future Development

No future development is planned for RD 361. Development in the Town of Lock is limited due to its historic district designation. There are no known development plans for the remaining agricultural land and operations and state park.

Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning)

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the District. Damage and disaster declarations related to severe weather for the Sacramento County Planning Area have occurred and will continue to occur in the future.

Past Occurrences

The following severe weather events in the Delta area were noted:

- 1986 – Due to the extreme storm event, multiple days of heavy rain, strong winds from extreme low pressure gradients, high tides and runoff affecting the entire Sacramento-San Joaquin Delta.
- 1997 – A series of large storms that produced heavy rain and high winds caused heavy runoff and high tide conditions that impacted the entire Sacramento – San Joaquin Delta region.

However, there were no identified damages to RD 369 from these events.

Vulnerability to Heavy Rains and Storms

Assets/Critical Facilities at Risk

Heavy rain and thunderstorms are the most frequent type of severe weather occurrence in the area. Wind and lightning often accompany these storms and have caused damage in the past. Problems associated with the primary effects of severe weather include flooding, pavement deterioration, washouts, high water crossings, landslide/mudslides, and downed trees. However, it is the secondary effects of heavy rain and storms that are of concern to RD 369. Heavy rains can cause flooding, levee failure, and stream bank erosion. The District noted that in the past when the system starts to become overwhelmed due to heavy rains, additional, temporary pumps have been brought in to assist.

Natural Resources at Risk

The District Planning Team noted that any resulting flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The entire Locke Historic District is at risk to damaging floods resulting from heavy rains.

Future Development

No future development is planned for RD 361. Development in the Town of Lock is limited due to its historic district designation. There are no known development plans for the remaining agricultural land and operations and state park.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather (including high winds) is an annual occurrence in the District. Tornadoes occur much less frequently. Damage related to high winds have occurred in the District

and will continue to occur in the future. Primarily, within the District, high winds cause increased wave action which act to erode the levees.

Past Occurrences

The following high wind events were noted within the Delta area:

- 1986 – Due to the extreme storm event, multiple days of heavy rain, strong winds from extreme low pressure gradients, high tides and runoff affecting the entire Sacramento-San Joaquin Delta.
- 1997 – A series of large storms that produced heavy rain and high winds caused heavy runoff and high tide conditions that impacted the entire Sacramento – San Joaquin Delta region.

Vulnerability to Wind and Tornadoes

Assets/Critical Facilities at Risk

The District Planning Team noted that the entire levee structures are at risk from wind. Other district assets may also be at risk depending on severity of wind event.

Natural Resources at Risk

The District Planning Team noted that all natural resources are at risk if wind caused levee failure in the District.

Historic and Cultural Resources at Risk

The entire Locke Historic District is potentially at risk to damaging winds.

Future Development

No future development is planned for RD 361. Development in the Town of Lock is limited due to its historic district designation. There are no known development plans for the remaining agricultural land and operations and state park.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Wildfire and urban wildfire are an ongoing concern for Sacramento County. Generally, the fire season extends from early spring to late fall. Fire conditions arise from a combination of hot weather, an accumulation of vegetation, and low moisture content in the air. These conditions when combined with high winds and years of drought increase the potential for a wildfire to occur. The Delta area can be extremely vulnerable to fires as a result of dense grassy vegetation combined with a growing number of structures and human activity in the region. RD 369 contains large areas of open grasslands that are a potential fuel source. The wooden construction of much of the town also contributes to the potential for a damaging fire. Any ignition has the chance to become an out of control wildfire.

Past Occurrences

Although not specifically a wildfire, on July 3, 2016, a fire erupted on the second floor of the Locke Country Store and two adjacent apartments located on Main Street. The fire resulted in the complete destruction of the second floor of the building and a building behind the store. There were no injuries. It should be noted that in 2004, when the County sold the land to the residents of Locke, numerous upgrades were made that include upgrades to water and sewer systems and the installation of overhead sprinklers which prevented the fire from spreading to other structures.

Vulnerability to Wildfire

Assets/Critical Facilities at Risk

All District owned and non-owned assets are at risk from wildfire.

Natural Resources at Risk

All natural resources are at risk from wildfire.

Historic and Cultural Resources at Risk

The Locke Historic District is at risk from wildfire.

Future Development

No future development is planned for RD 361. Development in the Town of Lock is limited due to its historic district designation. There are no known development plans for the remaining agricultural land and operations and state park.

5.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

5.6.1. Regulatory Mitigation Capabilities

Table 5-4 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 369.

Table 5-4 RD 369's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	An Emergency Safety Plan is under development for this District.
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year: County Code
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	

Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 369

5.6.2. Administrative/Technical Mitigation Capabilities

Table 5-5 identifies the department(s) responsible for activities related to mitigation and loss prevention for RD 369.

Table 5-5 RD 369's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	Y	Established for this plan
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	A vegetation maintenance program is in place for the levees. This involves using goats to eat down the weeds and spraying the vegetation twice annually.
Mutual aid agreements	Y	
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	N	
Community Planner	N	
Civil Engineer	N	
GIS Coordinator	N	

Other	
Technical	
Warning systems/services (Reverse 911, outdoor warning signals)	N
Hazard data and information	N
Grant writing	N
Hazus analysis	N
Other	
How can these capabilities be expanded and improved to reduce risk?	

Source: RD 369

5.6.3. Fiscal Mitigation Capabilities

Table 5-6 identifies financial tools or resources that the RD 369 could potentially use to help fund mitigation activities.

Table 5-6 RD 369's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	N	
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	N	
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 369

5.6.4. Mitigation Education, Outreach, and Partnerships

Table 5-7 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 5-7 RD 369's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

5.6.5. Other Mitigation Efforts

The District is responsible for levee maintenance. The District uses goats to maintain the vegetation on the levees. The District also sprays the vegetation semi-annually for additional vegetation control.

5.7 Mitigation Strategy

5.7.1. Mitigation Goals and Objectives

RD 369 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

5.7.2. Mitigation Actions

The planning team for RD 369 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Pump Station Upgrades and Backup Generators

Hazards Addressed: Flooding, Levee Failure, Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: The District maintains three pump stations: one for drinking water, one to pump water out of the land area, and one to pump from the waterway. In times of heavy storms, additional pumps have been brought in in order to effectively pump the large volumes of water. New pumps of increased capacity/power would be more effective when the current system is stressed and limit the need for temporary pumps. Backup generators would also be effective in establishing a constant power source to prevent flooding resulting from a failure of the current system.

Other Alternatives: Maintain status quo

Existing Planning Mechanisms through which Action will be Implemented: none

Responsible Office: RD 369 owner

Priority (H, M, L): High

Cost Estimate: To be determined

Potential Funding: HMGP, PDM

Benefits (avoided Losses): Property and Natural Resource Protection and Life Safety. New pumps and backup generators would improve the ability to pump during periods of heavy rain to limit any flood related damages to property and natural and historic resources and better protect local residents.

Schedule: 1-3 years

Action 2. Levee Maintenance Program Improvements

Hazards Addressed: Flooding, Levee Failure, Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: According to the Lower Sacramento/Delta North Regional Flood Management Plan, their primary District issues are related to maintenance activities. It is recommended that RD 369 focus on vegetation and rodent control, seepage control, bank protection/erosion control, access road maintenance, and encroachment repairs and modifications.

Other Alternatives: Maintain status quo

Existing Planning Mechanisms through which Action will be Implemented: to be determined

Responsible Office: RD 369 owner

Priority (H, M, L): High

Cost Estimate: To be determined

Potential Funding: HMGP, PDM, DWR grants

Benefits (avoided Losses): Property and Natural Resource Protection and Life Safety.

Schedule: 1-3 years

Delta Annex Chapter 6 Reclamation District 551

6.1 Introduction

This new chapter to the Delta Annex details the hazard mitigation planning elements specific to the Reclamation District 551 (RD 551), a new 2016 participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by RD 551. This chapter of the Delta Annex provides additional information specific to RD 551, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

6.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 551 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 6-1. Additional details on plan participation and RD 551 representatives are included in Appendix A.

Table 6-1 RD 551 Planning Team

Name	Position/Title	How Participated
Gilbert Cosio	District Engineer	Attended meetings and workshops; reported to the District; compiled data for this annex; review draft documents
Topper van Loben Sels	District President	Briefed in Sacramento County LHMP

6.3 Community Profile

The community profile for RD 551 is detailed in the following sections. Figure 6-1 displays a map and the location of RD 551 boundaries within Sacramento County.

Figure 6-1 Reclamation District 551 Map

	SECTIONS	MILES ANALYZED

6.3.1. RD 551 Overview, History, and Background

Reclamation District No. 551, Pearson District (District), is the local public entity that provides flood protection in the form of levee maintenance and drainage to the landowners of Pearson District. The District operates and maintains all the levees that protect the landowners. As described in Division of Water Resources, (currently known as Department of Water Resources) Bulletin No. 37, published in 1930, the District is described as protecting 8,800 gross acres, with a net protected area of 8,537 acres, within Sacramento County.

The District originally built the project levee along the Sacramento River (6.85 miles); USACE, under authority of the SRFCP, rebuilt portions of the levee. This is the levee recognized by both the state and federal governments as the primary flood protection levee, as part of the SRFCP. The District built the non-project levee along Snodgrass Slough (5.91 miles) to its present design in the 1920s. There are also 1.37 miles of non-project cross levee, adjacent to the Delta Meadows State Park.

The District does not supply water, which is the responsibility of the individual landowners; however, the District maintains 37.97 miles of canals and ditches that provide drainage to the property owners. These ditches and canals are fed by farmer ditches, which are designed by the landowner to drain their property adequately. Once the drain water enters the District's ditches and canals, water is removed at pumping plants located at one location on Pearson District.

Land use is predominantly agricultural, aside from the small town of Courtland. Orchards (including pears, apples, and cherries), vineyards, alfalfa, grain, and miscellaneous row crops are the primary crops. The historic town of Courtland is the largest residential area on the District. There are an estimated 636 residents within the District. Courtland has a sewage treatment plant operated by Sacramento County. There are public roads running along the entire length of the Sacramento River levee.

The District has no major land use changes, although there are statewide planning efforts that if carried out could require major land use changes, affecting all aspects of the District operation and maintenance of the levee and drainage system.

Interior ground elevations slope toward the center of the District. Interior ground elevations range from 12 feet (toe of Sacramento River levee) to -12 NGVD within the District interior. Top of levee elevations range from 19.0 to 27.5 feet national geodetic vertical datum (NGVD) along the non-project back levee, and 24.9 to 26.2 feet NGVD along the project levee (left bank of Sacramento River). The low elevation of 19.0 on the non-project levee is located at Lambert Road, still over 2.0 feet above the 100-year flood elevation. Except for this and two other road crossings, the non-project levee generally has over 6 feet of freeboard above the 100-year flood elevation.

Reclamation is one of the first forms of public improvement in California, with the early focus on reclaiming "swamp and overflowed" lands granted to the state under the Federal 1850 Arkansas Act. The term reclamation primarily encompasses flood control and drainage, but has also long included irrigation.[1] To

[1] Hershey v. Reclamation Dist. No. 108, 200 Cal. 550, 567-68 (1927).

help local landowners reclaim the swamp and overflowed lands, the state adopted a series of statutes authorizing them to form local reclamation and levee districts. The area of a proposed district was outlined in a formation petition presented to a state or county board, which would order a district to be formed after a majority vote of the affected landowners. Beginning in 1861, the Board of Swamp Land Commissioners issued the orders organizing reclamation and levee districts. Beginning in 1867, districts were organized under the Green Act by county boards of supervisors. (Stats. 1867-8, c. 415.) A few reclamation districts were also created by special act of the legislature. (See, e.g., Stats. 1911, c. 100 (RD 900).) Regardless of how they were formed, reclamation districts now operate under Water Code Division 15, § 50000 et seq., and levee districts under Division 19, § 70000 et seq. (See also Stats. 1911, c. 100, § 2.)

As reclamation districts were formed under the above noted laws, they were given numbers sequentially. Pearson District formed in 1893, and was given the number "551." The area protected by the District has remained the same for essentially the entire time of its existence.

Starting in the 1940s, USACE improved the Sacramento River levee is a flood control structure to meet the federal design standard. To satisfy the conditions of federal involvement in such projects, the Central Valley Flood Protection Board (CVFPB) agreed to operate and maintain the Sacramento River levee. USACE transferred the District levee, as part of Unit No. 111, completely over to CVFPB, formerly the State Reclamation Board, in September 1955. Under Section 8618 of the Water Code, reclamation districts are authorized to establish agreements with the CVFPB to perform these actions for the state. The District is required to maintain and operate the levees to meet the standards as listed in the Supplemental Operation and Maintenance Manual.

6.4 Hazard Identification

RD 551's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 551 (see Table 6-2).

Table 6-2 RD 551—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Extensive	Occasional	Limited	Low
Bird Strike				
Climate Change	Extensive	Occasional	Limited	Low
Dam Failure	Limited	Unlikely	Negligible	Low
Drought and Water Shortage	Extensive	Occasional	Critical	Low
Earthquake	Extensive	Occasional	Limited	Medium
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Extensive	Likely	Limited	High
Landslides				
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Significant	Highly Likely	Catastrophic	High
Severe Weather: Extreme Temperatures – Cold/Freeze				
Severe Weather: Extreme Temperatures – Heat				
Severe Weather: Fog				
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Significant	Likely	Critical	Medium
Severe Weather: Wind and Tornadoes				
Subsidence				
Volcano				
Wildfire:(Burn Area/Smoke)				

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area
Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid
Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

6.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 551's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 551 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

6.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 6.5.3, includes a description as to how the hazard affects RD 551 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

6.5.2. Vulnerability Assessment

This section identifies RD 551's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 6-3 lists particular critical facilities and other District assets identified by RD 551's planning team as important to protect in the event of a disaster. RD 551's physical assets, valued at over $4 million, consist of the buildings and infrastructure to support RD 551 operations.

Table 6-3 RD 551's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Pumps – Snodgrass Slough	Drain Pumps		$2,000,000	
Pumps – Lake	Drain Pumps		$1,000,000	

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
District Owned Facilities	Home, Buildings & Equipment		$2,000,000	

Source: RD 551

Natural Resources

In the past, RD 551 has protected a number of natural gas wells. Currently, there are no wells in operation on Pearson District. RD551's levees support vegetation that provide fish and wildlife habitat. Agricultural ground and ditches also support wildlife.

Historic and Cultural Resources

Since the land has been settled for over 150 years, there are many historic structures on Pearson District.

Growth and Development Trends

Pearson District is within the Primary Zone of the Delta. Therefore, in addition to Sacramento County, development is controlled by a State agency, the Delta Protection Commission. Therefore, there is little, if any, potential for growth beyond that allowed by agricultural zoning.

6.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 6-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 551 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County planning area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable District assets include the levees and supporting structures that the District owns. As stated, above, RD 551 levees and drainage provide protection to over $89,000,000 in assets as estimated by the Delta Risk Management Strategy report.

An estimate of the vulnerability of RD 551 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.

- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Earthquake and Earthquake: Liquefaction

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

In Sacramento County, the Delta (including RD 551) is at risk to liquefaction. The Delta sits atop a blind fault system on the western edge of the Central Valley. Moderate earthquakes in 1892 near Vacaville and in 1983 near Coalinga demonstrate the seismic potential of this structural belt. The increasing height of the levee system has prompted growing concern about the seismic stability of the levees. The concern is based on the proximity of faulting, the nature of the levee foundations, and the materials used to build the levees. Many levees consist of uncompacted weak local soils that may be unstable under seismic loading. The presence of sand and silt in the levees and their foundations indicates that liquefaction is also a possibility.

Past Occurrences

The District Planning Team noted no past occurrences of earthquake that have affected the District.

Vulnerability to Earthquake and Liquefaction

Although there have been no significant quakes in or closely adjacent to the Delta since high levees were originally constructed, there are at least five major faults within the vicinity of the Delta capable of generating peak ground acceleration values that would likely lead to levee failures. Should the levees that protect RD 551 fail, the dewatering costs would be in the millions of dollars.

Future Development

The consequences of a major earthquake in RD 551 will also increase with time. Because of increasing water demand and the state's growing population and economy, the economic consequences of an interruption in Delta water supply operations due to an earthquake will increase. Consequences to the Delta Region will also increase due to additional development.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Flooding on the Sacramento River has threatened the levees of RD 551 in the past. Flooding inside the leveed area would occur as a result of levee failure or overtopping. The flood elevations around Pearson

District exceed the elevation of almost every acre of ground protected by RD 551 levees. Therefore, a levee breach under flood conditions would be catastrophic to the landowners. In addition, the Pearson District levees are not certified to protect against the 100-year flood.

Past Occurrences

Past river floods have damaged the RD 551 levees in the form of erosion. Some of this erosion was repaired by RD 551 under flood fight conditions. Restoration erosion repair has typically been performed by the Corps of Engineers as authorized under PL 84-99. Repair work under PL 84-99 was performed by the Corps of Engineers on Pearson District levees following the recent floods of 1986, 1997, 1998, and 2006.

Past floods have also required flood fighting by RD 551. This flooding fighting has consisted of seepage control and emergency erosion repair. Seepage control is critical in levee breach prevention. The levees and levee foundations of Pearson District are very porous and subject to flood water seeping through, and under, the levee. If left uncontrolled, this seepage could accelerate to the point that it has the force to move levee material. This phenomenon is called piping, or internal erosion of the levee. Once enough material is moved out of the levee section, a levee breach occurs.

Vulnerability to Flood

Assets/Critical Facilities at Risk

Fl Flooding of Delta islands has the potential to negatively impact water quality both locally and statewide. The largest of California's drinking water sources is the Sacramento-San Joaquin Delta and its tributaries. The Delta provides water throughout the state via the State and Federal water projects. During a flood, there is a higher potential for the waters in the Delta to be exposed to chemicals, fuel, oil, and multiple other constituents of concern that can quickly degrade water quality. Flooding can also disturb soil and soil-borne materials such as mercury and organic matter that can degrade water quality. If the flood water rushing into a Pearson District levee breach is large enough in volume, the surge of water into the island will call saltwater to be pull from San Francisco Bay and into the Delta, thus impacting the water quality of the Delta and water users who export water out of the Delta.

Should a flood breach the levees, the entirety of the assets of RD 551 would be at risk. These assets include the small community of Courtland. All of the RD 3551 drain pumps would be flooded and therefore, RD 551 could not drain the flooded areas with their existing pumps; auxiliary pumps would have to be brought in.

Natural Resources at Risk

The District Planning Team noted no specific natural resources at risk to flooding.

Historic and Cultural Resources at Risk

The District Planning Team noted no specific historic or cultural resources at risk to flooding.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards.

Flood: Stormwater/Localized Flooding

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

During high rainfall events, the drainage system is not capable to evacuate water from the interior of Pearson District without flooding some low lying properties. On properties that farm annual row crops, this is not a problem since crops are not normally planted until after the rainy season. However, winter wheat, perennial, or multi-year crops are susceptible to damage when water overflows the banks of the drain canals.

Past Occurrences

Stormwater flooding occurs every few years. In most years, it is not significant enough to be a problem. For the most part, past flooding has damaged alfalfa and winter wheat. However, past floods have damaged county roads. In addition, many acres of vineyards and orchards have been planted in the past few years, so it is anticipated that these recently planted permanent crops may be damaged by future canal bank flooding.

Vulnerability to Localized Flooding

As stated above, stormwater flooding has the potential to result in significant damage due to the increased acreage of permanent crops. In addition, residences in the lower elevations of Courtland are at risk.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters.

Past Occurrences

The RD 551 levees have not failed in over 100 years. Two floods over the past few decades (1986 & 1997) required extensive flood fighting by RD 551 forces in order to prevent a levee breach.

Vulnerability to Levee Failure

Assets/Critical Facilities at Risk

A levee failure would impact almost all the assets and critical facilities on Pearson District; including the small community of Courtland. State Highways 160, as well as a number of county roads are at risk. Approximately 8,000 of agricultural land would be damaged and possibly rendered unfarmable for at least a year. There are many permanent crops on Pearson District, such as wine grapes, pears, apples and cherries that would be destroyed.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

Should a levee failure occur, all historic and cultural resources in the District would be at risk.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–High

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

Past Occurrences

RD 551 experiences bank erosion essentially every year there is above normal precipitation. As part of the Corps of Engineers Sacramento River Flood Control Project, RD 551 erosion has been periodically repaired by the Corps of Engineers under PL84-99. In years when the Corps does not perform repair, RD 551 repairs the erosion with financial assistance from the state's Delta Levees Subventions Program. Since RD 551 has been recently deemed ineligible for PL84-99 assistance, the likelihood is that the Corps will not perform erosion repairs in the future.

Vulnerability to Erosion

Erosion by itself puts the levee and any structures on the levee at risk. These structures include irrigation and drainage systems, residential buildings, agricultural buildings, wildlife habitat, etc. If left unresolved, erosion would lead to a levee breach, imposing risk on all of the assets of Pearson District.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards.

Severe Weather: Heavy Rain and Storms

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the District. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

Although water surface elevation is a major factor to levee seepage and overtopping, severe weather can cause significant damage, such as erosion, that puts the integrity of the Pearson District levee system at risk.

Vulnerability to Heavy Rain and Storms

Assets at Risk

Heavy rain and thunderstorms are the most frequent type of severe weather occurrence in the area. Wind and lightning often accompany these storms and have caused damage in the past. Problems associated with the primary effects of severe weather include erosion, flooding, pavement deterioration, washouts, landslide/mudslides, and downed trees. However, it is the secondary effects of heavy rain and storms that are of concern to RD 551. Heavy rains can cause flooding, levee failure, and stream bank erosion. Flooding, levee failure, and stream bank erosion can cost RD 551 millions in damages.

6.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

6.6.1. Regulatory Mitigation Capabilities

Table 6-4 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 551.

Table 6-4 RD 551's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y/2012	Five-year plan consisting of levee stability, seepage control and maintenance projects.
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y/2017	Through a state grant, Sacramento County is funding development of an Emergency Action Plan for RD 3. The plan will be complete in early 2017
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	Y/Ongoing	RD 551 consistently evaluates flooding of low areas and the need for improvements in it drainage system
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		Y Annual routine maintenance plans and participation in the state Delta Levees Subventions Program which assists in funding levee maintenance. RD 551 is also drafting a Letter of Intent to draft a System-Wide Improvement Framework to respond to maintenance and rehabilitation issues brought up by the Corps of Engineers 2013 Periodic Inspection Report
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	

Erosion or sediment control program	Y	Erosion control measures on levee and canal slopes as necessary. Sediment removal from drainage system canals as necessary.

6.6.3. Fiscal Mitigation Capabilities

Table 6-6 identifies financial tools or resources that the RD 551 could potentially use to help fund mitigation activities.

Table 6-6 RD 551's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	RD 551's annual assessment includes funding for future anticipated capital projects
Authority to levy taxes for specific purposes	Y	As dictated by law, RD 551 has the authority to levy taxes for specific purposes
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	N	
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	RD 551 has the ability to levy special assessments
Incur debt through private activities	N	
Community Development Block Grant	Y	
Other federal funding programs		
State funding programs

6.6.4. Mitigation Education, Outreach, and Partnerships

Table 6-7 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 6-7 RD 551's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	
Natural disaster or safety related school programs	N	

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
StormReady certification	Y	The RD 551 manager, trustees, and District Engineer have been, or soon will be, trained in SEMS and NIMS
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

6.6.5. Other Mitigation Efforts

RD 551 has been a very active participant in the state's Delta Levee Subventions Program for about 20 years. This program have proven useful and has enabled RD 551 to react financially if a non-routine cost arises.

6.7 Mitigation Strategy

6.7.1. Mitigation Goals and Objectives

RD 551 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

6.7.2. Mitigation Actions

The planning team for RD 551 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Levee Improvements

Hazards Addressed: EQ, EQ Liquefaction, Flood: 100/200/500-year, Flood: Localized Stormwater Flooding, Levee Failure, River/Stream/Creek Bank Erosion, Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning), Severe Weather (Wind and Tornadoes)

Goals Addressed: 1, 3

Issue/Background: The goal of this Mitigation Action is to improve the Pearson Distrct levees over the next five years to a level of protection that repairs current deficiencies as noted in the state's Flood System Repair Project, and correct issues noted in the 2013 Corps of Engineers Periodic Inspection Report.

Other Alternatives: None proposed at this time

Existing Planning Mechanisms through which Action will be Implemented:

Responsible Office: Reclamation District No. 551 as the local maintaining agency and the State of California Flood Protection Board as the local sponsor of the federal flood control project.

Priority (H, M, L): High

Cost Estimate: $5 million

Potential Funding: Delta Levee Subventions Project currently funded by Propositions 1, 1E and 84. The state flood control deferred maintenance program (2016), the state Flood System Repair Program.

Benefits (avoided Losses): Preservation of the protection of 8,000 acres. Most of this property is farmed and thus a contributing factor to the local, state and national economy. The assets on Grand Island have been estimated to exceed $89 million 10 years ago, and therefore are much larger today.

Schedule: 1 – 10 years depending on the availability of funds

Delta Annex Chapter 7 Reclamation District 554

7.1 Introduction

This chapter to the Delta Annex details the hazard mitigation planning elements specific to Reclamation District 554 (RD 554), a new participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the RD 554. This chapter of the Delta Annex provides additional information specific to RD 554, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

7.2 Planning Process

As described above, the District followed the planning process detailed in Section 554 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 554 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 7-1. Additional details on plan participation and RD 554 representatives are included in Appendix A.

Table 7-1 RD 554 Planning Team

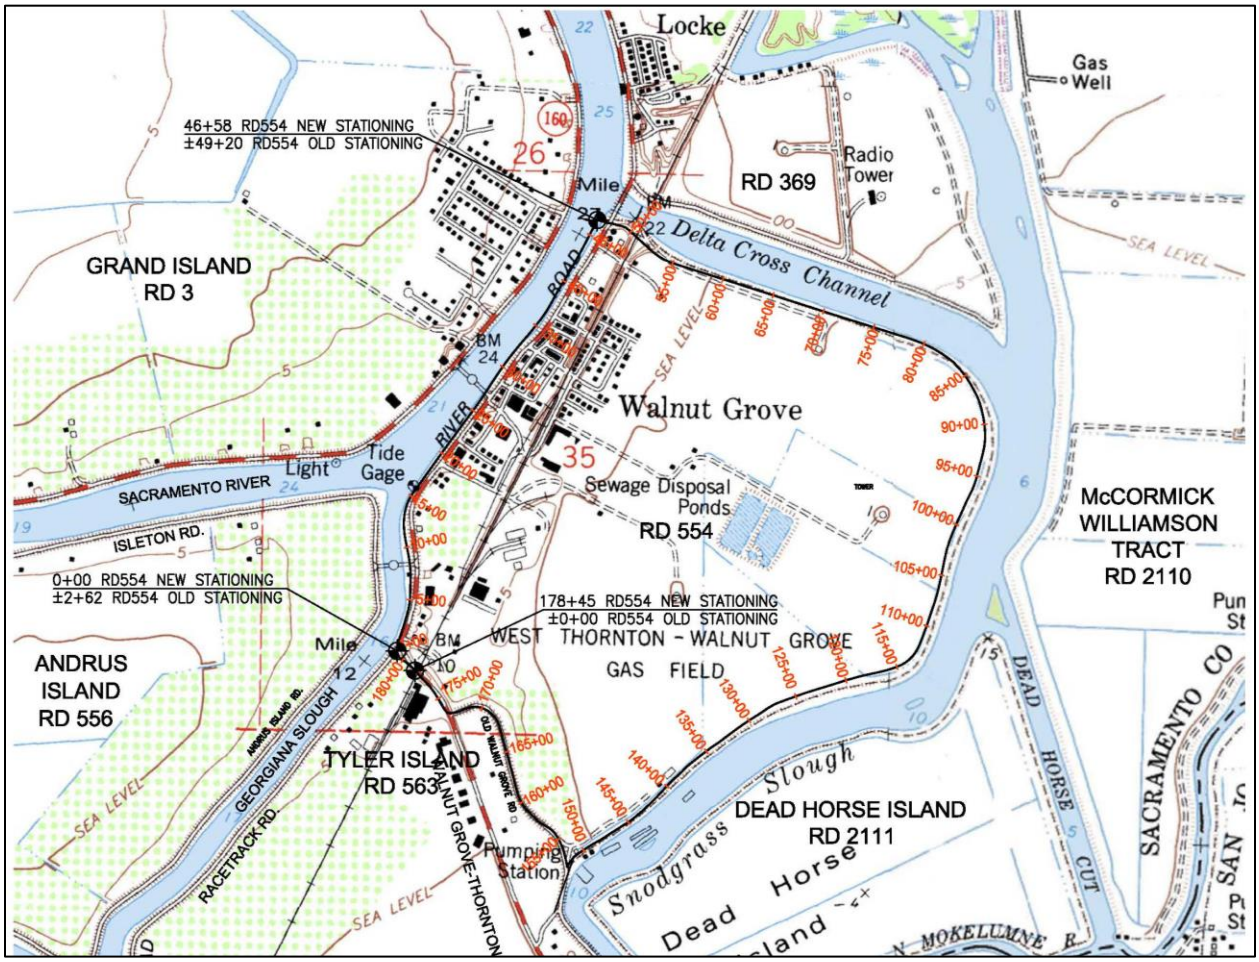
Name	Position/Title	How Participated
Emily Pappalardo	Project Manager	Attended meetings, collected data, drafted text, reviewed draft docs
Gilbert Labrie	District Engineer	Collected data, reviewed draft docs

Source: RD 554

7.3 Community Profile

The community profile for RD 554 is detailed in the following sections. Figure 7-1 displays a map and the location of RD 554 boundaries within Sacramento County.

Figure 7-1 Reclamation District 554 Map



Source: RD 554

7.3.1. RD 554 Overview, Background, and History

Reclamation District 554 protects the urban, eastern side of Walnut Grove, 374 acres of cropland, and the Walnut Grove Marina service area. Walnut Grove was established in 1850 by John Sharp and became a thriving agricultural center and shipping port by 1865.

Reclamation District 554 is the upper 452-acre portion of Tyler Island that is separately protected by 3.58 miles of levee. The District includes the east Walnut Grove urban area. It is the only town in the Delta that is interdependent and occupies both sides of the Sacramento River. The main commercial corridor is on this side of Walnut Grove along with the main sewer collection system and key government services. But the majority of the land use in this small district is rural/agricultural since the urban area is only 77 acres.

RD 554 is bordered by Sacramento River, Georgiana Slough, Snodgrass Slough, the Delta Cross Channel, and the cross levee between RD 554 and RD 563 (lower Tyler Island). Levees along the Sacramento River, Georgiana Slough, and the Delta Cross Channel are federal project levees (1.6 miles). The Cross Channel, Snodgrass Slough, and the cross-levee are non-project levees (1.98 miles), but are still held to the project

levee standard. Reclamation District 554 manages levee inspections, levee maintenance, and two pumping stations on the island. The pumping stations are both located along Snodgrass Slough.

7.4 Hazard Identification

RD 554's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 554 (see Table 7-2).

Table 7-2 RD 554—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Significant	Occasional	Critical	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Limited	Occasional	Negligible	Low
Dam Failure	Extensive	Unlikely	Catastrophic	Medium
Drought and Water Shortage	Significant	Likely	Critical	Medium
Earthquake	Limited	Occasional	Limited	Low
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Significant	Highly Likely	Limited	High
Landslides	Limited	Unlikely	Limited	Low
Levee Failure	Significant	Occasional	Critical	High
River/Stream/Creek Bank Erosion	Significant	Highly Likely	Limited	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Likely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Limited	Low
Severe Weather: Fog	Extensive	Highly Likely	Limited	Medium
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Critical	Medium
Severe Weather: Wind and Tornadoes	Extensive	Highly Likely	Limited	Medium
Subsidence	Limited	Occasional	Negligible	Low
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Limited	Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 5540 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

7.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 554's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.554 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 554 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

7.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 7.5.3, includes a description as to how the hazard affects the RD 554 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

7.5.2. Vulnerability Assessment

This section identifies RD 554's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 7-3 lists critical facilities and other District assets identified by the RD 554's planning team as important to protect in the event of a disaster. RD 554's physical assets, valued at over $35 million, consist of the buildings and infrastructure to support the RD 554 operations.

Table 7-3 RD 554's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address/ Coordinates	Replacement Value	Hazard Info
Levee	Infrastructure	n/a	$30,000,000	
Cross-levee	Infrastructure	n/a	$5,000,000	

Name of Asset	Facility Type	Address/ Coordinates	Replacement Value	Hazard Info
Pump Station	Infrastructure	38° 14' 12.86" 121° 29' 58.37"	$500,000	
Pump Station	Infrastructure	38° 14' 05.14" 121° 30' 05.79"	$500,000	

Source: RD 554

Natural Resources

Due to the urban nature of RD 554 there are only a few areas of freshwater wetland, upland, and riparian habitats. The size of the island and development that has taken place over time, has resulted in mostly ruderal vegetation. See Figure 7-2 for a map of vegetation types. According to the Department of Fish and Game Levee Log in the 5-Year Plan, riparian, scrub shrub, and freshwater marsh habitat types exist on and adjacent to the levees. The estimated amount of each type of habitat per lineal feet is shown on Table 7-4.

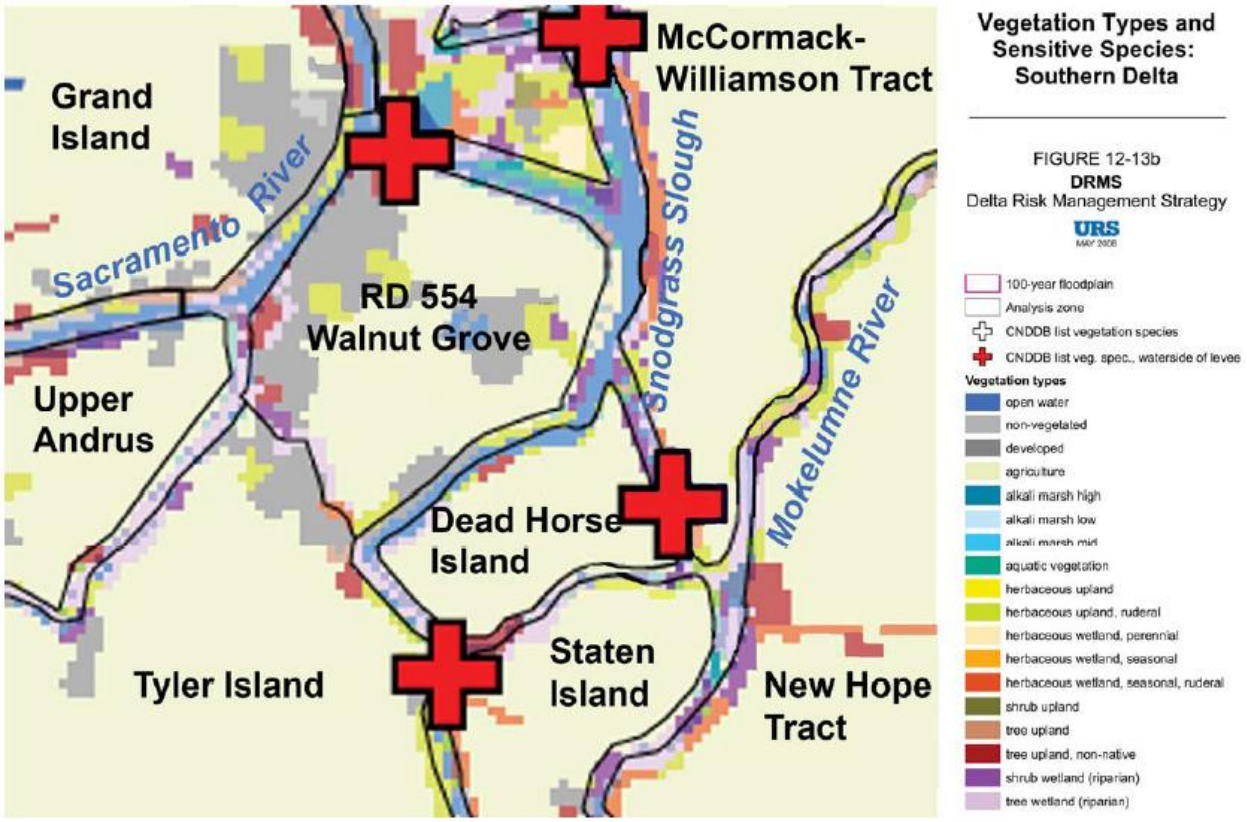
Table 7-4 RD 554 Vegetation Types

Type	Waterside	Landside
Riparian	2223 lf (3.66 ac.), 29 single trees	1710 lf (1.35 ac.) , 15 single trees
Scrub Shrub	880 lf (0.62 ac.), 23 single trees	1700 lf (1 ac), 40 single trees
Freshwater Marsh	1229 lf (0.37 ac.)	0 lf

Source: RD 554 2012 5-Year Plan

Note: These estimates are for non-project levees comprising the location of proposed projects in this plan.

Figure 7-2 RD 554 Vegetation Types

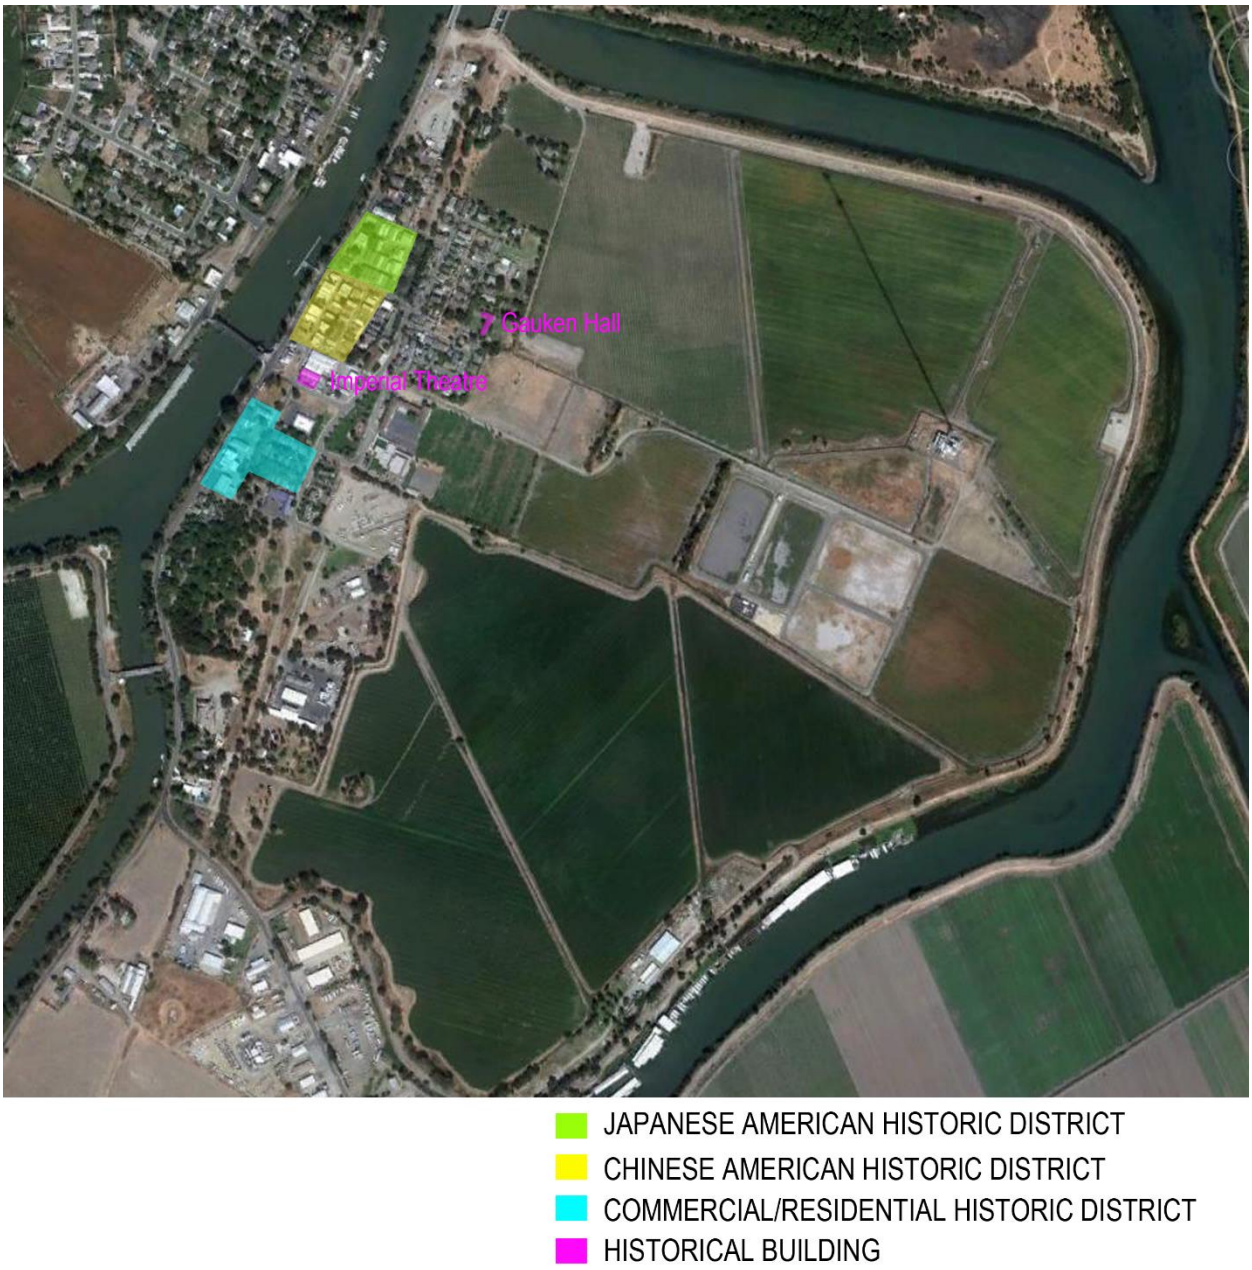


Source: RD 554 2012 5-Year Plan

Historic and Cultural Resources

In the Walnut Grove area, there are three nationally registered historic districts, the Walnut Grove Chinese and Japanese American Historical Districts, and the Walnut Grove Commercial/Residential Historic District. There are three nationally registered historical buildings, Guaken Hall, The Imperial Theatre, and the Jean Harvie Community Center. These are shown on Figure 7-3.

Figure 7-3 Historic Sites in Walnut Grove



Source: RD 554 2012 5-Year Plan

Growth and Development Trends

Limited growth is expected to occur in the District due to limits of Walnut Grove's SPA. There are approximately 10 acres of land available for development. Provided 1 new home has been built in the last decade, any anticipated growth is expected to be slow and small in nature.

7.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 7-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 554 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.554 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable District assets include the levees and pumping stations that the District owns and maintains. There are approximately 3.58 miles of levee surrounding the District. The levees along Georgiana Slough and the Delta Cross Channel are federal project levees. Snodgrass Slough and the cross-levee are non-project levees. The levee system is subject to riverine flooding. However, it is highly unlikely the levee system will fail due to overtopping. A high water situation could increase the hydraulic gradient within the levee that could result in under or through seepage. Seepage, if left unchecked, can result in levee failure and subsequent flooding. The District owns two pumping stations that are critical for island drainage. If the drainage system becomes compromised the District could experience localized flooding. If the system becomes compromised in a flood situation, damages could be worse than anticipated.

An estimate of the vulnerability of RD 554 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–Medium

Hazard Profile and Problem Description

While unlikely, it is possible that dam failure can create a high water situation in the adjacent channels that could put the levee system at risk of failure from overtopping, under seepage, through seepage or debris

impact. Given the distance from the dam system, a dam surge could dissipate prior to reaching this point in the Delta and result in a minor change in water elevation.

Past Occurrences

There are no past occurrences of dam failure.

Vulnerability to Dam Failure

Assets/Critical Facilities at Risk

The levees are at the highest risk to this hazard.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to erosive forces of high flows from dam failure.

Historic and Cultural Resources at Risk

Historic homes could be lost as a result of flooding due to dam failure.

Future Development

While future development may occur in the areas protected by levee that can be damaged during a dam failure, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Drought and Water Shortage

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

This hazard could disrupt crop irrigation. Prolonged disruption could result in the loss of a crop that year. In the event that orchards or vineyards experience disruption in irrigation, they could be lost for multiple years until they are replanted and begin producing a crop between 3 to 5 years. Agriculture is the primary industry on the island. Agricultural users pay assessments for levee maintenance and improvements. While there is some population on the island their assessment fees are low, but if agriculture is lost the District will not be able to cover levee maintenance or make any necessary improvements.

The residents and businesses could be impacted by drought but it is unlikely due to senior water rights and a prioritization system that puts municipal water at a higher priority than agriculture.

Past Occurrences

Although California did recently experience an extended drought, agriculture in this District remained largely unaffected due to senior water rights and riparian water rights. Some farmers voluntarily cut water use by 25% in the Delta in response to the drought in the Summer of 2015.

Vulnerability to Drought and Water Shortage

Assets/Critical Facilities at Risk

None.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

None.

Future Development

Future development in the District should not be affected by drought conditions.

Earthquake: Liquefaction

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

In the event an earthquake is intense enough to result in shaking that could cause the sandy soils to liquefy, the levees could resettle, move off their foundations and possibly fail. Failure could compromise the levee system and result in flooding.

Liquefaction at the base of historic buildings and residences can compromise the structures and possibly result in significant damage.

Past Occurrences

None.

Vulnerability to Liquefaction

Assets/Critical Facilities at Risk

The District levees and unreinforced historic buildings are the most at risk from this hazard.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to a destabilization of the bank from liquefaction. Liquefaction could also introduce substantial sediment into the waterway through the destabilization of soils. Sedimentation could impact sensitive aquatic species.

Historic and Cultural Resources at Risk

Historic homes could be lost as a result of compromised foundations from soil liquefaction.

Future Development

While future development may occur in the areas protected by levees, which can be comprised by earthquakes and liquefaction, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

A 100/200/500-year flood event could cause flooding within the District. A high water event, depending on the water elevation, is unlikely to cause failure due to overtopping as many other surrounding Districts are lower and more likely to fail before failure of RD 554 levees. Higher levels of water could increase hydraulic gradients within the levee section resulting in landside seepage or boils. Continued seepage, if left unaddressed, could erode the levee and result in failure. Heavy flows could also cause erosion and scour on the waterside bank that could undermine the levee and cause failure.

Past Occurrences

1986 was the closest the District came to experiencing a 100-year flood event when adjacent lower Tyler flooded. The District has not experienced a 200 or 500-yr flood.

Vulnerability to Flood: 100/200/500-year

Assets/Critical Facilities at Risk

The levee system and pumping stations are vulnerable to a 100/200/500-year flood. As the flows could exceed the capacity of both the levee system and the pumping station that is needed to drain the island.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to erosive forces of high flows from 100/200/500-year flows.

Historic and Cultural Resources at Risk

There are three nationally registered historic districts protected by the levee system, the Walnut Grove Chinese and Japanese American Historic Districts and the Walnut Grove Commercial/Residential Historic District. There are also three nationally registered historical buildings, Gauken Hall, Imperial Theater and Jean Harvie Community Center. There are also historic homes that are over 100 years old. A 100/200/500 year flood event could inundate these districts and historic places if the event results in levee failure. Such an event may also exceed the District's pumping facility and improper drainage could also flood the districts. Flooding could cause irreparable damage to the structures and they could be lost.

Future Development

While future development may occur in the areas protected by levees, which if compromised could cause severe flooding, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely
Vulnerability–High

Hazard Profile and Problem Description

Localized stormwater flooding can occur during heavy rains or seepage events that exceed the District's drainage capabilities. Lower areas around the island may be subject to minor flooding.

Past Occurrences

Localized stormwater flooding rarely occurs due to the higher elevation of the island. The most likely time this could have occurred in the past was during the wet year in 2006.

Vulnerability to Flood: Localized Stormwater Flooding

Assets/Critical Facilities at Risk

Localized flooding can overtax the Districts pumping system and create for a more hazardous situation involving the levee system by limiting the ability for inspection.

Natural Resources at Risk

None

Historic and Cultural Resources at Risk

There are three nationally registered historic districts protected by the levee system, the Walnut Grove Chinese and Japanese American Historic Districts and the Walnut Grove Commercial/Residential Historic District. There are also three nationally registered historical buildings, Gauken Hall, Imperial Theater and

Jean Harvie Community Center. There are also historic homes that are over 100 years old. Localized flooding could occur if the capacity of the District's pumping facility is exceeded. Flooding could cause irreparable damage to the structures and they could be lost.

Future Development

While future development may occur in the areas protected by levees, which if compromised could cause localized flooding, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Levee failure could result in inundation of the District and could also result in the flooding of lower Tyler Island.

Past Occurrences

The 5-Year Plan noted that in 1986, lower Tyler Island flooded and threatened to flood RD 554. At that time, an effort was undertaken to enhance the cross levee height by adding a berm on the lower Tyler side of the levee to insure that the urban area did not get flooded. The added height was not necessary when the water crested but the emergency construction paved the way for the more permanent configuration that exists today. That levee upgrade then led to a successful LOMR for eastern Walnut Grove and its Zone X determination in 1987.

Vulnerability to Levee Failure

The 2012 5-Year Plan addressed levee repair costs due to failure. To repair a levee breach and pump out the island the average cost has been estimated to be approximately $25 million. But the total truly depends on access, the size and severity of the breach, volume of water to be pumped out, weather conditions, etc. The $25 million figure assumes costs for $5/yd^3 of on-island replacement fill, 15/yd^3 of off-island fill, 6% per linear foot of engineering costs, and $5/foot for rip rap. The Jones Tract failure in 2004 is the most recent levee failure to provide insight into determining what a levee breach could cost today. It has been publicized that the 500-foot levee breach cost approximately $90 million for the repair, recovery, and associated damage. Many knowledgeable locals consider that figure inflated by as much as a factor of two.

Not only would a breach inundate RD 554, it would overtop (or by an intentional breach) the dry cross levee and flood the rest of Tyler Island. Flood waters would flow down to the lower part of the island since it is at a lower elevation than RD 554. The lowest elevation on the southern part of Tyler Island is -15.0 feet (NAVD 88) according to the LIDAR survey supplied by DWR. By the same survey, the lowest elevation on RD 554 is -1.0 feet.

The 5-Year Plan broke down costs by land use type:

- **Residential** – For RD 554, it is estimated that there could be a one-time displacement cost of $57,500 for all occupied households along with an additional $4,780 per day to house these residents elsewhere. On lower Tyler Island, the estimated one-time displacement could be $9000 and an additional $756 per day. The Walnut Grove Marina adds a transient population that is difficult to quantify since there are no statistics covering that element to determine associated costs. Furthermore, this number would fluctuate with the seasons. To house this population in emergency shelters it is estimated to cost $85 a day. As there would be sufficient time to evacuate, the costs to accommodate this unique group of part-time residents may not be significant. But the marina would be shut down until the island was pumped out.
- **Commercial** – Commercial structures will be adversely impacted from the time they are inundated through the time it takes to repair such damage and damage to surrounding infrastructure. There are about 48 businesses on the all of Tyler Island. Overall, a flood could cost Walnut Grove and Tyler Island businesses an estimated $113,000 per day. Some businesses may be unable to recover from a flood and could possibly be lost as the result of a flood event. Even west side residents and business would be affected because the sewer service may have to be curtailed.
- **Agricultural** – Crops grown on Tyler Island are generally alfalfa, wheat, corn, pears, truck crops, tomatoes, rice, and wine grapes. Tyler Island has a total of 8,687 acres of crops. Average cost for rehabilitation and field clean up is $235 per acre. This involves the removal of debris and sediment deposits after floodwaters have receded. Silt and debris can also clog drainage and irrigation ditches adding a variable cost to rehabilitation. The estimated total one-time cost for clean-up and rehabilitation is estimated to be $2.7 million. If inundation lasts longer than 14 days, it is assumed that the crops will be permanently lost. Any flood event that occurs between planting and harvest, could completely destroy the crops. Reestablishment of a lost crop dramatically increases economic losses. The inundation period is assumed to be five weeks on lower Tyler Island, meaning all crops on the lower end could potentially be lost in a flood event. However, due to the smaller size of RD 554 and an assumed inundation period of five days, not all crops may be lost. Not including clean-up costs, reestablishment of all crops on the island could total an estimated $29 million.

The 5-Year Plan also addressed infrastructure issues related to levee failure. Levee failure on Reclamation District 554 could cause direct physical damage to the island's infrastructure. If a break was to occur in the north inundating Walnut Grove/Thornton Road/J11, it would disrupt the island's connection to Highway 160 or 1-5, delaying up to 1,500 trips. The cost due to lost trips is small but the estimated time delay could cost $48,000 per day, $53,000 if 10% are assumed to be truck trips. Walnut Grove's surface streets could be inundated affecting the area on a local level by removing access to the town's businesses and services. The District also houses a FM radio and television transmission tower with support facilities serving KOVR, KXTV, and KQCA. This 2049' tower currently serves the Stockton-Sacramento-Modesto broadcasting area stations and radio stations (Fybush). The transmitter building is on stilts so the equipment will not be affected in a flood. But a flood could still restrict maintenance access to the building, and potentially interfere with broadcasting if there is a lengthy power disruption.

Overall, residential, commercial, agriculture, and infrastructure losses due to a flood event on all of Tyler Island could cost approximately $185,000 per day. The one-time/direct cost of the event to relocate the residents and businesses and reestablish cropland would be around $2.2 million. Assuming an inundation residence period 5 days on RD 554 (upper Tyler) a flood event there could cost approximately $1.6 million. Lower Tyler with an assumed inundation residence period of 5 weeks (35 days), a flood event could costapproximately $27.2 million of direct and indirect costs. These figure includes daily losses to residents

and business, one-time costs of displacement, rehabilitation costs of cropland, and reestablishment and annual production loss costs for vineyards and orchards. A flood event occurring between February and October, that would delay planting until the next season and is assumed to kill all crops, could add up to approximately $78.3 million of direct and indirect costs for both districts. This figure includes the estimated costs associated with repairing the breach and pumping out the islands, about $30 million.

Assets/Critical Facilities at Risk

Levees and district pumping plants. On island inundation can create an open water situation where a large fetch could develop and erode the interior of other levees within the District. Inundation of the drainage pump can make it inoperable and require replacement. Other critical facilities at risk include a fire department, police station and elementary school.

Natural Resources at Risk

Water quality issues were also addressed in the 5-Year Plan. Due to the urban nature of a portion of RD 554, a flood could release household and commercial chemicals potentially contaminating the surrounding waterways. A flood could also suspend sediment, metals, fertilizers, and pesticides that are attached to soil particles. Increased sedimentation of the waterway can reduce the amount of sunlight to reach submerged aquatic plants and also smother fish larvae and harm fish by clogging their gills. The extent of the effects on fish and aquatic species from suspended sediment and chemicals depend on the quantities of pollutants, amount of dilution, and frequency of freshwater releases.

Besides those listed above, other potential in-island pollutant sources could degrade water quality on the island and in the waterways. A long inundation period could create anoxic conditions in the soil can release toxic substances, such as manganese that is naturally occurring but can be dangerous to health in high concentrations. Other toxic substances such as, organochlorine "legacy" pesticides that, although have been banned for over 20 years, slowly degrade in the environment and can still be present in soils where it was applied. This can have harmful effects on fish species in terms of reducing food production, namely a primary producer, phytoplankton if released into the waterway. Although not harmful in small traces, "legacy" pesticides can become more concentrated through bioamplification and not only harm fish species but terrestrial and avian species as well.

Waterside habitat that is adjacent to the break could be lost due to the erosive forces of the water flowing through the break.

Historic and Cultural Resources at Risk

There are three nationally registered historic districts protected by the levee system, the Walnut Grove Chinese and Japanese American Historic Districts and the Walnut Grove Commercial/Residential Historic District. There are also three nationally registered historical buildings, Gauken Hall, Imperial Theater and Jean Harvie Community Center. There are also historic homes that are over 100 years old. A levee failure could inundate these districts and historic places. Such an event may also exceed the District's pumping facility and improper drainage could also flood the districts. Flooding could cause irreparable damage to the structures and they could be lost.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

River/Stream/Creek bank erosion could destabilize the levee slope and, if left unaddressed, cause levee failure through undercutting.

Past Occurrences

Bank erosion is currently occurring on the District levee but is minor and is a low priority for District repairs.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

The District's levees are at risk of erosion.

Natural Resources at Risk

Riparian benches exist along the District's levee and are at risk of being lost due to bank erosion.

Historic and Cultural Resources at Risk

None.

Future Development

While future development may occur in the areas protected by levees, which can be compromised by severe erosion issues the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Fog

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Fog can make it difficult to perform levee inspections during high water due to lack of visibility. It can also impact commuters that use the county road within this district. Many businesses front this road which creates slow car traffic and high pedestrian traffic. Low visibility can prove to be dangerous in high traffic areas.

Past Occurrences

Fog occurs annually.

Vulnerability to Fog

Assets/Critical Facilities at Risk

The levees are at risk due to the inability to perform inspections.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

None.

Future Development

While future development may occur in the areas protected by levees, which could be a concern if compromised during extreme erosion events, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, Lightning)

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Heavy rains and storms can result in higher flood flows that could increase the hydraulic gradients within the levee section and result in seepage or if great enough, possibly overtopping. They can also increase flows and result in erosion of the waterside bank.

Past Occurrences

The last heavy rain and storm event the District experienced was in 2006, 1997 and 1986. No significant damages occurred due to these high water events.

Vulnerability to Heavy Rain and Storms

Assets/Critical Facilities at Risk

The District levees and pumping plant are at risk of damage from heavy rains and storms.

Natural Resources at Risk

Riparian vegetation could be lost from high flows as a result of heavy rains and large storms.

Historic and Cultural Resources at Risk

The historic buildings and districts discussed above could be damaged from heavy storms due to falling trees or flooding.

Future Development

While future development may occur in the areas protected by levee, which can be compromised during severe weather events, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

In the event of high water, wind can create wave action that could cause erosion at the waterside bank of the District's levees.

Past Occurrences

Wind occurs on a regular basis. The hazard comes when high winds are coupled with high water, which happened in the winter of 2006. There was negligible impact from this event.

Vulnerability to Wind and Tornadoes

Assets/Critical Facilities at Risk

The District's levees are at risk.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

Wind could cause trees to fall and create flying debris that could damage historic structures.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

A wildfire could destroy private property and other such structures on the island.

Past Occurrences

None. A fire did cause part of a marina and 14 boats to burn down January 2015.

Vulnerability to Wildfire

Assets/Critical Facilities at Risk

The District's pumping station could be damaged in a fire. Furthermore the vegetation on the District levees could be burned leaving bare soil that could be subject to erosion.

Natural Resources at Risk

Riparian and shrub scrub vegetation could be lost in a wildfire.

Historic and Cultural Resources at Risk

There are three nationally registered historic districts protected by the levee system, the Walnut Grove Chinese and Japanese American Historic Districts and the Walnut Grove Commercial/Residential Historic District. There are also three nationally registered historical buildings, Gauken Hall, Imperial Theater and Jean Harvie Community Center. There are also historic homes that are over 100 years old. A wildfire on this island would devastate these districts and historic buildings if they become substantially burned.

Future Development

Future development should not be affected by the wildfire hazard.

7.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

7.6.1. Regulatory Mitigation Capabilities

Table 7-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 554.

Table 7-5 RD 554's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	The plan addresses flooding hazards and can be used to implement mitigation actions
Continuity of Operations Plan	Y	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		N

Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	Y	Version/Year: CBC 2013
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	Y	Walnut Grove Special Planning Area controls land use and development so could aide in reducing hazard impacts through land use and development criteria
Subdivision ordinance	N	
Floodplain ordinance	Y	Yes, Sacramento County Floodplain Ordinance restricts development in the floodplain
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	Y	PAL - District is working on being mapped back in Zone X
Elevation Certificates	Y	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 554

7.6.2. Administrative/Technical Mitigation Capabilities

Table 7-6 identifies the department(s) responsible for activities related to mitigation and loss prevention for RD 554.

Table 7-6 RD 554's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Annual vegetation management.
Mutual aid agreements	N	
Other	N	

Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	
Floodplain Administrator	Y	Determined via the Emergency Operations Plan
Emergency Manager	Y	Determined via the Emergency Operations Plan
Community Planner	N	
Civil Engineer	Y, FT	Staff is trained to coordinate with agencies and perform tasks in an emergency situation
GIS Coordinator	N	
Other	N	
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Fire Station siren in Walnut Grove, phone tree, Reverse 911
Hazard data and information	Y	
Grant writing	N	
Hazus analysis	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
RD 554 must organize a more appropriate warning system among trustees, public and staff. Also needs to have a plan in place to determine an Emergency Manager to coordinate Emergency Response activities.		

Source: RD 554

7.6.3. Fiscal Mitigation Capabilities

Table 7-7 identifies financial tools or resources that the RD 554 could potentially use to help fund mitigation activities.

Table 7-7 RD 554's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Delta Levees Subventions program to maintain levee system.
Authority to levy taxes for specific purposes	Y	Proposition 218 provides the District with the ability to raise assessments through a vote
Fees for water, sewer, gas, or electric services	Y	Fees are assessed by the County for sewer and water. SMUD provides electrical service.
Impact fees for new development		unknown
Storm water utility fee	Y	Assessments are developed for drainage
Incur debt through general obligation bonds and/or special tax bonds	N	

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Incur debt through private activities	Y	Bonds are obtained from the Bank of Rio Vista
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	Y	Delta Levee Subventions Program and Delta Levee Special Projects, Proposition 84 and 1E
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
The involvement of Federal agencies funds would help in reducing risk as well as the removal of the sunset clause on the Delta Levees Subventions Program.		

Source: RD 554

7.6.4. Mitigation Education, Outreach, and Partnerships

Table 7-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 7-8 RD 554's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	Walnut Grove Volunteer Fire Department, Delta Citizens Municipal Advisory Council
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Department of Water Resources Delta Flood Emergency Preparedness, Cal OES
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		

7.6.5. Other Mitigation Efforts

The US Army Corps of Engineers performed an erosion repair project along the Sacramento River levee summer 2007 to create a riparian bench and resolve erosion issues. The District is currently developing a geotechnical study to locate deficiencies within the system. Once problematic areas are identified the District will perform repair projects to improve the levee system and reduce risk.

7.7 Mitigation Strategy

7.7.1. Mitigation Goals and Objectives

RD 554 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

7.7.2. Mitigation Actions

The planning team for RD 554 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Apply for a Letter of Map Revision (LOMR) to bring the District back into Zone X.

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: The District is aiming to prove their levee system meets FEMA 100-year certification standards so that the District may be put back into a Zone X designation. The District applied for a Provisional Accredited Levee (PAL), but it took longer than anticipated for the District to provide the necessary information due to budgetary restrictions.

Project Description: District will apply for a Letter of Map Revision (LOMR) to re-certify that the levee system will protect against a 100-year flood event, Zone X.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $50,000

Benefits (Losses Avoided): Reduce in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Fall 2018

Action 2. Fill Abandoned Slough

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: An old slough that long ago was cut off from its source is creating a deficient area adjacent to the island cross levee due to its depth and steep slopes.

Project Description: Vegetation in the slough will be removed and the slough will be filled with imported fill to match the existing land level within the district.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $200,000

Benefits (Losses Avoided): Reduce in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Fall 2018

Action 3. Geotechnical Investigation

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: The District is aiming to prove their levee system meets FEMA 100-year certification standards so that the District may be put back into a Zone X designation. A geotechnical investigation is necessary information needed for levee evaluation.

Project Description: CPT tests will be done along certain areas where there are data gaps. From there a geotechnical study will be performed to determine if there are any repairs that need to be made to increase levee stability to meet FEMA requirements.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $30,000

Benefits (Losses Avoided): Aides in providing information for projects that will reduce in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Fall 2016

Action 4. Snodgrass Slough Levee Improvements

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: The District is aiming to prove their levee system meets FEMA 100-year certification standards so that the District may be put back into a Zone X designation. Improvements on the landside slopes of Snodgrass Slough are needed to meet FEMA criteria based on geotechnical studies.

Project Description: Based on findings in the geotechnical studies, landside slope improvements will be performed to accommodate FEMA criteria for 100-year level flood protection.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: Dependent on geotechnical studies, estimated $500,000

Benefits (Losses Avoided): Aides in providing information for projects that will reduce in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Summer 2017

Delta Annex Chapter 8 Reclamation District 556

8.1 Introduction

This chapter of the Delta Annex details the hazard mitigation planning elements specific to the Reclamation District 556 (RD 556), a new participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the RD 556. This chapter of the Delta Annex provides additional information specific to RD 556, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

8.2 Planning Process

As described above, the District followed the planning process detailed in Section 556 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 556 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 8-1. Additional details on plan participation and RD 556 representatives are included in Appendix A.

Table 8-1 RD 556 Planning Team

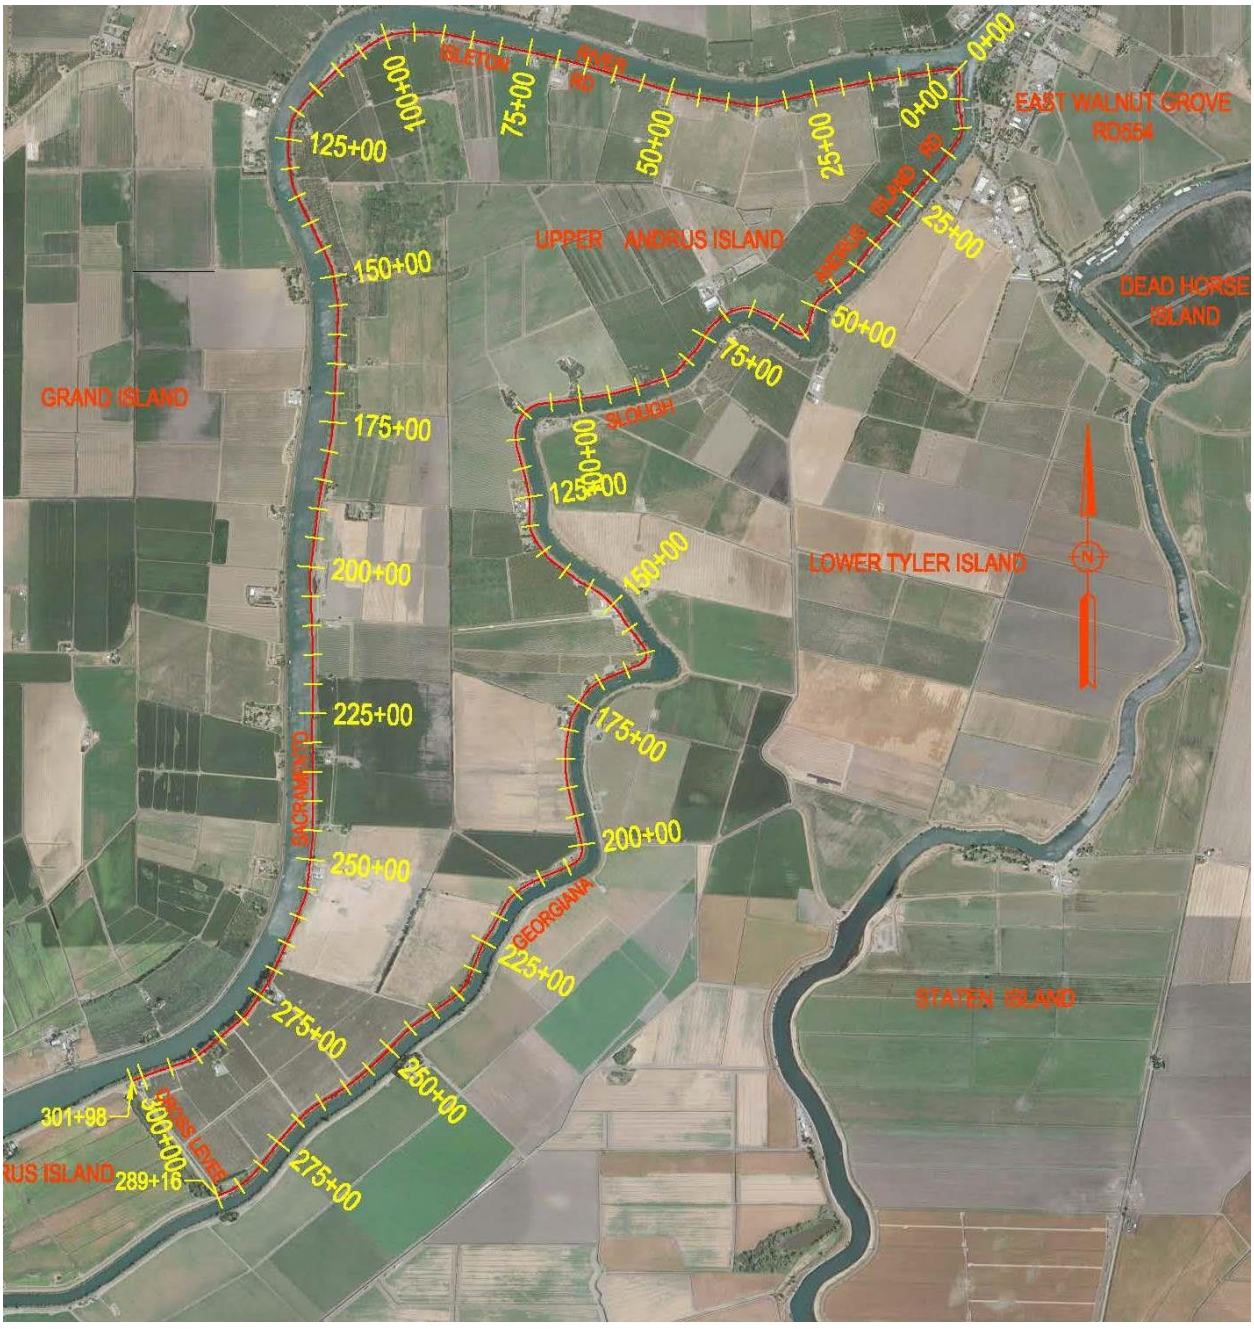
Name	Position/Title	How Participated
Emily Pappalardo	Project Manager	Attended meetings, collected data, drafted text, reviewed draft docs
Gilbert Labrie	District Engineer	Collected data, reviewed draft docs

Source: RD 556

8.3 Community Profile

The community profile for RD 556 is detailed in the following sections. Figure 8-1 displays a map and the location of RD 556 boundaries within Sacramento County.

Figure 8-1 Reclamation District 556 Map



8.3.1. RD 556 Overview, Background, and History

Reclamation District 556 was established in September 8, 1983 by the Water Code section 50000 et seq. There are five trustees that are elected every four years. The terms are staggered.

The District is currently under the FEMA Flood Zone designation AE. Meaning the District has a greater than 1% chance annually that it will flood, restricting development.

8.4 Hazard Identification

RD 556's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 556 (see Table 8-2).

Table 8-2 RD 556—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Significant	Occasional	Critical	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Limited	Occasional	Negligible	Low
Dam Failure	Extensive	Unlikely	Catastrophic	Medium
Drought and Water Shortage	Significant	Likely	Limited	Medium
Earthquake	Limited	Occasional	Limited	Low
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Limited	Highly Likely	Limited	High
Landslides	Limited	Unlikely	Limited	Low
Levee Failure	Significant	Occasional	Critical	High
River/Stream/Creek Bank Erosion	Significant	Highly Likely	Negligible	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Likely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Limited	Low
Severe Weather: Fog	Extensive	Highly Likely	Limited	Medium
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Critical	Medium
Severe Weather: Wind and Tornadoes	Extensive	Highly Likely	Limited	Medium
Subsidence	Limited	Occasional	Negligible	Low
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Limited	Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 5560 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

8.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 556's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.556 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 556 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

8.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 0, includes a description as to how the hazard affects the RD 556 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

8.5.2. Vulnerability Assessment

This section identifies RD 556's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 8-3 lists critical facilities and other District assets identified by the RD 556's planning team as important to protect in the event of a disaster. RD 556's physical assets, valued at over $105 million, consist of the buildings and infrastructure to support the RD 556 operations.

Table 8-3 RD 556's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address/ Coordinates	Replacement Value	Hazard Info
Levee	Infrastructure	n/a	$100,000,000	
Cross-Levee	Infrastructure	n/a	$5,000,000	

Name of Asset	Facility Type	Address/ Coordinates	Replacement Value	Hazard Info
Pump Station	Infrastructure	38°12'04.75" 121°32'40"	$500,000	

Source: RD 556

Natural Resources

The District is primarily comprised of cultivated lands within the interior of the island. Some riparian habitat can be found on the waterside slope of the levees.

Historic and Cultural Resources

There are no registered historical sites. But the bucolic nature of the historic farm homes surrounded by crops within the island adds to cultural value of the Delta as place.

Growth and Development Trends

Due to zoning and floodplain restrictions, essentially no growth has occurred on the island in recent history. For this reason no growth is expected.

8.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 8-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 556 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are similar to those described in Section 4.556 of the Base Plan and are based on data provided by the District as described further below.

In general, the most vulnerable District assets include the levees and supporting structures that the District owns. There are approximately 11.2 miles of project levees and 0.46 miles of cross levee separating Upper Andrus from the rest of Andrus Island. The levee system is subject to riverine flooding. However, it is unlikely the levee system will fail due to overtopping. A high water situation could increase the hydraulic gradient within the levee that could result in under or through seepage. Seepage, if left unchecked, can result in levee failure and subsequent flooding. The District owns a pumping station that is critical for island drainage. If the drainage system becomes compromised the District could experience localized flooding. If the system becomes compromised in a flood situation, damages could be worse than anticipated.

An estimate of the vulnerability of RD 556 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–Medium

Hazard Profile and Problem Description

While unlikely, it is possible that dam failure can create a high water situation in the adjacent channels that could put the levee system at risk of failure from overtopping, under seepage, through seepage or debris impact. Given the distance from the dam system, a dam surge could dissipate prior to reaching this point in the Delta and result in a minor change in water elevation.

Past Occurrences

There are no past occurrences of dam failure.

Vulnerability to Dam Failure

Assets/Critical Facilities at Risk

The levees are at the highest risk to this hazard.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to erosive forces of high flows from dam failure.

Historic and Cultural Resources at Risk

Historic homes could be lost as a result of flooding due to dam failure.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Drought and Water Shortage

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

This hazard could disrupt crop irrigation. Prolonged disruption could result in the loss of a crop that year. In the event that orchards or vineyards experience disruption in irrigation, they could be lost for multiple years until they are replanted and begin producing a crop between 3 to 5 years. Agriculture is the primary industry on the island. Agricultural users pay assessments for levee maintenance and improvements. If agriculture is lost the District will not be able to cover levee maintenance or make any necessary improvements.

Past Occurrences

Although California did recently experience an extended drought, agriculture in this District remained largely unaffected due to senior water rights and riparian water rights. Some farmers voluntarily cut water use by 25% in the Delta in response to the drought in the Summer of 2015.

Vulnerability to Drought and Water Shortage

Assets/Critical Facilities at Risk

None.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

None.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. Further, future development is not likely to be affected by drought conditions.

Earthquake: Liquefaction

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

In the event an earthquake is intense enough to result in shaking that could cause the sandy soils to liquefy, the levees could resettle, move off their foundations and possibly fail. Failure could compromise the levee system and result in flooding.

Past Occurrences

None.

Vulnerability to Earthquake: Liquefaction

Assets/Critical Facilities at Risk

The levees are at the highest risk to this hazard.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to a destabilization of the bank from liquefaction. Liquefaction could also introduce substantial sediment into the waterway through the destabilization of soils. Sedimentation could impact sensitive aquatic species.

Historic and Cultural Resources at Risk

Historic homes could be lost as a result of compromised foundations from soil liquefaction.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system, that can be compromised during an earthquake or liquefaction event. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

A 100/200/500-year flood event could cause flooding within the District. A high water event, depending on the water elevation, could cause failure due to overtopping but more realistically could increase hydraulic gradients within the levee section resulting in landside seepage or boils. Continued seepage, if left unaddressed, could erode the levee and result in failure. Heavy flows could also cause erosion and scour on the waterside bank that could undermine the levee and cause failure.

Past Occurrences

1986 was the closest the District came to experiencing a 100-year flood. The District has not experienced a 200 or 500-year flood.

Vulnerability to Flood: 100/200/500-year

Assets/Critical Facilities at Risk

The levee system and pumping station are vulnerable to a 100/200/500-year flood, as the flows could exceed the capacity of both the levee system and the pumping station that is needed to drain the island.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to erosive forces of high flows from 100/200/500-year flows.

Historic and Cultural Resources at Risk

Historic homes could be lost as a result of flooding due to a 100/200/500 year flood event.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system, which can be compromised during a flood event. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely
Vulnerability–High

Hazard Profile and Problem Description

Localized stormwater flooding can occur during heavy rains or seepage events that exceed the District's drainage capabilities. Lower areas around the island may be subject to minor flooding.

Past Occurrences

Some form of localized stormwater flooding occurs during most heavy rains. The most likely time this could have occurred in the past was during the wet year in 2006.

Vulnerability to Flood: Localized Stormwater Flooding

Assets/Critical Facilities at Risk

Localized flooding can overtax the Districts pumping system and create for a more hazardous situation involving the levee system by limiting the ability for inspection.

Natural Resources at Risk

None

Historic and Cultural Resources at Risk

Historic homes could be subject to localized stormwater flooding.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system, which can be compromised during flood events. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Levee failure could result in inundation of the District and could also result in the flooding of

Past Occurrences

None.

Vulnerability to Levee Failure

Assets/Critical Facilities at Risk

Levees and district pumping plant. An island inundation can create an open water situation where a large fetch could develop and erode the interior of other levees within the District. Inundation of the drainage pump can make it inoperable and require replacement.

Natural Resources at Risk

Waterside habitat that is adjacent to the break could be lost due to the erosive forces of the water flowing through the break.

Historic and Cultural Resources at Risk

Historic homes could be damaged from flooding as a result of a levee break.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by levee system. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

River/Stream/Creek bank erosion could destabilize the levee slope and, if left unaddressed, cause levee failure through undercutting.

Past Occurrences

Bank erosion is currently occurring on the District levees and must be remedied.

Vulnerability to Erosion

RD 556 tends to have issues along Georgiana Slough where natural curves in the channel have created erosion issues.

Assets/Critical Facilities at Risk

The District's levees are at risk of erosion.

Natural Resources at Risk

Riparian benches exist along the District's levee and are at risk of being lost due to bank erosion.

Historic and Cultural Resources at Risk

None.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system, which can be compromised by erosion. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Fog

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Fog can make it difficult to perform levee inspections during high water due to lack of visibility.

Past Occurrences

Fog occurs annually.

Vulnerability to Fog

Assets/Critical Facilities at Risk

The levees are at risk due to the inability to perform inspections.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

None.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system that could be compromised during heavy fog events. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, Lightning)

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Heavy rains and storms can result in higher flood flows that could increase the hydraulic gradients within the levee section and result in seepage or if great enough, possibly overtopping. They can also increase flows and result in erosion of the waterside bank.

Past Occurrences

The last heavy rain and storm event the District experienced was in 2006, 1997 and 1986. No significant damages occurred due to these high water events.

Vulnerability to Heavy Rain and Storms

Assets/Critical Facilities at Risk

The District levees and pumping plant are at risk of damage from heavy rains and storms.

Natural Resources at Risk

Riparian benches could be lost from high flows as a result of heavy rains and large storms.

Historic and Cultural Resources at Risk

None.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system, which can be compromised during severe storms. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

In the event of high water, wind can create wave action that could cause erosion at the waterside bank of the District's levees.

Past Occurrences

Wind occurs on a regular basis. The hazard comes when high winds are coupled with high water, which happened in the winter of 2006.

Vulnerability to Wind and Tornadoes

Assets/Critical Facilities at Risk

The District's levees.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

None.

Future Development

It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system, which can be compromised by high wind events. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

A wildfire could destroy private property and other such structures on the island.

Past Occurrences

None.

Vulnerability to Wildfire

Assets/Critical Facilities at Risk

The District's pumping station could be damaged in a fire. Furthermore the vegetation on the District levees could be burned leaving bare soil that could be subject to erosion.

Natural Resources at Risk

Riparian and shrub scrub vegetation could be lost in a wildfire.

Historic and Cultural Resources at Risk

Historic homes could be lost in a wildfire.

Future Development

Future Development It is unlikely future development will occur provided existing zoning codes and the District's FEMA flood designation that limits building on grade. The District does not control any building that may occur in the areas protected by the levee system. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees. Wildfire is unlikely to affect future development in the District.

8.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

8.6.1. Regulatory Mitigation Capabilities

Table 8-4 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 556.

Table 8-4 RD 556's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	

Local Emergency Operations Plan	In development	While this plan is being developed, there is unofficial protocol of those that live on the island have used over time to respond to flooding related hazards.
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year: CBC 2013
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts?** **Is the ordinance adequately administered and enforced?**
Zoning ordinance	Y	Yes, the District is mostly zoned agriculture which limits development
Subdivision ordinance	N	
Floodplain ordinance	Y	Yes, Sacramento County Floodplain Ordinance restricts development in the floodplain
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	Y	AE Zone
Elevation Certificates	Y	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
RD 556 will create a Five Year Plan to develop projects that reduce risk to life and property.		

Source: RD 556

8.6.2. Administrative/Technical Mitigation Capabilities

Table 8-5 identifies the department(s) responsible for activities related to mitigation and loss prevention for RD 556.

Table 8-5 RD 556's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Drainage system is effective. Developing a tree trimming and vegetation clearing plan
Mutual aid agreements	N	
Other	N	
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	Y	Determined via the Emergency Operations Plan
Emergency Manager	Y	Determined via the Emergency Operations Plan
Community Planner	N	
Civil Engineer	Y	Staff is trained to coordinate with agencies and perform tasks in an emergency situation
GIS Coordinator	N	
Other	N	
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Fire Station siren in Walnut Grove, phone tree, Reverse 911
Hazard data and information	Y	
Grant writing	N	
Hazus analysis	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
RD 556 must organize a more appropriate warning system among trustees, public and staff. Also needs to have a plan in place to determine an Emergency Manager to coordinate Emergency Response activities.		

Source: RD 556

8.6.3. Fiscal Mitigation Capabilities

Table 8-6 identifies financial tools or resources that the RD 556 could potentially use to help fund mitigation activities.

Table 8-6 RD 556's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Delta Levees Subventions program to maintain levee system.
Authority to levy taxes for specific purposes	Y	Proposition 218 provides the District with the ability to raise assessments through a vote
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	N	
Storm water utility fee	Y	Assessments for drainage
Incur debt through general obligation bonds and/or special tax bonds	N	
Incur debt through private activities	Y	Bonds from Bank of Rio Vista
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	Y	Delta Levee Subventions Program and Delta Levee Special Projects, Proposition 84 and 1E
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
The involvement of Federal agencies funds would help in reducing risk as well as the removal of the sunset clause on the Delta Levees Subventions Program.		

Source: RD 556

8.6.4. Mitigation Education, Outreach, and Partnerships

Table 8-7 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 8-7 RD 556's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	Walnut Grove Volunteer Fire Department
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Department of Water Resources Delta Flood Emergency Preparedness, Cal OES
Natural disaster or safety related school programs	N	
StormReady certification	N	

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
Greater public outreach from State agencies to community organizations to provide information about emergency response.		

8.6.5. Other Mitigation Efforts

The US Army Corps of Engineers performed an erosion repair project along the Sacramento River levee summer 2015 to create a riparian bench and resolve erosion issues. The District will perform vegetation removal on the Sacramento River and Georgiana Slough to reveal erosion issues. Once problematic areas are identified the District will perform repair projects to improve the levee system and reduce risk.

8.7 Mitigation Strategy

8.7.1. Mitigation Goals and Objectives

RD 556 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

8.7.2. Mitigation Actions

The planning team for RD 556 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Flood Response Activities, Georgiana Slough Weir

Hazards Addressed: Dam Failure, Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: A weir would reroute flood flows on Upper Andrus Island to Georgiana Slough to keep Andrus, lower Andrus and Brannan Islands from flooding. This would reduce the damages from a flood event on Upper Andrus significantly as the islands are separated by a cross-levee that may be insufficient for blocking flood flows.

Project Description: Place a weir along Georgiana Slough upstream of the cross levee to protect the adjacent islands from flooding.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Cost Estimate: In development, unknown at this time

Benefits (Losses Avoided): Will flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains from downstream islands with high value property and infrastructure.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Summer 2017

Project Priority: Medium

Action 2. Georgiana Slough Vegetation Management

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind, Wildfire

Goals Addressed: 1, 2, 3

Issue/Background: Limited funding has resulted in deferred maintenance of the levees vegetation. The vegetation is so dense it covers any potential erosion areas on the levee system.

Project Description: Trim trees and remove dense vegetation in accordance with the Central Valley Flood Protection Plan

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $500,000

Benefits (Losses Avoided): Aides in providing information for projects that will reduce in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Summer 2017

Action 3. Georgiana Slough Waterside Erosion Repair

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Scour due to high flows and channel meander has eroded and undercut the waterside bank. If left unaddressed, the slope may fail or result in underseepage that could ultimately cause levee failure and flood.

Project Description: These erosion areas have to initially be determined. Once they are a design will be developed. The designs will generally include filling voids at the waterside toe with rip rap and riparian bench will be enhanced with added fill. The levee slopes will be regraded and fill added to accommodate a Bulletin 192-82 critical levee section. Levee slopes will be a minimum of 2:1 landside and 3:1 water side where applicable.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: Not available.

Benefits (Losses Avoided): Reduction in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Summer 2018

Action 4. Topographic and Hydrographic Surveys and Data Collection

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: In the development of projects, topographic and hydrographic survey data must be performed to reveal areas that need repair and maintenance. It can also be used to develop designs and estimate costs to repair the levee system.

Project Description: Topographic survey data will be assembled through the use of field surveys and LiDAR data. Hydrographic surveys will be performed along Georgiana Slough to reveal bank erosion.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $30,000

Benefits (Losses Avoided): Aides in providing information for projects that will reduce in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: 2019

Delta Annex Chapter 9 Reclamation District 563

9.1 Introduction

This new chapter of the Delta Annex details the hazard mitigation planning elements specific to Reclamation District 563 (RD 563), a new 2016 participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by RD 563. This chapter of the Delta Annex provides additional information specific to RD 563, with a focus on providing additional details on the planning process, risk assessment and mitigation strategy for this District.

9.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 563 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 9-1. Additional details on plan participation and RD 563 representatives are included in Appendix A.

Table 9-1 RD 563 Planning Team

Name	Position/Title	How Participated
Chris Neudeck, KSN, Inc	District Engineer	Attended meetings, collected data, reviewed draft docs
Bill Darcie, KSN, Inc.	Project Manager	Attended meetings, collected data, reviewed draft docs
Brenna Howell, KSN, Inc.	Emergency Planner	Attended meetings, collected data, drafted text, reviewed draft docs

Source: RD 563

9.3 Community Profile

The community profile for RD 563 is detailed in the following sections. Figure 9-1 displays a map and the location of RD 563 boundaries within Sacramento County.

Figure 9-1 Reclamation District 563 Map

Source: RD 563 2013 5-Year Plan

9.3.1. RD 563 Overview

Reclamation District No. 563, also known as Tyler Island, is responsible for maintaining the levee and drainage system that provides flood protection for primarily agricultural land, there's also a small portion of infrastructure, residential, commercial, industrial, and governmental land use. Tyler Island is located in the Northern Delta between the town of Walnut Grove to the north, Staten Island to the east, Bouldin Island to the south, and Andrus Island to the West. The Island is surrounded by three major waterways, Snodgrass Slough to the north, the Mokelumne River to the east and Georgiana Slough to the west. There are three land access points onto the island including Walnut Grove Road to the north, the Walnut Grove bridge crossing of the Mokelumne River in the northeast, and the Tyler Island Road bridge crossing of Georgiana Slough in the southwest. Much of the District's levees are topped with paved or gravel Sacramento County roads including Walnut Grove Road to the north, Tyler Island Road which wraps around the southern two-thirds of the District, and Race Track Road to the northwest. The remainder of the District's levees are topped with a minimum 16' wide all-weather gravel road surface.

9.3.2. District History and Background

Reclamation District No. 364 (Upper Tyler Island) was formed on August 6, 1880, and Reclamation District No. 532 (Lower Tyler Island) was formed on February 11, 1891. On May 7, 1894 a petition was filed with the Sacramento County Board of Supervisors to form the current Reclamation District No. 563, which included the lands within the existing Reclamation District Nos. 364 and 532, along with lands that up to that time did not fall within the boundaries of an organized Reclamation District. Upon the formation of Reclamation District No. 563, District Nos. 364 and 532 ceased. Today Reclamation District No. 563 encompasses a total area of 8,990 acres, surrounded by 22.9 miles of levee, all located within Sacramento County.

The District's Board of Trustees is made up of three Trustees who meet regularly on a quarterly basis.

9.4 Hazard Identification

RD 563's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 563 (see Table 9-2).

Table 9-2 RD 563—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Extensive	Occasional	Limited	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Extensive	Occasional	Limited	Low
Dam Failure	Limited	Unlikely	Negligible	Low
Drought and Water Shortage	Extensive	Occasional	Critical	Low
Earthquake	Extensive	Occasional	Limited	Medium
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Extensive	Occasional	Critical	High
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Extensive	Likely	Limited	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Limited	Unlikely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Likely	Limited	Low
Severe Weather: Fog	Extensive	Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Likely	Critical	Medium
Severe Weather: Wind and Tornadoes	Extensive	Likely	Critical	High
Subsidence	Extensive	Likely	Critical	Medium
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Limited	Unlikely	Negligible	Low

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

9.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 563's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 563 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

9.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 9.5.3, includes a description as to how the hazard affects the RD 563 and information on past occurrences. The intent of these section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

9.5.2. Vulnerability Assessment

This section identifies RD 563's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 9-3 lists particular critical facilities and other District assets identified by the RD 563's planning team as important to protect in the event of a disaster. RD 563's physical assets, valued at over $6.3 million, consist of the buildings and infrastructure to support the RD 563 operations.

Table 9-3 RD 563's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Drainage Conveyances (92,650 ft.)	Essential Services	–	$325,000	Flood, Levee Failure, Liquefaction

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Pump Station #1 (including all station components)	Essential Services	–	$2.0 mil	Flood, Levee Failure, Liquefaction
Pump Station #2 (including all station components)	Essential Services	–	$2.0 mil	Flood, Levee Failure, Liquefaction
Pump Station #3 (including all station components)	Essential Services	–	$2.0 mil	Flood, Levee Failure, Liquefaction
West Thornton-Walnut Grove Gas Field	Essential Services	–	–*	Flood, Levee Failure, Liquefaction

Source: RD 563

* The gas field is not owned by the District, but is protected by its levees. No replacement value was available to the District Planning Team.

The Delta Risk Management Strategy Phase 1 report estimates the total assets within Reclamation District No. 563 to be $91,184,000, and does not include the value of the land. The Public Policy Institute estimates the land value to be $33,202,759, and the asset value to be $92,866,000. Recent land sales of similar properties and soil types in the region indicate the current land values are approximately $62,930,000. The value of other assets including homes, buildings, irrigation, drainage and appurtenant structures have been estimated to be 10% of the land value, for a total of approximately $6,293,000. This does not take into account two bridges on the Island which are collectively valued at approximately $50,000,000. The total value of land and assets is approximately $119,223,000. Given that this is a unique property is in a very desirable location with many opportunities for other uses, the value could be in excess of the stated amount.

Natural Resources

The Reclamation District No. 563 levee provides protection for valuable habitat essential for many threatened and endangered species. In general, Delta lands, including those protected by the District's levees, provide forage and cover for local and migratory populations of birds and terrestrial wildlife including many special status species. The levees also provide important waterside habitat and shoreline for various fisheries that includes several special status species. Flooding of Delta islands destroys habitat and kills most terrestrial species present.

In the District, according to a survey done in 2002, a total of 53.0 acres of levee-associated habitat and 38,997 linear feet of SRA habitat exist. Most of the levee-associated vegetation recorded on Tyler Island (44.7 acres) was riparian forest (trees greater than 20ft.tall). Riparian forest stands with Willow, Alder, and/or Oregon Ash consisted of 29.2 acres. Stands with Oak and/or Cottonwood accounted for 10.7 acres (24.0% of all RF). Additionally, Walnut trees totaled 2.5 acres. Other species accounted for 2.3 acres and associated with Tyler levees include: Box Elder, Black locust, Elderberry, Sycamore, Pine, and Button Bush. Most of the above habitat was recorded along Georgiana slough.

The second most common habitat type was shrub/scrub (7.8 acres). Observations involved individual plants from 5 to 19 feet tall. Over half (4.6 acres) of all shrub/scrub included Himalayan Blackberry and/or California Wild Rose. Both species can serve as forage and cover for birds and small mammals. Willow and Alder were also well represented (2.8 acres or 36%). All other shrub/scrub species only accounted for 0.37 acres or 5.0% of the total.

Freshwater marsh species were not very prevalent on Tyler Island (0.5-acre total). Tule species made up the vast majority of all freshwater marsh species recorded here. Cattail was only observed in one area and represents a negligible amount of freshwater marsh on Tyler.

Special Status Species identified on Tyler Island include three Western Pond Turtles (*Clemmys marmorata*) and a single Swainson Hawk (*Buteo swainsoni*). The Western Pond Turtles were identified at two separate locations (two individuals at one and a single turtle at the other). A Swainson Hawk was also identified on Tyler Island. "Special status" refers only to nesting populations of Swainson Hawks.

Historic and Cultural Resources

The District Planning Team noted that there are no known sites in the District.

Growth and Development Trends

Reclamation District No. 563 is zoned almost entirely (96%) as agricultural land. The remainder of the District is zoned as Industrial, Miscellaneous, Pipeline, Residential, Roadway, and Gas Well. The land on the District is owned by more than fifty different entities ranging from private land owners and utility companies to the local county government. The District Planning Team noted that there has been no growth and or development in the District during the last planning period.

9.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 9-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 563 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee and dam inundation areas, such as older facilities that may be constructed with unreinforced masonry and buildings built prior to the introduction of modern building codes. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

In general, the most vulnerable District assets include the levees and supporting structures that the District owns.

An estimate of the vulnerability of the RD 563 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.

- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Earthquake

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Earthquake vulnerability is primarily based on population and the built environment. Urban areas in high seismic hazard zones are the most vulnerable, while uninhabited areas are less vulnerable.

Ground shaking is the primary earthquake hazard. Many factors affect the survivability of structures and systems from earthquake-caused ground motions. These factors include proximity to the fault, direction of rupture, epicenter location and depth, magnitude, local geologic and soils conditions, types and quality of construction, building configurations and heights, and comparable factors that relate to utility, transportation, and other network systems. Ground motions become structurally damaging when average peak accelerations reach 10 to 15 percent of gravity, average peak velocities reach 8 to 12 centimeters per second, and when the Modified Mercalli Intensity Scale is about VII (18-34 percent peak ground acceleration), which is considered to be very strong (general alarm; walls crack; plaster falls).

Past Occurrences

After the most recent Napa Earthquake the District performed levee inspections and verified the continued operation of the pump stations around the island to check the levee integrity and ensure there was no damage to District assets as a result of the earthquake.

Vulnerability to Earthquake

Assets/Critical Facilities at Risk

The levees structures, pump stations and drainage conveyances are potentially at risk to an earthquake.

Natural Resources at Risk

All natural resources could be affected by an earthquake causing damage to the levee structure should the island flood due to an earthquake.

Historic and Cultural Resources at Risk

There are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, which could be compromised during an earthquake event, the District does not control this development. The District only can control whether the levees meet certification standards.

Earthquake: Liquefaction

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Earthquake is discussed in the section above, but is primarily focused on the vulnerability of buildings and people from earthquake shaking. This section deals with a secondary hazard associated with earthquake – the possible collapse of structural integrity o and the possible collapse of delta levees, due to liquefaction.

Past Occurrences

The District Planning Team noted that there are no known past occurrences of liquefaction to have affected RD 563.

Vulnerability to Liquefaction

Assets/Critical Facilities at Risk

The U.S. Geological Survey estimates that an earthquake of magnitude 6.7 or greater has a 62 percent probability of occurring in the San Francisco Bay Area between 2003 and 2032. Such an earthquake is capable of causing multiple levee failures in the Distict which could result in fatalities, extensive property damage and the interruption of water exports from the Delta for an extended period of time. Potential earthquakes on the Hayward, Calaveras or San Andreas faults pose the highest risk to Delta Region levees. All assets in the District are at risk to the effects of liquefaction.

Natural Resources at Risk

All natural resources in the District would be at risk to liquefaction and associated levee failures.

Historic and Cultural Resources at Risk

There are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, which could be compromised during an earthquake event, the District does not control this development. The District only can control whether the levees meet certification standards.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Tyler Island is located between two significant waterways, the North Fork of the Mokelumne River to the east, and Georgiana Slough to the south and west. Flooding on any of these waterways could cause problems for RD 563. Any overtoppings or other failures due to the proximity of these waterways are specifically noted below.

Past Occurrences

The 5-year plan for RD 563 included the following events of flooding in the District.

- 1906 and 1907 - A series of regional flood events occurred. More information can be found in the Past Occurrences Section of Levee Failure below.

Vulnerability to Flood

Assets/Critical Facilities at Risk

Flooding of Delta islands has the potential to negatively impact water quality both locally and statewide. The largest of California's drinking water sources is the Sacramento-San Joaquin Delta and its tributaries. The Delta provides water throughout the state via the State and Federal water projects. During a flood, there is a higher potential for the waters in the Delta to be exposed to chemicals, fuel, oil, and multiple other constituents of concern that can quickly degrade water quality. Flooding can also disturb soil and soil-borne materials such as mercury and organic matter that can degrade water quality.

Should a flood breach the levees, the entirety of the assets of RD 563 would be at risk. Levee failure is discussed later in this section. Flooding also causes erosion, which is discussed later in this section.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards.

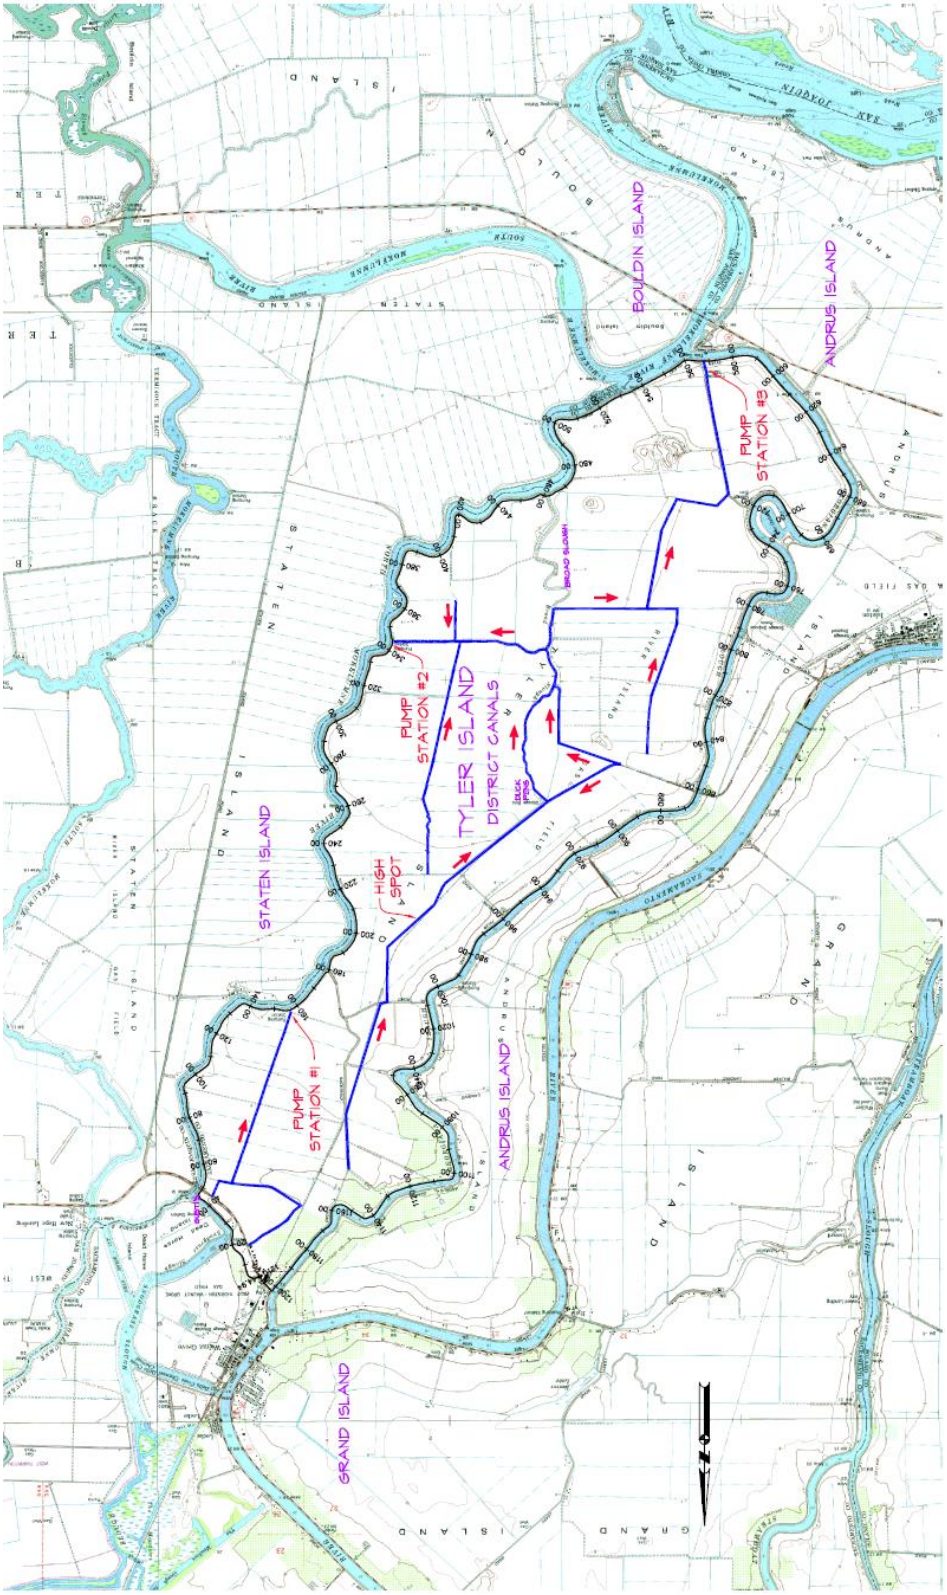
Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Historically, RD 563 has been at risk to flooding primarily during the spring months when river systems in the County swell with heavy rainfall. Localized flooding also occurs throughout the Planning Area at various times throughout the year with several areas of primary concern unique to the District. The District has a drainage system set up deal with localized flooding. This is shown on Figure 9-2.

Figure 9-2 RD 563 Drainage System



Source: RD 563 2013 5-Year Plan

Past Occurrences

The District Planning Team noted that in the last planning period there were no past occurrences.

Vulnerability to Localized Flood

Assets/Critical Facilities at Risk

The District Planning Team noted that all District assets are at risk to localized flooding; however, this flooding is likely to be a nuisance-type of flood, and would not have lasting impacts on the District.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will

collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters.

The Tyler Island levee provides a public benefit by maintaining water quality and water supply reliability for cities and farms in the San Joaquin Valley, San Francisco Bay area, and Southern California. Tyler Island is situated upstream of where fresh river water and salty bay water meet and mix. Under typical summer salinity conditions in the lower Sacramento River, salinity rises sharply at the outlet of the river into the bay. The Tyler Island levee is critical to controlling salinity intrusion to the interior Delta. A levee break would increase the rate and area of mixing and would allow the saline bay water to move further upstream, jeopardizing the fresh water supply exported from the Delta for the Central Valley Project water supply, the State Water Project, and the Contra Costa intake.

Most flooding occurs in winter and spring, when major saltwater intrusion is less likely. There are occasional levee failures under low-flow conditions, which can cause major short-term water-quality problems. For instance, the Andrus Island levee failed in the summer of 1972.

According to sources cited in the 5-Year Plan, salt concentrations in the central and western Delta quickly showed an increase up to six times their pre-failure levels, and additionally may have been a contributing factor in high mortality of juvenile bass that year. It took a large volume of extra reservoir releases to flush the salty water from the west Delta. Similar effects could occur if the Tyler Island levee was to fail under low flow conditions.

Past Occurrences

Historically, flooding in the Delta has resulted from levee failures caused by the separate or coincidental occurrence of very high tides and high stream outflow through the delta region. Strong onshore winds associated with low pressure storms aggravate flood potential by causing an additional rise of the water surface elevations, and can cause severe erosion on levees in a short period of time. Flood events resulting from high tides and/or high stream outflow cannot be reliably predicted, but should be expected to occur in the future. Levee failures from collapse of rodent dens, seepage, falling trees, or some other mechanical failure are unpredictable and relatively uncommon. Routine levee inspections are the primary protection against these types of levee failure events. It should be noted that since 1986, significant portions of the levee system within the Legal Delta have been rehabilitated and improved, which has resulted in an overall reduction in the number of flooded islands during post-1986 Delta flood threats.

The 5-year plan for RD 563 included the following events of levee failure in the District.

- 1906 and 1907 – A series of regional flood events caused the inundation of several islands including Reclamation District No. 563.

- 1982 – A series of large storms that produced heavy rain and high winds caused heavy runoff and high tide conditions that impacted the Districts levee, as well as the entire Sacramento – San Joaquin Delta region. The resulting impacts to the District's levee included water overtopping the levee, increased seepage through the levee, subsidence and partial failure of the levee landside slope, and severe erosion to the waterside slope including degradation of the existing rock slope erosion protection. $1.44 million in damages were sustained in this event.
- 1986 – Due to the extreme storm event, multiple days of heavy rain, strong winds from extreme low pressure gradients, high tides and runoff affecting the entire Sacramento-San Joaquin Delta, the District's levee failed in two locations along the North Fork of the Mokelumne River at approximate levee stations 228+00 and 238+00. More than $9 million in damages were sustained in this event.
- 1997 - A series of large storms that produced heavy rain and high winds caused heavy runoff and high tide conditions that impacted the Districts levee, as well as the entire Sacramento – San Joaquin Delta region. The District claimed costs for flood event related erosion repairs, emergency response – floodfight, and engineering technical assistance. Due to the improvements to the District's levee since the 1986 flood event, and well organized floodfight response, the District's levees and sustained only minor damage and performed well. $781,912 in damages were reported.
- 2006 Winter Storms. (FEMA 1628-DR) A large series of storm events generating high winds and heavy rain caused rivers to rise above flood stage. High winds during this time caused damage to the District's rock slope protection at various locations, road damage from levee patrols and repair equipment and seepage problems. Repairs were made to the rock slope protection and roads. The seepage site was stabilized with a gravel blanket. Overall the levee performance was good.

Vulnerability to Levee Failure

The primary threats to Delta levees are high water surface elevations from floods or high tides, wave action due to high winds or boat wakes, and rodent damage, either as individual actions or in combination. Levees that may have structural issues involving poor foundations, inadequate geometry or other geotechnical issues can be at a higher risk of failure from any of the primary threats. Subsidence of Delta lands has been reported to be a major risk to Delta levees, however, subsidence is limited or non-existent under and adjacent to the levees as those areas have consolidated over the last fifty years and oxidation of the peat foundations is limited because it is not farmed. Subsidence in general is limited to a very small percentage of the delta. Seismic risk is always a factor for California, but it is generally thought by Delta engineers to have been overstated in the DRMS study, and therefore is not something that is currently designed for, although, any levee improvements will help to mitigate that risk. Climate change and sea level rise have also been identified as issues for levee vulnerability. Because these impacts will occur over long periods of time, it should not be an overwhelming problem to address them as they occur.

The two primary vulnerabilities that threaten the levee system on Tyler Island involve levee stability and levee geometry. The Tyler Island levee system has a history of levee stability problems including settlement, movement, seepage, and slope failure. Documentation of the levee's performance is extensive. There are several historical seepage sites up and down the district due to threats ranging from foundation and structural soil deficiencies to rodent damage. Waterside erosion also continues to be a constant threat, especially along the Project Levee portion of Georgiana Slough. The levee break in 1986 and the ensuing inundation of the entire Island however, stands as the most poignant reminder of levee vulnerability. Levee improvements since that time have greatly improved the District's levee system and the levee has performed well in subsequent flood events.

Georgiana Slough which borders the District Project Levee, is a major corridor to transport Sacramento River water to the State and Federal water project pumps located in the southern Delta. Failure the Project Levee could impact the operation of those facilities.

Assets/Critical Facilities at Risk

Should the levees fail, all District assets would be at risk.

A failure or breach of the District's levee system could result in flooding of the District to depths of approximately 25 feet on average. Costs associated with such an event have been calculated using actual costs from the 2004 Jones Tract Flood. All information used was gathered from the final FEMA Project Worksheets used to close out the claims for all of the public agencies involved in the disaster event (FEMA 1529-DR). Additional costs for work not claimed to FEMA included work performed by the United States Army Corps of Engineers; these costs were established from the invoiced amount provided by the Contractor. For Reclamation District No. 563, the estimated cost of a flood event resulting from a single levee failure would be approximately $31,600,000 based on the costs from the 2004 Jones Tract flood event, with costs for distinct emergency and repair activities. The cost analysis above does not include damage to privately owned property and improvements.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous

amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

Past Occurrences

The 5-year plan for RD 563 included the following events of erosion in the District.

- 1982 – A series of large storms that produced heavy rain and high winds causing erosion in the District. More information can be found in the Past Occurrences Section of Levee Failure above.
- 1997 – A series of large storms that produced heavy rain and high winds caused heavy runoff and high tide conditions that eroded the Districts levee. More information can be found in the Past Occurrences Section of Levee Failure above.
- 2006 – A large series of storm events generating high winds and heavy rain caused rivers to rise above flood stage. High winds during this time caused damage to the District's rock slope protection at various locations. More information can be found in the Past Occurrences Section of Levee Failure above.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

The entirety of the levee system in RD 563 is at risk to erosion.

Natural Resources at Risk

The District Planning Team noted that flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, which can be compromised by severe erosion, the District does not control this development. The District only can control whether the levees meet certification standards.

Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning)

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the District. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

The 5-year plan for RD 563 included the following events of severe weather in the District.

- 1986 – Due to the extreme storm event, multiple days of heavy rain, strong winds from extreme low pressure gradients, high tides and runoff affecting the entire Sacramento-San Joaquin Delta, the District's levee failed. More information can be found in the Past Occurrences Section of Levee Failure above.
- 1997 – A series of large storms that produced heavy rain and high winds caused heavy runoff and high tide conditions that impacted the Districts levee, as well as the entire Sacramento – San Joaquin Delta region. More information can be found in the Past Occurrences Section of Levee Failure above.

Vulnerability to Heavy Rains and Storms

Assets/Critical Facilities at Risk

Heavy rain and thunderstorms are the most frequent type of severe weather occurrence in the area. Wind and lightning often accompany these storms and have caused damage in the past. Problems associated with the primary effects of severe weather include flooding, pavement deterioration, washouts, high water crossings, landslide/mudslides, debris flows, and downed trees. However, it is the secondary effects of heavy rain and storms that are of concern to RD 563. Heavy rains can cause flooding, levee failure, and stream bank erosion. Flooding, levee failure, and stream bank erosion can cost RD 563 millions in damages.

Natural Resources at Risk

The District Planning Team noted that flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, which can be compromised during severe storm events, the District does not control this development. The District only can control whether the levees meet certification standards.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

According to historical hazard data, severe weather (including high winds) is an annual occurrence in the District. Tornadoes occur much less frequently. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

The 5-year plan for RD 563 included the following events of winds and tornadoes in the District.

- 1986 – Due to the extreme storm event, multiple days of heavy rain, strong winds from extreme low pressure gradients, high tides and runoff affecting the entire Sacramento-San Joaquin Delta, the District's levee failed. More information can be found in the Past Occurrences Section of Levee Failure above.
- 2006 Flood Event. Rip rap was placed on waterside slopes to mitigate damage caused from high winds.

Vulnerability to Wind and Tornadoes

Assets/Critical Facilities at Risk

The District Planning Team noted that the entire levee structures are at risk from wind.

Natural Resources at Risk

The District Planning Team noted that all natural resources are at risk if wind caused levee failure in the District.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, which can be compromised during high wind events, the District does not control this development. The District only can control whether the levees meet certification standards.

Subsidence

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

For over a century, subsidence of the organic soils in portions of the Delta has led to an increasing need for subsurface drainage. Aerobic oxidation of organic carbon, the primary cause of subsidence, began in the late 1800s as the nutrient-rich organic soils were cleared and farming began. Peat fires, lit to level agricultural fields prior to 1950, and wind erosion are also significant causes of subsidence throughout the Delta. Since reclamation of the island began, elevations have fallen to as much as 20 feet below sea level, requiring protection by over 1,125 miles of man-made levees throughout the Delta. Drainage is provided by a network of ditches that collect and transport shallow groundwater, irrigation runoff, and levee seepage to pump stations that discharge back into the Delta waterways. These ditches create an unsaturated root zone for crops, and provide a more stable levee foundation.

Past Occurrences

The 5-year plan for RD 563 included the following events of subsidence in the District.

- 1982 – A series of large storms that produced heavy rain and high winds causing subsidence in the District. More information can be found in the Past Occurrences Section of Levee Failure above.

Vulnerability to Subsidence

Assets/Critical Facilities at Risk

The management issues raised by land subsidence range in scale from those faced by individual farmers to the possible global-scale issue posed by the carbon-dioxide flux, with its possible link to climate change. At the most local level, individual farmers or reclamation districts must maintain drainage networks on the islands and pump the agricultural drainage back into waterways. These costs increase gradually as subsidence progresses. All levee structures in RD 563 are at risk to subsidence.

Natural Resources at Risk

The District Planning Team noted that all natural resources are at risk from subsidence.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levee, which can be compromised by subsidence activity, the District does not control this development. The District only can control whether the levees meet certification standards.

9.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

9.6.1. Regulatory Mitigation Capabilities

Table 9-4 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 563.

Table 9-4 RD 563's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y 2013	5 Year Plan identifies hazards that may affect RD 563. Some mitigation strategies are proposed. An Evacuation Plan is detailed, as well as an Emergency Response Plan.
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	Under development at time of development of this planning process
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Version/Year:

Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?

9.6.4. Mitigation Education, Outreach, and Partnerships

Table 9-7 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 9-7 RD 563's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

9.6.5. Other Mitigation Efforts

The entire Tyler Island levee system is inspected daily by the landowners, Trustees, and/or District staff who are familiar with all aspects of its functions. The District Engineer typically performs inspections at the request of the District, or more frequently when warranted. During high water or severe weather events, inspection frequency is increased to meet the demand. Like all Federal Project Levees, the Georgiana Slough Project Levee portion of the District is inspected in the fall and spring by the Department of Water Resources levee inspectors. Reports are compiled and submitted to the District. The District staff also inspects the Federal Project Levee in the winter and summer, and submits reports back to the Department of Water Resources.

9.7 Mitigation Strategy

9.7.1. Mitigation Goals and Objectives

RD 563 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

9.7.2. Mitigation Actions

The planning team for RD 563 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Rock Slope Protection Project

Hazards Addressed: EQ, EQ Liquefaction, Flood: 100/200/500-year, Flood: Localized Stormwater Flooding, Levee Failure, River/Stream/Creek Bank Erosion, Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning), Severe Weather (Wind and Tornadoes), Subsidence

Goals Addressed: 1, 3

Issue/Background: The goal of this Mitigation Action is to improve the Tyler Island levees over the next five years to a level of protection that meets, or exceeds, the U.S. Army Corps of Engineers' (USACE) PL84-99 Levee Standard.

Project Description: The District would like to ensure the protection of the existing levee by adding supplementary quarry stone riprap above the existing riprap to any portions of the waterside slope of the levee requiring supplementary rock slope protection. This will prevent erosion and avoid ongoing repairs to the levee structure.

Other Alternatives: none

Existing Planning Mechanism(s) through which Action Will Be Implemented: Permitting process, Finalizing the EIR, potential CEQA Design Process

Responsible Office/Partners: RD 563

Project Priority: High

Cost Estimate: $813,000

Benefits (Losses Avoided): Preservation of 563 levee structures, Ecosystem Restoration and Habitat Enhancement Component, Reversing Land Subsidence, Ensuring Adequate and Effective Emergency Response Plans, Benefitting Water Quality, Improving Water Supply Reliability

Potential Funding: Prop 1 and 1E, 84 Funds, HMGP Grant Programs, seeking cost sharing partners for project ongoing.

Timeline: 1-10 years depending on regulatory process and funding

Action 2. HMP and PL-8499 Levee Improvement Projects

Hazards Addressed: EQ, EQ Liquefaction, Flood: 100/200/500-year, Flood: Localized Stormwater Flooding, Levee Failure, River/Stream/Creek Bank Erosion, Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning), Severe Weather (Wind and Tornadoes), Subsidence

Goals Addressed: 1, 3

Issue/Background: The goal of this Mitigation Action is to improve the Tyler Island levees over the next five years to a level of protection that meets, or exceeds, the U.S. Army Corps of Engineers' (USACE) PL84-99 Levee Standard.

Project Description: The District would like to bring portions of the RD 563 levee currently below the HMP Criteria to six inches above the PL 84-99 Standard using 2:1 landside slopes. If sufficient funding is available, the segments of levee improved during this phase will include portions of the levee that meet the HMP Criteria, but do not meet the design template for this project, due to the many relatively short stretches of levee that do not meet the PL 84-99 Standard in close proximity to longer stretches of levee that do not meet the HMP Standard. After the entire levee meets or exceeds the HMP Criteria, the District will bring any remaining portions of levee below the PL 84-99 Standard to six inches above the PL 84-99 Standard.

Other Alternatives: none

Existing Planning Mechanism(s) through which Action Will Be Implemented: Permitting process, Finalizing the EIR, CEQA Design Process

Responsible Office/Partners: RD 563

Project Priority: High

Cost Estimate: $16,000,000

Benefits (Losses Avoided): Preservation of 563 levee structures, Ecosystem Restoration and Habitat Enhancement Component, Reversing Land Subsidence, Ensuring Adequate and Effective Emergency Response Plans, Benefitting Water Quality, Improving Water Supply Reliability

Potential Funding: Prop 1 and 1E, 84 Funds, HMGP Grant Programs, seeking cost sharing partners for project.

Timeline: 1-10 years depending on regulatory process and funding

Delta Annex Chapter 10 Reclamation District 1002

10.1 Introduction

This chapter to the Delta Annex details the hazard mitigation planning elements specific to the Reclamation District 1002 (RD 1002), a new participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter to the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the base plan document. As such, all sections of the base plan, including the planning process and other procedural requirements apply to and were met by the RD 1002. This chapter of the Delta Annex provides additional information specific to RD 1002, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

10.2 Planning Process

As described above, the District followed the planning process detailed in Section 1002 of the base plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 1002 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 10-1. Additional details on plan participation and RD 1002 representatives are included in Appendix A.

Table 10-1 RD 1002 Planning Team

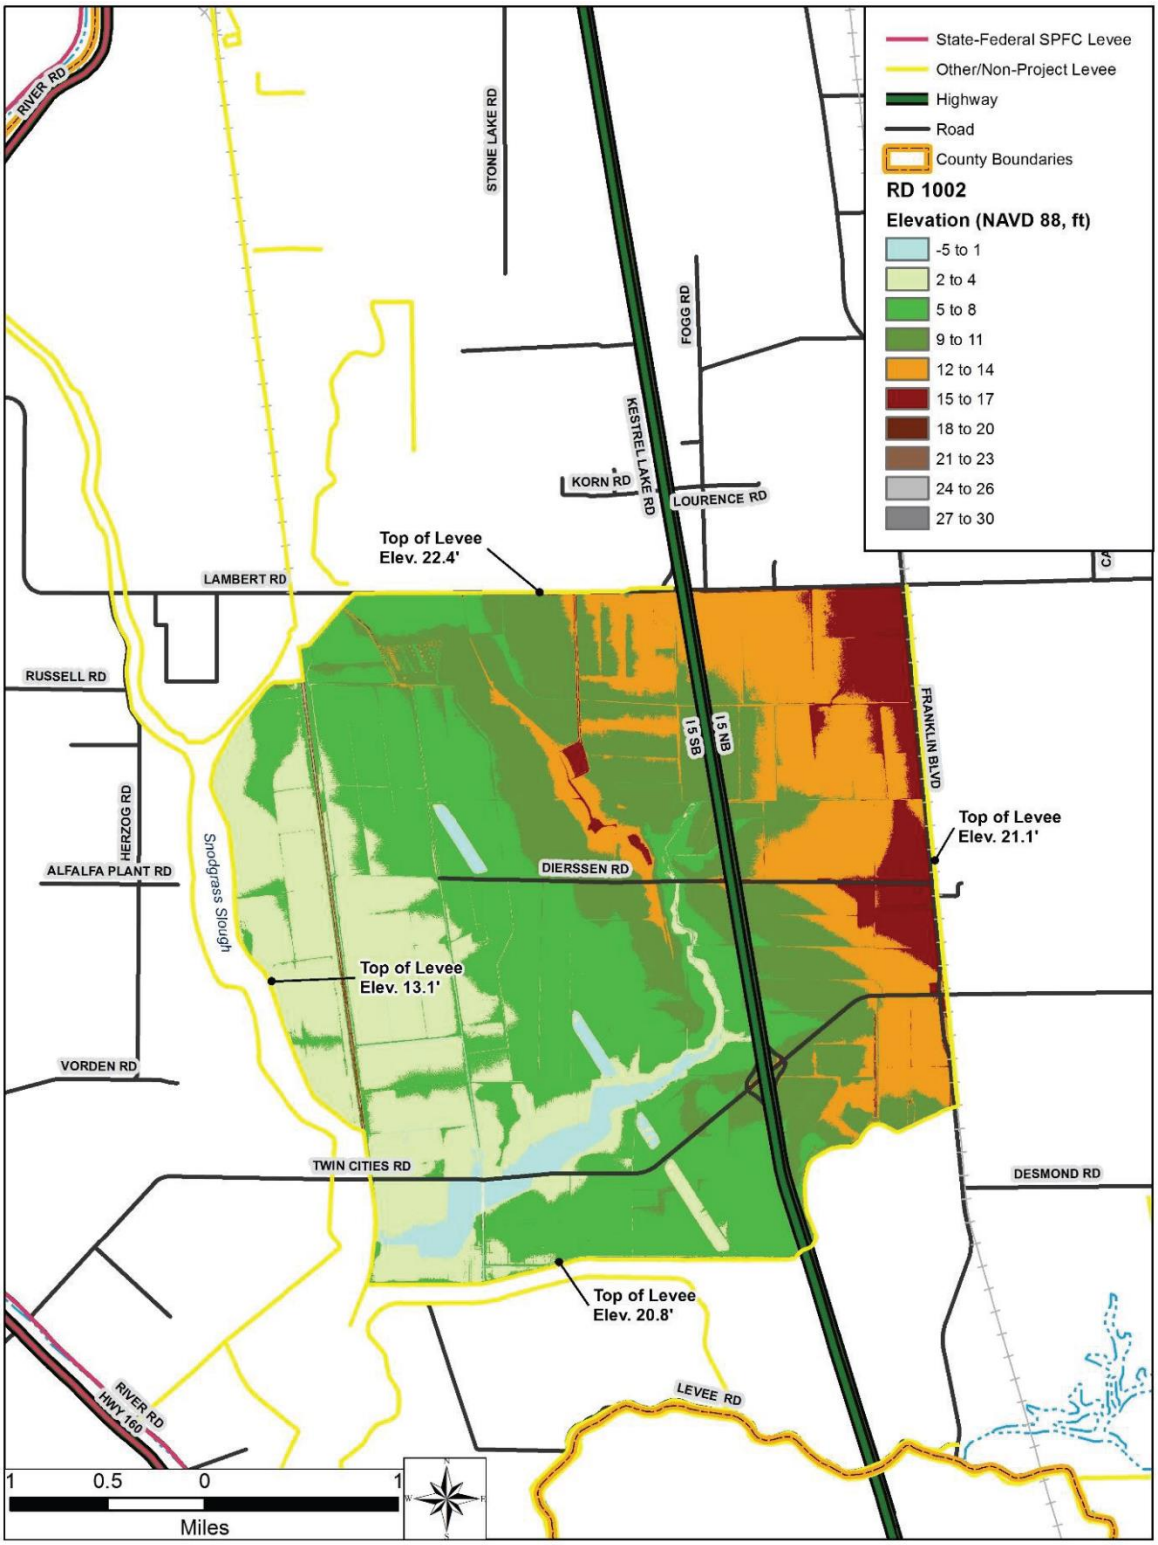
Name	Position/Title	How Participated
Emily Pappalardo	Project Manager	Attended meetings, collected data, drafted text, reviewed draft docs
Gilbert Labrie	District Engineer	Collected data, reviewed draft docs

Source: RD 1002

10.3 Community Profile

The community profile for RD 1002 is detailed in the following sections. Figure 10-1 displays a map and the location of RD 1002 boundaries within Sacramento County.

Figure 10-1 Reclamation District 1002



10.3.1. RD 1002 Overview, Background, and History

Glanville Tract, Reclamation District 1002 (RD 1002 or District) was established in May 6, 1912 under water code Section 50000 et. seq. It has three trustees that are elected in 4-year, staggered terms. The Board of Trustees meets on an as needed basis. Glanville Tract is 6,829 acres and is surrounded by Snodgrass Slough on the south and west. Glanville Tract is located in Sacramento County in the Primary and Secondary Zone of the Delta. Approximately 13.4 miles of levees surround RD 1002 and are non-project levees.

As described in the Glanville Tract Flood Emergency Safety Plan, Reclamation District 1002 is responsible for maintenance, repair, and improvements of its nearly than 13.4 miles of levees and drainage system providing flood protection. The District maintains canals and ditches that provide drainage to the property owners. The levees protect the District, which is predominantly agricultural land, from flooding. Alfalfa, grain, orchards, tomatoes, potatoes, vineyards are the primary crops grown on the island; there is also a significant amount of irrigated pasture for cattle and goats.

There are 15 households on the Tract with a changing population of no more than 59 people. The maintenance of the levee system is critical to the economy supported by acres of prime agricultural land. Interstate 5 runs through the middle of the Tract, Lambert Road on the north, Franklin Boulevard on the east, and Twin Cities Road on the south.

10.4 Hazard Identification

RD 1002's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 1002 (see Table 10-2).

Table 10-2 RD 1002—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Significant	Occasional	Critical	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Limited	Occasional	Negligible	Low
Dam Failure	Extensive	Unlikely	Catastrophic	Medium
Drought and Water Shortage	Significant	Likely	Critical	Medium
Earthquake	Limited	Occasional	Limited	Low
Earthquake: Liquefaction	Significant	Occasional	Limited	Low
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Significant	Highly Likely	Medium	High
Landslides	Limited	Unlikely	Limited	Low
Levee Failure	Limited	Occasional	Critical	High
River/Stream/Creek Bank Erosion	Limited	Highly Likely	Limited	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Likely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Limited	Low
Severe Weather: Fog	Extensive	Highly Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Critical	Medium
Severe Weather: Wind and Tornadoes	Extensive	Highly Likely	Limited	Medium
Subsidence	Limited	Occasional	Negligible	Low
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Limited	Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 10020 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

10.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 1002's hazards and assess the District's vulnerability separate from that of the planning area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the planning area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 1002 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

10.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 10.5, includes a description as to how the hazard affects the RD 1002 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the planning area.

10.5.2. Vulnerability Assessment

This section identifies RD 1002's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 10-3 lists critical facilities and other District assets identified by the RD 1002's planning team as important to protect in the event of a disaster. RD 1002's physical assets, valued at over $120 million, consist of the buildings and infrastructure to support the RD 1002 operations.

Table 10-3 RD 1002's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address/ Coordinates	Replacement Value	Hazard Info
Levee	Infrastructure	n/a	$115,000,000	
Pumping Station	Infrastructure	38° 16' 08.40"	$5,000,000	

Name of Asset	Facility Type	Address/ Coordinates	Replacement Value	Hazard Info
		121° 29' 05.24"		

Source: RD 1002

Natural Resources

There is a significant amount of riparian vegetation along Snodgrass Slough which is approximately 7 miles in length on the western and southern ends of Glanville Tract. There are also areas of freshwater marsh on the south east corner of the district.

Historic and Cultural Resources

There are several homes and structures that house the farmers and support agricultural activities on the island.

Growth and Development Trends

Due to zoning and floodplain restrictions, essentially no growth has occurred on the island in recent history. For this reason no growth is expected.

10.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 10-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 1002 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the base plan for more detailed information about these hazards and their impacts on the Sacramento County planning area). Methodologies for calculating loss estimates are the similar to those described in Section 4.1002 of the base plan and are based on data provided by the District as described further below. In general, the most vulnerable District assets include the levees and supporting structures that the District owns. Of the 13.4 miles of levee that surrounds the district 7 miles of that system border Snodgrass Slough. The levee system is subject to riverine flooding and storm water run-off. The levee system could fail due to overtopping or seepage. A high water situation could increase the hydraulic gradient within the levee that could result in under or through seepage. Seepage, if left unchecked, can result in levee failure and subsequent flooding.

An estimate of the vulnerability of RD 1002 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.

- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–Medium

Hazard Profile and Problem Description

While unlikely, it is possible that dam failure can create a high water situation in the adjacent channels that could put the levee system at risk of failure from overtopping, under seepage, through seepage or debris impact. Given the distance from the dam system, a dam surge could dissipate prior to reaching this point in the Delta and result in a minor change in water elevation.

Past Occurrences

There are no past occurrences of dam failure.

Vulnerability to Dam Failure

Assets/Critical Facilities at Risk

The levees and pumping station are at the highest risk to this hazard.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to erosive forces of high flows from dam failure.

Historic and Cultural Resources at Risk

Homes and agricultural facilities could be lost as a result of flooding due to dam failure.

Future Development

While future development may occur in the areas protected by levee, which could be compromised by an upstream dam failure, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Drought and Water Shortage

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

This hazard could disrupt crop irrigation. Prolonged disruption could result in the loss of a crop that year. In the event that orchards or vineyards experience disruption in irrigation, they could be lost for multiple years until they are replanted and begin producing a crop between 3 to 5 years. Agriculture is the primary industry on the island. Agricultural users pay assessments for levee maintenance and improvements. If agriculture is lost the District will not be able to cover levee maintenance or make any necessary improvements.

Past Occurrences

Although California did recently experience an extended drought, agriculture in this District remained largely unaffected due to senior water rights and riparian water rights. Some farmers voluntarily cut water use by 25% in the Delta in response to the drought in the Summer of 2015.

Vulnerability to Drought and Water Shortage

Assets/Critical Facilities at Risk

None.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

None.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

A 100/200/500-year flood event could cause flooding within the District. A high water event, depending on the water elevation, could cause failure due to overtopping and/or could increase hydraulic gradients within the levee section resulting in landside seepage or boils. Continued seepage, if left unaddressed, could erode the levee and result in failure. Heavy flows could also cause erosion and scour on the waterside bank that could undermine the levee and cause failure.

Past Occurrences

The District has had to implement the use of sandbags in high water years. The District experienced flooding in 1986 and 1997 due to events that were closest to a 100-year flood event.

Vulnerability to Flood: 100/200/500-year

Assets/Critical Facilities at Risk

The levee system is very vulnerable to a 100/200/500-year flood. Riverine floods and storm water run off lows could exceed the capacity of the levee system. The flood could also overtax the District's flooding system that could cause even further flooding.

Natural Resources at Risk

Riparian habitats that border the channel can be lost due to erosive forces of high flows from 100/200/500-year flows.

Historic and Cultural Resources at Risk

Homes and agricultural facilities could be lost as a result of flooding due to a 100/200/500 year flood event.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely
Vulnerability–High

Hazard Profile and Problem Description

Localized stormwater flooding can occur during heavy rains or seepage events that exceed the District's drainage capabilities. Lower areas around the island may be subject to flooding.

Past Occurrences

Some form of localized stormwater flooding occurs during most heavy rains. The most likely time this could have occurred in the past was during the wet years of 2011, 2006, 1997 and 1986. The District must address storm water runoff with sandbags to provide ample freeboard.

Vulnerability to Flood: Localized Stormwater Flooding

Assets/Critical Facilities at Risk

Localized flooding can overtax the Districts drainage and levee system and create for a more hazardous situation involving the levee system by limiting the ability for inspection.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

Homes and agricultural facilities and crops could be damaged as a result of localized flooding.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Levee failure could result in inundation of the District.

Past Occurrences

1986, through an intentional levee break.

Vulnerability to Levee Failure

For RD 1002 the problematic areas are near the south-western end of the district near the packing house where boils have occurred in the past. Also the eastern levee near the Cosumnes River Preserve was intentionally broken in 1986 and has been problematic since.

Assets/Critical Facilities at Risk

Levees are the most at risk of this hazard. An island inundation can create an open water situation where a large fetch could develop and erode the interior of other levees within the District. The pumping station if inundated can also be damaged from a levee break.

Natural Resources at Risk

Waterside habitat that is adjacent to the break could be lost due to the erosive forces of the water flowing through the break.

Historic and Cultural Resources at Risk

Homes and agricultural facilities could be lost as a result of flooding due to a levee failure.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

River/Stream/Creek bank erosion could destabilize the levee slope and, if left unaddressed, cause levee failure through undercutting.

Past Occurrences

Bank erosion is currently occurring on the District levees and must be remedied.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

The District's levees are at risk of erosion.

Natural Resources at Risk

Riparian benches exist along the District's levee and are at risk of being lost due to bank erosion.

Historic and Cultural Resources at Risk

None.

Future Development

While future development may occur in the areas protected by levees, which can be compromised from severe erosion, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, Lightning)

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Heavy rains and storms can result in higher flood flows that could increase the hydraulic gradients within the levee section and result in seepage or if great enough, possibly overtopping. They can also increase flows and result in erosion of the waterside bank.

Past Occurrences

The last heavy rain and storm event the District experienced was in 2006, 1997 and 1986. No significant damages occurred due to these high water events.

Vulnerability to Heavy Rain and Storms

Assets/Critical Facilities at Risk

The District levees and pumping plant are at risk of damage from heavy rains and storms.

Natural Resources at Risk

Riparian benches could be lost from high flows as a result of heavy rains and large storms.

Historic and Cultural Resources at Risk

None.

Future Development

While future development may occur in the areas protected by levee, which can be compromised by severe weather events, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

A wildfire could destroy private property and other such structures on the island as well as the pumping plant.

Past Occurrences

None.

Vulnerability to Wildfire

Assets/Critical Facilities at Risk

The vegetation on the District levees could be burned leaving bare soil that could be subject to erosion.

Natural Resources at Risk

Riparian, shrub scrub and freshwater marsh vegetation could be lost in a wildfire.

Historic and Cultural Resources at Risk

Homes, agricultural facilities and crops could be lost as a result of flooding due to wildfire.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and the ongoing maintenance of these levees.

10.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

10.6.1. Regulatory Mitigation Capabilities

Table 10-4 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 1002.

Table 10-4 RD 1002's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	In development	While this plan is being developed, there is unofficial protocol of those that live on the island have used over time to respond to flooding related hazards.
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year: CBC 2013
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	

Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Zoning ordinance	Y	Yes, the District is mostly zoned agriculture which limits development
Subdivision ordinance	N	
Floodplain ordinance	Y	Yes, Sacramento County Floodplain Ordinance restricts development in the floodplain
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	Y	Zone AE
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
The District must develop a strategy to resolve erosion issues.		

Source: RD 1002

10.6.2. Administrative/Technical Mitigation Capabilities

Table 10-5 identifies the department(s) responsible for activities related to mitigation and loss prevention for RD 1002.

Table 10-5 RD 1002's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	Must develop vegetation management strategy
Mutual aid agreements	N	
Other	N	
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	Y	Determined via the Emergency Operations Plan (in development)
Emergency Manager	Y	Determined via the Emergency Operations Plan (in development)

Community Planner	N	
Civil Engineer	Y	Staff is trained to coordinate with agencies and perform tasks in an emergency situation
GIS Coordinator	N	
Other	N	
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Reverse 911, phone tree
Hazard data and information	N	
Grant writing	N	
Hazus analysis	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
The District must develop a better warning system to alert residents.		

Source: RD 1002

10.6.3. Fiscal Mitigation Capabilities

Table 10-6 identifies financial tools or resources that the RD 1002 could potentially use to help fund mitigation activities.

Table 10-6 RD 1002's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	
Authority to levy taxes for specific purposes	Y	Proposition 218 provides the District with the ability to raise assessments through a vote
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	N	
Storm water utility fee	Y	Assessments for drainage
Incur debt through general obligation bonds and/or special tax bonds		
Incur debt through private activities	Y	Bonds can be obtained from the Bank of Rio Vista
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
The District could apply to become a part of the Delta Levees Subventions Program to aide in funding levee improvement projects.		

Source: RD 1002

10.6.4. Mitigation Education, Outreach, and Partnerships

Table 10-7 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 10-7 RD 1002's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?		
The District could develop a public outreach program it inform residents of disaster related issues.		

10.6.5. Other Mitigation Efforts

The District plans on removing dense vegetation along Snodgrass Slough to reveal areas with significant erosion. Once these areas are determined the District will develop a multi-year plan to address problematic areas.

10.7 Mitigation Strategy

10.7.1. Mitigation Goals and Objectives

RD 1002 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

10.7.2. Mitigation Actions

The planning team for RD 1002 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Geotechnical Investigation

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3

Issue/Background: The District has problematic areas in Snodgrass Slough that require a geotechnical investigation to determine the best steps to take to resolve.

Project Description: District will have CPT tests done and analyzed to determine soil stability in the effort to design the appropriate solution to resolve levee issues

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $30,000

Benefits (Losses Avoided): Aides in providing information for projects that will reduce in flood risk from levee failure, bank erosion, 100/200/500-year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Winter 2018

Action 2. Snodgrass Slough Levee Improvements

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind

Goals Addressed: 1, 2, 3, 4

Issue/Background: Erosion areas have been hidden by dense vegetation and have not been addressed due to a lack of funding.

Project Description: Once erosion areas would are revealed the district can create designs to repair and maintain the levee system to meet Bulletin 192-82 standards. The levees will be graded to accommodate a 3:1 waterside and 2:1 landside slope.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: In planning stages, unknown.

Benefits (Losses Avoided): Aides in providing information for projects that will reduce in flood risk from levee failure, bank erosion, 100/200/500 year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Summer 2020

Action 3. Snodgrass Slough Vegetation Management

Hazards Addressed: Levee Failure, Earthquake: Liquefaction, River Bank Erosion, Flood 100/200/500-year, Severe Weather: Heavy Rains, Severe Weather: Wind, Wildfire

Goals Addressed: 1, 2, 3

Issue/Background: Limited funding has resulted in deferred maintenance of the levees vegetation. The vegetation is so dense it covers any potential erosion areas on the levee system.

Project Description: Trim trees and remove dense vegetation in accordance with the Central Valley Flood Protection Plan

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: None

Responsible Office/Partners: Reclamation District Board of Trustees and District Engineer Gilbert Labrie

Project Priority: High

Cost Estimate: $200,000

Benefits (Losses Avoided): Aides in providing information for projects that will reduce in flood risk from levee failure, bank erosion, 100/200/500-year flood and heavy rains.

Potential Funding: District assessments and Delta Levees Subventions Program

Timeline: Fall 2017

Delta Annex Chapter 11 Reclamation District 1601

11.1 Introduction

This new chapter of the Delta Annex details the hazard mitigation planning elements specific to the Reclamation District 1601 (RD 1601), a new 2016 participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by RD 1601. This chapter of the Delta Annex provides additional information specific to RD 1601, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

11.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 1601 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 11-1. Additional details on plan participation and RD 1601 representatives are included in Appendix A.

Table 11-1 RD 1601 Planning Team

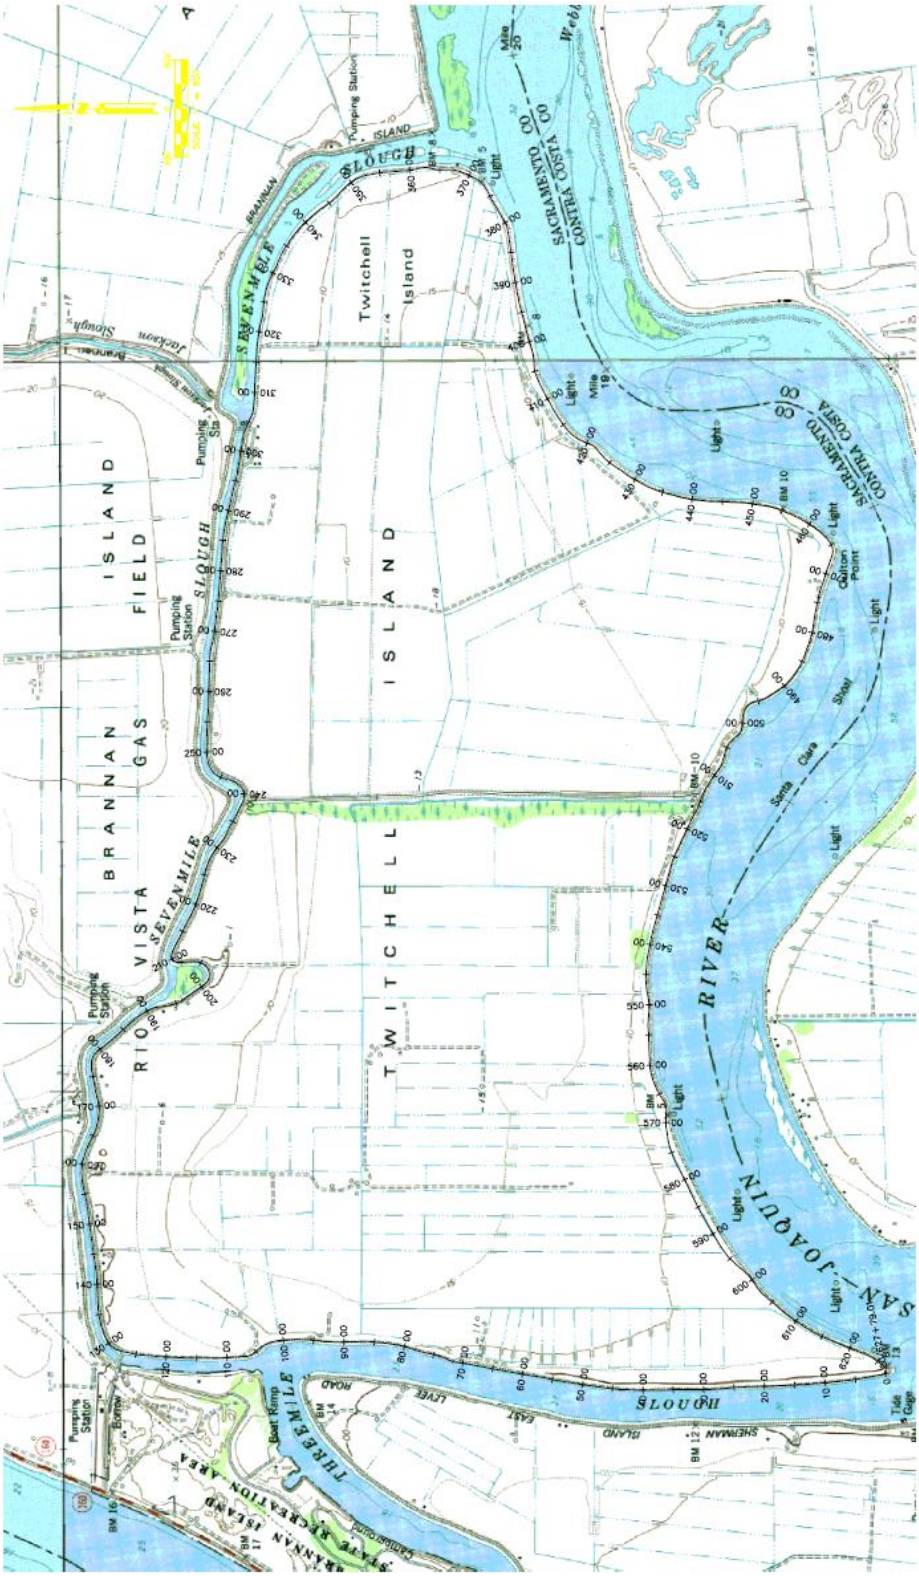
Name	Position/Title	How Participated
Chris Neudeck, KSN, Inc	District Engineer	Attended meetings, collected data, drafted text, reviewed draft docs
Bill Darcie, KSN, Inc.	Project Manager	Attended meetings, collected data, drafted text, reviewed draft docs
Brenna Howell, KSN, Inc.	Emergency Planner	Attended meetings, collected data, drafted text, reviewed draft docs

Source: RD 1601

11.3 Community Profile

The community profile for RD 1601 is detailed in the following sections. Figure 11-1 displays a map and the location of RD 1601 boundaries within Sacramento County.

Figure 11-1 Reclamation District 1601



Source: RD 1601 2010 5 Year Plan

11.3.1. RD 1601 Overview

Reclamation District No. 1601, also known as Twitchell Island, maintains 11.9 miles of levee made up of 2.5 miles of Federal Flood Control Project levee and 9.4 miles of non-project levee. The District is bordered by Sevenmile Slough, Threemile Slough and the San Joaquin River. Sacramento County maintains a paved road along Sevenmile Slough from levee station 127+50 to 303+00. The county road provides emergency evacuation to the East via Brannan-Andrus Island and State Highway 12 or to the West via State Highway 160.

11.3.2. District History and Background

The lands within the District were privately owned up until 1991 when the State of California purchased the majority of the property within the island. The State's interest in the island is primarily to ensure that the levees would be improved to protect against flooding of the island. Flooding in the Western Delta could severely degrade water quality within the Delta and impact the operations of the State and Federal water projects due to salt intrusion from areas downstream. Following the State's purchase of property on the island, the State, being the largest landowner, appointed the majority of the Trustee positions on the District's Board.

Continuous routine maintenance activities have occurred on the levees throughout the history of the island and include smaller projects not listed here. Types of work performed on a routine basis include erosion repairs, road repairs, debris removal, minor core trenching, ditch cleaning, pump repair and maintenance, vegetation control, and rodent control.

11.4 Hazard Identification

RD 1601's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 1601 (see Table 11-2).

Table 11-2 RD 1601—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Extensive	Occasional	Limited	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Extensive	Occasional	Limited	Low
Dam Failure	Limited	Unlikely	Negligible	Low
Drought and Water Shortage	Extensive	Occasional	Critical	Low
Earthquake	Extensive	Occasional	Limited	Medium
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Extensive	Occasional	Critical	High
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Extensive	Likely	Limited	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Limited	Unlikely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Likely	Limited	Low
Severe Weather: Fog	Extensive	Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Likely	Critical	Medium
Severe Weather: Wind and Tornadoes	Extensive	Likely	Critical	High
Subsidence	Extensive	Likely	Critical	Medium
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Limited	Unlikely	Negligible	Low

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

11.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 1601's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 1601 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

11.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 11.5.3, includes a description as to how the hazard affects RD 1601 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

11.5.2. Vulnerability Assessment

This section identifies RD 1601's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 11-3 lists particular critical facilities and other District assets identified by RD 1601's planning team as important to protect in the event of a disaster. RD 1601's physical assets, valued at over $4.3 million, consist of the buildings and infrastructure to support RD 1601 operations.

Table 11-3 RD 1601's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Pump Station #1 (including all station components)	Essential Services	–	$2.0 mil	Flood, Levee Failure, Liquefaction

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Pump Station #2 (including all station components)	Essential Services	–	$2.0 mil	Flood, Levee Failure, Liquefaction
Drainage Conveyances	Essential Services	–	#350 K	Flood, Levee Failure, Liquefaction, Severe Weather
Underground Electric Crossing*	Essential Services	–	–	Flood, Levee Failure, Liquefaction
Overhead Electric Crossings*	Essential Services	–	–	Flood, Levee Failure, Liquefaction
Siphons*	Essential Services	–	–	Flood, Levee Failure, Liquefaction
Electric Pullbox Underground Docs	Essential Services	–	–	Flood, Levee Failure, Liquefaction

Source: RD 1601

* These assets are not owned by the District, but are protected by its levees. No replacement value was available to the District Planning Team

The 2010 5-year plan noted that the total estimated value of the 3,634.88 acres of land within the District is $16,338,771.

Natural Resources

Twitchell Island has established a total of 15.12 acres of valuable permanent habitat and mitigation sites. Much of the habitat provided is riverine or palustrine, providing essential habitat for flora and fauna native to the Delta. The habitat areas provide a permanent, undisturbed environment for sensitive Delta species, as well as providing habitat, food and resting areas for migratory wildlife. The value of these habitat areas is undefined, but the loss of these areas could greatly impact the species that depend upon these valuable ecosystem components.

A habitat assessment was done in 2001 for the District. Findings from that were:

- One special-status plant (Blue Elderberry) was observed along the levee during the field survey.
- No special status animals were observed during field work;
- The Shaded Riverine Aquatic Habitat was found to total 1,642 lineal feet;
- The Riparian Forest habitat on the waterside of the levee consisted of individual trees or extensive reaches of continuous canopy. The Riparian Forest was found to total 3,285 lineal feet;
- The Shrub/Scrub habitat consists of willow, and blackberry on the waterside of the levee. The Shrub/Scrub was found to total 7,917 lineal feet;
- The Freshwater Marsh habitat of tules along the levee waterside toe was found to total 7,781 lineal feet;
- The landside levee slopes consisted of bare ground, ruderal vegetation, urbanized environment with cultivated plants, small areas of Shrub/Scrub habitat, and Riparian Forest of individual trees or continuous canopy with varying amounts of understory;
- The landside Riparian Forest along the levee was found to cover 465 lineal feet. The majority of this habitat was found along levee station 38+959 to39+396 in the toe ditch;
- The landside Shrub Scrub habitat along the levee was found to cover 177 lineal feet.

In 1993, a 4.04 acre habitat mitigation site was established and planted from Stations 545+00 to 560+00 and Stations 570+00 to 600+00, with a Conservation Easement established specifically for the mitigation site between stations 545+00 and 560+00. The overall mitigation site was designed to consist of 1.12 acres of palustrine emergent (freshwater marsh) habitat, 1.92 acres of lacustrine (open water) habitat, 2.3 acres of palustrine forest (riparian woodland) habitat, and 0.65 acres of annual grassland habitat. The flora planted were predominantly tule and cattail in the freshwater marsh, and white alder, red willow and sandbar willow in the riparian woodland. Two ponds totaling 1.92 acres were excavated to approximately 6 feet deep with approximately 1:1 side slopes to provide the open water habitat. The open water and annual grassland did not require plantings.

In 1999, an 8.08 acre habitat mitigation site was transferred to the Department of Fish and Game via a Transfer of Control and Possession and Conservation Agreement. The site runs parallel to the drainage canal at the District Pump station, reaching 5,440 feet northward along the canal from approximately Station 585+00, and provides various types of protected habitats, including palustrine shrub and scrub, palustrine forest, and fresh water marsh habitats. The site was initially established to mitigate 5.78 acres of palustrine emergent habitat lost due to levee repairs and rehabilitation at Stations 0+00 to 127+00 and 360+00 to 396+00. Much of the mitigation site was originally planted with feed corn). The site was enhanced in 2007 when 35 black willow trees were planted along the canal.

In 2000, a 3.0 acre habitat site was planted between levee Stations 570+00 and 600+00 that provides 1.4 acres of emergent tidal marsh habitat and 1.6 acres of shaded riverine aquatic habitat. This habitat area was created between the original levee and a new setback levee.

Openings were cut into the original levee, allowing water to circulate between the levees. The levee crown and landside slope of the old levee was re-vegetated, and the tidal bench and waterside slope of the setback levee were planted with native woody and herbaceous vegetation. Woody plants included willows, ash, box elder, alder, cottonwood, valley oak, dogwood, button willow, wild rose, wild blackberry, blue elderberry, and wild grape. Herbaceous plants included California hibiscus, grasses, sedges, rushes, and tules. The setback levee slope was planted with grasses only for maintenance purposes.

The habitat mitigation sites on Twitchell Island provide a variety of protected habitats. In general, Delta lands provide forage and cover for local and migratory populations of birds and terrestrial wildlife including many special status species. The levees also provide important waterside habitat and shoreline for various fisheries that includes several special status species.

Historic and Cultural Resources

The District Planning Team noted that there are no known historic and or cultural resources in the District at this time.

Growth and Development Trends

The District Planning Team noted that there has been no growth and development in the District since the last planning period.

11.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 11-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 1601 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable District assets include the levees and supporting structures that the District owns such as the two pump stations, the drainage conveyances and the natural resources within the island.

An estimate of the vulnerability of RD 1601 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Earthquake

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Earthquake vulnerability is primarily based on population and the built environment. Urban areas in high seismic hazard zones are the most vulnerable, while uninhabited areas are less vulnerable.

Ground shaking is the primary earthquake hazard. Many factors affect the survivability of structures and systems from earthquake-caused ground motions. These factors include proximity to the fault, direction of rupture, epicenter location and depth, magnitude, local geologic and soils conditions, types and quality of construction, building configurations and heights, and comparable factors that relate to utility, transportation, and other network systems. Ground motions become structurally damaging when average peak accelerations reach 10 to 15 percent of gravity, average peak velocities reach 8 to 12 centimeters per

second, and when the Modified Mercalli Intensity Scale is about VII (18-34 percent peak ground acceleration), which is considered to be very strong (general alarm; walls crack; plaster falls).

Past Occurrences

After the most recent Napa Earthquake the District performed levee inspections and verified the continued operation of the pump stations around the island to check the levee integrity and ensure there was no damage to District assets as a result of the earthquake.

Vulnerability to Earthquake

Assets/Critical Facilities at Risk

The District Planning Team noted that the levees structures, pump stations and drainage conveyances are potentially at risk to an earthquake

Natural Resources at Risk

The District Planning Team noted that All natural resources could be affected by an earthquake causing damage to the levee structure should the island flood due to an earthquake.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, which may be compromised by an earthquake event the District does not control this development. The District only can control whether the levees meet certification standards.

Earthquake: Liquefaction

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Earthquake is discussed in the section above, but is primarily focused on the vulnerability of buildings and people from earthquake shaking. This section deals with a secondary hazard associated with earthquake – the possible collapse of structural integrity and the possible collapse of delta levees, due to liquefaction.

Past Occurrences

The District Planning Team noted that there are no known past occurrences of liquefaction to have affected the District.

Vulnerability to Liquefaction

Assets/Critical Facilities at Risk

The U.S. Geological Survey estimates that an earthquake of magnitude 6.7 or greater has a 62 percent probability of occurring in the San Francisco Bay Area between 2003 and 2032. Such an earthquake is capable of causing multiple levee failures in the Distict which could result in fatalities, extensive property damage and the interruption of water exports from the Delta for an extended period of time. Potential earthquakes on the Hayward, Calaveras or San Andreas faults pose the highest risk to Delta Region levees. All assets in the District are at risk to the effects of liquefaction.

Natural Resources at Risk

All natural resources in the District would be at risk to liquefaction of the levee foundations and associated levee failures.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, which may be compromised by an earthquake event the District does not control this development. The District only can control whether the levees meet certification standards.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

The District is bordered by Sevenmile Slough, Threemile Slough and the San Joaquin River. Flooding on any of these waterways could cause problems for RD 1601.

Past Occurrences

The 5-Year Plan for RD 1601 included a history of flooding in the District.

- 1986 Flood event. Poor levee performance, with several instances of boils that were treated with sandbag coffer dams. Individual boils were sandbagged on the landward levee slope at Stations 361+81, 365+50, 373+98, 405+87, 406+39, 408+49, 414+83, and 502+22, and groups of boils were sandbagged on the landward levee slope at Stations 500+64 to 501+69 and 534+94 to 536+52. Dredged fill material was placed on the waterward levee slope and the bottom of the slough in an attempt to seal a boil at Station 363+39 to 366+56. The State of California updated its flood Hazard Mitigation Plan (HMP), establishing both short-term and long-term guidelines for levee rehabilitation, including

minimum requirements for levee geometry that were required to be met by 1991 in order to receive future federal disaster assistance.

- 1997 Flood Event. USACE made emergency repairs by placing a 250 foot long gravel blanket extending 60 feet past the landside levee toe at approximately Station 59+00. Further emergency repairs were made by the District by pulling rock up from the waterside toe of the levee to form two berms on the levee crown at the juncture of Sevenmile Slough and the San Joaquin River, and on the PL 84-99 levee along Threemile Slough, approximately Station 380+00 to 385+00.
- 1998 Flood Event. During the flood event of 1998, riprap was placed on waterside slopes to mitigate damage by high water and high winds,
- 2005 to 2006 Flood Event. A storm event starting on December 30, 2005 required emergency action beginning on January 1, 2006. Four long reach excavators were used to restore the rock slope protection at Stations 363+74 to 565+00 and 580+00 to 628+74 that was lost as a result of the extreme high water and winds along the San Joaquin River. The construction involved pulling the slipped rock up along the waterside slope from the waterside levee toe. Two angle blade bulldozers were used to clear debris on the levee crown and restore eroded sections of levee due to the high water and wind-generated waves splashing over the levee to the landside slope, including portions of the levee road that were no longer passable. The San Joaquin reach of the Twitchell Island levee was nearly overtopped. 25,000 feet of existing riprap was repositioned to form a break wall by Dutra Construction in 40 consecutive hours to protect the levee from extreme wind and wave wash.

Vulnerability to Flood

Assets/Critical Facilities at Risk

Flooding of Delta islands has the potential to negatively impact water quality both locally and statewide. The largest of California's drinking water sources is the Sacramento-San Joaquin Delta and its tributaries. The Delta provides water throughout the state via the State and Federal water projects. During a flood, there is a higher potential for the waters in the Delta to be exposed to chemicals, fuel, oil, and multiple other constituents of concern that can quickly degrade water quality. Flooding can also disturb soil and soil-borne materials such as mercury and organic matter that can degrade water quality.

Additionally, maintaining the current configuration of Delta levees and channels is critical to insure Delta salinity standards are met and salt water intrusion from the bay into the Delta does not occur. Twitchell Island is one of the eight western islands, which collectively form a crucial group of islands which, if breached, could each individually greatly degrade water quality in the Delta from the transportation of tidal salt water through the major Delta channels where fresh and salt waters mix. Additionally, if the island did flood, the evaporative losses from the flooded island would have an additional detrimental impact to the overall water quality in the surrounding Delta waterways.

Should a flood breach the levees, the entirety of the assets of RD 1601 would be at risk. Levee failure is discussed later in this section. Flooding also causes erosion, which is discussed later in this section.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, the District does not control this development. The District only can control whether the levees meet certification standards.

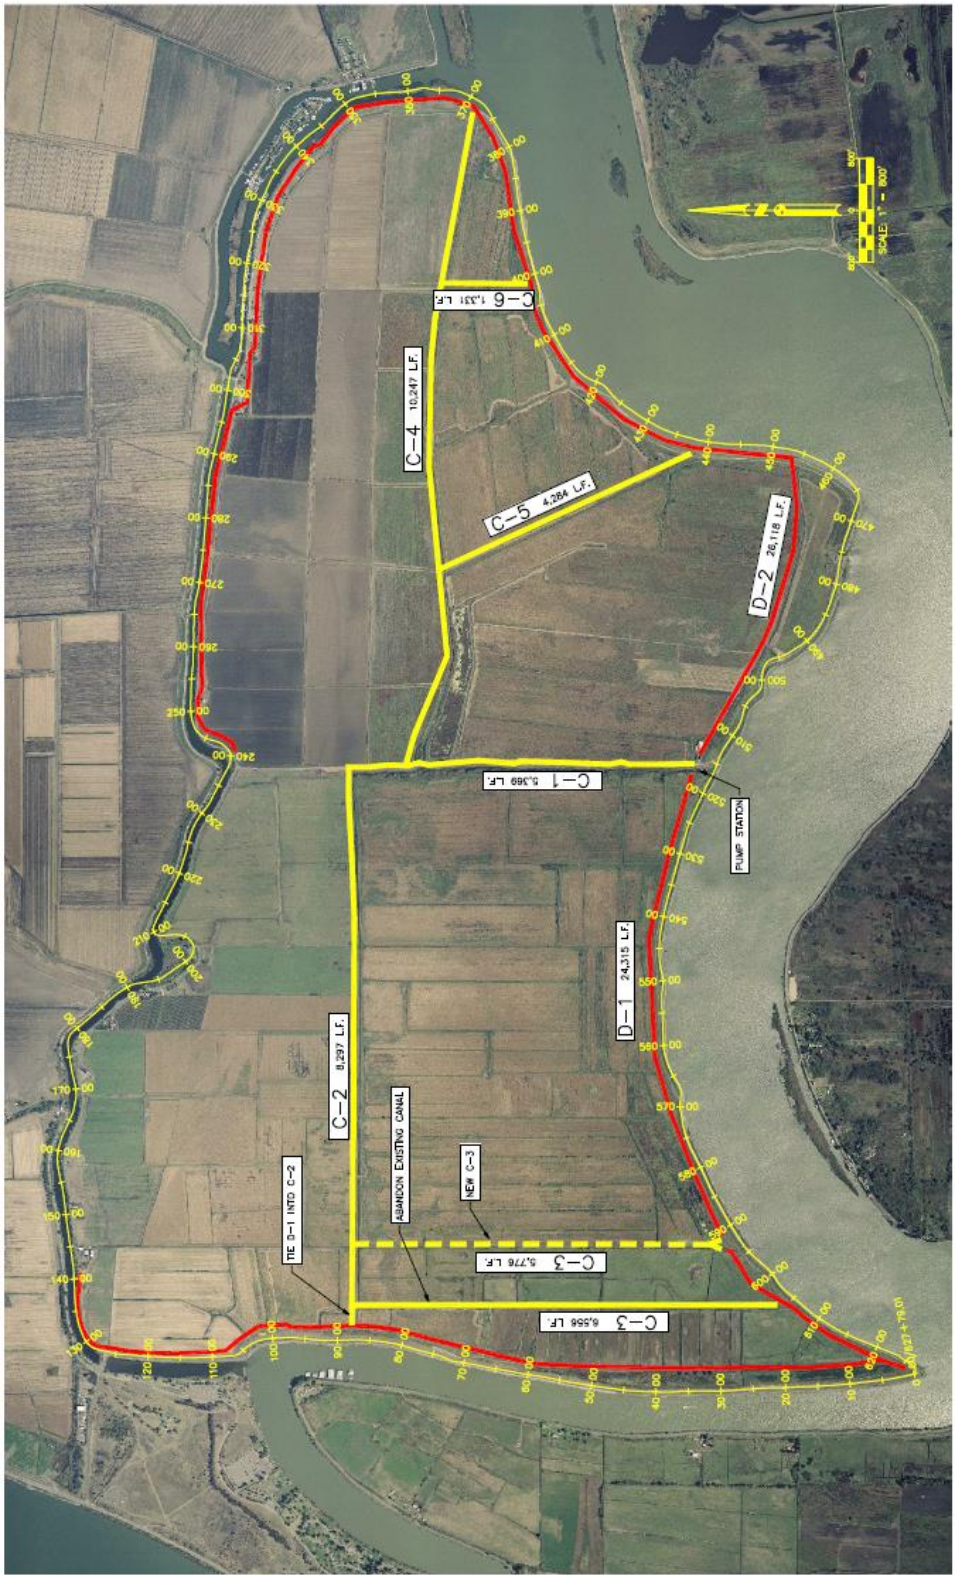
Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Historically, RD 1601 has been at risk to flooding primarily during the spring months when river systems in the County swell with heavy rainfall. Localized flooding also occurs throughout the Planning Area at various times throughout the year with several areas of primary concern unique to the District. The District has a drainage system set up deal with localized flooding. This is shown on Figure 11-2.

Figure 11-2 RD 1601 Drainage System



Source: RD 1601 2010 5-Year Plan

Past Occurrences

The District Planning Team noted that in the last planning period there were no past occurrences.

Vulnerability to Localized Flood

Assets/Critical Facilities at Risk

The District Planning Team noted that all District assets are at risk to localized flooding; however, this flooding is likely to be a nuisance-type of flood, and would not have lasting impacts on the District.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, the District does not control this development. The District only can control whether the levees meet certification standards.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will

collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters

Past Occurrences

The 5-Year Plan documented the history of levee failures in RD 1601.

- 1906, 1907 & 1909: Flooding of entire island occurred from levee failure or overtopping.
- 1964: Levee at approximately Station 390+00 cracked and/or dropped in December 1964, requiring immediate repair.
- 1980: A large settlement crack occurred in the levee crown at Station 376+00 to 380+00, arcing from the landward to the center of the crown and back to the landward. Crack width was from 1 to 4 inches, with a vertical settlement of 3 to 6 inches. Rock revetment was added to the waterward levee slope. Dredged material was placed on the landward levee slope as the crack gradually opened further and settlement increased. The dredge material was moved off the slope to create a 25 foot wide by 1.5 foot high stability berm at the landward toe of the levee. A core trench was constructed at Station 415+00 to 421+00 to cut off seepage. Riprap placement and dredging occurred in response to a high water and wind event, and was funded by the Federal Disaster Assistance Administration (FDAA) in the amount of $100,550. The levee crown in was low at Station 530+00 to 532+00, and required sandbags to be placed along the waterward shoulder during high tides and high winds from the south in February. A crack occurred near the landward toe of the levee, with a width of 3 inches and length of 150 feet. Dredged material was placed in the low areas on the landside of the levee, on the landward slope, and in limited amounts on the levee crown. Boils occurred on the landward levee slope at Station 415+00 to 421+00, located 5 to 6 feet below the crown. High tides at this time were 5 feet below the levee crown. A backhoe was brought in to dig a core trench in the levee crown between 6 and 7 feet deep and 18 inches wide. The trench was dug in 8 to 10 foot segments, with each segment being inspected, backfilled in layers, and tamped with the backhoe bucket before digging the next trench segment. A crack approximately 5 feet below the levee crown was discovered opposite two of the boils, and appeared to extend through the levee on a diagonal. The crack was 6 to 8 inches wide, and 1/2 inch high.
- 2006: Seepage at Stations 445+00 to 450+00, 480+00, 500+00 to 510+00, 530+00 to 540+00, and 600+00 was stopped by coring and sealing the levee with a Bentonite mix after a failed attempt at Stations 535+00 to 540+00 to stop seepage using a vibratory wall by DWR.

Vulnerability to Levee Failure

The two primary vulnerabilities that threaten the levee system on Twitchell Island involve levee stability and levee geometry.

The Twitchell Island levee system has a long history of levee stability problems including settlement, movement, seepage, and slope failure. Documentation of the levee's performance is extensive. GEI Consultants, a geotechnical, environmental and water resources engineering firm, obtained information from the California Department of Water Resources documenting these problems as far back as 1955 during

the course of research for the January 2009 "Geotechnical Investigation and Evaluation Report" performed for the San Joaquin River portion of the levees. The San Joaquin river levee reach has historically shown more problems relative to Stability. Deep organic soils and sands in conjunction with deep water and high winds cause this reach of levee to be extremely vulnerable to failure during high water and storm events. It should also be noted that the investigations did not locate an acceptable on-island borrow material suitable for levee projects As of the last complete profile survey of the island in 2008, and taking into account completed projects through fiscal year ending June 30, 2010, there remain several locations along Sevenmile Slough that do not meet the Hazard Mitigation Plan (HMP) standard for geometry.

This standard requires the levee to be one foot above base flood elevation, and 1.5:1 waterside and 2:1 Landside slopes. There is approximately 3000' (5%) of District levee below the HMP Standard and approximately 28,000' (45%) below the PL84 Standard. These values were calculated by analyzing a combination of the most current District surveys, including the 2009 District Aerial Survey for the San Joaquin River levee and the 2006 KSN GPS Survey for the Threemile Slough and Sevenmile Slough levees. Levee centerline profiles were cut through each of the modeled survey surfaces and compared to water surface elevation profiles from the US Army Corps of Engineers' 1992 Sacramento-San Joaquin Delta Special Hydrology Study.

Sevenmile Slough is isolated from tidal waters by water control structures that, along with the balance of the levee system, meet the HMP standard. Up until 2006, the District was considered to have met the HMP standard; however, in 2006 the Federal Emergency Management Agency determined that because the entire Sevenmile slough levee did not meet the geometry required in HMP, that the District was not eligible for Federal Disaster Assistance. Thus, the vulnerability to the District is both a flood threat due to overtopping caused by low levee crown elevations and a financial threat because no Federal Disaster Assistance would be available for damages resulting from a declared disaster event.

Assets/Critical Facilities at Risk

Should the levees fail, all District assets would be at risk.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, the District does not control this development. The District only can control whether the levees meet certification standards.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

Past Occurrences

The 5-Year Plan documented the history of erosion in RD 1601.

- 1981: Erosion on the waterward side of the levee was repaired and protected with riprap revetment at Station 625+00 to 628+74
- 1982-1983: The flood event FEMA 677 DR caused waterside erosion, multiple cracks on the landside slope along with sinkholes, subsidence areas, and seepage areas. Disaster claims totaled $1,818,160 $1,818,160 for construction of landside berms, raising levee crown, and riprap erosion protection.
- 2009: Riprap was installed on the levee waterside slope and crown on the setback levee at Stations 570+00 to 595+00 to mitigate erosion that had occurred in past years.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

The entirety of the levee system in RD 1601 is at risk to erosion.

Natural Resources at Risk

The District Planning Team noted that stream bank erosion in the Delta islands can possibly destroy habitat, kill species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, which can be compromised by severe erosion, the District does not control this development. The District only can control whether the levees meet certification standards.

Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning)

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the District. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

The 5-Year Plan for RD 1601 included a history of heavy rains in the District.

- 2005 to 2006. A storm event starting on December 30, 2005 required emergency action beginning on January 1, 2006. Four long reach excavators were used to restore the rock slope protection at Stations 363+74 to 565+00 and 580+00 to 628+74 that was lost as a result of the extreme high water and winds along the San Joaquin River. The construction involved pulling the slipped rock up along the waterside slope from the waterside levee toe. Two angle blade bulldozers were used to clear debris on the levee crown and restore eroded sections of levee due to the high water and wind-generated waves splashing over the levee to the landside slope, including portions of the levee road that were no longer passable. The San Joaquin reach of the Twitchell Island levee was nearly overtopped. 25,000 feet of existing riprap was repositioned to form a break wall by Dutra Construction in 40 consecutive hours to protect the levee from extreme wind and wave wash.

Vulnerability to Heavy Rains and Storms

Assets/Critical Facilities at Risk

Heavy rain and thunderstorms are the most frequent type of severe weather occurrence in the area. Wind and lightning often accompany these storms and have caused damage in the past. Problems associated with the primary effects of severe weather include flooding, pavement deterioration, washouts, high water crossings, landslide/mudslides, debris flows, and downed trees. However, it is the secondary effects of heavy rain and storms that are of concern to RD 1601. Heavy rains can cause flooding, levee failure, and stream bank erosion. Flooding, levee failure, and stream bank erosion can cost RD 1601 millions in damages.

Natural Resources at Risk

The District Planning Team noted that all natural resources could be at risk from heavy rains on the district.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, which can be compromised by severe weather events, the District does not control this development. The District only can control whether the levees meet certification standards.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

According to historical hazard data, severe weather (including high winds) is an annual occurrence in the District. Tornadoes occur much less frequently. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

The 5-Year Plan for RD 1601 included a history of wind and tornadoes in the District.

- 1998 Flood Event. During the flood event of 1998, riprap was placed on waterside slopes to mitigate damage by high water and high winds.
- 2006 Flood Event. Rip rap was placed on waterside slopes to mitigate damage caused from high winds.

Vulnerability to Wind and Tornadoes

Assets/Critical Facilities at Risk

The District Planning Team noted that the entirety of the levee structures are at risk from wind.

Natural Resources at Risk

The District Planning Team noted that all natural resources in the District are at risk if winds caused a levee failure in the District.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, which can be compromised by high wind events, the District does not control this development. The District only can control whether the levees meet certification standards.

Subsidence

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

For over a century, subsidence of the organic soils in portions of the Delta has led to an increasing need for subsurface drainage. Aerobic oxidation of organic carbon, the primary cause of subsidence, began in the late 1800s as the nutrient-rich organic soils were cleared and farming began. Peat fires, lit to level agricultural fields prior to 1950, and wind erosion are also significant causes of subsidence throughout the Delta. Since reclamation of the island began, elevations have fallen to as much as 20 feet below sea level, requiring protection by over 1,125 miles of man-made levees throughout the Delta. Drainage is provided by a network of ditches that collect and transport shallow groundwater, irrigation runoff, and levee seepage to pump stations that discharge back into the Delta waterways. These ditches create an unsaturated root zone for crops, and provide a more stable levee foundation.

Past Occurrences

The 5-Year Plan documented the history of subsidence in RD 1601.

- 1982-1983: The flood event FEMA 677 DR caused waterside erosion, multiple cracks on the landside slope along with sinkholes, subsidence areas, and seepage areas. The levee was found to have problems with subsidence and seepage, and had cracks in the landward slope at Stations 374+00 to 378+00, 384+00 to 387+00, 405+00 to 409+00, 419+00 to 436+00, 526+00 to 530+00, 550+00 to 554+00, and 567+00 to 569+50. Import fill material was placed on the landward levee slope to flatten the slope, and a landside berm fill was constructed, with Mirafi fabric placed under the berm fill, except at Stations 384+00 to 387+00, 534+00 to 536+25, and 567+00 to 569+50. Sink holes were located at the landward toe of the levee at Stations 448+00, 550+00, and were filled with import fill material.
- 1985 to 1986: The levee was found to have problems with subsidence and seepage, and had cracks in the landward slope at Stations 363+39 to 367+00 and 582+00 to 588+34.

The District Planning Team noted that, in addition to the 5-Year Plan history, a 2006 storm event caused subsidence in the District. An area on the west side of Pump Station #1 suffered from subsidence.

Vulnerability to Subsidence

Assets/Critical Facilities at Risk

The management issues raised by land subsidence range in scale from those faced by individual farmers to the possible global-scale issue posed by the carbon-dioxide flux, with its possible link to climate change. At the most local level, individual farmers or reclamation districts must maintain drainage networks on the

islands and pump the agricultural drainage back into waterways. These costs increase gradually as subsidence progresses. The District Planning Team noted that all levee structures in the District are at risk to subsidence.

Natural Resources at Risk

The District Planning Team noted that all natural resources in the District are at risk to subsidence.

Historic and Cultural Resources at Risk

The District Planning Team noted that there are no known historic and or cultural resources at risk on the island.

Future Development

While future development may occur in the areas protected by levees, which can be compromised by subsidence activity, the District does not control this development. The District only can control whether the levees meet certification standards.

11.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

11.6.1. Regulatory Mitigation Capabilities

Table 11-4 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 1601.

Table 11-4 RD 1601's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y 2010	5 Year Plan identifies hazards that may affect RD 1601. Some mitigation strategies are proposed. An Evacuation Plan is detailed, as well as an Emergency Response Plan.
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	In progress at the time of the development of this plan will be completed by December 2016
Continuity of Operations Plan	N	

Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N

11.6.4. Mitigation Education, Outreach, and Partnerships

Table 11-7 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 11-7 RD 1601's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

11.6.5. Other Mitigation Efforts

The entire Twitchell Island levee system consists of 2.5 miles of Federal Project Levee and 9.4 miles of Non-Project levee and is inspected daily by District staff who are familiar with all aspects of its function. The District engineer typically performs an inspection once a month or more frequently when warranted. The Federal Project Levee along Threemile Slough is inspected in the Fall and Spring by the Department of Water Resources levee inspectors. Reports are compiled and submitted to the District. The District staff also inspects the Federal Project Levee in the Winter and Summer, and submits reports back to the Department of Water Resources. During high water or severe weather events, inspection frequency is increased to meet the demand. The entire levee is inspected continuously at one hour intervals.

11.7 Mitigation Strategy

11.7.1. Mitigation Goals and Objectives

RD 1601 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

11.7.2. Mitigation Actions

The planning team for RD 1601 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Levee Improvement Project

Hazards Addressed: EQ, EQ Liquefaction, Flood: 100/200/500-year, Flood: Localized Stormwater Flooding, Levee Failure, River/Stream/Creek Bank Erosion, Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning), Severe Weather (Wind and Tornadoes), Subsidence

Goals Addressed:

Issue/Background: The goal of this Mitigation Action is to improve the Twitchell Island levees over the next five years to a level of protection that meets, or exceeds, the U.S. Army Corps of Engineers' (USACE) PL84-99 Levee Standard.

Project Description: The District would like to bring portions of the RD 1601 Twitchell Island levee currently below the HMP Criteria to six inches above the PL 84-99 Standard using 2:1 landside slopes. If sufficient funding is available, the segments of levee improved during this phase will include portions of the levee that meet the HMP Criteria, but do not meet the design template for this project, due to the many relatively short stretches of levee that do not meet the PL 84-99 Standard in close proximity to longer stretches of levee that do not meet the HMP Standard. After the entire levee meets or exceeds the HMP Criteria, the District will bring any remaining portions of levee below the PL 84-99 Standard to six inches above the PL 84-99 Standard.

Other Alternatives: none

Existing Planning Mechanism(s) through which Action Will Be Implemented: Permitting process, Finalizing the EIR, CEQA Design Process

Responsible Office/Partners: RD 1601

Cost Estimate: $90 -100 million

Project Priority: High

Benefits (Losses Avoided): Preservation of 563 levee structures, Ecosystem Restoration and Habitat Enhancement Component, Reversing Land Subsidence, Ensuring Adequate and Effective Emergency Response Plans, Benefitting Water Quality, Improving Water Supply Reliability

Potential Funding: Prop 1 and 1E, 84 Funds, HMGP Grant Programs, seeking cost sharing partners for project.

Timeline: 1-10 years depending on regulatory process and funding

Delta Annex Chapter 12 Reclamation District 2111

12.1 Introduction

This new chapter to the Delta Annex details the hazard mitigation planning elements specific to the Reclamation District 2111 (RD 2111), a new 2016 participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This chapter of the Delta Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by RD 2111. This chapter of the Delta Annex provides additional information specific to RD 2111, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

12.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 2111 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table 12-1. Additional details on plan participation and RD 2111 representatives are included in Appendix A.

Table 12-1 RD 2111 Planning Team

Name	Position/Title	How Participated
Daniel Wilson	President	Attended meetings, collected data, drafted text and reviewed draft documents
Chiles Wilson	Trustee	Attended meetings, collected data, drafted text and reviewed draft documents
Dixie Wilson	Trustee	Attended meetings, collected data, drafted text and reviewed draft documents
Bill Darcie	Project Manager	RSN, Inc.

12.3 Community Profile

The community profile for RD 2111 is detailed in the following sections. Figure 12-1 displays a map and the location of RD 2111 boundaries within Sacramento County.

Figure 12-1 Reclamation District 2111 Map

Source: RD 2111

12.3.1. RD 2111 Overview and Background

Reclamation District No. 2111, Dead Horse Island is near the town of Walnut Grove, several miles to the west of Interstate 5 between Sacramento and Stockton. The District is protected by approximately 13,650 feet of non-project levee. The District has one landowner, who holds all of the lands within. Dead Horse Island is surrounded by Dead Horse Cut to the east, the North Mokelumne River to the south, and Snodgrass Slough to the north and west. The island is accessible by bridge from Staten Island, which connects to the southwest most portion of Dead Horse Island. The levee crown road is an all-weather gravel surface, and in one portion of the Island veers off the crown to avoid an existing structure; the levee crown is still accessible to truck traffic if necessary in a flood event, and the required levee crown width for access is provided adjacent to the structure.

Reclamation District No. 2111 is responsible for maintaining the levee and drainage system that provides flood protection for Dead Horse Island, shown in Figure 12-1. The District was formed in 1980, and encompasses an area of 211 acres, surrounded by 2.58 miles of non-project levee, all located within Sacramento County. The District's Board of Trustees is made up of three Trustees who meet annually, or as necessary.

Dead Horse Island is located in the North Delta and is bordered by Dead Horse Cut to the east, the North Mokelumne River to the south, and Snodgrass Slough to the north and west. The District is located within the boundaries of the North Delta Water Agency. Emergency ingress and egress routes are via a private road on Staten Island off North Walnut Grove Road immediately east of the bridge over the North Fork of the Mokelumne River.

Dead Horse Island is located just downstream of the Delta Cross Channel. Water from the Sacramento River flows into both the South Fork and North Fork of the Mokelumne Rivers around the perimeter of Dead Horse Island as it flows toward the State and Federal Water Project Pumps near the City of Tracy. The Reclamation District No. 2111 levees provide the conduit for this water to enter both the North Fork and South Fork of the Mokelumne River, and are important to the proper function of the State and Federal Water Projects.

None of the waterways immediately surrounding Dead Horse Island is a significant commercial marine transportation route, but every waterway around Dead Horse Island is navigable during certain times of the year. A private dock and lagoon serve the Island at approximately Station 6+00. There are also two marinas across the waterways from the Island: a marina called "Wimpy's" near the southeast corner of the Island, and Walnut Grove marina across from the westernmost point of the Island. These marinas are major hubs for recreational boating in the area, and there is substantial boat traffic in the channels surrounding Reclamation District No. 2111, which increases the erosion to which the District levees are subject. The waterways surrounding Reclamation District No. 2111 are used extensively by recreational boaters and by marine contractors that perform levee maintenance, flood fight response and other construction activities.

12.4 Hazard Identification

RD 2111's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 2111 (see Table 12-2).

Table 12-2 RD 2111—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Extensive	Unlikely	Limited	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Extensive	Unlikely	Limited	Low
Dam Failure	Extensive	Unlikely	Limited	Low
Drought and Water Shortage	Extensive	Occasional	Critical	Low
Earthquake	Extensive	Unlikely	Negligible	Low
Earthquake: Liquefaction	Significant	Unlikely	Negligible	Low
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Limited	Likely	Limited	Low
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Significant	Likely	Limited	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Limited	Unlikely	Negligible	Low
Severe Weather: Extreme Temperatures – Heat	Limited	Unlikely	Negligible	Low
Severe Weather: Fog	Limited	Unlikely	Negligible	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Limited	Unlikely	Negligible	Low
Severe Weather: Wind and Tornadoes	Limited	Unlikely	Negligible	Low
Subsidence	Limited	Unlikely	Critical	Low
Volcano	Extensive	Unlikely	Catastrophic	Low
Wildfire:(Burn Area/Smoke)	Limited	Unlikely	Negligible	Low

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

12.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 2111's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 2111 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

12.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section 12.5.3, includes a description as to how the hazard affects RD 2111 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

12.5.2. Vulnerability Assessment

This section identifies RD 2111's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table 12-3 lists particular critical facilities and other District assets identified by RD 2111's planning team as important to protect in the event of a disaster. RD 2111's physical assets, valued at over $150,000, consist of the buildings and infrastructure to support RD 2111 operations.

Table 12-3 RD 2111's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Drain Pump 10	Essential Services		$50,000	Out of floodplain
Drain Pumps	Essential Services		$100,000	Out of floodplain

Source: RD 2111

Natural Resources

The Reclamation District No. 2111 levee provides protection for valuable habitat essential for many threatened and endangered species. In general, Delta lands, including those protected by the District's levees, provide forage and cover for local and migratory populations of birds and terrestrial wildlife including many special status species. The levees also provide important waterside habitat and shoreline for various fisheries that includes several special status species. Flooding of Delta islands destroys habitat and kills most terrestrial species present.

Historic and Cultural Resources

Per the 2015 Five-Year Plan, there are not historic or cultural resources in the District.

Growth and Development Trends

According to the District in 2011, Dead Horse Island currently supports three permanent residences and several small structures which are generally not occupied. Three fulltime residents live on the Island. The permanent residences are above the required HMP levee crown elevation. The Planning Team for the District noted that futued development is limited in secondary zone of the Delta from the Delta Protection Plan.

12.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table 12-2 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 2111 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable District assets include the levees and supporting structures that the District owns.

An estimate of the vulnerability of RD 2111 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.

- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

The Reclamation District No. 2111 levee is generally overtopped or the levee is breached during large flood events due to a confluence of several waterways in the vicinity of Dead Horse Island, which is located just downstream of where the Cosumnes and Mokelumne Rivers and Dry Creek merge with Snodgrass Slough. The island is separated from the Sacramento River by one reclamation district and the flood gates for the Delta Cross Channel. Flooding of the island occurs primarily because the island is located in a hydraulic choke point in the river system that is impacted by the timing of storms, the unrestricted flows from the Cosumnes River and Dry Creek as well as the management of reservoir releases on the Mokelumne River.

Historically, flooding in the Delta has resulted from levee failures caused by the separate or coincidental occurrence of very high tides, high runoff, and river outflow through the Delta region. Strong onshore winds associated with low pressure storms increase flood potential by causing an additional rise of the water surface elevations, and can cause severe erosion on levees in a short period of time. Flood events resulting from high tides and/or high river outflow cannot be reliably predicted, and must be expected to occur in the future.

Past Occurrences

Past occurrences of flooding are detailed in the levee failure section below.

Vulnerability to Flood

Assets/Critical Facilities at Risk

Flooding of Delta islands has the potential to negatively impact water quality both locally and statewide. The largest of California's drinking water sources is the Sacramento-San Joaquin Delta and its tributaries. The Delta provides water throughout the state via the State and Federal water projects. During a flood, there is a higher potential for the waters in the Delta to be exposed to chemicals, fuel, oil, and multiple other constituents of concern that can quickly degrade water quality. Flooding can also disturb soil and soil-borne materials such as mercury and organic matter that can degrade water quality.

Dead Horse Island is located just downstream from the confluence of the Mokelumne and Cosumnes Rivers. The Cosumnes River is one of the few remaining rivers that does not have any dams, and flows are unrestricted upstream of Dead Horse Island. The Mokelumne River is controlled by several dams, with Camanche Dam being the principal flood control reservoir. McCormack Williamson Tract, located upstream to the northeast and adjacent to Dead Horse Island, has a restricted elevation levee on the upstream

end of the tract that overtops and fills McCormack Williamson Tract when the Mokelumne and Cosumnes Rivers reach an elevation of 20.0 feet (NAVD 88 datum). The flood water that is contained within McCormack Williamson Tract builds up within the Tract until it overtops and breaches the levee on the downstream end of the Tract, adjacent to Dead Horse Island. When the McCormack Williamson Tract downstream levee fails, all of the water accumulated from upstream is released in a very short time, and given the narrow channels surrounding Dead Horse Island, causes an immediate short term rise in the water surface elevations in the channels surrounding Dead Horse Island. The majority of the recent flood events on Dead Horse Island can be attributed to this type of hydraulic event that commonly occurs during flood flows on the Mokelumne and Cosumnes Rivers.

Based on past history, the District Planning Team noted that the island's levees are sufficient to protect against a 100-year flood. A 200- or 500-year flood would likely overwhelm or overtop the levees. The District Planning Team also noted that both marinas are unstable – they will break and block bridges during high water.

Should a flood breach the levees, the entirety of the assets of RD 2111 would be at risk. Levee failure is discussed later in this section. Flooding also causes erosion, which is discussed later in this section.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The Planning Team for the District noted no historic or cultural resources at risk to flooding.

Future Development

There is only one building site in the District. It is above the floodplain.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from

high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters

Past Occurrences

The 2015 Five-Year Plan contained detail of past occurrences of levee failure and how it affected the District. Those details are here below:

- 1900 – Dead Horse Island was initially reclaimed. The levee on the east side of the Island was constructed by dredgers, which separated the Island from McCormack Williamson Tract.
- 1907 – A flood event breached the levee on nearby Tyler Island, and likely flooded Reclamation District No. 2111 as well.
- December 1955 – Rainfall on a deep Sierra snowpack caused flooding at Reclamation District No. 2111. Levee failed and the District was inundated.
- 1957 – A flood event caused inundation at Dead Horse Island. The levee failed and the District was inundated.
- 1980 – Levee failure at approximately Station 96+00 to 97+00. Due to hydraulic conditions in this portion of the Delta, the levee was overtopped by rising floodwaters causing the failure along Snodgrass Slough opposite the Walnut Grove Marina. Reclamation District No. 2111 was inundated. The levee was temporarily repaired so that the Island could be dewatered. Complete repair of the failed levee section occurred during the following summer months and the full levee section was restored. A FEMA claim was filed, and helped to defer the costs of the repair.
- February 1986 – The east end of the Island was overtopped. In the words of one of the District trustees, this flood event caused overtopping simultaneously "all over" the District. The location of the District at the confluence of the of the Mokelumne and Cosumnes Rivers caused a huge volume of water to overwhelm the District in a very short time, and the elevation of the levee was insufficient to protect the District against this rapid floodwater rise. The levee prism also failed as a result in the rapid pressure increase from the high water. In addition to the increased flow throughout the Delta, floodwaters around the District rose even further due to an unexpected flow restriction in the North Fork of the Mokelumne River at the New Hope Bridge, where several house boats had broken loose of their moorings and lodged against the bridge (see photo). The house boats had been docked at the New Hope Marina, located upstream of the split between the North Fork and South Fork of the Mokelumne River, near the western portion of the District levee. Note the marina blocking water that caused the RD 2111 levees to fail.

Source: 2015 Five-Year Plan for RD 2111

- January 1997 – The District levee failed at approximately Station 107+00 to 110+00 just as the levee was about to be overtopped. Consequences: A levee break occurred opposite the Walnut Grove Marina during a flood event. The District was fully inundated. Several boats and sections of the dock from the Walnut Grove Marina were pulled through the levee breach into the interior of the island. Other recreational boats, house boats, and sections of dock were also pulled into the Millers Ferry Bridge, including a two story floating home which particularly threatened to reduce flows down the North Fork of the Mokelumne River, increase the flood threat to adjacent islands, and possibly destroy the bridge, cutting off one of the few available emergency evacuation routes (see photo). The large house boat was eventually destroyed and the debris was sucked under the bridge.

Source: 2015 Five-Year Plan for RD 2111

In earlier flood events, there are reports that the McCormack Williamson Tract levee was purposely breached on Dead Horse Cut prior to its overtopping, successfully attenuating the flood impacts previously anticipated to affect neighboring islands. These planned levee breaches also limited damage to the interior of the McCormack Williamson levees as the size and location of the planned breaches can be controlled, and the water surface elevation within the tract does not increase beyond the downstream high water surface elevations.

It should be noted that since 1986, significant portions of the levee system within the Legal Delta have been rehabilitated and improved, which has significantly reduced the number and frequency of levee breaches and failures during post-1986 Delta flood events.

Vulnerability to Levee Failure

Levee failures from collapse of rodent dens, seepage, falling trees, or some other mechanical failure are unpredictable and relatively uncommon. Routine levee inspections are the primary preventative measure against these types of levee failure events.

There are several standards that the levees in the Delta must meet in order to remain eligible for certain State and Federal disaster assistance programs. These include the Hazard Mitigation Plan (HMP) criteria and the Public Law 84-99 Flood Control and Coastal Emergency Act (PL 84-99) Standard for agricultural levees. The assessment below is based on the District's 2012 Hazard Mitigation Plan (HMP) Survey, performed by KSN Inc., and is corroborated by the State of California Department of Water Resources (DWR) 2007 Light Detection and Ranging (LiDAR) Survey. As of 2012, the District meets the following standards shown in Table 12-4.

Table 12-4 Reclamation District 2111 Levee Standards of Protection

Delta Agricultural Levee Standard	Feet of Levee	Percentage of Levee
Total Levee Length	13,642 feet	–
Meets HMP Standard	11,856 feet	87%
Meets PL 84-99 (Public Law 84-99 Flood Control and Coastal Emergency Act) Standard	1,786 feet	13 %

Source: 2015 Five Year Plan for RD 2111

Assets/Critical Facilities at Risk

Should the levees fail, all District assets would be at risk.

Natural Resources at Risk

Flooding of Delta islands destroys habitat, kills most species present, and can entrain and strand large populations of native and non-native fish species.

Historic and Cultural Resources at Risk

The Planning Team for the District noted no historic or cultural resources at risk to levee failure.

Future Development

There is only one building site in the District. Future development in the District is unlikely.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

Past Occurrences

There is erosion that occurs every year on RD 2111 levees. These may worsen depending on water and wave conditions.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

The entirety of the levee system in RD 2111 is at risk to erosion.

Natural Resources at Risk

The Planning Team for the District noted no natural resources at risk to flooding.

Historic and Cultural Resources at Risk

The Planning Team for the District noted no historic or cultural resources at risk to flooding.

Future Development

There is only one building site in the District. Future development is unlikely

12.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

12.6.1. Regulatory Mitigation Capabilities

Table 12-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 2111.

Table 12-5 RD 2111's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	In progress.

Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y 2015	Five-Year Plan
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N

12.6.4. Mitigation Education, Outreach, and Partnerships

Table 12-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table 12-8 RD 2111's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Other	N	
How can these capabilities be expanded and improved to reduce risk?		

12.6.5. Other Mitigation Efforts

The District Planning Team noted no other mitigation efforts.

12.7 Mitigation Strategy

12.7.1. Mitigation Goals and Objectives

RD 2111 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

12.7.2. Mitigation Actions

The planning team for RD 2111 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Rock Slope Protection Project

Hazards Addressed: EQ, EQ Liquefaction, Flood: 100/200/500-year, Flood: Localized Stormwater Flooding, Levee Failure, River/Stream/Creek Bank Erosion, Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning), Severe Weather (Wind and Tornadoes), Subsidence

Goals Addressed: 1, 2, 3, 4

Issue/Background: The goal of this Mitigation Action is to improve the Dead Horse Island levees over the next five years to a level of protection that meets, or exceeds, the U.S. Army Corps of Engineers' (USACE) PL84-99 Levee Standard.

Project Description: The District would like to ensure the protection of the existing levee by adding supplementary quarry stone riprap above the existing riprap to any portions of the waterside slope of the levee requiring supplementary rock slope protection. This will prevent erosion and avoid ongoing repairs to the levee structure.

Other Alternatives: none

Existing Planning Mechanism(s) through which Action Will Be Implemented: Permitting process, Finalizing the EIR, potential CEQA Design Process

Responsible Office/Partners: RD 2111

Project Priority: High

Cost Estimate: $813,000

Benefits (Losses Avoided): Preservation of 2111 levee structures, Ecosystem Restoration and Habitat Enhancement Component, Reversing Land Subsidence, Ensuring Adequate and Effective Emergency Response Plans, Benefitting Water Quality, Improving Water Supply Reliability

Potential Funding: Prop 1 and 1E, 84 Funds, HMGP Grant Programs, seeking cost sharing partners for project ongoing.

Timeline: 1-10 years depending on regulatory process and funding

Action 2. HMP and PL-8499 Levee Improvement Projects

Hazards Addressed: EQ, EQ Liquefaction, Flood: 100/200/500-year, Flood: Localized Stormwater Flooding, Levee Failure, River/Stream/Creek Bank Erosion, Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning), Severe Weather (Wind and Tornadoes), Subsidence

Goals Addressed: 1, 2,3, 4

Issue/Background: The goal of this Mitigation Action is to improve the Dead Horse Island levees over the next five years to a level of protection that meets, or exceeds, the U.S. Army Corps of Engineers' (USACE) PL84-99 Levee Standard.

Project Description: The District would like to bring portions of the RD 2111 levee currently below the HMP Criteria to six inches above the PL 84-99 Standard using 2:1 landside slopes. If sufficient funding is available, the segments of levee improved during this phase will include portions of the levee that meet the HMP Criteria, but do not meet the design template for this project, due to the many relatively short stretches of levee that do not meet the PL 84-99 Standard in close proximity to longer stretches of levee that do not meet the HMP Standard. After the entire levee meets or exceeds the HMP Criteria, the District will bring any remaining portions of levee below the PL 84-99 Standard to six inches above the PL 84-99 Standard.

Other Alternatives: none

Existing Planning Mechanism(s) through which Action Will Be Implemented: Permitting process, Finalizing the EIR, CEQA Design Process

Responsible Office/Partners: RD 2111

Project Priority: High

Cost Estimate: $16,000,000

Benefits (Losses Avoided): Preservation of 2111 levee structures, Ecosystem Restoration and Habitat Enhancement Component, Reversing Land Subsidence, Ensuring Adequate and Effective Emergency Response Plans, Benefitting Water Quality, Improving Water Supply Reliability

Potential Funding: Prop 1 and 1E, 84 Funds, HMGP Grant Programs, seeking cost sharing partners for project.

Timeline: 1-10 years depending on regulatory process and funding

Annex H Cosumnes Community Services District Fire Department

H.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Cosumnes Community Services District Fire Department (Cosumnes Fire Department or CFD), a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the CFD. This Annex provides additional information specific to CFD, with a focus on providing additional details on the risk assessment and mitigation strategy for this community.

H.2 Planning Process

As described above, the CFD followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), the CFD formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table H-1. Additional details on plan participation and CFD representatives are included in Appendix A.

Table H-1 CFD Planning Team

Name	Position/Title	How Participated
Troy Bair	Deputy Chief	Reviewed and provided input and updates on all areas of annex.
Kris Hubbard	Battalion Chief	Reviewed and provided input and updates on all areas of annex. Attended HMPC meetings.
John Ebner	Financial Analyst	Reviewed and provided input and updates on all areas of annex.

Source: CFD

Coordination with other community planning efforts is paramount to the successful implementation of this plan. This Section provides information on how the CFD integrated the previously-approved 2011 Plan into existing planning mechanisms and programs. Specifically, the CFD incorporated into or implemented the 2011 LHMP through other plans and programs shown in Table H-2.

Table H-2 2011 LHMP Incorporation

Planning Mechanism 2011 LHMP Was Incorporated/Implemented In.	Details?
District Emergency Operations Plan / Continuity of Operations Plan	The LHMP was utilized to develop an up to date emergency operations plan that will provide for a coordinated response before, during, and after a disaster incident affecting the District.
Hazard Specific Appendices	Hazard specific annexes created to identify hazard-specific risk areas and evacuation routes, specify provisions and protocols for warning the public and disseminating emergency public information and specifiy the types of protective equipment and detection devices for responders.

H.3 Community Profile

The community profile for the CFD is detailed in the following sections. Figure H-1 displays a map and the location of CFD boundaries within Sacramento County.

Figure H-1 CFD Boundaries

H.3.1. Department Overview, History and Background

The Cosumnes Community Services District Planning Area encompasses the former territory of six Plains Miwok tribelets along the Cosumnes River drainage and two, possibly three tribelets along the Sacramento River. In 1850, Elk Grove was established as a hotel stop and a stop for the stage. It is located about 15 miles south of historic Sutter's Fort and thus became a crossroads for business, entertainment, mail service and agriculture, and acted as home base for gold miners in nearby communities.

The roots of the Cosumnes Community Services District Fire Department date back to 1893, when the Elk Grove Fire Department started with a single hose cart and a small group of volunteers, and 1921, when the all-volunteer Galt Fire Protection district was formed. Today, the two fire departments operate as one, servicing growing communities with progressive, modern firefighter practices and equipment.

The Cosumnes CSD Fire Department is the product of two mergers. The first occurred in 1985 when the Elk Grove Fire Department merged with the Elk Grove Parks and Recreation District, one of the oldest park districts in the state, to become the Elk Grove Community Services District. The second merger was in 2006, when the CSD merged its fire services with the Galt Fire Protection District forming the Cosumnes Community Services District.

Initially, the town of Elk Grove developed around a stage stop on the Monterey Trail, though after the railroad passed by east of town, Elk Grove's center shifted to its present location. "Old Town" Elk Grove is located about a mile east of State Route 99 (formerly U.S. Route 99, the north-south artery of the California Central Valley).

America's first transcontinental highway, the Lincoln Highway, ran through Galt until it was ultimately replaced by State Route 99. Lincoln Way in central Galt is a remnant of this historic route. Galt grew around the rail depot and State Route 99 throughout the first half of the twentieth century. Improvements to State Route 99 in recent years have made Galt more accessible, which has resulted in increased population and growth to the west and northeast.

The original 1850 Spanish land grant, Rancho del los Moquelumnes, was purchased in 1861 by Dr. Obed Harvey, considered today as Galt's founder. His purchase included much of the Dry Creek Township which was later established as the town of Galt in 1869 by the Western Pacific Railroad company. A prominent early settler, John McFarland, named the town after his former home in Ontario, Canada, which was named after a Scottish novelist, John Galt. The combination of favorable land for agriculture and the proximity to the railroad provided Galt with the economic support to continue to grow.

With the decline of gold mining in the Sierra Nevada foothills by the end of the eighteenth century, Galt, like many other Central Valley towns, saw the arrival of miners looking to start anew in agriculture. The City's proximity to several major rivers and the water resources of the Sacramento-San Joaquin River Delta made Galt ideal for the establishment of agriculture early in California's history.

Today, Galt is at a strategic location between the growing areas of Sacramento and Stockton. The city's proximity to I-5 and SR 99 provides Galt excellent access to the rest of the Central Valley and California.

Despite fast growth in the region, the city continues to maintain its small-town character while balancing the needs for housing and acknowledging its important agricultural heritage.

Cosumnes Fire Department provides all risk emergency services to the cities of Elk Grove, and Galt. Additionally, services are provided to the communities of Sheldon, Pleasant Grove Laguna, Laguna West, and Franklin.

H.3.2. Geography and Climate

The District has a Mediterranean climate, characterized by damp to wet, mild winters and hot, dry summers. The wet season is generally October through April, though there may be a day or two of light rainfall in June or September. The mean annual temperature is 61.1°F, with monthly means ranging from 45.8°F in December to 75.4°F in July. Summer heat is often moderated by a sea breeze known as the "delta breeze" which comes through the Sacramento-San Joaquin River Delta from the San Francisco Bay.

On average, 96 days in the year experience some degree of fog, which usually occurs in the morning (tule fog). The foggiest months are December and January. Tule fog can be extremely dense, lowering visibility to less than 100 feet and making driving conditions extremely hazardous. Chilling tule fog events have been known to last for several consecutive days or weeks. During tule fog events temperatures do not exceed 50 degrees.

Snowfall is exceptionally rare in the District (at an elevation of only 45 to 47 feet above sea level). The all-time record snowfall was 3.5 inches on January 4, 1888. Dustings occur every 5–10 years, with up to an inch accumulation in outlying areas. During especially cold winter and spring storms, intense showers do occasionally produce a significant amount of hail, which can create hazardous driving conditions. Significant snow accumulations occur each year in the foothills located 40 miles (65 km) east of the city.

On average, there are 74 days where the high exceeds 90°F, and 15 days where the high exceeds 100°F; on the other extreme, freezing nights occur 16 nights per year. At Sacramento International Airport, extremes have ranged from 18°F on December 22, 1990 to 115°F on June 15, 1961.

The average annual precipitation is 21.45 inches. On average, precipitation falls on 62 days each year in Sacramento region, and nearly all of this falls during the winter months. Average January rainfall is 3.84 inches, and measurable precipitation is rare during the summer months. In February 1992, Sacramento region had 16 consecutive days of rain, resulting in an accumulation of 6.41 inches for the period. A record 7.24 inches of rain fell on April 20, 1880. On rare occasions, monsoonal moisture surges from the Desert Southwest can bring upper-level moisture to the Sacramento region.

H.3.3. Economy

Studies for foreseeable future point to slow growth in the labor markets which directly impacts the Cosumnes Fire Department. The Department, which includes the cities of Elk Grove and Galt, was affected by the subprime mortgage crisis and the decrease in new home construction which has historically played an important part in the overall local economy. Of the region's five largest job sectors (government, trade,

transportation, utilities, and leisure), three continue to struggle which in effect has slowed the region's recovery.

H.3.4. Population

As of 2010-2014, the total population of Elk Grove is 158,455. The Elk Grove population density is 3,751.40 people per square mile, which is much higher than the state average density of 232.55 people per square mile and is much higher than the national average density of 82.73 people per square mile.

H.4 Hazard Identification

CFD's planning team identified the hazards that affect the Department and summarized their frequency of occurrence, spatial extent, potential magnitude, and significance specific to CFD (see Table H-3).

Table H-3 CFD—Hazard Identification Table

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Limited	Likely	Negligible	Medium
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change				
Dam Failure	Limited	Unlikely	Negligible	Low
Drought and Water Shortage	Significant	Likely	Limited	Medium
Earthquake	Significant	Likely	Negligible	Low
Earthquake: Liquefaction				
Flood: 100/200/500-year	Limited	Likely	Limited	High
Flood: Localized Stormwater Flooding	Significant	Likely	Limited	Medium
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Limited	Occasional	Limited	Low
River/Stream/Creek Bank Erosion	Limited	Occasional	Negligible	Low
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Likely	Limited	Medium
Severe Weather: Extreme Temperatures – Heat	Extensive	Likely	Limited	Medium
Severe Weather: Fog	Extensive	Likely	Negligible	Medium
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Likely	Limited	Medium
Severe Weather: Wind and Tornadoes	Limited	Occasional	Limited	Low
Subsidence	Limited	Unlikely	Negligible	Low
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Limited	Highly Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

H.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile CFD's hazards and assess the Department's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Section 4.3 Vulnerability Assessment in the main plan. The hazard profile discusses the threat to the Planning Area and describes previous occurrences of hazard events and the likelihood of future occurrences. The vulnerability assessment analyzes the population, property, and other assets at risk to hazards ranked of medium or high significance that may vary from other parts of the Planning Area. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

H.5.1. Hazard Profiles

At the beginning of each hazard vulnerability assessment in Section H.5.3, a brief statement is given as to how the hazard affects the CFD, as well as past occurrences. The intent of this section is to provide jurisdictional specific information on hazards.

H.5.2. Vulnerability Assessment and Assets at Risk

This section identifies CFD's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, economic assets, and growth and development trends.

Assets at Risk

Table H-4 lists particular critical facilities and other community assets identified by the CFD's planning team as important to protect in the event of a disaster. CFD's physical assets, valued at over $64 million, consist of the buildings and infrastructure to support the CFD operations.

Table H-4 CFD's Critical Facilities, Infrastructure, and Other Department Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Cosumnes Fire Administration Campus	Administration/Apparatus support, and training	10573 E. Stockton Blvd. Elk Grove, CA 95624	$17,000,000	
Cosumnes Fire Stations (8)	Emergency Response		$40,000,000	
Cosumnes CSD Administration	CSD Administration	9355 E. Stockton Blvd. Elk Grove, CA 95624	$7,000,000	

Source: CFD

Critical Facilities

For purposes of this plan, a critical facility is defined as:

Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, (3) Hazardous Materials Facilities.

This definition was refined by separating out three categories of critical facilities as further described in Section 4.3.1 of the Base Plan. An inventory of critical facilities in the CFD is provided in Table H-5 and shown in Figure H-2 and Figure H-3.

Table H-5 CFD Critical Facilities: Summary Table

CF Definition Category	Type	Total by Location
Essential Services Facilities	Corporation Yard	2
Essential Services Facilities	Detention Basin	24
Essential Services Facilities	Dispatch Center	2
Essential Services Facilities	Emergency Evacuation Shelter	12
Essential Services Facilities	Emergency Operations Center	2
Essential Services Facilities	Fire Station	9
Essential Services Facilities	Government Facilities	20
Essential Services Facilities	Medical Health Facility	10
Essential Services Facilities	Law Enforcement	3
Essential Services Facilities	Sand Bag	7
Essential Services Facilities	Jail	1
Essential Services Facilities	State And Fed Facilities	4
Essential Services Facilities	Wastewater Treatment Facility	2
Essential Service Facilities	Electrical Sub -Stations	12
Essential Service Facilities	Water Treatment Facility	5
Essential Service Facilities	Co-Generation Plant	1
Essential Service Facilities	Photovoltaic Farm	5
Essential Service Facilities	Food Bank	1
Essential Service Facilities	Senior Center	1
Essential Service Facilities	Cal Trans Service Center	1
At Risk Population Facilities	Adult Residential	54
At Risk Population Facilities	Assisted Living Centers	57
At Risk Population Facilities	Day Care Center	37
At Risk Population Facilities	Group Home	6
At Risk Population Facilities	Hotel	8
At Risk Population Facilities	Infant Center	1
At Risk Population Facilities	Public and Private Schools	45
At Risk Population Facilities	Adult Day Care	6

CF Definition Category	Type	Total by Location
At Risk Population Facilities	Special Education School	1
Hazardous Materials Facilities	Oil Collection Centers	1
Hazardous Materials Facilities	Large Propane Storage	1
Total		**341**

Natural Resources

The CFD has a variety of natural resources of value to the community: habitat types are listed below, detailed in Table H-6. Table H-7 delineates the special status species that can be found in the CFD.

- Annual Grassland (including both disturbed and vernal pool grasslands)
- Cropland
- Orchard
- Freshwater Marsh
- Open Water (including both lacustrine and riverine habitats)
- Riparian (Scrub or Woodland)
- Urban/Developed Areas
- Vernal Pools
- Vineyards

Table H-6 Habitat Types within the CFD

Habitat Types	Acres (Approximate)	Percent Study Area
Annual Grassland	7,550	30%
Cropland	9,276	37%
Disturbed	21	<1%
Freshwater Marsh	135	<1%
Open Water	767	3%
Orchards	51	<1%
Other	10	<1%
Riparian (Scrub or Woodland)	320	1%
Seasonal Wetland	431	2%
Urban	5,232	21%
Vernal Pools	258	1%
Vineyards	954	4%
Total	**25,006**	**100%**

Note: "Other" includes those areas designated as recreational areas, the TNC Reserve, and roads.
Source: Draft South Sacramento County Habitat Conservation Plan – vegetation data interpreted from 1997-1998 aerial photos (minimal ground-truthing)

Table H-7 Special-Status Species Potentially Occurring in the CFD

Common Name	Scientific Name	Regulatory Status	Potential for Occurrence
Plants			
Ahart's Dwarfrush	*Juncus leiospermus var. ahartii*	SC; --; 1 B	Yes
Amador Rush-Rose	*Helianthemum suffrutescens*	SCL; --; 3	No

Long-eared Myotis	*Myotis evotis*	SC; --; --	Yes
Long-legged Myotis	*Myotis volans*	SC; --; --	Yes
Pacific Western Big- eared bat	*Corynorhinus townsendii townsendii*	SC; CSC (full species); --	Yes
Pale Townsend's Big- eared bat	*Corynorhinus townsendii pallescens*	SC; CSC (full species); --	Yes

Common Name	Scientific Name	Regulatory Status	Potential for Occurrence
San Francisco Dusky-footed woodrat	*Neotoma fuscipes annectens*	SC; CSC; --	No
San Joaquin Pocket Mouse	*Perognathus inornatus*	SC; --; --	Yes
San Joaquin Woodrat	*Neotoma fuscipes riparia*	FE; CSC; --	No
Small-footed Myotis	*Myotis ciiolabrum*	SC; --; --	Yes
Yuma Myotis	*Myotis yumanensis*	SC; --; --	Yes

FE = federally endangered FT = federally threatened
SC = federal species of concern
C = candidate FPT = federal proposed threatened FPE = federal proposed endangered SLC = Species of Local Concern
CE = state endangered
CT = state threatened CR = state rare
CSC = California species of special concern
C = candidate for listing
1 B = CNPS list plants rare, threatened, or endangered in California or elsewhere
2 = CNPS list plants rare, threatened, or endangered in California, but more numerous elsewhere * = not enough information available on this species
3 = CNPS list plants about which CNPS needs more information
4 = CNPS list plants of limited distribution – a watch list

Source: Foothill Associates, 2002

Historic and Cultural Resources

The CFD has 4 has registered federal historic sites:

- William Ehrhardt House (Elk Grove)
- Elk Grove Historic District (Elk Grove)
- Brewster Building (Galt)
- Brewster House (Galt)

In addition to the registered sites, there are several assets within CFD that define the community and represent the area's history. Some additional historical sites of importance are listed below.

- Old Town Elk Grove Shopping District.
- Rhodes School - first constructed in 1872, now located in Elk Grove Park.
- Murphy's Corral site of the beginning of the conquest of California by the United States on June 10, 1846.
- Galt Historic Business District.

Economic Assets

The largest employers with the CFD include: The Elk Grove Unified School District, Kaiser Permanente, and Apple Computers.

Growth and Development Trends

As of 2010 the growth within the CFD has been at 2.51%. The Regional Mall on Promenade Parkway and the Wilton Miwok Tribe Casino and Hotel will be developed in the near future.

Development since the 2011 Plan

The CFD has seen an increase in their service area population since the 2011 plan. Specifically, this includes:

CFD implemented a development project since 2011 increasing the numbers and capacity of District assets. New development tracked by totals and hazard risk areas are shown in Table H-8. All development in the identified hazard areas, including the 1% annual chance floodplains, areas protected by levees, and high wildfire risk areas, were completed in accordance with all current and applicable development codes and standards and should be adequately protected. Thus, with the exception of more people living in District service areas potentially exposed to natural hazards, this growth should not cause a significant change in vulnerability of the District to identified priority hazards.

Table H-8 CFD Development by Year and Hazard Areas since 2011

Asset Type	Year Built	Outside of Known Hazard Area	1% Annual Chance Flood	Area Protected by Levee	Wildfire Risk Area[1]	Other
Fire Station	2012		X			Landslide area
Total						

Source: CFD

[1]Moderate or higher wildfire risk area

H.5.3. Estimating Potential Losses

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table H-3 as high or medium significance hazards. Impacts of past events and vulnerability of the CFD to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the same as those described in Section 4.3 of the Base Plan. In general, the most vulnerable structures are those located within the floodprone areas, WUI areas, unreinforced masonry buildings, and buildings built prior to the introduction of modern building codes.

An estimate of the vulnerability of the CFD to each identified priority hazard, in addition to the estimate of risk of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.

- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Agricultural Hazards

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Agricultural cropland occurs interspersed throughout the rural residential areas in the City of Elk Grove, and throughout the Planning Area, with the majority occurring within the western portion of the Planning Area. More information on agricultural hazards of concern may be found in their annex (Annex B) to this Plan.

Past Occurrences

The CFD Planning Team noted that there have been no past occurrences of agricultural hazards in the City.

Vulnerability to Agricultural Hazards

Because this habitat is intensively managed, vegetation is limited to cultivated crops, predominately grains, orchards, and vineyards, with ruderal (weedy) vegetation along the margins. Ruderal species observed include Italian ryegrass (*Lolium multiforum*), ripgut brome (*Bromus diandrus*), and yellow star-thistle (*Centaurea solstitialis*).

Future Development

Future development in the District is not expected to be affected by ag hazards.

Drought

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water. A review of wildfire threat zones in the District based on fuel type, density, and percent of slope range from moderate to high – some of this is based upon the current drought situation. The Department's response plan has been designed to deliver the right mix of structural and wildland engines capable of rough terrain firefighting.

Past Occurrences

The District Planning Team noted that drought has been an ongoing issue in the past 5 years.

Vulnerability to Drought

Based on historical information, the occurrence of drought in California, including the Cities of Elk Grove and Galt, is cyclical, driven by weather patterns. Drought has occurred in the past and will occur in the future. Periods of actual drought with adverse impacts can vary in duration, and the period between droughts is often extended. Although an area may be under an extended dry period, determining when it becomes a drought is based on impacts to individual water users. The vulnerability of Elk Grove and Galt to drought is City-wide, but impacts may vary and include reduction in water supply and an increase in dry fuels.

Future Development

The District Planning Team noted that drought would not necessarily be a limiting or contributing factor to future growth within the district. Economy will be the driving force on expansion and building within the area.

Flood 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Major surface waters in the area of the District include the Morrison Creek Stream Group, and include Elder, Elk Grove, Laguna (and tributaries), Morrison, Strawberry, and Whitehouse Creeks near Elk Grove. Badger Creek, Willow Creek, Laguna Creek, Skunk Creek, Deadman Gulch, and Dry Creek, which drain to the Cosumnes River are near Galt. These can be seen on Figure H-4.

Figure H-4 CFD Major Waterways and Sources of Flooding

Source: CFD

Past Occurrences

The CFD experienced a significant flood specifically in January 1997. During this time period major transportation corridors, Interstate 5 and Highway 99 were shut down due to rising water levels. The loss of transportation corridors had a major impact on emergency services delivery to quickly respond to routine and flood related emergencies. The rising waters from the Cosumnes River essentially divided the district into two separate areas

Vulnerability to Flood

Elk Grove

Elk Grove area is part of the Sacramento River watershed, which covers approximately 27,000 square miles, with 400 miles of river from Lake Shasta to the convergence of the Sacramento-San Joaquin Delta. The City is also a part of this larger watershed. More specifically, surface water resources in Elk Grove are a part of the Morrison Creek Stream Group, and include Elder, Elk Grove, Laguna (and tributaries), Morrison, Strawberry, and Whitehouse Creeks. Florin, Gerber, and Union House creeks are located close to the City. Deer Creek is located in the eastern portion of the City, parallel to the Cosumnes River. The Cosumnes River is the eastern border of the City; however, all of the creeks in the area drain into the Morrison Creek Stream Group, then eventually into the Sacramento River. Runoff from precipitation and snowmelt from the Sierra Nevada mountains are the main sources of surface water supply in the City.

Laguna Creek, the Cosumnes River, and the Sacramento River are the main surface hydrological features in the City. The Morrison Creek Stream Group drainage basin covers 192 square miles. The nine creeks that drain into Morrison Creek flow southwest and eventually drain into the Beach Stone Lakes area west of Interstate 5.

Laguna Creek, the main creek that flows through the City of Elk Grove, has been altered by development. There have been channels, levees, and culverts created to alleviate the possibility of flooding, as well as to accommodate different development scenarios. Some of the other creeks in the City have also been altered to accommodate development or alleviate flooding potential. Structures and assets at risk, population at risk, and critical facilities at risk for Elk Grove can be found in their annex (Annex B) to this plan.

Galt

Although the City is located outside of the major flood plain area, the City experiences two types of flooding. The first is associated with local water courses. The second is associated with localized flood events resulting from inadequate surface flow. Heavy rainfall causes these types of flooding events.

Runoff from the City's study area is drained by a variety of local streams and creeks including Badger Creek, Willow Creek, Laguna Creek, Skunk Creek, Deadman Gulch, and Dry Creek, which drain to the Cosumnes River. The areas near the confluence of these smaller water courses with the Cosumnes River includes large areas of flood plain, which absorb excess flows from local watersheds during heavy rains and spring floods. Much of the storm water of this floodplain is maintained through a complex system of levees and dikes. Structures and assets at risk, population at risk, and critical facilities at risk for Galt can be found in their annex (Annex D) to this plan.

Assets at Risk

Parks and Greenbelts may be impacted within the flood prone areas. Buildings and infrastructure may have minimal impact.

Natural Resources at Risk

The District Planning Team noted that a wildlife preserve may be at risk to flooding.

Historic and Cultural Resources at Risk

The District Planning Team noted no historic or cultural assets at risk.

Future Development

The District Planning Team noted that flooding would not necessarily be a limiting or contributing factor to future growth within the District. Economy will be the driving force on expansion and building within the area.

Flood: Localized/Stormwater

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Localized flooding occurs at various times throughout the year and there are several areas of concern unique to the cities within the District. Historically, they have been at risk of flooding primarily during the spring months when the waterway/creek systems swell with heavy rainfall. This may produce local street flooding due to high water in the waterway/creek systems causing outfalls to back-up into the drainage inlets.

Past Occurrences

The District does not track localized flooding for the District.

Vulnerability to Localized Flood

Elk Grove

Historically, the City of Elk Grove has been at risk to flooding primarily during the spring months when river systems in the County swell with heavy rainfall. Localized flooding also occurs at various times throughout the year with several areas of primary concern unique to the City of Elk Grove. In the "Sheldon" area of Elk Grove, local flooding is widespread but generally minor; the flat land causes floodwaters to spread out, reducing threats to life. These areas of concern are shown in Annex B: City of Elk Grove of this plan.

Galt

Flooding events can occur any time during the rainy season (November to April). These events result from prolonged, heavy rainfall and are characterized by high peak flows of moderate duration and large volumes of runoff. Flooding is more severe when prior rainfall has resulted in saturated ground conditions. Other localized flooding hazards are caused by obstacles to natural drainage flows, such as small creek dams and dikes formed by freeway and railroad fills.

Cloudburst storms, sometimes lasting as long as three hours, can occur any time from the late fall to early spring, and may occur as an extremely severe sequence within a general winter rainstorm. Flooding from cloudburst activity is characterized by high peak flow, short duration of flood flow, and a small volume of runoff.

Potential issues of concern include a general lack of curbs and gutters in portions of the City of Galt. The lack of curb and gutters along with inadequate or incomplete storm drains can result in standing water that is both a public health nuisance and a potential hazard. Other sources of flooding concern are the size and capacity of small agricultural drainage structures that do not accommodate large storm flows.

More information on localized flooding in the City of Galt can be found in Annex D: City of Galt of this plan.

Assets at Risk

The District noted no specific District assets at risk to localized flooding.

Future Development

The District Planning Team noted that localized flooding would not necessarily be a limiting or contributing factor to future growth within the District. Economy will be the driving force on expansion and building within the area.

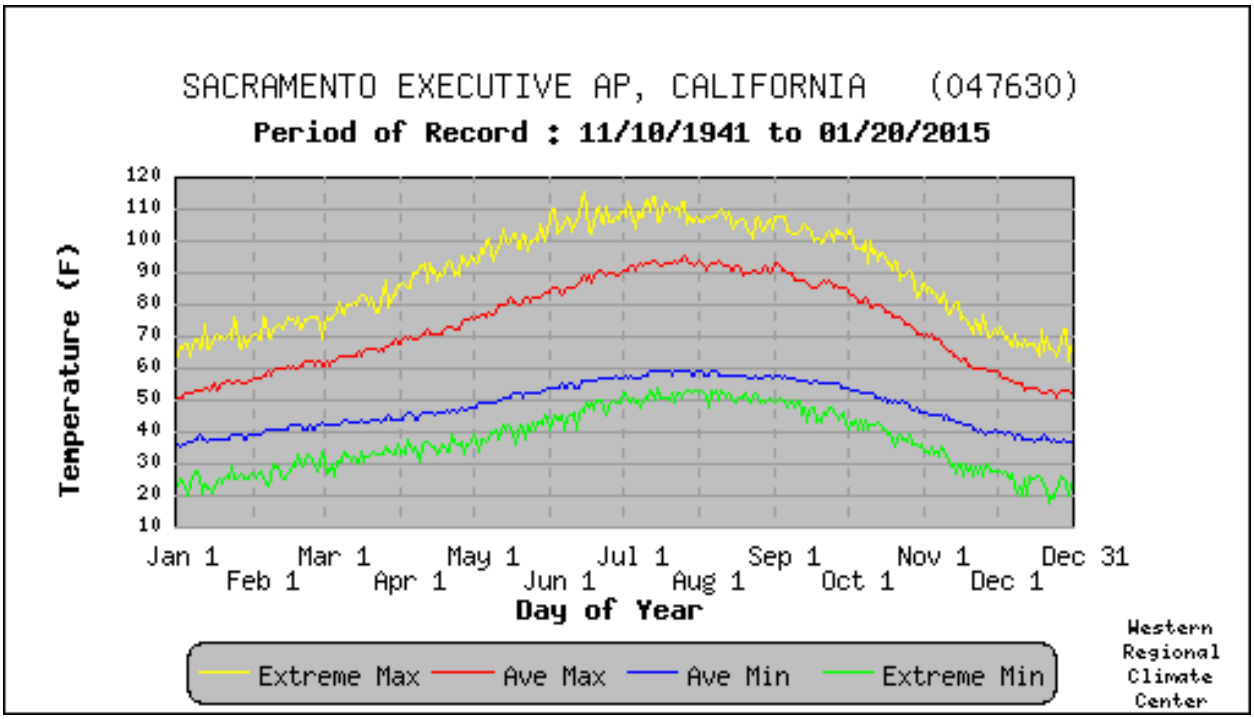
Severe Weather: Extreme Temperatures – Heat

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

The Cosumnes Fire Department experiences temperatures in excess of 100 degrees during the summer and fall months. The temperature moves to 105-110°F in rather extreme situations (see Figure H-5). Many months see a high number of days where daily high temperatures exceed 90°F. Generally, people who live and work in this weather are prepared to cope with the extremes in that they dress appropriately and stay in air conditioned buildings during the peak temperature periods of the day.

Figure H-5 Daily Temperatures Averages and Extremes for the Cosumnes Fire Department



Source: Western Regional Climate Center, Sacramento FAA Airport Station

Past Occurrences

Record high temperatures in the District are shown in Table H-9.

Table H-9 Record Temperatures in the Cosumnes Fire Department

Month	Temperature	Date	Month	Temperature	Date
January	74°	1/12/2009	July	114°	7/13/1972
February	76°	2/19/1964	August	110°	8/10/1996
March	88°	3/26/1988	September	108°	9/01/1950
April	95°	4/30/1996	October	104°	10/02/2001
May	105°	5/28/1984	November	87°	11/01/1960
June	115°	6/15/1961	December	72°	12/28/1967

Source: Western Regional Climate Center, Sacramento FAA Airport Station

Vulnerability to Heat

Health impacts are the primary concern with this hazard, though economic impacts are also an issue. The elderly and individuals below the poverty level are the most vulnerable to extreme temperatures. Nursing homes and elder care facilities are especially vulnerable to extreme heat events if power outages occur and air conditioning is not available. In addition, individuals below the poverty level may be at increased risk to extreme heat if use of air conditioning is not affordable.

Reliance on air conditioning can cause a strain on the electrical energy in the Cosumnes Fire Department operational area. Occasionally peak demands outweigh supply and a condition known as brown-out occurs. This is an extremely dangerous situation for electrical equipment as it operates without the needed electricity causing damage to the systems. Days of extreme heat have been known to result in medical emergencies, civil unrest, and unpredictable human behavior. Periods of extended heat and dryness (droughts) can have major economic, agricultural, and water resources impacts.

Future Development

The District Planning Team noted that heat would not necessarily be a limiting or contributing factor to future growth within the District. Economy will be the driving force on expansion and building within the area.

Severe Weather: Fog

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

The Sacramento Valley can produce some extremely dangerous fog in the winter and early spring months. These are a type of radiation fog called "tule fog." Tule Fog forms on cold and clear nights, when the ground is moist and there is very little wind. Under such conditions the ground cools quickly and thus cools the air above it as well. The moisture in this cooled air condenses and can create extremely dense fog. Since the air may be stagnant and there is little evaporative effect from the sun in winter months, tule fogs can last for several days and, in some instances, over a week. Under these conditions, visibility is often reduced to 600 feet, but can drop to less than 10 feet.

Past Occurrences

The District noted no past occurrences of fog in the past 5 years.

Vulnerability to Fog

When tule fog forms, a severe risk is posed to traffic with the potential for multi-car pileups, especially on freeways such as Highway 99 and Interstate 5. This may have an economic impact on the communities of Elk Grove, and Galt due to delays in transportation times or even the shutting-down of the major freeways of Interstate 5 and Highway 99. The same dense and lingering fog can also produce adverse health effects in the population with respiratory ailments. The Sacramento Air Quality Management District on occasion will impose burning restrictions on county residents to minimize the poor air quality as a result of the fog which traps the smoke at ground level and prevents the smoke from rising during tule fog events.

Assets at Risk

The District noted no assets at risk to fog.

Future Development

The District Planning Team noted that fog would not necessarily be a limiting or contributing factor to future growth within the District. Economy will be the driving force on expansion and building within

Severe Weather: Heavy Rain and Storms

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the communities served by the Cosumnes Fire Department.

Past Occurrences

The District noted no past occurrences of heavy rains in the past 5 years.

Vulnerability to Heavy Rain and Storms

Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future. Heavy rains and thunderstorms are the most frequent type of severe weather occurrence in the area. Wind and lightning often accompany these storms and have caused damage. Problems associated with the primary effects of severe weather include flooding, pavement deterioration, washouts, high water crossings, landslide/mudslides, debris flows, and downed trees and power outages.

Assets at Risk

The District noted no assets at risk to heavy rains. However, calls for service may increase due to heavy rainfall events. The likelihood of increase of vehicle related incidents during the event and timing may have a limited duration impact on the District.

Future Development

The District Planning Team noted that heavy rains would not necessarily be a limiting or contributing factor to future growth within the District. Economy will be the driving force on expansion and building within the area.

Wildfire

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Wildland fires are common in open space areas with vegetation that exhibits low fuel moisture. The threat for wildland fires is increased during the warmer months which are typically from late May until late October of every year. High winds can also contribute to the spread and severity of the fire. Specifically winds from the north which is drying winds they will support extreme wildland fire behavior, as opposed to winds from the west which have the ability to add moisture to fuels minimizing extreme fire behavior.

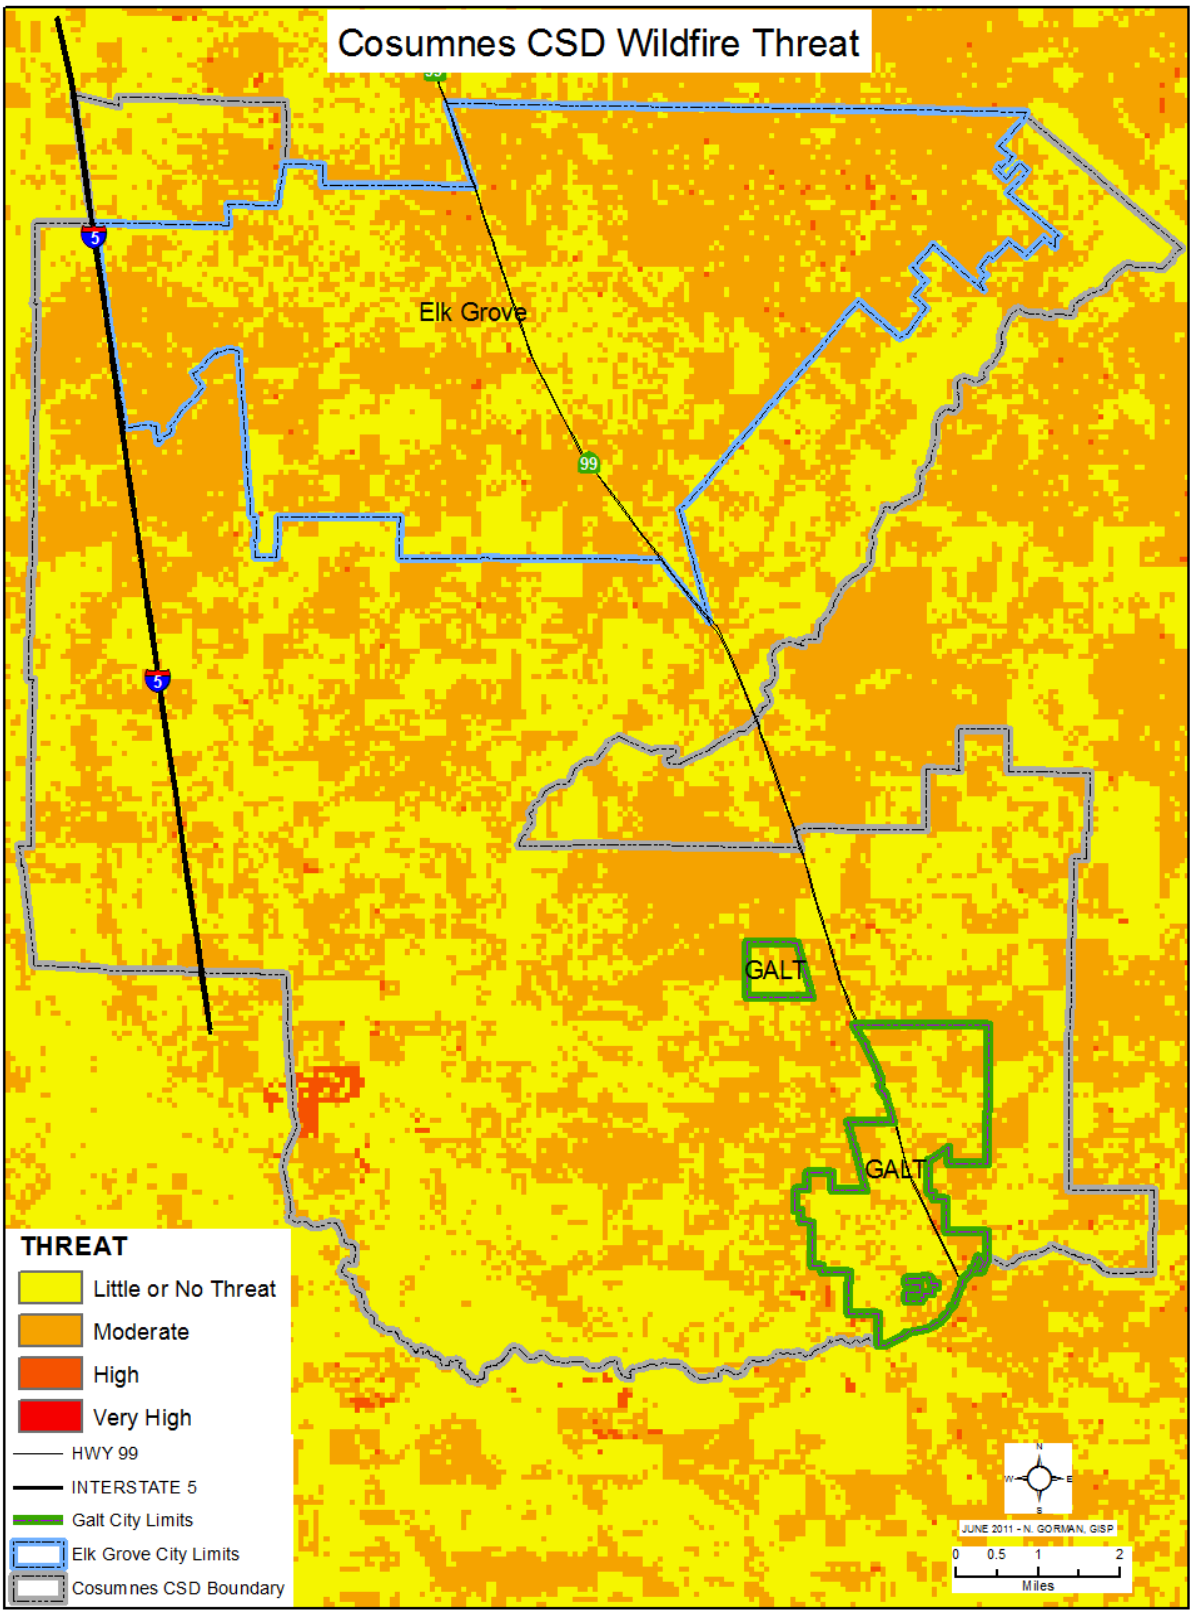
Past Occurrences

The District noted no large wildfires have occurred in the past 5 years.

Vulnerability to Wildfire

Generally, the undeveloped portions of the Cosumnes Fire Department do not pose a high risk due to existing agricultural practices on the land. Most lands are actively cultivated with irrigated crops that have minimal fire fuel. However, grass fires can occur on uncultivated lands, particularly where there is native vegetation, such as the riparian corridors near local water courses. Fire hazards also exist in urbanized areas of the Cosumnes Fire Department. Residential and Commercial structure fires can occur particularly in neighborhoods where you have a mix of undeveloped parcels adjacent to developed parcels which requires a higher level of emergency resources for suppression activities. Additionally, in the rural setting the use of propane gas is commonly used for heating and cooking by residents. The propane is stored in large tanks ranging in size from 300 gallons up to 1,000 gallons and will create additional safety concerns for responding fire personnel in the wildland urban interface environment. Figure H-6 depicts the wildfire threat in the Cosumnes Fire Department.

Figure H-6 Wildfire Threat in the CFD



Assets at Risk

The District has assets at risk to wildfire. The District maintains the ability to protect the District facilities from wildfires.

Natural Resources at Risk

The District noted no specific natural resources at risk to wildfire.

Historic and Cultural Resources at Risk

The District noted no specific historic or cultural resources at risk to wildfire.

Future Development

As future development occurs, the threat of wildfire within the incorporated areas will continue to decrease. As drought conditions continue an increased threat remains to open land areas. A measurable impact can be seen in certain areas that meet urban interface conditions.

H.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

H.6.1. Regulatory Mitigation Capabilities

Table H-10 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the CFD.

Table H-10 CFD's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	Y	Discusses potential hazards and outlines mitigation strategies.
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	Y	

Engineering Studies for Streams	N	
Community Wildfire Protection Plan	Y	Weed abatement and Prevention Plans
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year: Under revision
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	Y	Rating: 3/9 (urban/rural)
Site plan review requirements		
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	Y	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: CFD

H.6.2. Administrative/Technical Mitigation Capabilities

Table H-11 identifies the department(s) responsible for activities related to mitigation and loss prevention for CFD.

Table H-11 CFD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	

Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	
Mutual aid agreements	Y	Local and State
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	Y	
Community Planner	N	
Civil Engineer	N	
GIS Coordinator	N	
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	
Hazard data and information		
Grant writing	Y	
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: CFD

H.6.3. Fiscal Mitigation Capabilities

Table H-12 identifies financial tools or resources that the CFD could potentially use to help fund mitigation activities.

Table H-12 CFD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	N	
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	
Storm water utility fee	N	

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Incur debt through general obligation bonds and/or special tax bonds	Y	
Incur debt through private activities	N	
Community Development Block Grant	Y	
Other federal funding programs		
State funding programs		
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: CFD

H.6.4. Mitigation Education, Outreach, and Partnerships

Table H-13 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table H-13 CFD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	CERT
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Community Outreach Programs through the Fire Department
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

H.6.5. Other Mitigation Efforts

The District noted no other mitigation efforts.

H.7 Mitigation Strategy

H.7.1. Mitigation Goals and Objectives

CFD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

H.7.2. Mitigation Actions

The planning team for CFD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Flood Response Equipment

Hazards Addressed: Flood Response Personnel Equipment

Goals Addressed: 1, 2, 3, 4

Issue/Background Statement: When the threat of flooding is imminent to the citizens, the CFD will stage equipment and personnel to best serve the cities of Elk Grove, Galt, and the unincorporated areas of Sacramento County that lie within the Fire Protection District. It is the goal to continually maintain water rescue capability through on-going training to maintain skills, stay current with respect to safety gear which allows personnel to operate safely in a dangerous and dynamic environment.

Other Alternatives: One alternative is to develop automatic aid agreements with neighboring jurisdictions both police and fire to share resources. These agreements complement each other when flooding is more localized. If flooding is widespread, throughout the region, then the ability to count on neighboring jurisdictions is diminished because resources are deployed to respond to emergencies within their response areas reducing the amount of available resources.

Another alternative is to deploy and staff the departments flood boats adding an increased flood response capability to the response area.

Existing Planning Mechanisms through which Action will be implemented: Personnel will continually review flood boat operations, conduct assessments of safety gear to ensure that all of the dry and wet suits are safe for emergency responders and that the suits provide a barrier from contaminated water. Perform site evaluations of flood prone areas, and continue to work with neighboring emergency responders to strengthen working relationships in the area of emergency response.

Responsible Office: Deputy Chief of Operations

Priority: High

Cost Estimate: To purchase water rescue safety gear for 20 emergency responders is $20,000. The water rescue safety gear is a combination of gear which includes:

- a personal floatation device(lifejacket)
- a whistle used to communicate during water rescue operations,
- a dry suit to be used during sustained rescue operations
- a helmet
- All Terrain Booties
- Swimfins
- Gloves
- Knife
- Rope bag with a minimum of 75' of polypropylene rope. Polypropylene rope is designed float and is water resistant
- The cost is approximately $1,000 for a complete set per employee.
- Benefits (Losses Avoided):
- Immediate response to life threaten emergencies
- Better response capabilities through the use of flood rescue boats, and properly trained and equipped fire personnel.
- Greater operating capability, with proper equipment.
- Potential Funding:
- Grant opportunities to purchase personnel safety equipment to properly staff the 8 flood rescue boats and 2 swiftwater rescue boats.
- Donations from private parties, looking to support emergency operations
- General fund request from the CFD budget process

Schedule: Proper safety gear will allow personnel to continually perform site evaluations of high risk flood prone areas. Furthermore, meet and train with neighboring emergency service providers to review their response capability, and any additional changes in their operations from the previous year.

Action 2. Flood Response Training

Hazards addressed: Flood Response Personnel Training

Goals Addressed: 1, 2, 3, 4

Issue/Background Statement: Flood rescue operations are very unpredictable and inherently dangerous to all emergency personnel who operate in this environment. The skill sets required to operate safely and effectively take time to acquire and demonstrate proficiency. The flood rescue environment also contains many unknowns as it pertains to water quality, and underwater hazards that can impact rescue operations by trained personnel. Continual investment in fire personnel training will minimize the risk to the public and fire personnel as they operate in an unpredictable flood environment.

Existing Planning Mechanisms through which Action will be Implemented: Working through the CFD Training Division, personnel will continually review flood boat operations, conduct assessments of safety

gear to ensure that all of the dry and wet suits are safe for emergency responders and that the suits provide a barrier from contaminated water. Perform site evaluations of flood prone areas, and continue to work with neighboring emergency responders to strengthen working relationships in the area of emergency response.

Responsible Office: Deputy Chief of Operations and the Battalion Chief of Training for the Cosumnes Fire Department.

Priority: High

Cost Estimate: These course descriptions and costs were provided by Rescue 3 International. It would be the intent to provide these courses every other year as part of ongoing skills maintenance for all fire line personnel.

Swiftwater Rescue Technician: The SRT1 course provides fire personnel with the fundamentals of survival in moving water and training to affect in-water rescues. Fire personnel gain knowledge in hydrology and river classifications, size-up, and site control and scene management. Practical skills include self-rescue, swiftwater swimming and the fundamentals of shore, boat and in-water rescues. Additionally fire personnel are introduced to the basics of boat handling and the fundamentals of rope rescue including mechanical advantage and anchor systems.

Swiftwater Rescue Technician Advanced: will challenge fire personnel beyond the emphasis on self-rescue to concentrate on victim rescue. Fire personnel are exposed to more complex water rescue situations including a mock night river rescue scenario. The three day course includes 4-6 hours of classroom instruction, followed by two and one-half days of hands-on skill development.

Fire personnel are introduced to the role and utilization of various skills in river and flood rescue, including:

- rope systems
- management of litter & patient raising systems
- highline systems
- advanced river search concepts
- performing rescues at night or in low visibility
- Basic flood disaster management.

Flood Rescue Boat Operator: this course is designed to train fire personnel in handling motorized boats during flood operations. Fire personnel are exposed to a number of topics including types of motorized boats suitable for water rescue, boat handling on still or slowly moving water, crew roles, boat safety and problem solving. Techniques are then put to work doing searches in flood environments, stranded victim and in-water retrieval, and rescue of conscious and unconscious persons

Swiftwater Rescue Boat Operator: this course is designed to introduce fire personnel to boat operations on swiftwater. During the course fire personnel gain experience reading moving water and operating boats in current. Using a motor and paddles, fire personnel will practice such skills as use and avoidance of hydraulics, ferrying across current, and obstacle navigation will be practiced in class I and II whitewater. Fire personnel then progress to operating both up and down stream in class III and above whitewater. Other exercises include night operation scenarios and multiple boat operations.

The total dollar amount to deliver this level of training to 140 line employees every other year is approximately $122,000 or $61 000 annually.

- $48,800 is allocated for boat operator training for approximately 50 personnel.
- $36,600 is allocated for Swiftwater Rescue Technician Unit 1 for 140 personnel.
- $36,600 is allocated for Swiftwater Rescue Technician Advanced for 140 personnel.

Benefits (Losses Avoided): The benefit to completing this training is that the Cosumnes Fire Department is able to field a trained and capable water rescue team to affect rescues for the citizens and members of the public who are in need of emergency assistance.

Potential Funding:

- Grant opportunities to fund training for fire personnel to properly staff the 8 flood rescue boats and 2 swiftwater rescue boats.
- Donations from private parties, looking to support training programs
- General fund request from the CFD budget process

Schedule: On a bi-annual basis the Cosumnes Fire Department will instruct all personnel on swiftwater survival skills. The Department will also deliver a focused review on boat operations with personnel assigned to 2 of the fire stations that specialize in water rescue emergencies. The training will allow personnel to safely perform site evaluations of high risk flood prone areas. Furthermore, meet and train with neighboring emergency service providers to review their response capability and any additional changes in their operations from the previous year.

LOS RIOS
COMMUNITY
COLLEGE
DISTRICT

Annex I Los Rios Community College District

I.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Los Rios Community College District (LRCCD), a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by LRCCD. This Annex provides additional information specific to LRCCD, with a focus on providing additional details on the risk assessment and mitigation strategy for this District.

I.2 Planning Process

As described above, the LRCCD followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), LRCCD or District formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table I-1. Additional details on plan participation and District representatives are included in Appendix A.

Table I-1 LRCCD Planning Team

Name	Position/Title	How Participated
Debbie Turner	General Service/Risk Mgmt Supervisor	Responsible for the plan update, coordinating meetings, collected data, and reviewed draft document. Attended (HMPC) meetings.
Vince Montoya	Director, Facilities Maintenance	Provided completed and future maintenance projects, attended committee meetings, provided input, provided mitigation projects, and reviewed draft document. Involved in the weekly planning meetings for short and long term maintenance and repair projects for LRCCD.
Joe Meyer	Supervisor, Facilities Planner	Responsible for providing information on completed and future construction projects, attended committee meetings, provided input, and reviewed draft document. Involved in the weekly planning meetings for short and long term capital improvement projects for LRCCD.
Daniel Broussard	Police Captain	Provided data, attended committee meetings, and reviewed draft document.
Jason Gregg	Director, IT	Provided information on IT systems and projects, provided input, and reviewed draft document. Involved in the weekly planning meeting for short and long term information technology projects for LRCCD.

I.2.1. Coordination with Other District Planning Efforts

Coordination with other community planning efforts is paramount to the successful implementation of this plan. This Section provides information on how the LRCCD integrated the previously-approved 2011 Plan into existing planning mechanisms and programs. Specifically, LRCCD incorporated into or implemented the 2011 LHMP through other plans and programs shown in Table I-2.

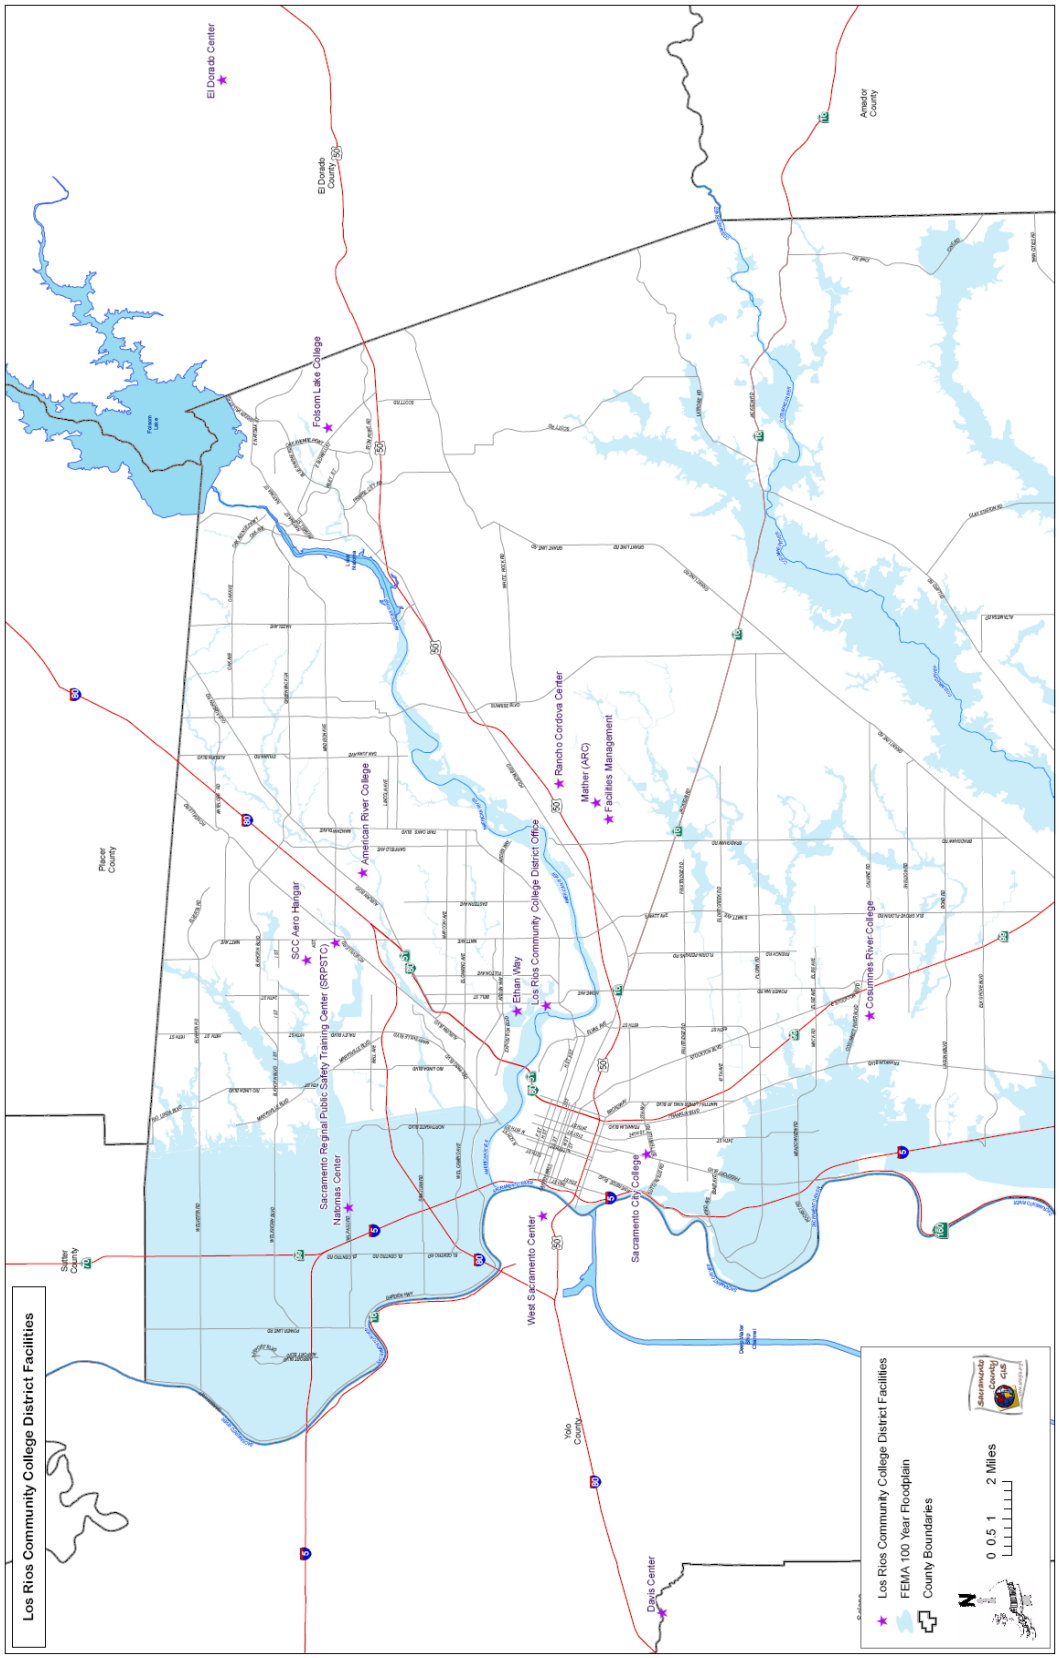
Table I-2 2011 LHMP Incorporation

Planning Mechanism 2011 LHMP Was Incorporated/Implemented In.	Details?
District Wide planning meetings for capital improvements and maintenance projects.	Provided information to assist in developing construction and maintenance projects.
Information Technology Planning Meetings	Resource for planning IT projects for continuing service and critical facilities.

I.3 Community Profile

The community profile for the LRCCD is detailed in the following sections. Figure I-1 displays a map and the location of LRCCD boundaries within Sacramento County.

Figure I-1 LRCCD Boundaries



I.3.1. College Overview, History, and Background

Los Rios Community College District is one of the nation's most respected learning institutions and the second-largest community college district in California. The College is a two-year public college district that serves the greater Sacramento region. Los Rios includes: American River, Cosumnes River, Folsom Lake and Sacramento City colleges; major education and outreach centers in Davis, Elk Grove, Natomas, Placerville, Rancho Cordova and West Sacramento; and specialized workforce and economic development programs for business, government and organizations throughout the region. The colleges offer AA/AS degrees, certificates and transfer education opportunities - students complete freshman and sophomore years and transfer to a four-year college or university - in more than 70 career fields.

The District's 2,400 square mile service area includes all of Sacramento County, most of El Dorado County and parts of Yolo, Placer and Solano counties. About 71,000 students are enrolled in the colleges and about 5,875 employees to include full-time, part-time, and temporary.

- American River College – 153 acres with 122 buildings
- Natomas Center – 1 building
- Cosumnes River College – 180 acres with 90 buildings
- Elk Grove Center – 1 building
- Folsom Lake College – 151 acres with 21 buildings
- El Dorado Center – 3 buildings
- Rancho Cordova Center – 1 building
- Sacramento City College – 72 acres with 38 buildings
- Aeronautics (McClellan) - 2 buildings
- Davis Center – 1 building
- West Sacramento Center – 1 building

Other sites support vocational programs include: Sacramento Regional Public Safety Center (1 building), Mather (2 buildings) for auto collision and bio-diesel program, and Pre-Apprenticeship training program (2 buildings).

Operational buildings include Facilities Management (1 building), District Office support (9 buildings) and Police Services and Workforce and Economic Development (1 building)

I.4 Hazard Identification

LRCCD's planning team identified the hazards that affect the district and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to LRCCD (see Table I-3).

Table I-3 LRCCD—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude / Severity	Significance
Agricultural Hazards	Limited	Unlikely	Negligible	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Limited	Unlikely	Negligible	Low
Dam Failure	Limited	Unlikely	Negligible	Low
Drought and Water Shortage	Limited	Unlikely	Negligible	Low
Earthquake	Limited	Unlikely	Negligible	Low
Earthquake: Liquefaction	Limited	Unlikely	Negligible	Low
Flood: 100/200/500-year	Limited	Unlikely	Critical	Medium
Flood: Localized Stormwater Flooding	Limited	Occasional	Critical	Medium
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Limited	Unlikely	Negligible	Low
River/Stream/Creek Bank Erosion	Limited	Unlikely	Negligible	Low
Severe Weather: Extreme Temperatures – Cold/Freeze	Limited	Unlikely	Negligible	Low
Severe Weather: Extreme Temperatures – Heat	Limited	Unlikely	Negligible	Low
Severe Weather: Fog	Limited	Unlikely	Negligible	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Limited	Likely	Limited	Medium
Severe Weather: Wind and Tornadoes	Limited	Likely	Limited	Low
Subsidence	Limited	Unlikely	Negligible	Low
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Limited	Unlikely	Negligible	Low

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

I.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile LRCCD's hazards and assess the vulnerability separate that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the College is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

I.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section I.5.3, includes a description as to how the hazard affects LRCCD and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

I.5.2. Vulnerability Assessment and Assets at Risk

This section identifies LRCCD's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk

Table I-4 lists particular critical facilities and other community assets identified by the LRCCD's planning team as important to protect in the event of a disaster. LRCCD's physical assets, valued at over $ 1 billion, consist of the buildings and infrastructure to support the LRCCD locations.

Table I-4 LRCCD's Critical Facilities, Infrastructure, and Other College Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
American River College (ARC)	Main Campus	4700 College Oak Dr. Sacramento 95841	$254,197,824	Flooding, Severe Weather: heavy rain, wind and tornadoes
Cosumnes River College (CRC)	Main Campus	8401 Center Parkway Sacramento 95823	$167,593,422	Severe Weather: heavy rain, wind, and tornadoes
Davis Center	Center under Sacramento City College	1720 Jade Street Davis 95616 (Yolo County)	$9,161,562	Severe Weather: heavy rain, wind, and tornadoes
District Office	Operational Support	1919 Spanos Court Sacramento 95825	$7,616,526	Flooding, Levee Failure, Severe Weather: heavy rain, wind and tornadoes

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Elk Grove Center	Center under Cosumnes River College	10051 Big Horn Blvd. Elk Grove 95757	$10,000,000	Severe Weather: heavy rain, wind, and tornadoes
El Dorado Center	Center under Folsom Lake College	6699 Campus Dr Placerville 95667 (El Dorado County)	$24,769,530	Severe Weather: heavy rain, wind & tornadoes, and wildfire
Ethan Way Center	Special services for business and industry	1410 Ethan Way Sacramento 95825	$7,824,282	Flooding, Levee failure, Severe Weather: heavy rain, wind & tornadoes
Facilities Management	Operational Support	3753 Bradview Dr. Sacramento 95827	$9,787,218	Severe Weather: heavy rain, wind and tornadoes
Folsom Lake College	Main Campus	10 College Parkway Folsom 95630	$164,452,008	Severe Weather: heavy rain ,wind and tornadoes
Mather Location (Leased)	Off site program for American River College	10150 Missile Way Mather 95655	$6,713,862	Severe Weather: heavy rain, wind and tornadoes

Critical Facilities

For purposes of this plan, a critical facility is defined as:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, (3) Hazardous Materials Facilities.*

An inventory of critical facilities as determined by the LRCCD planning group as shown in Table I-5 and Table I-6.

Table I-5 LRCCD Critical Facilities: Summary Table

Location	Essential Services Facility	At Risk Population facility	Hazardous Material facility	Total by Location
ARC (American River College)	112	4	3	119
CRC (Cosumnes River College)	58	5	3	66
DO (District Office)	2	0	0	2
EDC (El Dorado Center)	5	1	1	7
Ethan Way	1	0	0	1

Economic Assets

LRCCD is one of the largest employers (5,875) within the local area and serving the largest student population (over 71,000).

Growth and Development Trends

Growth within LRCCD will include mostly infrastructure improvements, building modernization and a few additional buildings at current sites. Additional locations are not being added over the next five years.

Development since the 2011 Plan

The LRCCD has increased structures since the 2011 plan. Specifically, this includes opening a 28,480 square foot center in October 2015 valued at $15 million dollars within in the city of Rancho Cordova (Sacramento County) serving 2,500 students. Students can pursue their general education requirements or learn English as a second language. This central location will also respond to local and state business needs with programs focused on skills needed to work in the public sector.

LRCCD implemented several development projects since 2011 increasing the numbers and capacity of LRCCD assets. New development tracked by totals and hazard risk areas are shown in Table I-7. All development in the identified hazard areas, including the 1% annual chance floodplains, areas protected by levees, and high wildfire risk areas, were completed in accordance with all current and applicable development codes and standards and should be adequately protected. Thus, with the exception of more

people living in campus areas potentially exposed to natural hazards, this growth should not cause a significant change in vulnerability of LRCCD to identified priority hazards.

Table I-7 LRCCD Development by Year and Hazard Areas since 2011

Asset Type	Year Built	Outside of Known Hazard Area	1% Annual Chance Flood	Area Protected by Levee	Wildfire Risk Area[1]	Other

[1]Moderate or higher wildfire risk area

I.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table I-3 as high or medium significance hazards. Impacts of past events and vulnerability of LRCCD to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the same as those described in Section 4.3 of the Base Plan. In general, the most vulnerable structures are those located within the floodprone areas, wildland areas, unreinforced masonry buildings, and buildings built prior to the introduction of modern building codes.

An estimate of the vulnerability of LRCCD to each identified priority hazard, in addition to the estimate of risk of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.

- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Flooding and Localized Flooding

Likelihood of Future Occurrence–Occasional (Flooding); Likely (Localized)
Vulnerability–Medium

Although flooding is a "medium" risk for LRCCD, the County plan has an emphasis on flood hazards. The below information reflects flood data for LRCCD. Currently, there is one specific LRCCD project planned to address localized flooding since this is considered a medium risk for LRCCD.

Hazard Profile and Problem Description

The flooding hazard is considered occasional with a medium hazard risk based on past assessments. Please see map of LRCCD facilities overlaid on the 100 year flood zone on Figure I-1 in Section I.3

Past Occurrences

On December 1, 2012 the water from Arcade Creek surpassed the bank flowing onto the south east end of American River College campus creating damages to multiple buildings at the Health & Education complex. The recovery cost was $122,671.44.

In 1995, the Arcade Creek flooding inundated the parking lot and track at American River College, the damages totaled $23,000. According to SAFCO (June 2011) the Arcade creek at the base of American River College is routinely maintained to keep the creek in good standing to avoid overflow. During any storm event the LRCCD Police Department and Facilities Maintenance monitors the creek level in case the parking lot needs to be evacuated.

In 1994 at Cosumnes River College, the parking lot flooded due to slow storm drains. There were no damages. As a mitigation project, the City of Sacramento built a detention pond on the north/west corner of the campus to prevent future flooding.

There is a 11.55% percent chance of occurrence in the next year. (Where possible, frequency was calculated based on existing data. It was determined by dividing the number of events observed by the number of years on record and multiplying by 100—this gives the percentage of the event happening in any given year.)

Vulnerability to Flood

Values at Risk

As shown in the Table I-8, the number of structures and the value are divided up between flood zones. According to the DFIRM maps by FEMA, there are 44 structures in the floodplain and a replacement value of approximately $336 million. However, the estimated loss would be approximately $67 million, which is 20% of the value.

Table I-8 LRCCD Properties in the FEMA Floodplain

DFIRM Zone	# of Structures	Value-Structure plus Content	Estimated Loss (20% of the value)*	Population (Students & Employees)
AE	2	$14,797,242	$2,959,448	3161
X (200 yr)	42	$321,608,676	$64,321,735	17,853
Total	**44**	**$336,405,918**	**$67,281,184**	**30,976**

*Estimated losses assume that a flood is unlikely to cause total destruction. Losses are related to a variety of factors, including flood depth, flood velocity, building type and construction. Using FEMA's recommendations, average damage is estimated to be 20 percent of the total building value.

The 42 structures are all within one campus location (Sacramento City College).

Population at Risk

For the two sites listed (Natomas Center and Ethan Way) in the AE Flood zone, the approximate occupancy is 5,122 (student enrollment plus employees).

Critical Facilities at Risk

The critical facilities at risk in the AE flood zone are classrooms and computer labs that would be relocated to a different location or campus. The District police dispatch location is located on the second floor of the Ethan Way building.

The critical facilities listed in Zone X (200 year flood zone) include 37 essential service facilities, 4 at risk population facilities, and 3 hazardous materials. These number were obtained from the above Table I-6.

Insurance Coverage, Claims Paid, and Repetitive Losses

LRCCD is self- insured up to $100,000 with insurance pool coverage up to $600 million per occurrence (excluding flood coverage). LRCCD has separate flood insurance policies for the Natomas and Ethan Way facilities. Both of these facilities fall in the AE flood zone. LRCCD has not experienced repetitive losses due to flooding.

Future Development

Our Natomas site in the AE zone has a future plan for two more multi-story buildings. Working with the City of Sacramento on future flood planning and mitigation would be a move in a positive direction for this area.

The Sacramento City College location has a shared storm water drain system and with any site improvements on campus may be an opportunity to team up with the City of Sacramento for flood mitigation or solutions that could potentially be added to project planning.

Severe Weather: Heavy Rains and Storms; Wind and Tornadoes

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

It is likely that each year we have a potential for storm damage and have identified this hazard as medium. There is a 23% percent chance of occurrence in the next year. (Where possible, frequency was calculated based on existing data. It was determined by dividing the number of events observed by the number of years on record and multiplying by 100—this gives the percentage of the event happening in any given year.)

When there are heavy rains and strong winds, it usually affects multiple locations within LRCCD. For example, the January 2008 storms caused damages at 7 locations incurring a cost of $48,000 in damages. This included 16 items listed on the claim form. The state reimbursed LRCCD $38,600. Majority of the replacement cost were for items that were outside of the buildings, such as bent fence post, ripped sun covers, ripped banners, damage to storage containers, fallen trees, debris cleanup, and a broken window. The Facilities Management building had part of the roofing system blown off which created a leak inside the building and the damages were over $8,000. This was the first occurrence of damages to this building.

Past Occurrences

Historically, LRCCD has suffered approximately $167,000 in damages of which approximately $136,000 was recovered through disaster assistance programs. The events took place in 1994, 1995, 1997, 2003, 2004, 2008.

Vulnerability to Severe Weather

Assets at Risk

LRCCD has 295 structures and contents with a value of over one billion dollars.

Population at Risk

The population district wide is approximately 77,000 people to include students and employees. Severe weather has the ability to cancel classes or close campuses.

Critical Facilities at Risk

The main data center at the District Office supports the LRCCD's software systems, computers operations, and student services. This center has a 22-hour diesel generator that will provide power to the data center during a power outage.

The District police dispatch center at Ethan Way site is at risk of losing power. To mitigate this facility being affected by power outage, in 2008 a backup dispatch center was included in the new Operations building design at the Cosumnes River College campus. A backup generator is in the planning stages to be added at the Ethan Way location for dispatch.

Future Development

A repetitive loss to any one building or infrastructure is not common for LRCCD. When analyzing past losses, LRCCD grouped the losses by type within the district from 1994 through 2011.

For damages to roofing systems, there were approximately $17,000 in damages due to the wind and the rain forcing water into the roofing system. A total of 25 buildings were affected and of those occurrences 20 buildings were damaged during the 1995 storm. These damages were in the 1995, 2004, 2008 events. There is a 11.5% chance of occurrence in the next year*.

For damages due to fallen trees, there were approximately $11,000 in damages and those events took place in 1995, 2003, 2004, 2008. There were a total of 9 different incidents and of those occurrences 3 incidents took place in the 2008 storm. There is a 15% chance of occurrence in the next year*.

*Where possible, frequency was calculated based on existing data. It was determined by dividing the number of events observed by the number of years on record and multiplying by 100—this gives the percentage of the event happening in any given year.

I.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

I.6.1. Regulatory Mitigation Capabilities

Table I-9 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place throughout LRCCD.

Table I-9 LRCCD's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y	Each campus has a master plan and mitigation actions are completed through capital improvement planning or maintenance and repair planning.
Capital Improvements Plan	Y	Hazards that are directly related to specific projects may be included within projects (individual).
Economic Development Plan	N	
Local Emergency Operations Plan	N	
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	California Building Code 2013—LRCCD is under the jurisdiction of the Division of the State Architect and use the code they deem appropriate.
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	
Fire department ISO rating:	N	
Site plan review requirements	Y	LRCCD has the state architect review projects site plans with respect to ADA Accessibility and Landscaping (water use).
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	

Erosion or sediment control program	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: LRCCD

I.6.2. Administrative/Technical Mitigation Capabilities

Table I-10 identifies the department(s) responsible for activities related to mitigation and loss prevention for LRCCD.

Table I-10 LRCCD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	Y	To review hazards related to LRCCD
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Facilities Maintenance grounds department maintains drainage systems, roofing systems, and tree trimming to prevent damages to property and people.
Mutual aid agreements	N	
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	Y	District police department works with multiple surrounding agencies to anticipate and respond to public safety issue, and natural disasters.
Community Planner	N	
Civil Engineer	N	
GIS Coordinator	N	
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	We use a mass notification system to address emergencies with employees and students.
Hazard data and information	N	
Grant writing	N	
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: LRCCD

I.6.3. Fiscal Mitigation Capabilities

Table I-11 identifies financial tools or resources that LRCCD could potentially use to help fund mitigation activities.

Table I-11 LRCCD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Capital Improvement funds for mitigation projects if they are directly related to a specific Capital Improvement project. For example, while renovating the athletic fields the main storm drain is going to be improved to reduce the risk of localized flooding.
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	N	
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	Bond funding has been used for past projects—for example seismic retro fitting of Hughes Stadium which was first build in 1928.
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	Y	The State provided special maintenance and special repair (SMSR) funding for schools. With this funding, we were able to complete roofing renovations district wide.. This funding is not guaranteed to be part of the annual budget.
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: LRCCD

I.6.4. Mitigation Education, Outreach, and Partnerships

Table I-12 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information

Table I-12 LRCCD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Yes	Members of the LRCCD police department speak to campus groups (students and employees) up to 100 times per year providing public safety information that may include the 72-hour household preparedness.
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Yes	Members of the LRCCD police department speak to campus groups to provide fire safety and fire response specific training up to 15 times per year as well as including household preparedness (72-hour) in multiple public safety presentations each year.
Natural disaster or safety related school programs	Yes	Continue to train employees on National Incident Management System (NIMS) emergency preparation, and Campus Community Emergency Response Team (C-CERT) and building evacuation training.
StormReady certification	No	
Firewise Communities certification	No	
Public-private partnership initiatives addressing disaster-related issues	No	
Other		
How can these capabilities be expanded and improved to reduce risk?		

LRCCD Police Department conducts emergency operation drills at various locations throughout the school year. Depending on the type of drill it may involve outside agencies. In the past, outside agencies included local fire, police, CalEma (California Emergency Management Agency), Center for Disease Control, Red Cross, and Sacramento County OES. The LRCCD Police Department continues to train employee on Campus Community Emergency Response Team C-CERT and train employees to evacuate a building or shelter in place using the ACES (Action Coordinator for Emergency Survival) program.

I.6.5. Other Mitigation Efforts

To sustain our services during and after a disaster, such as flooding and severe weather, there is a strong support to protect LRCCD against dating center failure including network and server infrastructure and access to the Internet. LRCCD is in the process of updating data centers at the District Office and Folsom Lake College. Currently the two data centers have generator backup power sources and each has a 10Gbps connection to the Corporation for Education Network Initiatives California (CENIC) for Internet access. Each of the connections connect at a different location on the CENIC backbone. LRCCD is in the process of projects at each of the data centers of upgrading to Liebert Smartrow technology. LRCCD

is also hopes to complete 4 additional 10Gbps circuits to create a 10Gbps Ring between the main campuses and District Office. LRCCD is also looking to install at least 1Gbps connection at the outreach centers and other district facilities. This is all in effort to improve connectivity for services including communications (phones, email, and others), and all Internet access.

LRCCD is also looking at architecture and deploying redundant WAN (Wide Area Network site to site) connectivity and on main campuses for the core and distribution LAN (Local Area Network with site building to building or floor to floor) networking. This will provide complete resiliency to failures of fiber and/or network electronics along either pathways, or data center, and failures at either of the CENIC connections, or the main data centers at LRCCD locations. The project continues with participation of CENIC, AT&T, SECC/Comcast and the LRCCD DO-IT Department. CENIC internet connections bandwidth was increased from 1Gbps each to 10Gbps (only one pathway is active at a time) and LRCCD will complete main campus WAN connectivity from single 1Gbps pathway to multiple 10Gbps pathways.

LRCCD purchased an emergency mass notification system in 2009 to alert students and employees for emergencies (such as disasters, shelter in place, campus closures, etc.) by sending text messages, email messages or calling a mobile phone. The system is in the process of being upgraded to improved features, ease of use, and aligns with technological advances for future options. With the upgrade, it will be easier to post to social media sites, and digital signage. The upgrades should be completed by October 2016.

The system can provide information to the majority of students and employees. The annual maintenance fees are funding by LRCCD.

In 2008, LRCCD established a Preparedness Assessment Team (PAT), to make on-going assessment of emergency management, preparedness and readiness in the district. The team assesses and makes recommendations for strategic actions to increase the capacity for and quality of disaster preparedness and management at all district locations. There are subcommittees for training, facility issues, communications, and building coordinator program. The Preparedness Assessment Team consists of 26 employees from various backgrounds and meet on a quarterly basis.

LRCCD District police have trained over 550 employees in the SEMS/NIMS program. This training is open to all employees and students but is mandatory for all employees who are an Emergency Operations Command member.

District police has trained 150 employees in the College Community Emergency Response Team (C-CERT) program district wide. Each year multiple trainings are offered across the district to update skills or certify staff. This program is self-funded by LRCCD.

I.7 Mitigation Strategy

I.7.1. Mitigation Goals and Objectives

LRCCD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

I.7.2. Mitigation Actions

The planning team for LRCCD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. District Wide Roofing Renovations

Hazards Addressed: Severe Weather: Heavy Rain, Wind, and Storms

Goals Addressed: 1, 2, 3

Issue/Background: In recent years, the State of California has stopped providing funds for public building maintenance. LRCCD used those funds for a roof maintenance program. Renovation to LRCCD roof systems will provide a proactive approach to minimize potential property damage and loss of equipment due to water damage from severe wind and rain. In looking at all the roofing systems District wide, this project would cover those roofing systems that are near the end of the roofs life cycle.

Project Description: To minimize cost, the project would include repairing the roof system to make it more weather resistant using a foam system that will integrate with the existing structure and equipment that is already in place.

Other Alternatives: No action

Existing Planning Mechanisms through which Action will be Implemented: Implementation and maintenance of the plan update is critical to the overall success of hazard mitigation planning.

Responsible Office: Los Rios Community College District-Facilities Maintenance

Priority (H, M, L): High

Cost Estimate: $1.3 million

Potential Funding: Infrastructure dollars

Benefits (avoided Losses): Mitigate damage to multiple buildings at the Health & Education complex.

Schedule: 1-3 years

Action 2. ARC Drainage at Arcade Creek

Hazards Addressed: Localized flooding from Arcade Creek onto campus

Goals Addressed: 1, 2, 3

Issue/Background: On 12/1/2012, the water from Arcade Creek surpassed the bank flowing onto the south east end of American River College Campus creating damage to multiple building at the Health & Education complex. The recovery cost was $122,671.44.

Project Description: Regrade the land to have the water flow back into the creek has already been completed. Local swell improved with recent program development for athletic fields.

Other Alternatives: Main storm drain extension around ARC stadium.

Existing Planning Mechanisms through which Action will be Implemented: Implementation and maintenance of the plan update is critical to the overall success of hazard mitigation planning.

Responsible Office: Los Rios Community College District-Facilities Maintenance

Priority (H, M, L): High

Cost Estimate: $1.3 million

Potential Funding: Infrastructure dollars

Benefits (avoided Losses): Mitigate damage to multiple buildings at the Health & Education complex.

Schedule: 1-3 years

Action 3. Protect District Property

Hazards Addressed: Localized Flooding

Goals Addressed: 1, 2, 3

Issue/Background: Localized flooding is a threat for property damage to buildings, parking lots, and road closures. In addition, flooding on our property has the potential of limiting student access to campus buildings, attending classes, and displacing employees. Based on the severity of damage and the duration, the classes may be moved to other buildings, another campus or may be cancelled for the semester creating a hardship for the student's educational goals.

Project Description: Mitigation projects may be addressed during infrastructure improvements and construction projects by our Facilities Planning team as opportunities arise. For example, while improving athletic fields, we were able to add an improved storm water drain system project to prevent flooding from the local stream.

Other Alternatives:

Existing Planning Mechanism(s) through which Action Will Be Implemented: Through Capital Improvement planning, LRCCD would look for opportunities to improve against localized flood risk.

Responsible Office/Partners: Los Rios Community College District - Facilities Management

Project Priority: High

Cost Estimate: Varies

Benefits (Losses Avoided):

Potential Funding: Infrastructure dollars or mitigation grant

Timeline: When funding is available.

Annex J Sacramento Metropolitan Fire District

J.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Sacramento Metropolitan Fire District (Metro Fire), a new participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by Metro Fire. This Annex provides additional information specific to Metro Fire, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

J.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), Metro Fire formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table J-1. Additional details on plan participation and Metro Fire representatives are included in Appendix A.

Table J-1 Metro Fire Planning Team

Name	Position/Title	How Participated
Greg Casentini	Asst. Chief/Fire Marshal	Program administration, reviewed draft documents. Attended HMPC meetings.
Michael Teague	Fire Captain	Research, Data collection, drafted documents. Attended HMPC meetings.

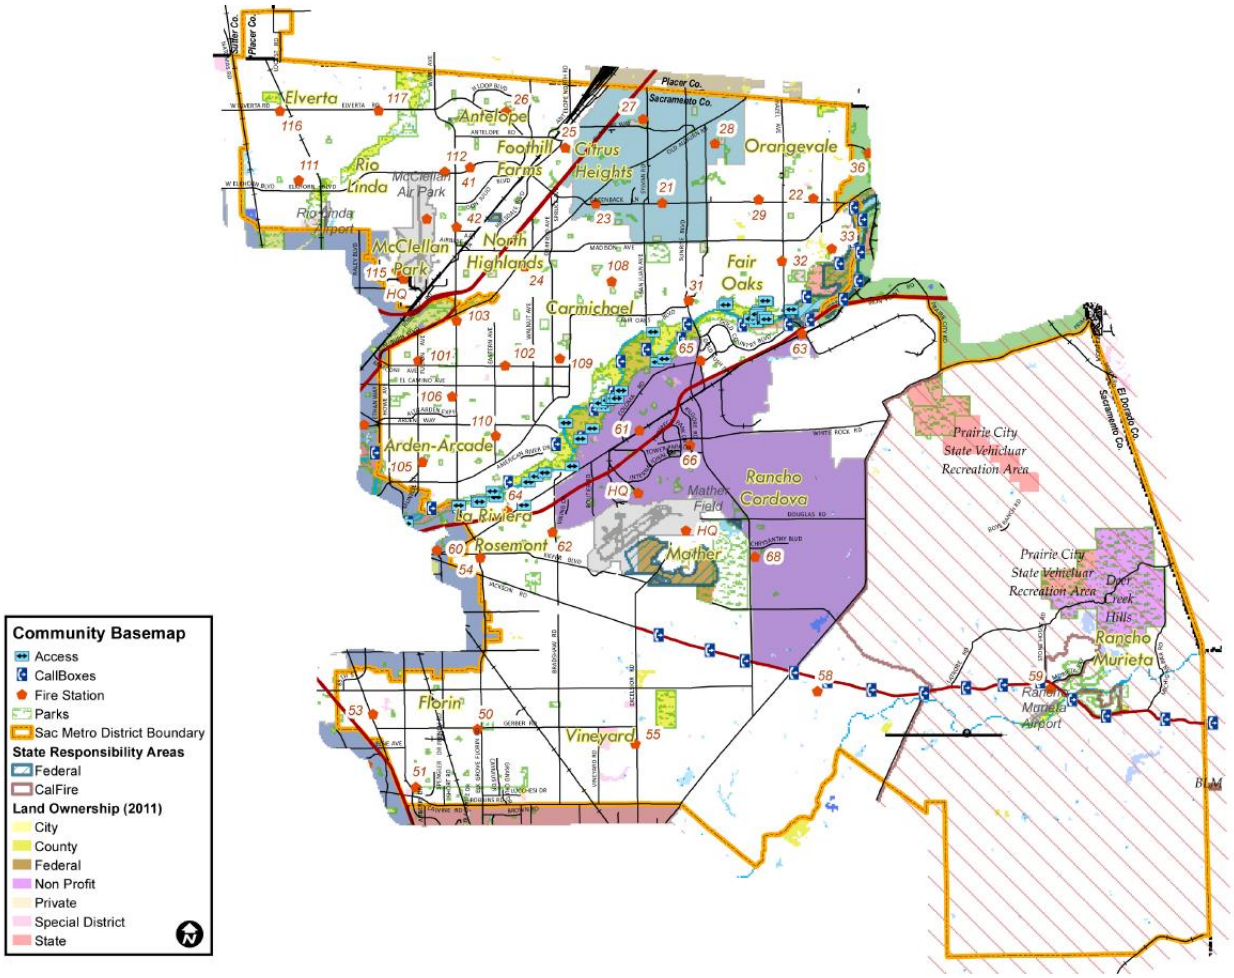
J.3 Community Profile

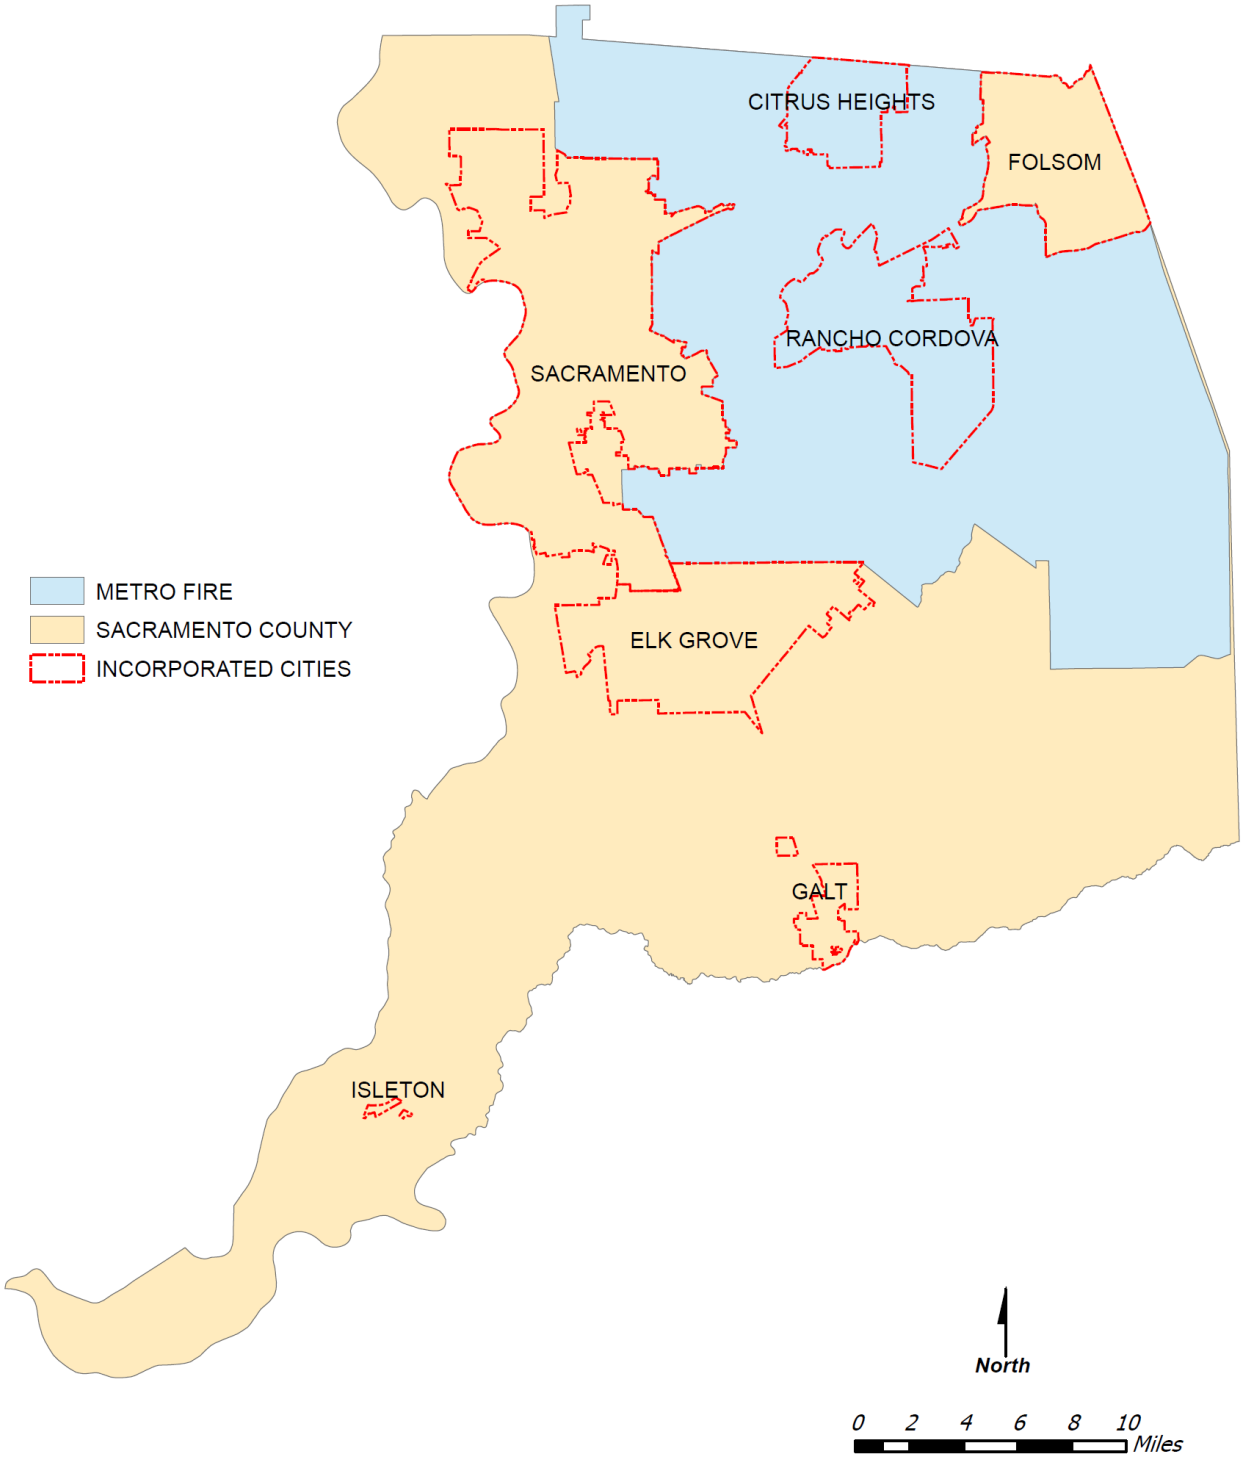
The community profile for Metro Fire is detailed in the following sections. Figure J-1 and Figure J-2 displays a map and the location of Metro Fire boundaries within Sacramento County.

Figure J-1 Sacramento Metropolitan Fire District Map



Source: American River Community Wildfire Protection Plan

Figure J-2 Location of Metro Fire in Sacramento County



Source: Sacramento Metro Fire District

J.3.1. District Overview, History, and Background

On September 25, 1999 by unanimous vote, the Board of Directors of the American River Fire District adopted an application for reorganization resolution with the Sacramento County Fire Protection District. On September 23, 1999, the Board of Directors of Sacramento County Fire adopted the application for reorganization with the American River Fire District. The adoptions of these resolutions officially called for the reorganization of both districts, which occurred on December 1, 2000.

The administration and membership of the District recognize the contribution and rich history of its predecessor departments. There are 16 prior fire departments represented in the Metro Fire organization. The predecessor agencies include:

- Arcade 1/26/42 to 6/30/86
- Arden 1/4/43 to 7/31/83
- Carmichael 1/30/42 to 7/31/83
- Citrus Heights 12/31/33 to 6/30/89
- Elverta 10/22/25 to 12/31/86
- Fair Oaks 3/27/28 to 11/2/93
- Florin 1/26/42 to 6/30/97
- Mather Field 1918 to 9/3/93
- McClellan Field 1937 to 4/1/01
- Michigan Bar 1/1/43 to 11/9/47
- Mills 6/8/22 to 11/1/59
- North Highlands 9/24/51 to 6/2/84
- Orangevale 3/2/36 to 12/1/45
- Rancho Cordova 11/2/59 to 6/30/89
- Rio Linda 6/23/23 to 12/31/86
- Sloughhouse 11/1/47 to 6/30/90

The Sacramento Metropolitan Fire District, serves a population of over 727,000 in a 417 square mile service area. Metro Fire is the 7th largest fire agency in the State of California.

Metro Fire is a combination of 16 smaller fire departments that, over the years, merged to create this California Special District. The last merger was in December 2000 when American River Fire Department and Sacramento County Fire Protection District merged to form the Sacramento Metropolitan Fire District, pursuant to Government Code Section 56839. As a special district, Metro Fire is governed by a Board of Directors; each member is elected by the voters within a geographical area, or division, of Metro Fire's operational area.

On any given day, there are 155 on-duty personnel to serve the District's communities. Routine and emergency operations are managed with five (5) Battalion Chiefs with oversight through an Assistant Chief assigned a 24-hour shift. Metro Fire is comprised of three branches - Operations, Administration, and Support Services.

- **Operations** includes Fire & Rescue, Emergency Medical, Training & Safety, Special Operations, Homeland Security, Fire Investigation, and Health & Wellness Divisions.
- The **Administration** Branch consists of Economic Development, Finance, Human Resources, and Information Technology Divisions.

- **Support Services** oversees Community Risk Reduction, Community Services, Facilities, Fleet Maintenance, and Logistics Divisions.

J.4 Hazard Identification

Metro Fire's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to Metro Fire (see Table J-2).

Table J-2 Metro Fire—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Limited	Occasional	Limited	Low
Bird Strike	Limited	Likely	Negligible	Low
Climate Change	Significant	Likely	Limited	Low
Dam Failure	Limited	Unlikely	Critical	Medium
Drought and Water Shortage	Extensive	Highly Likely	Limited	Medium
Earthquake	Significant	Likely	Limited	Medium
Earthquake: Liquefaction	Limited	Likely	Limited	Low
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding	Significant	Highly Likely	Limited	Low
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Limited	Occasional	Negligible	Medium
River/Stream/Creek Bank Erosion	Limited	Occasional	Negligible	Low
Severe Weather: Extreme Temperatures – Cold/Freeze	Significant	Likely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Significant	Highly Likely	Limited	Low
Severe Weather: Fog	Significant	Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Limited	Low
Severe Weather: Wind and Tornadoes	Significant	Likely	Limited	Low
Subsidence	Limited	Unlikely	Limited	Low
Volcano	Limited	Unlikely	Limited	Low
Wildfire:(Burn Area/Smoke)	Significant	Highly Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

J.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile Metro Fire's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Hazard Profiles and Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to Metro Fire is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

J.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section J.5.3, includes a description as to how the hazard affects the Metro Fire and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

J.5.2. Vulnerability Assessment and Assets at Risk

This section identifies Metro Fire's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table J-3 lists particular critical facilities and other District assets identified by the Metro Fire's planning team as important to protect in the event of a disaster. Metro Fire's physical assets, valued at over $165 million, consist of the buildings and infrastructure to support the Metro Fire operations.

Table J-3 Metro Fire's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Fire Station 21	Essential	7641 Greenback Ln Citrus Heights, CA 95610	$5,000,000	Earthquake
Fire Station 22	Essential	6248 Chestnut Ave., Orangevale 95662	$3,000,000	Earthquake
Fire Station 23	Essential	6421 Greenback Ln., Citrus Heights 95621	$4,000,000	Earthquake
Fire Station 24	Essential	4942 College Oak Dr., Sacramento 95841	$3,000,000	Earthquake
Fire Station 25	Essential	7352 Roseville Rd., Sacramento 95842	$3,000,000	Earthquake
Fire Station 26	Essential	8000 Palmerson Dr., Antelope 95843	$3,000,000	Earthquake
Fire Station 27	Essential	7474 Grand Oaks Bl., Citrus Heights 95621	$3,000,000	Earthquake
Fire Station 28	Essential	8189 Oak Ave., Citrus Heights 95610	$3,000,000	Earthquake
Fire Station 29	Essential	8681 Greenback Ln., Orangevale 95662	$3,000,000	Earthquake
Fire Station 31	Essential	7950 California Ave., Fair Oaks 95628	$3,000,000	Earthquake
Fire Station 31	Essential	8890 Roediger Lane, Fair Oaks 95628	$3,000,000	Earthquake
Fire Station 33	Closed	5148 Main Ave., Orangevale 95662	$2,000,000	Earthquake, Wildfire
Fire Station 41	Essential	6900 Thomas Dr., North Highlands 95660	$3,000,000	Earthquake

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Fire Station 42	Essential	5608 North Haven, North Highlands 95660	$2,000,000	Earthquake
Fire Station 50	Essential	8880 Gerber Rd., Sacramento 95828	$3,000,000	Earthquake, Dam Failure
Fire Station 51	Essential	8210 Meadowhaven Dr., Sacramento 95828	$2,000,000	Earthquake, 500 year flood, Dam Failure
Fire Station 53	Essential	6722 Fleming Ave., Sacramento 95828	$2,000,000	Earthquake, 200 year flood, 500 year flood, Dam Failure
Fire Station 54	Essential	8900 Fredric Ave., Sacramento 95826	$1,500,000	Earthquake, 200 year flood, 500 year flood, Dam Failure
Fire Station 55	Essential	7776 Excelsior Rd., Sacramento 95829	$2,000,000	Earthquake, Wildfire
Fire Station 58	Essential	7250 Sloughhouse Rd., Elk Grove 95624	$2,000,000	Earthquake, Wildfire
Fire Station 59	Essential	7210 Murieta Drive, Rancho Murieta 95683	$2,000,000	Earthquake
Fire Station 61	Essential	10595 Folsom Bl., Rancho Cordova 95670	$3,000,000	Earthquake, 500 year flood, Dam Failure
Fire Station 62	Essential	3646 Bradshaw Rd., Sacramento 95827	$3,000,000	Earthquake, Dam Failure
Fire Station 63	Essential	12395 Folsom Bl., Rancho Cordova 95742	$1,500,000	Earthquake, Dam Failure
Fire Station 64	Essential	9116 Vancouver Dr., Sacramento 95826	$1,500,000	Earthquake, 500 year flood, Dam Failure
Fire Station 65	Essential	11201 Coloma Rd., Rancho Cordova 95670	$3,000,000	Earthquake, 500 year flood, Dam Failure
Fire Station 66	Essential	3180 Kilgore Rd., Rancho Cordova 95670	$2,000,000	Earthquake, Dam Failure

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Fire Station 68	Essential	4381 Anatolia Dr., Rancho Cordova, 95742	$2,000,000	Earthquake
Fire Station 101	Essential	3000 Fulton Ave., Sacramento 95821	$2,000,000	Earthquake
Fire Station 102	Essential	4501 Marconi Ave., Sacramento 95821	$1,500,000	Earthquake
Fire Station 103	Essential	3824 Watt Ave., Sacramento 95821	$2,000,000	Earthquake
Fire Station 105	Essential	2691 Northrop Ave., Sacramento 95864	$2,000,000	Earthquake, 200 year flood, 500 year flood, Dam Failure
Fire Station 106	Essential	2200 Park Towne Cir., Sacramento 95825	$3,000,000	Earthquake, Dam Failure
Fire Station 108	Essential	6701 Winding Way, Fair Oaks 95628	$2,000,000	Earthquake
Fire Station 109	Essential	5634 Robertson Ave., Carmichael 95608	$2,000,000	Earthquake
Fire Station 110	Essential	1432 Eastern Ave., Sacramento 95864	$2,000,000	Earthquake, Dam Failure
Fire Station 111	Essential	6609 Rio Linda Blvd., Rio Linda, CA 95673	$2,000,000	Earthquake, Dam Failure
Fire Station 112	Essential	6801 34th St., North Highlands 95660	$1,500,000	Earthquake
Fire Station 114	Essential	5824 Kelly Way, McClellan 95652	$2,000,000	Earthquake
Fire Station 115	Essential	4727 Kilzer Ave., McClellan 95652	$2,000,000	Earthquake

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Fire Station 116	Essential	7995 Elwyn Ave., Elverta 95626	$1,500,000	Earthquake, Dam Failure
Fire Station 117	Essential	7961 Cherry Brook Dr., Elverta 95626	$1,500,000	Earthquake, Dam Failure
Headquarters	Essential	10545 Armstrong Ave Mather, CA 95665	$20,000,000	Earthquake
Fleet Maintenance Facility	Essential	4425 Dudley Blvd McClellan Ca 95652	$20,000,000	Earthquake
Logistics/Training	Essential	3012 Gold Canal DR Rancho Cordova CA 95670	$5,000,000	Earthquake
Sacramento Regional Fire and EMS Communications Center	Essential	10230 Systems Parkway, Sacramento CA 95827	$20,000,000	Earthquake, Dam Failure

Source: Metro Fire

Natural Resources

Land uses within the District include urban, suburban, and undeveloped (natural or agricultural). The terrain throughout is primarily flat or composed of gently rolling hills, with the steepest terrain being located in the eastern portion of the District, where the Central Valley begins to transition into the Sierra Foothills, and along the American River.

The northern portion of the District is the most developed, and includes the urban and suburban development within the cities of Citrus Heights and Rancho Cordova, and surrounding unincorporated communities. Citrus Heights is located north of the American River, where it covers approximately 14 square miles immediately adjacent to Interstate 80. Rancho Cordova occupies nearly 34 square miles on the south side of the American River. A much larger area of urban and suburban development surrounds these communities, and is loosely circumscribed by Interstate 80 to the north and Highway 50 to the south. The American River runs between these two roadways, and forms a green belt through the developed area.

The southern portion of the District is occupied by scattered unincorporated communities, and extensive areas of grassland, pasture, and cropland. Other natural habitats include oak woodland, vernal pools, riparian habitat, and wetlands. There are numerous seasonal and perennial waterways within the District. The largest of the rivers is the American River, which traverses the northern portion of the District, and is bordered by riparian forest. It flows out of the man-made reservoir Folsom Lake, which is located just to the east of the District. The other primary river in the District is Cosumnes River, which flows across the

southern portion, roughly between the communities of Wilton and Rancho Murieta. Most rivers and streams are ephemeral, and dewater during the dry season.

There are many special-status plant species that have been documented in the CNDDB within a 5-mile radius around the District and are also included a USFWS quad search encompassing the District. These include:

- Big-scale balsamroot
- Peruvian Dodder
- Dwarf downingia
- Tuolumne Button-celery
- Boggs Lake hedge-hyssop
- Ahart's dwarf rush
- Northern California Black Walnut
- Legenere
- Pincushion navarretia
- Slender Orcutt grass
- Sacramento Orcutt grass

According to California Fish and Wildlife the following special status animals likely reside in Metro Fire's jurisdiction:

- Valley Elderberry Longhorn Beetle
- California Red-legged Frog
- Foothill Yellow-legged Frog
- Western Spadefoot
- Western Pond Turtle
- California Horned Lizard
- Bald Eagle
- Golden Eagle
- Peregrine Falcon
- Prairie Falcon
- Burrowing Owl
- Osprey
- Northern harrier
- Sharp-shinned hawk
- Cooper's hawk
- Ferruginous hawk
- Merlin (Falco columbarius)
- Long-eared owl
- Short-eared owl
- Loggerhead Shrike
- Tricolor blackbird
- Yellow-breasted Chat
- Yellow Warbler
- Greater Sandhill Crane
- Willow Flycatcher
- Purple Martin
- Pallid bat
- Townsends big-eared bat

- California mastiff bat

Historic and Cultural Resources

The Planning Team for the District put together a table of historic and cultural resources for the District. These were compiled by the District and are shown on Table J-4.

Table J-4 Points of Historical or Cultural Interest

Name of Asset	Address	Type of Landmark
American River Grange Hall N0 172	2720 Kilgore Rd, Rancho Cordova	National Register of Historic Places
Brighton School	3312 Bradshaw Road Sacramento	National Register of Historic Places
Indian Stone Corral	Orangevale	National Register of Historic Places
Nisenan Village Site	Carmichael	National Register of Historic Places
Old Fair Oaks Bridge	Bridge St Fair Oaks	National Register of Historic Places
Sacramento Air Depot Historic District	McClellan Air Force Base	National Register of Historic Places
Slocum House	7992 California Ave, Fair Oaks	National Register of Historic Places
Fifteen Mile House – Overland Pony Express Route	White Rock & Gold Valley Rd Rancho Cordova	California Historical Landmark
Sacramento Assembly Center- Camp Kohler	Walerga Park	California Historical Landmark
Sheldon Grist Mill	Meiss Rd and Hwy 16, Sloughouse	California Historical Landmark
Sloughhouse	Meiss Rd and Hwy 16 Sloughhouse	California Historical Landmark

Source: Metro Fire District

Growth and Development Trends

CITY OF CITRUS HEIGHTS

The City of Citrus Heights is a mostly built-out suburban city surrounded by similar development in unincorporated areas. A variety of commercial and office uses line the historic Auburn Boulevard commercial corridor and occupy small centers along a number of arterials including: Antelope Road, Fair Oaks Boulevard, Madison Avenue and San Juan Avenue. Although some of the older commercial centers along these arterials are beginning to show signs of deterioration, retail development has shifted over the past decades to the Sunrise MarketPlace, where Sunrise Mall and Marketplace at Birdcage serve as regional shopping centers.

The older residential area of the north-central city is comprised of primarily large lots and has retained a more rural setting, with large parcels accommodating hobby farming and livestock grazing. Smaller subdivisions and multi-family developments form the majority of the residential areas, with many of the denser multi-family neighborhoods surrounding the Sunrise MarketPlace.

Approximately 97 percent of the city is currently developed. Development of the remaining 3 percent of vacant land under the City of Citrus Heights General Plan could result in an increase of approximately 149

acres of residential development and 46 acres of commercial development. Future land uses consistent with the General Plan could result in an increase of approximately 3,577 residential dwelling units by 2035, which is an increase of approximately 10 percent over 2010 levels. Development of future land uses consistent with the General Plan could also result in an increase in population of approximately 15,880 or 18 percent from 2010 to 2035 (AECOM 2011).

The city was incorporated in 1997 with 88 percent of the homes built before 1989 and 36 percent were built in the 1970s. The majority of these homes were constructed as tract homes associated with the building boom of that decade. The majority of these homes were built quickly with inconsistent construction quality. Many of these homes are now experiencing failing roofs and HVAC systems. In addition, 861 homes were built prior to 1939, some of which lack complete plumbing and may be dilapidated. Most of these homes utilize electronic wiring and plumbing that can pose potential fire risk.

CITY OF RANCHO CORDOVA

The City of Rancho Cordova grew substantially after World War II, fueled by employment demand at Aerojet and Mather Air Force Base. The city contains relatively large amounts of undeveloped land, with even more undeveloped land within its Planning Area. Between 2003 and 2013, 5,000 new homes were built in the city. The city was incorporated in 2003. The City is currently working on four specific plans to guide development is several large undeveloped areas within the city, including: the Sunridge Specific Plan (10,000 dwelling units on 2,600 acres); Westborough Specific Plan (6,000 dwelling units on 1,700 acres); the Arboretum-Waegell Specific Plan (5,000 dwelling units on 1.350 acres); and the Mather Field Specific Plan. In addition, the completed Rio Del Oro Specific Plan allows 11,600 new dwelling units on 3,800 acres.

UNINCORPORATED COMMUNITIES

Antelope

Antelope is a residential community bounded by the Sacramento-Placer County line to the north, Antelope Road to the south, the Southern Pacific Railroad line to the east, and Dry Creek to the west. Antelope was established in the mid-1800s. Planning policies that have guided growth include the Antelope Community Plan, adopted in 1985 and the subsequent East Antelope Specific Plan, adopted in 1995. The community is nearly built out. One large vacant property remains undeveloped at the northwest intersection of Don Julio and Elverta Roads. The County's Housing Element projects construction of about 2,700 new dwelling units between 2005 and 2025.

Arden-Arcade

The Arden-Arcade community is located at the heart of Sacramento County and is marked by the convergence of several major freeways and thoroughfares. Arden-Arcade is bound by the American River to the south, Interstate 80 to the north, Ethan Avenue to the west and Mission Avenue on the east. Arden-Arcade includes nearly 40 distinct neighborhood areas and a number of shopping areas. The Arden-Arcade Community offers a range of housing options, everything from apartments to mansions. California State University, Sacramento (CSUS) is located just west of the Arden-Arcade boundary. Much of Arden-Arcade

began to develop in the 1940s with the Town and Country Village shopping center (the first suburban shopping center in Northern California). Most of the population growth in Arden-Arcade occurred up through the 1960s and 1970, when it is estimated that 75-80 percent of the community was developed with urban uses, and it is now one of the most fully developed areas of urban Sacramento. The County's Housing Element projects construction of about 200 new dwelling units between 2005 and 2025 in this community.

Carmichael and Old Foothill Farms

Carmichael and Old Foothill Farms is a fully developed community located 10 miles northeast of downtown Sacramento. It is bounded by Mission Avenue on the west, the American River on the south, San Juan Avenue on the east, and by the City of Citrus Heights on the north. The first settlers of Carmichael lived on 10-acre parcels, but following World War II, the community experienced rapid growth and its rural character began changing to a more suburban nature. Carmichael maintains its village feel, featuring a number of small shops, restaurants, and recreational activities. The community offers a complete range of homes, from apartments and townhouses to beautiful residences overlooking the American River and its parkway. Fair Oaks Boulevard is one of the community's major commercial corridors featuring shops, restaurants and services. A corridor plan was created for the boulevard (as well as a portion of Manzanita Avenue) that designates distinct local planning districts, including the creation of a SPA for the "Main Street District" that functions as the community's town center. The County's Housing Element projects construction of about 300 new dwelling units between 2005 and 2025 in this community.

Rancho Murieta

Rancho Murieta is a gated master planned community begun in the 1970s consisting of single family dwellings and townhouses. Rancho Murieta is surrounded by commonly-held open space and contains a small lake, golf course, and a few community services buildings (such as churches). It is located on eastern boundary of the District, and straddles the Jackson Highway (Highway 16). While Rancho Murieta itself is almost built to capacity, the Sacramento County Housing Element projects construction of about 3,000 new dwelling units between 2005 and 2025.

Fair Oaks

Fair Oaks is a well-established community of nearly 31,000 residents. The Fair Oaks community is bounded by the American River on the south, San Juan Avenue on the west, Madison Avenue on the north, and Blue Ravine on the east. It consists of a mix of small business district, suburban and semi-rural neighborhoods spanning over 11 square miles. The area is home to rolling hills and numerous native oaks. The County's Housing Element projects construction of about 300 new dwelling units between 2005 and 2025 in this community.

North Highlands - Foothill Farms

North Highlands is a diverse suburban community of 43,000 residents that is located approximately 10 miles northeast of downtown Sacramento. The North Highlands – Foothill Farms area is bounded by Antelope Road to the north, the city of Citrus Heights to the east, Arcade Creek and the city of Sacramento to the south, and on the west by Sacramento and McClellan Park, 28th Street, and Dry Creek. The community was formally established in 1952 and grew with the development of the McClellan Air Force

Base (now known as McClellan Business Park). McClellan Business Park is one of the largest business parks in California and will ultimately employ up to 34,000 individuals. The County's Housing Element projects construction of about 300 new dwelling units between 2005 and 2025.

Orangevale

Orangevale is a well-established community in northeastern Sacramento County. The Orangevale community is bounded by the Sacramento-Placer County line to the north, Madison Avenue to the south, Folsom to the east, and Kenneth Avenue and Fair Oaks Boulevard to the west. Most of the commercial property is in the southern portion of the community, along Greenback Lane. The northern portion of Orangevale is a rural and wildland island in the more densely developed portion of Sacramento County. This area also contains oak-covered Orangevale Community Park. Some residential properties are zoned to accommodate horses and orchards. The County's Housing Element projects construction of about 500 new dwelling units between 2005 and 2025 in this community.

Rio Linda and Elverta

The Rio Linda and Elverta community is located in the north-central section of Sacramento County and is bounded on the north by the Sutter and Placer County boundaries, on the west by the Western Pacific Railroad and Steelhead Creek, on the south by the City of Sacramento, and on the east by McClellan Park, 28th Street and Dry Creek. In addition to typical suburban and multi-family housing types, these two communities have large rural residential areas. The County's Housing Element projects construction of about 3,000 new dwelling units between 2005 and 2025.

Vineyard

The Vineyard area is located ten miles from downtown Sacramento in the geographic center of Sacramento County. It is bounded by Jackson Highway and Kiefer Boulevard on the north, Calvine Road on the south, Grantline Road on the east, Elk Grove-Florin Road on the west. Vineyard is currently home to over 24,000 residents, with many more expected once several planned new communities are built out. The northern border of the Vineyard area is shared with the former Mather Air Force Base. The Sacramento County General Plan Housing Element projects construction of about 16,000 new dwelling units between 2005 and 2025.

PROJECTED URBANIZATION

Future Growth Areas within the Urban Service Boundary

The County's General Plan contains objectives to encourage sustainability and accessibility while protecting valuable and sensitive environmental resources. To further these objectives, the plan has sustainable growth management policies including policies to limit new development to areas inside the Urban Service Description of Metro Fire Community Wildfire Protection Plan 6-26 Sacramento Metropolitan Fire District Boundary (USB) as shown on Figure 6-7. The General Plan also contains commercial corridor plans that will be implemented to provide multi-modal access along certain main corridors and revitalize some of the existing unincorporated communities. Future growth will occur as infill within the existing communities and development of currently undeveloped or lightly developed areas

within the adopted Urban Services Boundary (area as designated as Urban Service Areas). New Growth Areas identified by the County in 2012 include the Cordova Hills Master Plan area; the Mather Specific Plan area; New Bridge Master Plan area; Jackson Township Master Plan area. In addition, new development would continue in the other approved Master Plan areas shown on the attached figure showing Master Plan areas (e.g. Elverta Specific Plan area). As described previously, the County Housing Element projects substantial growth by 2025 in the community Vineyard (which likely includes the community of Cordova), moderate growth (2,500-3,000 new units) in Antelope and Rio Linda/Elverta. Little growth is projected in Arden-Arcade, Carmichael/Old Foothill Farms, Orangevale, North Highlands – Foothill Farms, and Fair Oaks.

Development Potential Outside the Urban Services Boundary

There is some potential for new development outside the USB. One of these potential growth areas is the eastern part of the county between Highway 50 and Rancho Murieta. This is the area that supports almost all the oak woodland in the District. Accordingly, it is the part of the District most at risk from wildfire. Other than the Rancho Murieta community area, this area is designated in the General Plan as Agriculture, 80-acre minimum parcel size. Future 80-acre ranchettes in or adjacent to the woodland areas could experience relatively high wildfire risk. It is noted that despite the General Plan land use designations for this area, the County Housing Element projects substantial growth (20,000 new dwelling units) in the Cosumnes and Rancho Murieta communities between 2005 and 2025.

In 2012, the City of Folsom annexed 3,585 acres for the Folsom South of U.S. Highway 50 Specific Plan, located between Highway 50 and White Road, Prairie City Road, and El Dorado County. Up to 11,000 residential units may eventually be developed in this area. The EIR/EIS prepared for that project noted that the land was within a State Responsibility Area and that the State has mapped the area as having a "moderate" fire hazard rating. On that basis, the EIR/EIS found that future development in the area would not be exposed to a substantial risk from wildfires.4 There are current plans to begin development of the area with one developer proposing in 2013 to build 900 new homes on 441 acres by 2015.

J.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table J-2 as high or medium significance hazards. Impacts of past events and vulnerability of the Metro Fire to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee and dam inundation areas, such as older facilities that may be constructed with unreinforced masonry and buildings built prior to the introduction of modern building codes, or wildfire areas.

An estimate of the vulnerability of the Metro Fire to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on

past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–Medium

Hazard Profile and Problem Description

Dam failures can result from a number of natural or manmade causes such as earthquakes, erosion of the face or foundation, improper siding, rapidly rising flood waters, structural/design flaws, and deliberate human actions. Folsom Dam is the major dam which affects Metro Fire and the populations in the inundation areas. Folsom Dam is owned by the US Bureau of Reclamation. The flood waters from a dam failure would likely affect the District's service area.

The ability to warn downstream communities in the event of a flood event caused by a dam failure is generally dependent on conditions such as the frequency of inspections for the dam's structural integrity, the flood wave arrival time (the time it takes for the flood wave to reach its maximum distance of inundation), or the ability to notify persons downstream and their ability to evacuate or take preventative actions to minimize damage to utilities or infrastructure. The existence and frequency of updating and exercising an evacuation plan that is site-specific assists in warning and evacuation functions.

A dam failure will cause loss of life, damage to property, and other ensuing hazards, as well as the displacement of persons residing in the inundation path.

Past Occurrences

There have been no incidents of a dam failure that have affected Metro Fire Assets. In 1995 a failure of a flood gate resulted in an uncontrolled release of water from the Folsom Dam. The American River levee system was able to contain the water.

Vulnerability to Dam Failure

Assets/Critical Facilities at Risk

The Bureau of Reclamation provided several dam and dike failure scenarios. The worst case scenario would be the failure of Folsom Dam. The resulting inundation would affect 17 fire district facilities considered essential. Warning time would vary from 1 hour to 3 hours for these facilities. The following facilities are at risk of damage due to dam failure.

- Station 50
- Station 51
- Station 53
- Station 54
- Station 61
- Station 62
- Station 63
- Station 64
- Station 65
- Station 66
- Station 105
- Station 106
- Station 110
- Station 111
- Station 116
- Station 117
- Sacramento Regional Fire and EMS Communications Center

Natural Resources at Risk

Much of the American River Parkway would be damaged during a failure of Folsom Dam. This could destroy vital habitat for both special status plants and animals.

Historic and Cultural Resources at Risk

All of the Points of Historical and Culture Interest listed in Table J-4 would be at risk during a dam failure.

Future Development

Most of the development in Metro Fire's jurisdiction is occurring in the northwest portion (Elverta/Rio Linda) of Sacramento County, the south east portion of the City of Rancho Cordova and the Vineyard area. A failure of any of the dikes north of the Folsom Dam would inundate Elverta with flood waters causing damage to the new development in the area. The development in the southeast portion of Rancho Cordova is not threatened by dam failure.

Drought and Water Shortage

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Drought is different than many of the other natural hazards in that it is not a distinct event and usually has a slow onset. Drought can severely impact a region both physically and economically. Drought affects different sectors in different ways and with varying intensities. Adequate water is the most critical issue and is critical for manufacturing, tourism, recreation, and commercial and domestic use. As the population in the area continues to grow, so will the demand for water.

Drought is a significant hazard, especially to the forested areas of the District. Drought conditions stress and leave the forest susceptible to disease and insect infestation. As a result of recent drought conditions throughout California, infestations of the Pine Beetle are on the rise. Drought also stresses grasslands, and leaves them more susceptible to wildfire.

Past Occurrences

Droughts occur in California with regularity. The current drought started in 2011. Previous droughts occurred in 2007-2009, 1986-1991, and 1976-1977.

Vulnerability to Drought and Water Shortage

Assets a Risk

Unlike other natural disasters, drought does not affect individual properties. The effects of continued drought are felt area-wide. The greatest change to Metro Fire would be the decrease in the amount of training using water. During previous droughts, firefighting training using water was reduced to save this resources.

Natural Resources at Risk

Prolonged drought can cause an increase for wildfire occurrence and intensity. Drought can cause tree death which can create a significant increase in wildfire behavior.

Historic and Cultural Resources at Risk

No historic or cultural resources are at risk from drought.

Future Development

Prolonged drought could cause a reduction in future development due to the lack of water resources for new dwellings.

Earthquake

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

An earthquake is caused by a sudden slip on a fault. Stresses in the earth's outer layer push the sides of the fault together. Stress builds up, and the rocks slip suddenly, releasing energy in waves that travel through the earth's crust and cause the shaking that is felt during an earthquake. Earthquakes can cause structural damage, injury, and loss of life, as well as damage to infrastructure networks, such as water, power, gas, communication, and transportation. Earthquakes may also cause collateral emergencies including dam and levee failures, hazmat incidents, fires, avalanches, and landslides. The degree of damage depends on many interrelated factors. Among these are: the magnitude, focal depth, distance from the causative fault, source mechanism, duration of shaking, high rock accelerations, type of surface deposits or bedrock, degree of consolidation of surface deposits, presence of high groundwater, topography, and the design, type, and quality of building construction.

Past Occurrences

Since 1931 there have been 17 significant earthquakes within 30 miles of Sacramento. The US Geological Survey predicts that there is a 45% chance of a 5.0 earthquake over the next 50 years.

Vulnerability to Earthquake

Assets a Risk

Many Fire District facility were constructed before seismic upgrades were required. Only 4 fire stations have been built in the last 10 years. All other stations are in excess of 20 years old. Some stations are unreinforced masonry construction which is especially vulnerable during earthquakes. At least 30 fire stations do not meet current seismic guidelines.

Natural Resources at Risk

No natural resources are at risk for earthquake damages.

Historic and Cultural Resources at Risk

All historical buildings are at risk for damage during an earthquake.

Future Development

California Building Code requires all new construction to have features that will reduce damage due to an earthquake.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Flooding is the rising and overflowing of a body of water onto normally dry land. History clearly highlights floods as one of the most frequent natural hazards impacting Sacramento County. Floods are among the most costly natural disasters in terms of human hardship and economic loss nationwide. Floods can cause substantial damage to structures, landscapes, and utilities as well as life safety issues. Floods can be extremely dangerous, and even six inches of moving water can knock over a person given a strong current. A car will float in less than two feet of moving water and can be swept downstream into deeper waters. This is one reason floods kill more people trapped in vehicles than anywhere else. During a flood, people can also suffer heart attacks or electrocution due to electrical equipment short outs. Floodwaters can transport large objects downstream which can damage or remove stationary structures, such as dam spillways. Ground saturation can result in instability, collapse, or other damage. Objects can also be buried or destroyed through sediment deposition. Floodwaters can also break utility lines and interrupt services. Standing water can cause damage to crops, roads, foundations, and electrical circuits. Direct impacts, such as drowning, can be limited with adequate warning and public education about what to do during floods. Where flooding occurs in populated areas, warning and evacuation will be of critical importance to reduce life and safety impacts from any type of flooding.

Metro Fire has two major rivers running though the district. The American River runs east to west from Folsom Dam until the confluence with the Sacramento River in the City of Sacramento. The Cosumnes River crosses the District in the southern part of the county. Both rivers have been subject to flooding in the past.

The American River bisects the Fire District. There are a limited number of bridges that cross the river. Large scale flooding could damage the bridge crossing, creating significant problems maintaining response levels during flooding.

There are several stream groups that can affected Metro Fire. These include Arcade Creek, Dry Creek and Cripple Creek in the north part of the District. Morrison Creek and Deer Creek are in the southern portions of the District. These creeks often flood during heavy rain. Deer Creek overtops and blocks Scott Rd between Boys Ranch Rd and Latrobe RD during many storms.

Past Occurrences

In 1986 severe weather over a ten day period caused flooding in the area. The American River was flowing beyond its predicted safe flow for several days.

The New Years flood of 1996-1997 caused widespread stream flooding and a levee failure on the Cosumnes river.

Vulnerability to Flood

Assets a Risk

Three Metro Fire Facilities are within the 200 year flood plain. According to the flood depth maps published by the Sacramento Area Flood Control Agency these stations would likely be exposed to water that is over 5 feet deep. The facilities are:

- Station 54
- Station 53
- Station 105

For additional facilities are within the 5000 year flood plain. These facilities are:

- Station 51
- Station 61
- Station 64
- Station 65

Natural Resources at Risk

Extensive flooding along the American River Parkway would damage sensitive habitat of many special-status plants and animals.

Historic and Cultural Resources at Risk

Most of the Points of Historical and Cultural Interest are with the flood plains. Flooding would cause severe damage to historic buildings as they were not built to resist flooding.

Future Development

Most of the future development in the Fire District is occurring in areas that are not susceptible to flooding.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Flooding caused by levee failure can occur as the result of partial or complete collapse of an impoundment, and often results from prolonged rainfall and flooding. The primary danger associated with dam or levee failure is the high velocity flooding of properties downstream of the breach. Section 4.2.15 Levee Failure describes the levee inventory in the Sacramento County Planning Area.

Flooding caused by levee failure would vary in the District depending on which structure fails and the nature and extent of the failure and associated flooding. Flooding may present a threat to life and property depending on buildings or facilities flooded. Damage may include buildings, their contents and loss of

critical services to the community. Large flood events can affect lifeline utilities (e.g., water, sewerage, and power), transportation, jobs, tourism, the environment, agricultural industry, and the local and regional economies.

Levee Flood Protection Zones estimate the maximum area that may be inundated if a project levee fails when water surface elevation is at the top of a project levee. Zones depicted on Figure 4.69 of the Base Plan do not necessarily depict areas likely to be protected from flow events for which project levees were designed. Figure 4.69 of the Base Plan illustrates the depths of flooding should a levee that protects that area fail.

Past Occurrences

In January 1997, a private levee on the Cosumnes River failed. This levee breach flooded mostly agricultural land in southeastern Sacramento County. There was not a significant impact on Metro Fire facilities or operations.

There have been no failures of the American River Levee System in recent history.

Vulnerability to Levee Failure

Assets a Risk

The facilities that are at risk for flooding are also at risk of levee failure.

Natural Resources at Risk

Extensive flooding from levee failure along the American River Parkway would damage sensitive habitat of many special-status plants and animals.

Historic and Cultural Resources at Risk

Most of the Points of Historical and Cultural Interest are with the flood plains. Flooding would cause severe damage to historic buildings as they were not built to resist flooding from levee failures.

Future Development

Most of the future development in the Fire District is occurring in areas that are not susceptible to flooding and levee failure.

Wildfire

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

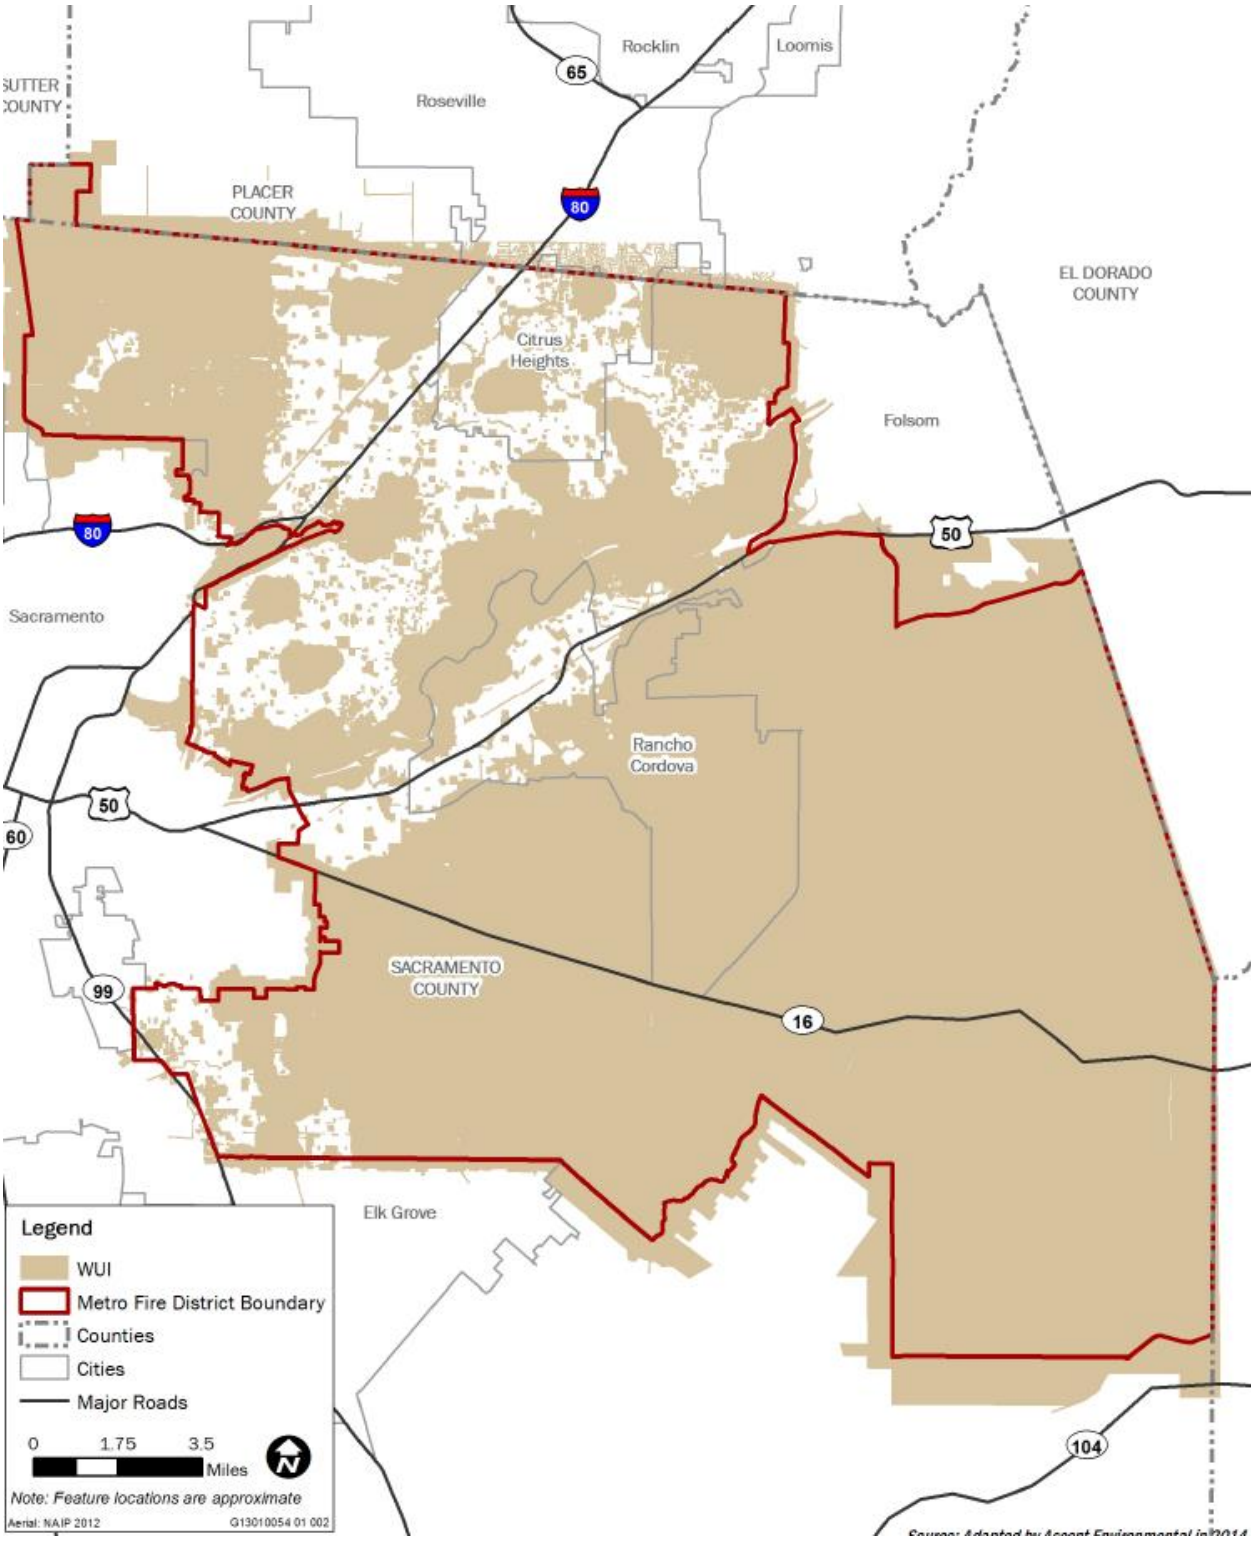
According to the American River CWPP, wildland fires are common in open space areas with vegetation that exhibits low fuel moisture. The threat for wildland fires is increased during the warmer months which are typically from late May until late October of every year. High winds can also contribute to the spread and severity of the fire. Specifically winds from the north which is drying winds they will support extreme wildland fire behavior, as opposed to winds from the west which have the ability to add moisture to fuels minimizing extreme fire behavior.

The WUI is the meeting point between wildland vegetation or fuels and structures (Figure J-3). At this interface, the structure and vegetation are sufficiently close that a wildfire could spread to a structure or a structure fire could ignite vegetation. The proximity of vegetation and structures needed to spread fire varies with the vegetation (fuel) type, the siting of the structure, and the exterior characteristics (building material and design) of the structure itself. WUI is defined on a scale larger than one lot or neighborhood.

In the past, the vast majority of wildfires occurred in remote locations and caused little damage to property or loss of human life. During the last 50 years, however, history is replete with examples of destructive fires in the WUI throughout California. Almost all of the wildfires within the District are caused by humans, and are closer to developed areas. Because of the increased values that accompany structures and other improvements, most losses from wildfire occur in the WUI.

Much of the development occurring in Metro Fire's jurisdiction is in the WUI. The current development projects in the Elverta area and the City of Rancho Cordova are in the WUI. There are also development occurring in the Rancho Murieta area.

Figure J-3 WUI in the Metro Fire District



Source: American River CWPP Appendix A

Past Occurrences

Metro Fire responds to an average of 869 wildfires per year (based on records from 2008-2013). This comprises 37 percent of all fires, even though wildlands cover only 15 percent of the District's 417 square mile jurisdictional area.

The number of wildfires in the District is rising, with a 5 percent increase in 2012 alone (Sacramento Metropolitan Fire District 2013). Simultaneously, major residential development has begun throughout the District, with a forecasted population increase of 200,000. Because most wildfires are human-caused, this higher population may well translate into more wildfires. The risk of wildfire is especially concerning because the wildland areas in these communities are not restricted to the outskirts of the District's jurisdictional area, but rather are interspersed amongst residential and commercial areas, creating a large wildland urban interface area. Additional risk factors for Metro Fire include topographical challenges in the ARP area that could impact fire suppression efforts, environmental considerations in the community, diversity of terrain, and increased residential development and population growth within WUI areas.

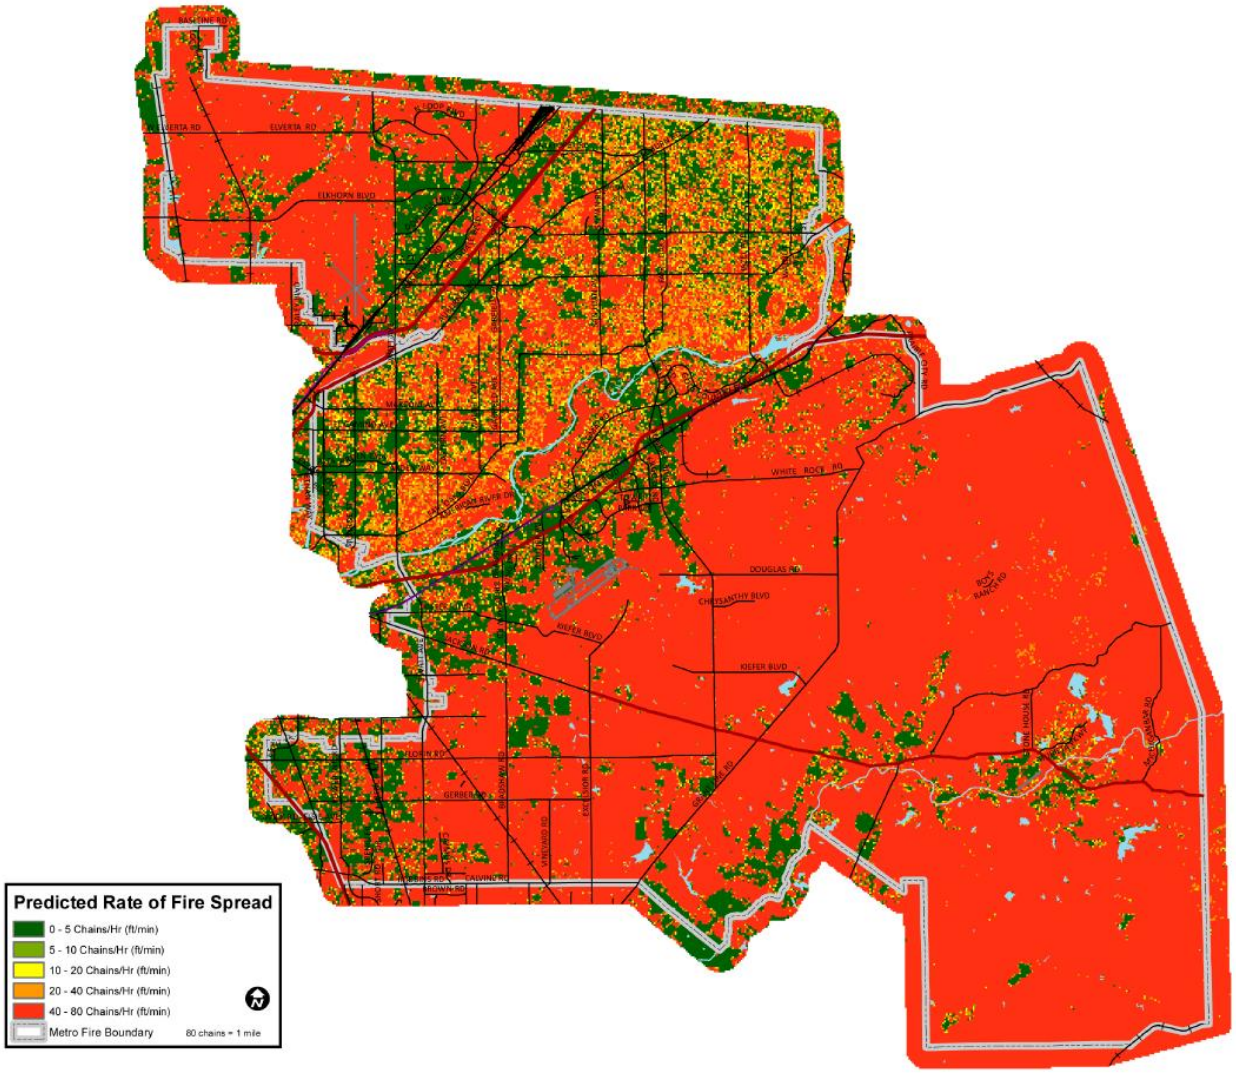
On June 10, 2008 a wildland fire started on Jackson Road east of Bradshaw Road. The Jackson Fire eventually burned 6400 acres, destroyed 5 homes and cause severe injuries to one firefighter. This fire required the extensive use of both automatic and mutual aid from both within Sacramento County and out-of-county resources.

Vulnerability to Wildfire

There are many ways to assess fire hazard; most utilize fuels, weather and topography, with possible inclusions of elevation, or fire history. Fire behavior modeling was used to assess the potential hazards within the District because it:

- integrates the effects of fuels, weather, and topography;
- denotes where containment may be easiest as well as where access may be precluded during a time of fire; and
- warns where natural resources may be unduly harmed by a wildfire as well as where fire may be inconsequential to natural resources.

Figure J-4 Predicted Rate of Fire Spread in the Metro Fire District



Source: American River CWPP Appendix A

Much of the land within the District is not predicted to have the capacity to burn under a wildfire, due to a lack of vegetation. Areas where surface fire can spread are located north of the American River, near Mather Air Field and the southeastern portion of the District. These generally coincide with lands mapped as WUI.

Assets a Risk

Only two Fire District facilities are at risk for wildfire: Station 58 and Station 33 (currently closed).

Natural Resources at Risk

The District Planning Team noted that all special status species and plant communities in the District are at risk to wildfire.

Historic and Cultural Resources at Risk

The following Points of Historic or Cultural Interest are at risk to wildfire:

- Indian Stone Corral
- Niscenan Village Site
- Sheldon Grist Mill'
- Sloughhouse

Future Development

The areas that are experiencing the greatest development are the southeastern portion of the City of Rancho Cordova, the Vineyard area and the northwestern portion of the county in the Elverta/Rio Linda area. All these areas are part of the WUI and are at greater risk for wildfire. Metro Fire has not formally designated a WUI area so the WUI components of the California Building Code do not apply except in the High Fire Severity Zone that is designated along the American River Parkway.

J.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

J.6.1. Regulatory Mitigation Capabilities

Table J-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the Metro Fire.

Table J-5 Metro Fire's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan		
Capital Improvements Plan		
Economic Development Plan		
Local Emergency Operations Plan	Y 2004	This plan is currently being updated. Hazards are identified. The plan does not identify mitigation strategy.
Continuity of Operations Plan		
Transportation Plan	N/A	
Stormwater Management Plan/Program	N/A	
Engineering Studies for Streams	N/A	

Community Wildfire Protection Plan	Y 2014	This plan addresses the wildfire hazards in the Fire District and recommends mitigation actions.
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N/A	Score:
Fire department ISO rating:	Y	Rating: 3/9
Site plan review requirements	Y	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance		
Subdivision ordinance		
Floodplain ordinance		
Natural hazard specific ordinance (stormwater, steep slope, wildfire)		
Flood insurance rate maps		
Elevation Certificates		
Acquisition of land for open space and public recreation uses		
Erosion or sediment control program		
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: Metro Fire

J.6.2. Administrative/Technical Mitigation Capabilities

Table J-6 identifies the department(s) responsible for activities related to mitigation and loss prevention for Metro Fire.

Table J-6 Metro Fire's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission		
Mitigation Planning Committee		

Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)		
Mutual aid agreements		
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official		
Floodplain Administrator	N	
Emergency Manager		
Community Planner		
Civil Engineer		
GIS Coordinator		
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)		
Hazard data and information		
Grant writing		
Hazus analysis		
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: Metro Fire

J.6.3. Fiscal Mitigation Capabilities

Table J-7 identifies financial tools or resources that the Metro Fire could potentially use to help fund mitigation activities.

Table J-7 Metro Fire's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding		
Authority to levy taxes for specific purposes	Y	This has not been attempted
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	Impact fees have been use open new fire stations
Storm water utility fee	N/A	

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Incur debt through general obligation bonds and/or special tax bonds	Y	
Incur debt through private activities		
Community Development Block Grant		
Other federal funding programs	Y	SAFER, AFG, HSGP
State funding programs		
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: Metro Fire

J.6.4. Mitigation Education, Outreach, and Partnerships

Table J-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table J-8 Metro Fire's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	Y	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	
Natural disaster or safety related school programs	Y	
StormReady certification		
Firewise Communities certification		
Public-private partnership initiatives addressing disaster-related issues		
Other		
How can these capabilities be expanded and improved to reduce risk?		

J.6.5. Other Mitigation Efforts

As stated in the American River CWPP, there are mitigation efforts ongoing by the District. This includes:

- Fuel reductions projects
- Treatment of structural ignitability
- Vegetation treatments

Information on these items may be found in greater detail in the CWPP.

J.7 Mitigation Strategy

J.7.1. Mitigation Goals and Objectives

Metro Fire adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

J.7.2. Mitigation Actions

The planning team for Metro Fire identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Relocate the essential facilities in the 200 year flood plain.

Hazards Addressed: Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: 3 Fire stations (54, 53, 105) are located within the 200 year flood plain of the American River. These stations would become uninhabitable during a significant flood. Apparatus and equipment are vulnerable to damage.

Project Description: Locate suitable properties. Construct new fire stations to replace the 3 in the flood plain.

Other Alternatives: Raising station above flood level.

Existing Planning Mechanism(s) through which Action Will Be Implemented: Capital Improvement Plan

Responsible Office/Partners: Sacramento Metropolitan Fire District Facilities Director

Project Priority: Medium

Cost Estimate: $15,000,000

Benefits (Losses Avoided): Prevents the loss of essential emergency facilities.

Potential Funding: Capital improvement funds, grant funding

Timeline: 3-5 years

Action 2. Perform seismic study of all district facilities and identify those facilities at greatest risk for earthquake damage.

Hazards Addressed: Earthquake

Goals Addressed: 1, 3, 4

Issue/Background: Except for 4 fire stations rebuilt of the last 7 years all other district fire stations are more than 20 years old. Many stations are unreinforced masonry construction and have a substantial risk of collapse during an earthquake.

Project Description: Perform a study of all district facilities to assess the risk of damage from earthquakes. Develop a list of seismic retrofit priorities for district facilities. Identify funding sources for seismic retrofitting of fire stations.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: Capital Improvement Plan

Responsible Office/Partners: Metro Fire Facilities

Project Priority: Low

Cost Estimate: $250,000

Benefits (Losses Avoided): Will identify those district facilities that need to be retrofitted or replaced to avoid earthquake damage.

Potential Funding: Grant funding

Timeline: 1-3 years

Action 3. Implement a Wildland Urban Interface (WUI) Building/Fire Code

Hazards Addressed: Wildfire

Goals Addressed: 1, 3, 4

Issue/Background: Metro Fire does not have a designated WUI area and has implement a WUI Building/Fire Code. By designating a WUI area, WUI provisions of the California Building Code will become enforceable.

Project Description: Designate a WUI area within Metro Fire based on the information in the Community Wildfire Protection Plan. Develop WUI building code and defensible space ordinances

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: Community Wildfire Protection Plan

Responsible Office/Partners: Metro Fire Community Risk Reduction Division

Project Priority: High

Cost Estimate: $10,000

Benefits (Losses Avoided): New construction in the WUI will meet guidelines to reduce the ignition potential of the structures in the WUI.

Potential Funding: Staff time, grant founding

Timeline: 1 year

Action 4. Develop and Implement a comprehensive WUI fuels management program.

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: Reducing wildland fuels in the WUI will reduce the possibility of structure loss during a WUI fire. There are many stakeholders who will want to be involved in the fuels management program, citizens, property owners, county parks, state parks, and water districts. Fuel reduction can take on several different mechanism including grazing, hand clearing, mechanical clearing and prescribed burning.

Project Description: Hire a fuels management officer. Develop a fuels management policy. Convene a stakeholders group to prioritize projects. Implement fuels reductions as described in the CWPP. Develop an invasive species reduction program using prescribed burning and hand and mechanical clearing of non-native plants.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: CWPP

Responsible Office/Partners: Community Risk Reduction Division

Project Priority: High

Cost Estimate: $750,000 per year

Benefits (Losses Avoided): Reducing fuels in the WUI will decrease the likely hood of building ignition reducing structural losses during a wildfire.

Potential Funding: Grant founding

Timeline: 1-5 years

Action 5. Deploy 2 remote automated weather stations (RAWS) in Metro Fire jurisdiction

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: There are no weather stations in Metro Fires jurisdiction that provide readings that are compatible with the National Fire Danger Rating System (NFDRS). Having the correct reading will allow Metro Fire to issue weather advisories..

Project Description: Develop locations to place 1-2 RAWS in Sacramento County. Purchase and install the equipment. Develop a policy for issuing wildfire warnings. Develop policies relating to fire danger and the amount of equipment dispatched to a wildland fire incident.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: CWPP

Responsible Office/Partners: Community Risk Reduction Division

Project Priority: High

Cost Estimate: $20,000 per RAWS, yearly maintenance $3000

Benefits (Losses Avoided): Providing real time wildfire weather report would allow the district issue warnings about dangerous outdoor activities reducing the risk of wildfire.

Potential Funding: Grant found

Timeline: 2-3

Action 6. Defensible space ordinance

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: Metro Fire does not have a defensible space ordinance or inspection program

Project Description: Develop and implement a defensible space ordinance for all WUI areas. Perform defensible space inspections.

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: CWPP

Responsible Office/Partners: Community Risk Reduction

Project Priority: Medium

Cost Estimate: $10,000 to implement ordinance, $300,000 per year for inspections

Benefits (Losses Avoided): Defensible space will reduce the structure loss from wildland fires.

Potential Funding: Staff time, fines and fees, grant founding

Timeline: 2-4 years

Annex K Reclamation District 800

K.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Reclamation District 800 (RD 800), a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the RD 800. This Annex provides additional information specific to RD 800, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

K.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 800 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table K-1. Additional details on plan participation and RD 800 representatives are included in Appendix A.

Table K-1 RD 800 Planning Team

Name	Position/Title	How Participated
Robert C. Wagner, P.E.	District Engineer	Reviewed Draft Documents
Patrick W. Ervin, P.E.	Engineer	Attended Meetings, Drafted Text

K.2.1. Coordination with Other District Planning Efforts

Coordination with other District planning efforts is paramount to the successful implementation of this plan. This Section provides information on how the District integrated the previously-approved 2011 Plan into existing planning mechanisms and programs. Specifically, RD 800 incorporated into or implemented the 2011 LHMP through other plans and programs shown in Table K-2.

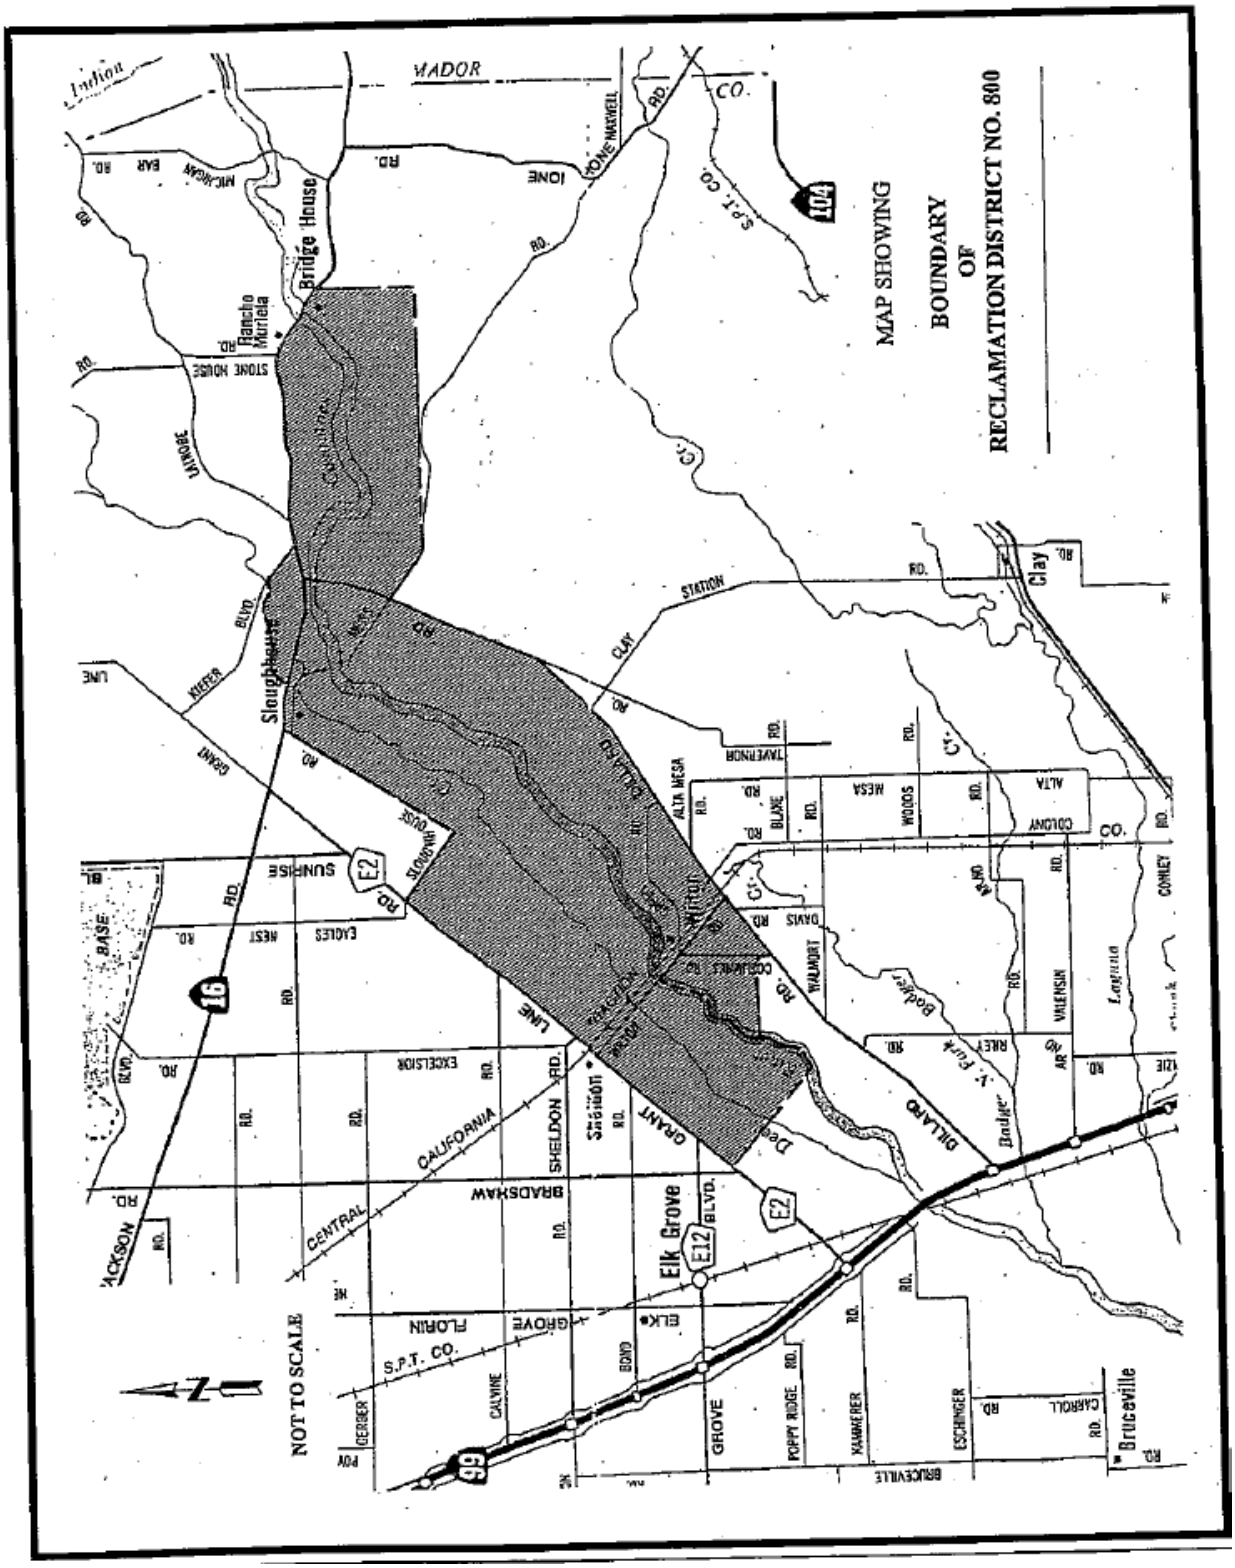
Table K-2 2011 LHMP Incorporation

Planning Mechanism 2011 LHMP Was Incorporated/Implemented In.	Details?
Erosion Repair Implemented	The District has repaired 4 places along the Consumnes River that had significant erosion issues between levee stations 100+00 and 404+50.

K.3 Community Profile

The community profile for RD 800 is detailed in the following sections. Figure K-1 displays a map and the location of RD 800 boundaries within Sacramento County.

Figure K-1 Reclamation District 800 Map



Source: RD 800

K.3.1. RD 800 Overview, Background, and History

Reclamation District No. 800 is an area within Sacramento County lying along the Cosumnes River and was originally created by action of the California State Legislature in 1907 (Statutes 1907,Ch 213). This original District, comprised of 2,136 acres, is located between Deer Creek and the Cosumnes River east of Elk Grove in Sacramento County. In January 1997, a flood of extraordinary size occurred on the Cosumnes River between Sloughhouse and Wilton requiring considerable construction work to levees along the river. However, no levee breaks occurred on those maintained by Reclamation District 800.

As a result of the 1997 flood on the Cosumnes River, it became apparent that a public agency was needed to maintain the levees and facilities along the river between Sloughhouse and Wilton areas, outside the boundaries of Reclamation District 800. At the request of landowners along the Cosumnes River whose lands were not included within Reclamation District 800, the Trustees of the District sought an amendment to the act under which the District was formed, in order to modify the boundaries and incorporate additional lands on the right bank of the Cosumnes River and to include, for the first time, lands on the left bank of the river down to the vicinity of Wilton.

To accommodate the above additions of land, SB 437 (Senator Patrick Johnston) was introduced and adopted by the Legislature and signed by the Governor as Chapter 191, Statutes of 1997. This action provided for the increase in District acreage from 2,136 to 25,435 acres. The total potential levee length is 34.05 miles with 17.65 miles along the right (or north) bank and 16.40 miles along the left (or south) bank.

Since the 1997 flood, with assistance from the County of Sacramento and funding by the U.S. Department of Agriculture, repairs were completed to levees along the Cosumnes River.

K.4 Hazard Identification

RD 800's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 800 (see Table K-3).

Table K-3 RD 800—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards				
Bird Strike				
Climate Change				
Dam Failure				
Drought and Water Shortage				
Earthquake				
Earthquake: Liquefaction				
Flood: 100/200/500-year	Extensive	Occasional	Catastrophic	High
Flood: Localized Stormwater Flooding				
Landslides				
Levee Failure	Extensive	Occasional	Catastrophic	High
River/Stream/Creek Bank Erosion	Significant	Highly Likely	Catastrophic	High
Severe Weather: Extreme Temperatures – Cold/Freeze				
Severe Weather: Extreme Temperatures – Heat				
Severe Weather: Fog				
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Significant	Likely	Critical	Medium
Severe Weather: Wind and Tornadoes				
Subsidence				
Volcano				
Wildfire:(Burn Area/Smoke)				

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area
Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid
Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

K.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 800's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 800 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

K.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section K.5.3, includes a description as to how the hazard affects the RD 800 and information on past occurrences. The intent of this section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

K.5.2. Vulnerability Assessment

This section identifies RD 800's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table K-4 lists particular critical facilities and other District assets identified by the RD 800's planning team as important to protect in the event of a disaster. RD 800's physical assets, valued at over $100 million, consist of the buildings and infrastructure to support the RD 800 operations.

Table K-4 RD 800's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
RD 800 levees	Levee		In excess of $100,000,000	Flood

Source: RD 800

Natural Resources

The Planning Team for the District noted no natural resources.

Historic and Cultural Resources

The Planning Team for the District noted no historic or cultural resources.

Growth and Development Trends

Growth and development within RD 800 has remained relatively unchanged since 2011. The District is composed of rural farmland with few economic drivers.

Development since the 2011 Plan

The RD has not seen an increase in their service area population since the 2011 plan. There is currently a project in the planning/permitting phase that will fix a large erosion area adjacent to Rooney Dam the Cosumnes River.

K.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table K-3 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 800 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee and dam inundation areas, such as older facilities that may be constructed with unreinforced masonry and buildings built prior to the introduction of modern building codes. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

In general, the most vulnerable District assets include the levees and supporting structures that the District owns.

An estimate of the vulnerability of the RD 800 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.

- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Flooding would occur as a result of levee failure or overtopping.

Past Occurrences

The District Planning Team noted that multiple levee failures occurred on the Cosumnes in 1997 which led to flooding.

Vulnerability to Flood

Assets at Risk

Flooding would occur as a result of levee failure or overtopping. Levee failure from either breaching or overtopping would result in the total loss of levee embankment material, as was the case in the 1997 flood event. Levee embankment failure within the current District boundary from the 1997 event resulted in multiple levee failure sites along the Cosumnes River. The resulting damage to agricultural lands was extensive, with the most damage occurring immediately adjacent to the levee breach causing severe erosion to agricultural lands, deposition of sands and debris and the complete destruction of adjacent vineyards and irrigation systems.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards. The District Planning Team did note, that future development is unlikely.

Levee Failure

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the District from several sources including levee failure. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters

Past Occurrences

The Planning Team for the District noted multiple levee failures in 1997 which led to flooding.

Vulnerability to Levee Failure

Assets at Risk

Potential for severe damage to the Wilton Road crossing over the Cosumnes River would require detouring of extensive daily high volume traffic of Wilton Road. Closure of the road would severely delay public safety agency emergency response. Truck and vehicular traffic impacts would have severe economic impacts to the local economy.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards. The District Planning Team did note, that future development is unlikely.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

Past Occurrences

The District Planning Team noted that bank erosion is an ongoing problem, but noted no major past occurrences.

Vulnerability to Erosion

Assets at Risk

The waterside levee slope of the Cosumnes River is heavily vegetated and considered to be high value habitat with an abundance of endangered species. Consequently, the vulnerability to stream bank erosion is high, the cost to mitigate for habitat loss prevents the District from repairing existing eroded areas.

Future Development

While future development may occur in the areas protected by levees that may be affected by erosion, the District does not control this development. The District only can control whether the levees meet certification standards. The District Planning Team did note, that future development is unlikely.

Severe Weather: Heavy Rain and Storms

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the District. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

The District Planning team noted that 1997 storms caused high flows in the Consumnes which cause levee failures and flooding.

Vulnerability to Heavy Rain and Storms

Assets at Risk

Heavy rain and thunderstorms are the most frequent type of severe weather occurrence in the area. Wind and lightning often accompany these storms and have caused damage in the past. Problems associated with the primary effects of severe weather include flooding, pavement deterioration, washouts, high water crossings, landslide/mudslides, debris flows, and downed trees. However, it is the secondary effects of heavy rain and storms that are of concern to RD 800. Heavy rains can cause flooding, levee failure, and stream bank erosion. Flooding, levee failure, and stream bank erosion can cost RD 800 millions in damages.

Future Development

While future development may occur in the areas protected by levee, the District does not control this development. The District only can control whether the levees meet certification standards and can withstand heavy rains and storms. The District Planning Team did note, that future development is unlikely.

K.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

K.6.1. Regulatory Mitigation Capabilities

Table K-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 800.

Table K-5 RD 800's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	N	
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y	5-Year Plan California DWR Emergency Safety Plan
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	N	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	Encroachment permit regulations
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	Y	Erosion control measures on levee and canal slopes as necessary

Incur debt through general obligation bonds and/or special tax bonds	N	
Incur debt through private activities	N	
Community Development Block Grant	Y	
Other federal funding programs		
State funding programs		
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 800

K.6.4. Mitigation Education, Outreach, and Partnerships

Table K-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table K-8 RD 800's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Other		
How can these capabilities be expanded and improved to reduce risk?		

K.6.5. Other Mitigation Efforts

Levee maintenance practices designed to protect District levee system includes annual vegetation management and rodent control. Due to environmental protection limitations, District disaster reduction practices are limited.

K.7 Mitigation Strategy

K.7.1. Mitigation Goals and Objectives

RD 800 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

K.7.2. Mitigation Actions

The planning team for RD 800 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Erosion Repair

Hazards Addressed: Bank Erosion / Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Because RD 800 is outside of the legal Delta, it does not qualify for many State programs designed to fund the maintenance and repair District levees. Thus, there are many erosion sites on RD 800 that lack funds for repair.

Other Alternatives: None

Existing Planning Mechanisms through which Action will be Implemented: The District will rely on its Engineer to locate erosion sites and prioritize them by severity. Available funds will be used to repair the most severe erosion areas first. Depending on the size of the erosion site, regulatory permits may be

required by agencies such as the California Department of Fish and Wildlife and the U.S. Army Corps of Engineers.

Responsible Office: RD 800, RD Engineer

Priority (H, M, L): H

Cost Estimate: $1,000,000

Potential Funding: None

Benefits (avoided Losses): Homes, Agricultural Crops

Schedule: Ongoing

Action 2. Emergency Supplies

Hazards Addressed: Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Due to lack of funds, the District has minimal flood fight supplies on-hand. The California Department of Water Resources recommends the following items for flood fighting per 5 to 6 miles of levee:

- visquine plastic 10 rolls (@100'x20'x10mil)
- sandbags 5,000
- twine @ 200 lb. Test 8 boxes
- wooden stakes 200
- tie buttons 1,000

Tools needed:

- Lineman pliers 8 each
- sledge hammers 8 each
- shovels 10 each
- life jackets All personnel

In addition to flood fight supplies, the District also needs flood fight materials such as 18"-minus rock stockpiles to help prevent levee breaches and aggregate base rock to repair levee roads as they are damaged during a flood fight.

Other Alternatives: None

Existing Planning Mechanisms through which Action will be Implemented: Board of Trustees would purchase and stockpile supplies in strategic locations throughout the District.

Responsible Office: RD 800, RD Engineer

Priority (H, M, L): H

Cost Estimate: $500,000

Potential Funding: None

Benefits (avoided Losses): Homes, Agricultural Crops

Schedule: Ongoing

Annex L Reclamation District 1000

L.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Reclamation District 1000 (RD 1000), a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the RD 1000. This Annex provides additional information specific to RD 1000, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

L.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), RD 1000 formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table L-1. Additional details on plan participation and RD 1000 representatives are included in Appendix A.

Table L-1 RD 1000 Planning Team

Name	Position/Title	How Participated
Board of Trustees		Approved Emergency Action Plan and LHMP
Paul Devereux	General Manager/District Engineer	Participated in LHMP update process; drafted District's information included in LHMP; edited District Emergency Action Plan; participated in regional flood emergency exercise
AECOM	Consultant	Drafted District Emergency Action Plan (EAP)
Don Caldwell	Superintendent	Reviewed District EAP; participated in regional flood emergency exercise
Terrie Figueroa	Admin Services Manager	Reviewed District EAP; participated in regional flood emergency exercise

Source: RD 1000

L.2.1. Coordination with Other District Planning Efforts

Coordination with other District planning efforts is paramount to the successful implementation of this plan. This Section provides information on how the District integrated the previously-approved 2011 Plan into existing planning mechanisms and programs. Specifically, RD 1000 incorporated into or implemented the 2011 LHMP through other plans and programs shown in Table L-2.

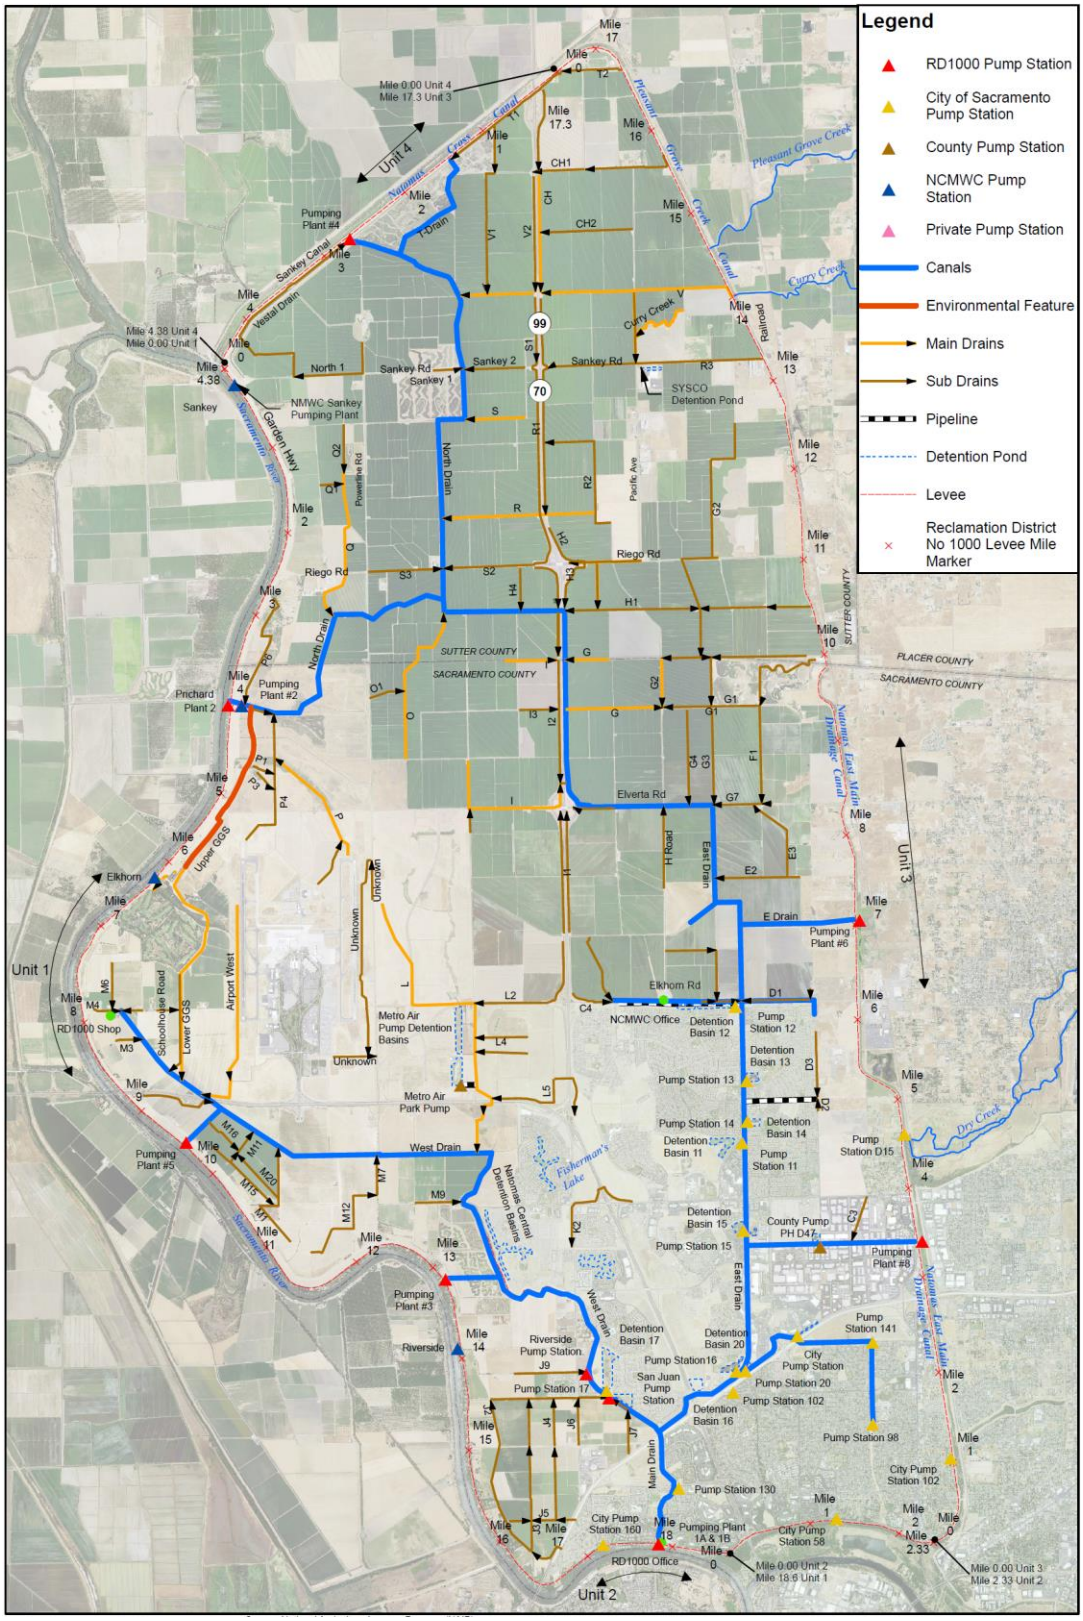
Table L-2 2011 LHMP Incorporation

Planning Mechanism 2011 LHMP Was Incorporated/Implemented In.	Details?
Emergency Action Plan	Identifies potential flood risks and District's plan to monitor and respond in an emergency including communications, pre-disaster deployment; flood fight materials storage; emergency response contracts all in compliance with NIMS and SEMS protocols
Capital Improvement Plan	Identifies improvements to District facilities to improve flood safety; assist with monitoring and responding in a flood emergency; and improve system reliability thereby reducing the overall flood risk
Security Risk Assessment	Identified critical District infrastructure and recommended measures to improve security and insure District can perform essential functions during an emergency
Strategic Plan	Identifies District mission to reduce flood risk; preparations for floods and emergency response; outreach to community including information during flood emergency; coordination with other regional agencies including City and County of Sacramento

L.3 Community Profile

The community profile for RD 1000 is detailed in the following sections. Figure L-1 displays a map and the location of RD 1000 boundaries within Sacramento County.

Figure L-1 Reclamation District 1000 Map



Source: RD 1000

L.3.1. RD 1000 Overview

Reclamation District No. 1000 has been providing flood protection and public safety to residents, businesses, schools, and agriculture since 1911. RD 1000 is a special district formed by the California State legislature. The District's job is to protect the lives and property in the Natomas basin from flooding. RD 1000 maintain 42 miles of levees surrounding Natomas, over 30 miles of large drainage canals and seven pump stations that collect and pump the storm water and agricultural runoff back into the adjacent river system. The District is governed by a seven-member Board of Trustees elected by the property owner's within the Natomas basin. The District operates under the direction of the District's General Manager who reports directly to the Board of Trustees. The District Superintendent supervises the daily activities of the field crew and reports to the General Manager.

L.3.2. District Overview, History and Background

Reclamation District No. 1000 was created by an act of the State Legislature on April 8, 1911 (Act). The purpose was to allow for the reclamation of what was then known as the American Basin for agricultural purposes. The American Basin historically flooded from the Sacramento and American Rivers overflowing their banks due to winter rains and runoff from the foothills giving it the rich fertile soil to support the agriculture which dominated the early years in Natomas. Much of the land was owned by the Natomas Company of California. The Act gave the District authority and responsibility for flood control and drainage in what has become the Natomas Basin.

Reclamation of Natomas began in 1913 with construction of the perimeter levee system which was completed in 1915. The original cost was approximately $2 million and was financed by the sale of bonds. Some of these original bonds are still in the possession of the District. Following completion of the levees, an interior drainage system consisting of canals, ditches and drains was constructed to collect both stormwater runoff from precipitation that falls within the leveed area as well as agricultural runoff from irrigated farm land. The original system conveyed all the runoff to a large pumping plant constructed in 1915 at the terminus of Second Bannon Slough (Plant 1A) at the south end of the District. This plant still exists and is used today. It is located directly across the Garden Highway from the District Office. A second pumping plant (Plant 2) was added at Pritchard Lake in 1920 along the Sacramento River north of Elverta Road, and a third plant (Plant 3) was added in 1939 also located on the Sacramento River just north of San Juan Road. Eventually four more pump plants were added at various locations in the District to accommodate more development and relieve pressure on the original plants.

The drainage system stayed in this configuration for a number of years. In the 1950's and 1960's urbanization of the Natomas Basin began, predominantly because of its close proximity to downtown Sacramento and the construction of the interstate highway system. The first area to develop was the Gardenland area in the southern extremity of the basin tucked up against the American River and Natomas East Main Drain Canal. In the 1960's Sacramento Metropolitan Airport was developed. A new pumping plant paid for by the County was constructed to handle the increased runoff from the newly constructed airport. Through the decades more development occurred starting with the South Natomas Community, Arco Arena, and the surrounding areas.

The levees around Natomas were designed to handle the historical "flood of record" which was the 1907 and 1909 floods on the Sacramento River. Another large flood event occurred in 1937 which the system safely passed with only minor problems. Again, in 1955 an even larger flood roared through the Central Valley around Christmas. The Natomas levees held with some minor sloughing along the Sacramento River near the Sacramento/Sutter County line. However, as a result of this flood, the Army Corps of Engineers raised the Natomas Cross Canal and Pleasant Grove Creek Canal levees as much as two to three feet in anticipation of future even larger flood events. In addition, by 1955 Folsom Dam was operational which provided additional flood storage capacity along the American River on the District's southern flank.

The system remained generally in the same condition as originally constructed until February 1986 when the flood of record occurred along the Sacramento and American Rivers fueled by a series of large Pacific storms carrying significant amounts of sub-tropical water. These storms coined as the "Pineapple Express" because of its origins near the Hawaiian Islands are now referred to as "atmospheric rivers". The flood on the Sacramento River caused significant seepage along the adjacent levee which nearly resulted in a catastrophic levee failure. Early flood emergency response by the District followed by a major flood fight by the Army Corps of Engineers prevented a levee failure. As a result of the near failure, the levees system surrounding Natomas was de-certified and any further development halted.

A system of repairs was initiated in the early 1990's on both the Sacramento River and Natomas East Main Drain Canal Work along the Sacrament was done by the Corps of Engineers (Sacramento Urban Project) while the work on the NEMDC was done by the Sacramento Area Flood Control Agency or SAFCA (North Area Local Project).

As a result of these projects, the levees were "certified" in 1997 and urban development began again with North Natomas in the City of Sacramento, bringing thousands of new residents, businesses and supporting infrastructure. Industrial and commercial development also expanded in the vicinity of the airport to support its growing needs. And the airport itself has undergone and continues to undergo significant expansion to support the growing passenger demands. In each case, the District worked with the appropriate land use agency to insure the impacts of the development and increased runoff are mitigated and do not overburden the existing drainage system. In most cases, large detention storage basins have been incorporated into new development to temporarily store the increased urban runoff and allow it to be bled back into our system at a rate similar to the pre-development condition. These detention basins are augmented by improvements to the existing pumping plants to assist in handling the increased urban runoff.

In January 1997, a flood similar in size and river levels struck the Sacramento area. The improved levee system passed the flood event with minimal issues supporting the levee infrastructure investment. However, a number of other levees in California failed during the flood event, and a deadly catastrophic flood in the New Orleans area raised questions about other potential levee safety issues—namely the potential for underseepage concerns. Following an analysis of the Natomas levees based on this new criteria, they were again de-certified in 2003 shutting down further urbanization

Efforts to address this newly defined levee risk and the potential for further urbanization of the Natomas basin are described later in this appendix.

L.4 Hazard Identification

RD 1000's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to RD 1000 (see Table L-3).

Table L-3 RD 1000—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards				
Bird Strike				
Climate Change				
Dam Failure	Extensive	Unlikely	Critical	Low
Drought and Water Shortage				
Earthquake				
Earthquake: Liquefaction	Limited	Unlikely	Limited	Low
Flood: 100/200/500-year	Extensive	Likely	Catastrophic	High
Flood: Localized Stormwater Flooding	Limited	Occasional	Limited	Medium
Landslides				
Levee Failure	Extensive	Occasional	Catastrophic	Medium
River/Stream/Creek Bank Erosion	Significant	Likely	Critical	High
Severe Weather: Extreme Temperatures – Cold/Freeze				
Severe Weather: Extreme Temperatures – Heat				
Severe Weather: Fog				
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Limited	Likely	Critical	Low
Severe Weather: Wind and Tornadoes				
Subsidence				
Volcano				
Wildfire:(Burn Area/Smoke)				

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

L.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile RD 1000's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to RD 1000 is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

L.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section L.5.3, includes a description as to how the hazard affects the RD 1000 and information on past occurrences. The intent of these section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

L.5.2. Vulnerability Assessment

This section identifies RD 1000's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table L-4 lists particular critical facilities and other District assets identified by the RD 1000's planning team as important to protect in the event of a disaster. RD 1000's physical assets, valued at over $2.1 billion, consist of the buildings and infrastructure to support the RD 1000 operations.

Table L-4 RD 1000's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
RD 1000 Plant 1A and 1B	Essential		$25 million	Flood
RD 1000 Plant 2	Essential		$5 million	Flood

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
RD 1000 Plant 3	Essential		$10 million	Flood
RD 1000 Plant 4	Essential		$7 million	Flood
RD 1000 Plant 5	Essential		$4 million	Flood
RD 1000 Plant 6	Essential		$7 million	Flood
RD 1000 Plant 8	Essential		$15 million	Flood
District Drains/Canals	Essential		$50 million*	Flood
RD 1000 Levee system	Essential		$2 billion**	Flood
Sacramento International Airport	Transportation		County	Flood
City of Sacramento River Pump Stations (3)	Essential		City	Flood
City of Sacramento Drainage Pump Stations	Essential		City	Flood
Schools (2 high schools, middle and elementary	High Potential		Natomas USD	Flood
Fire Stations	Essential		City	Flood
Senior Housing	High Potential		City	Flood
Interstate 5 and 80 Highway 99	Transportation		Caltrans	Flood
Day Care Centers	High Potential		City	Flood
Hazardous Material Sites	High Potential		City	Flood

Source: RD 1000

* the drains and canals would not have to be replaced but would need repairs after a flood event—estimate is for repairs if a flood occurred

** the levee system would not need to be replaced if a flood occurred but repaired. This is the cost to replace the system; the cost to repair the system following a flood about $200 million

Natural Resources

Within the District, the Natomas Basin Conservancy operates and maintains a number of wildlife preserve areas under the Natomas Basin Habitat Conservation Plan. The purpose of the preserves are to provide habitat for endangered and other species to mitigate for the impact of development within the Sutter County and City of Sacramento jurisdiction of the Natomas Basin.

Historic and Cultural Resources

There are a number of undisclosed Native American culturally sensitive sites which are generally buried below the ground and therefore would not be impacted by a flood event.

Growth and Development Trends

As described above, urban development was halted in the District when the levees were decertified in 2003. A comprehensive project for the District's perimeter levee system was studied and developed by SAFCA,

State of California and the Army Corps of Engineers. Work is required on the entire 42-miles of perimeter levees protection the District. As planned, the levee improvements would provide 200-year flood protection to the Natomas Basin, consistent with the newly adopted State flood control standards for urban areas (Urban Level of Protection or ULOP Criteria).

Work was initiated by SAFCA and the State of California in 2006 to mitigate the flood risk. With the construction that was completed (approximately 50% of the levee improvements) and the Federal authorization of the Natomas Levee Project in 2014, the area was remapped into an A99 FEMA flood plain designation recognizing the progress made towards eventually removing Natomas from a FEMA designated Special Flood Hazard Area. Under the A99 floodplain designation, development is again allowed within the District. However, given the continued flood risk, the local land use agencies are limiting the amount of urban development until the work is complete and the levees are re-certified.

With the lifting of the building moratorium, a number of projects are initiating the entitlement process and new development is expected in the District in the City of Sacramento, County of Sacramento and Sutter County over the next 30 years.

Development since the 2011 Plan

The RD has seen limited growth in their service area population since the 2011 plan due to the building moratorium as a result of the flood risk. The current population within the District is estimated at just over 100,000.

As noted above, a project to strengthen and improve the perimeter levee system to provide 200-year flood protection is underway. About 50% of the improvements were constructed by SAFCA between 2006 and 2013. The remaining improvements will be completed by the Corps of Engineers starting in 2017 and are scheduled to be completed by 2025.

Since 2011, the District completed the replacement of Pumping Plant No. 2. It was taken out during the 2006 flood event due to levee stability concerns at the site. A FEMA disaster assistance grant was used to fund the majority of the replacement project. The pump station is located in the basin and therefore subject to the flood risk identified.

L.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table L-3 as high or medium significance hazards. Impacts of past events and vulnerability of the RD 1000 to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee and dam inundation areas, such as older facilities that may be constructed with unreinforced masonry and buildings built prior to the introduction of modern building codes. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

In general, the most vulnerable District assets include the levees and supporting structures that the District owns.

An estimate of the vulnerability of the RD 1000 to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Flood

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

As noted in this document, the current levee system does not meet the FEMA 100-year standard and therefore the District is vulnerable to a catastrophic flood from the potential failure of the perimeter levee system. The District Planning team noted that the likelihood of these floods is 1%, 0.5%, and 0.2% respectively in any given year; however, given current condition of levees, the risk of failure is what is high until they are recertified.

Past Occurrences

See descriptions of past flood events in Section L.3.2.

Vulnerability to Flood

Assets/Critical Facilities at Risk

The current population in Natomas is 100,000 based on the 2010 census and the Corps of Engineer's estimates total property damages (both public and private) would likely exceed $10 billion.

The District has seven pump stations in the interior basin used to pump the stormwater and agricultural runoff from the basin into the adjacent riverine system. A catastrophic levee failure could eventually damage all eight of the pump stations and require their reconstruction. Table L-4 shows the estimated

replacement cost for each of the pump stations. In addition, the District has a corporation yard and a main office in Natomas. The main office is located on top of the existing Sacramento River levee and would likely not be physically damaged by a catastrophic flood event though it would not be functional due to loss of utilities including power as a result of the flood. The corporation yard would be damaged due to a flood event and could result in a loss of the District's equipment fleet unless it can be relocated to high ground before flood waters affect the corporation yard. This would be dependent on the location of a levee breach in relation to the yard.

Natural Resources at Risk

RD 1000's drains, canals and ditches are considered natural resources in that they provide habitat for a number of species in the Natomas Basin. A large flood event would cause modest damage to these facilities requiring repairs and modifications such as sediment removal, access road and gate replacements.

Historic and Cultural Resources at Risk

The District Planning Team noted no cultural or historic resources that would be affected.

Future Development

As described above, urban development was halted in the District when the levees were decertified in 2003. A comprehensive project for the District's perimeter levee system was studied and developed by SAFCA, State of California and the Army Corps of Engineers. Work is required on the entire 42-miles of perimeter levees protection the District. As planned, the levee improvements would provide 200-year flood protection to the Natomas Basin, consistent with the newly adopted State flood control standards for urban areas (Urban Level of Protection or ULOP Criteria).

Work was initiated by SAFCA and the State of California in 2006 to mitigate the flood risk. With the construction that was completed (approximately 50% of the levee improvements) and the Federal authorization of the Natomas Levee Project in 2014, the area was remapped into an A99 FEMA floodplain designation recognizing the progress made towards eventually removing Natomas from a FEMA designated Special Flood Hazard Area. Under the A99 floodplain designation, development is again allowed within the District. However, given the continued flood risk, the local land use agencies are limiting the amount of urban development until the work is complete and the levees are re-certified.

With the lifting of the building moratorium, a number of projects are initiating the entitlement process and new development is expected in the District in the City of Sacramento, County of Sacramento and Sutter County over the next 30 years.

Flood: Localized Stormwater

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

The Natomas basin which is the jurisdiction of Reclamation District No. 1000, is a low-lying basin surrounded on all four sides by levees. The District operates and maintains miles of canals and drainage ditches which collect local rainfall from within the Natomas basin and transports the water to a system of seven pump stations for discharge into the adjacent river systems.

Past Occurrences

Over the history of the District, there have been a number of localized floods. However, prior to urban development, these floods impacted primarily agricultural properties during the non-growing season. Since urban development, there have been instances of localized flooding, the worst being in Feburary 1986, when spills through the "Sankey Gap" along the eastern perimeter levee system combined with interior runoff due to rainfall affected travel on Highway 99 as well as a number of interior roads. Had an evacuation been necessary, it would have been significantly impacted by the road closures.

The District does not have documents for other localized floods other than anecdotal information from landowners and Natomas residents.

Vulnerability to Localized Stormwater Flooding

Assets/Critical Facilities at Risk

The major interior canals in the urbanized area (City of Sacramento) in the southern quarter of the Natomas basin also have a levee system to contain the 100-year flood within the canals. If the pump stations are not operable due to power failure in the area, the canals are at risk of overflowing creating localized flooding. Flooding would be shallow (less than 3 feet), significantly less than from a failure of the perimeter levee; however, it would impact emergency response and evacuation routes should the perimeter levee system subsequently fail.

Natural Resources at Risk

RD 1000's drains, canals and ditches are considered natural resources in that they provide habitat for a number of species in the Natomas Basin. Stormwater flooding would cause modest damage to these facilities requiring repairs and modifications such as bank erosion and access road repairs.

Historic and Cultural Resources at Risk

The District Planning Team noted no cultural or historic resources that would be affected.

Future Development

Future development is not likely to be limited by localized flooding.

Levee Failure

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available.

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee, causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

A major overtopping of a levee, if flow persists, will result in severe erosion of the levee crowns on the landward side and cause levee failure over a period of minutes to several hours. A severe levee overtopping can, therefore, be considered as a levee break for the purpose of determining the extent of flooding that any area will suffer. Generally, overtopping can be predicted based on river stages and the warning given depending on the source of the flood waters

Past Occurrences

There have been no failures of District levees.

Vulnerability to Levee Failure

With the levee improvements that have been completed to date and the anticipated improvements described about to be completed by the Corps of Engineers over the next 10 year; the risk of a levee failure is significantly reduced and not likely to occur. However, if a larger storm event or an unforeseen levee stability issue results in a levee failure, there are a number of District facilities at risk as noted in the table above. These include the District pump stations, our Corporation Yard and potentially the District's main office depending on the location of a levee failure.

Natural Resources at Risk

RD 1000's drains, canals and ditches are considered natural resources in that they provide habitat for a number of species in the Natomas Basin. A large flood event would cause modest damage to these facilities requiring repairs and modifications such as sediment removal, access road and gate replacements.

Historic and Cultural Resources at Risk

The District Planning Team noted no cultural or historic resources that would be affected.

Future Development

As described above, urban development was halted in the District when the levees were decertified in 2003. A comprehensive project for the District's perimeter levee system was studied and developed by SAFCA, State of California and the Army Corps of Engineers. Work is required on the entire 42-miles of perimeter levees protection the District. As planned, the levee improvements would provide 200-year flood protection to the Natomas Basin, consistent with the newly adopted State flood control standards for urban areas (Urban Level of Protection or ULOP Criteria).

Work was initiated by SAFCA and the State of California in 2006 to mitigate the flood risk. With the construction that was completed (approximately 50% of the levee improvements) and the Federal authorization of the Natomas Levee Project in 2014, the area was remapped into an A99 FEMA floodplain designation recognizing the progress made towards eventually removing Natomas from a FEMA designated Special Flood Hazard Area. Under the A99 floodplain designation, development is again allowed within the District. However, given the continued flood risk, the local land use agencies are limiting the amount of urban development until the work is complete and the levees are re-certified.

With the lifting of the building moratorium, a number of projects are initiating the entitlement process and new development is expected in the District in the City of Sacramento, County of Sacramento and Sutter County over the next 30 years.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Stream bank erosion is a natural process, but acceleration of this natural process leads to a disproportionate sediment supply, stream channel instability, land loss, habitat loss and other adverse effects. As farmers settled the valleys in the 1800s, the Gold Rush drew prospectors to the hills. As mining in the Sierra Nevada turned to the more "efficient" methods of hydraulic mining, the use of environmentally destructive high-pressure water jets washed entire mountainsides into local streams and rivers. As a result, the enormous amounts of silt deposited in the riverbeds of the Central Valley increased flood risk. As a remedy to these rising riverbeds, levees were built very close to the river channels to keep water velocity high and thereby scour away the sediment. However, the design of these narrow channels has been too successful. While

the Gold Rush silt is long gone, the erosive force of the constrained river continues to eat away at the levee system and stream banks within the District.

The District Planning team noted that while erosion is likely to occur, it only is a threat if it impacts the stability of the adjacent levee causing a failure

Past Occurrences

RD 1000 conducted bank erosion studies in 1999 and 2004 to identify sites where erosion is of concern and could lead to levee erosion if not addressed. The District has continued to monitor these sites on a limited basis since 2004. In addition, the Army Corps of Engineers and California Department of Water Resources undertakes annual inspections of the Sacramento River to identify erosion sites that could impact the integrity of the adjacent levee system. Four sites both on the Corps list and the in the District's reports have now been repaired through contracts with the Corps of Engineers. These sites are along the Sacramento River adjacent to Natomas at River Miles 78.0, 77.2, 73.5 and 68.9.

During the winter of 2011, RD 1000 staff undertook emergency repairs at approximate RM 68.4 as high water during this past season eroded a significant portion of the bank and was threatening the adjacent levee. This site is just downstream of the work done by the Corps of Engineers at RM 68.9 and is part of an approximately 5800 foot reach of eroding bank site identified in the District's report that is being monitored.

In addition to this site, the District's studies in 1999 and 2004 have identified 6 additional small erosion sites which are being monitored and are being requested to be repaired through the Sacramento River Bank Protection Project though it currently has not been identified by the Corps for remedial work.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

The entirety of the levee system in RD 1000 is at risk to erosion.

Natural Resources at Risk

The natural resources at risk would be the same as those identified above for a levee failure or flood. In addition, the eroding banks themselves are natural resources as they provide critical habitat for fisheries by providing Shaded Riverine Habitat and in-stream woody vegetation.

Historic and Cultural Resources at Risk

The District Planning Team noted no cultural or historic resources that would be affected.

Future Development

This hazard is not applicable to future development issues.

L.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

L.6.1. Regulatory Mitigation Capabilities

Table L-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the RD 1000.

Table L-5 RD 1000's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y	District adopted a 2015-2020 Strategic Plan
Capital Improvements Plan	Y	Yes
Economic Development Plan	N	
Local Emergency Operations Plan	Y	Yes
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	N	
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	Y	Proposed projects which impact levees or drainage facilities require permits from District and include plan review and sign of

Land Use Planning and Ordinances	Y/N	Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	Y	Title 23 California Water Code
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	Y	Erosion control measures on levee and canal slopes as necessary
Other	Y	District has adopted a Development Impact Fee
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 1000

L.6.2. Administrative/Technical Mitigation Capabilities

Table L-6 identifies the department(s) responsible for activities related to mitigation and loss prevention for RD 1000.

Table L-6 RD 1000's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	District's O&M activities directly reduce flood risks as described above including vegetation management; levee maintenance and monitoring during flood events
Mutual aid agreements	Y	District has mutual aid agreements with City and County of Sacramento
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	Y	RD 1000 District Manager
Community Planner	N	
Civil Engineer	Y	RD 1000 District Manager/Consultant

GIS Coordinator	Y	RD 1000 District Manager/Consultant

How can these capabilities be expanded and improved to reduce risk?		

Source: RD 1000

L.6.3. Fiscal Mitigation Capabilities

Table L-7 identifies financial tools or resources that the RD 1000 could potentially use to help fund mitigation activities.

Table L-7 RD 1000's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	District using Capital Reserves to fund projects
Authority to levy taxes for specific purposes	Y	For increase in assessments must comply with Proposition 218 which requires vote
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	District requires impact fee and mitigation for new development
Storm water utility fee		
Incur debt through general obligation bonds and/or special tax bonds	Y	District has authority but currently has no GO Bonds outstanding
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	Y	Emergency funding through Corps of Engineer's PL 84-99 authority; FEMA disaster assistance funding and grants for declared emergency events
State funding programs		
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: RD 1000

L.6.4. Mitigation Education, Outreach, and Partnerships

Table L-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table L-8 RD 1000's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.		
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	District has community outreach program started five years ago. Reach out to a variety of community and neighborhood groups annually. Also, District has a Facebook page and Twitter account that we use to provide information to the public both generally and during an emergency.
Natural disaster or safety related school programs		
StormReady certification		
Firewise Communities certification		
Public-private partnership initiatives addressing disaster-related issues		
Other		
How can these capabilities be expanded and improved to reduce risk?		

L.6.5. Other Mitigation Efforts

Efforts are currently underway to address both these potential risks with the goal of providing Natomas at least 200 year level of flood protection (a 0.5% risk of flooding in any given year) and looking for opportunities to improve the system even beyond this level; particularly as urbanization of the basin continues.

As described previously, perimeter levee improvements (Natomas Levee Improvement Project) have been completed by the Sacramento Area Flood Control Agency (SAFCA) with local assessment funds and State Bond funds for approximately half of the system. The remaining levee improvements are to be completed by the Corps of Engineers as federal funds are appropriated

RD 1000 has worked with other partners in the Natomas Basin including the Sacramento Area Flood Control Agency, Natomas Central Mutual Water Company, Natomas Basin Conservancy, Sacramento

County Airports and the City of Sacramento on projects of mutual benefit that address public safety and the District's flood control mission.

L.7 Mitigation Strategy

L.7.1. Mitigation Goals and Objectives

RD 1000 adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

L.7.2. Mitigation Actions

The planning team for RD 1000 identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. River Berm and Levee Erosion

Hazards Addressed: Levee failure and Levee overtopping and loss of riverine habitat

Goals Addressed: 1, 2, 3, 4

Issue/Background: The District's perimeter levee system is susceptible to active erosion due to high velocity flows and fluctuating water levels in the river system. The erosion on the river banks, if not mitigated, will eventually reach the levee section undermining the foundation leading to levee slope failure and levee overtopping. The Corps of Engineers and State DWR conduct annual inspection to identify critical erosion locations.

Project Description: When erosion reaches a critical stage jeopardizing the adjacent levee, a bank erosion project is constructed. Work includes place a rock toe and bottom of the eroding slope with an earthen planting berm placed on top which includes environmental mitigation features.

Other Alternatives: Armor levee slopes. More expensive and results in loss of critical habitat.

Existing Planning Mechanism(s) through which Action Will Be Implemented: RD 1000 Capital Improvement Plan and Sacramento River Bank Protection federally authorized project and California state funds as appropriated

Responsible Office/Partners: RD 1000, California Dept of Water Resources and Corps of Engineers for river bank erosion

Project Priority: Medium

Cost Estimate: $10 to $50 Million for river erosion over time

Benefits (Losses Avoided): Loss of property and life due to catastrophic levee failure due to river bank erosion

Potential Funding: RD 1000, California DWR and Corps of Engineers for river bank erosion

Timeline: Projects are implemented when erosion reaches critical stage

Action 2. Erosion Protection Canal Banks

Hazards Addressed: Erosion, Levee failure, Localized flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Both the District's perimeter levee system and interior drainage canals are susceptible to active erosion due to water flows in the rivers and fluctuating water levels in the interior canals. The erosion on the river banks, if not mitigated, will eventually reach the levee section undermining the foundation leading to slope failure and levee overtopping. Along the drain canals, fluctuating water levels cause the side slopes to slough which eventually reaches the tops of the canal banks and causes loss of the access roads and adjacent ground.

Project Description: The canal slopes are stabilized by placing a layer of rock slope protection at the waterline and re-grading the canal slope. above

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: District's Capital Improvement Plan and on-going maintenance

Responsible Office/Partners: RD 1000 for canals;

Project Priority: High

Cost Estimate: $10 Million for interior canals;

Benefits (Losses Avoided): Loss of property and canal repair/replacement costs for canal bank erosion

Potential Funding: RD 1000 for canal bank erosion;

Timeline: Canal bank erosion protection is done annually

Action 3. Implement Security Measures at Key Facilities

Hazards Addressed: Localized flooding, levee failure, levee overtopping

Goals Addressed: 1, 2, 3, 4

Issue/Background: The District had a security risk assessment conducted by an outside contractor who recommended specific measures be implemented to reduce the risk at key District facilities

Project Description: Security measures include improved perimeter fencing to reduce vandalism and theft; security monitoring using cameras, physical patrols and other security measures. The key facilities identified include the District office and Corporation Yard as well as the pump stations

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented: District's Capital Improvement Program

Responsible Office/Partners: RD 1000

Project Priority: High

Cost Estimate: $1.5 Million

Benefits (Losses Avoided): Reduce risk of power loss due to vandalism and theft which would avoid localized flooding; insure District materials and equipment are available for flood emergency response to reduce risk of levee failure/overtopping

Potential Funding: RD 1000 and state-wide grants

Timeline: Current. Projects on-going on an annual basis

Action 4. 2014 Capital Improvement Plan

Hazards Addressed: Localized flooding, levee failure, levee overtopping, erosion

Goals Addressed: 1, 2, 3, 4

Issue/Background: District identified a number of capital project needs—some of which are included in this plan under separate Mitigation Action Worksheets

Project Description: See attached

Other Alternatives:

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: RD 1000

Project Priority: Varies by project

Cost Estimate: Estimate $1.0 to $3.0 million annually to implement over next 20 years

Benefits (Losses Avoided): Avoid potential loss of life, property damage

Potential Funding: RD 1000, SAFCA, USACE, State of California

Timeline: Portions of CIP currently being implemented

Action 5. Implement Supervisory Control and Acquisition Data system (SCADA) on District canals and pump stations

Hazards Addressed: Localized flooding

Goals Addressed: 1, 2, 3

Issue/Background: District cannot remotely monitor levels in canals and pump stations—only physical monitoring available

Project Description: SCADA system allows for remote monitoring of canals and pump stations and operations.

Other Alternatives: Physical monitoring and operations

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: Natomas Central Mutual Water Company

Project Priority: High

Cost Estimate: $1.5 million

Benefits (Losses Avoided): Flood losses due to localized flooding

Potential Funding: District funds and Bureau of Reclamation District grant

Timeline: Initiate in 2016

Action 6. Public Outreach and Education

Hazards Addressed: Flood risk including localized flooding, levee failure and levee overtopping

Goals Addressed: 1, 2, 3, 4

Issue/Background: Providing education and information to the public allows for them to prepare for and respond during a flood emergency including evacuation procedures, personal and family preparation.

Project Description: District will outreach to community based organizations providing information about the District and our critical role in provide flood protection. Also improve our website and social media presence to provide information to the public during flood on status of canal, river levels and levee conditions.

Other Alternatives: Respond to phone calls during emergency

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: RD 1000; City of Sacramento; County of Sacramento; Sutter County

Project Priority: High

Cost Estimate: $50,000 to $100,000 annually

Benefits (Losses Avoided): Assist with potential emergency evacuation and personnel property protection during flood emergency—prevent potential loss of life and loss of property

Potential Funding: RD 1000

Timeline: Currently implemented

Action 7. Stockpile and pre-stage flood emergency response materials

Hazards Addressed: Levee failure, levee overtopping

Goals Addressed: 1, 2, 3

Issue/Background: District needs to have readily available flood fight materials such as sand bags, rock, AB and fill material in close proximity to potential levee failure areas to stabilize levee and avoid failure.

Project Description: Purchase properties at strategic locations in District to stockpile flood fight materials. Purchase and store materials at the sites for deployment during flood emergency

Other Alternatives: Stockpile at remote locations or purchase as necessary—delay in response which could result in levee failure

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: RD 1000

Project Priority: High

Cost Estimate: $2.5 million

Benefits (Losses Avoided): Catastrophic levee failure, loss of life and significant property loss

Potential Funding: RD 1000

Timeline: Immediate

Action 8. Emergency response improvements including radios for communications

Hazards Addressed: Levee failure, levee overtopping, localized flooding

Goals Addressed: 1, 2, 3

Issue/Background: Current operations rely on cell phone communications. During flood emergency, cell phone communication not reliable. Also District needs additional flood fight equipment such as portable lights, trailers, flatbed trucks, ect.

Project Description: Purchase radios to allow communication between District personnel during emergency and with outside emergency operational area coordinators including law enforcement, fire and Sacrament County OES. Also purchase additional flood fight equipment such as portable lights, trailers and flatbed trucks for emergency response

Other Alternatives: Cell phone

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: RD 1000; Sacramento County OES

Project Priority: Very High

Cost Estimate: $100,000 for radios; $300,000 for equipment

Benefits (Losses Avoided): Coordinated emergency response can prevent levee failure or overtopping avoiding catastrophic flooding, loss of life and significant property damage

Potential Funding: RD 1000, Sac County OES

Timeline: Prior to 2016 flood season

Action 9. Emergency Back-up Generator for pump stations

Hazards Addressed: Localized flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Only one District pump station has an emergency backup generator for power failure situations. Need to have additional generators at existing pump stations or portable generators that could be deployed to stations if power is lost. Without pumping capacity, canals will overtop and flood adjacent property and flood potential evacuation routes in case of imminent levee overtopping or failure

Project Description: Construct permanent back up diesel or gas powered generators at current pump plants or provide for two or more portable generators for deployment during power outage

Other Alternatives: None

Existing Planning Mechanism(s) through which Action Will Be Implemented:

Responsible Office/Partners: RD 1000

Project Priority: High

Cost Estimate: $3.0 million

Benefits (Losses Avoided): Localized flood damages to properties due to water overtoping canals. Disruption to evacuation and/or emergency response due to flooded access routes

Potential Funding: RD 1000

Timeline: Purchase as funds available--2018

Annex M Sacramento Regional County Sanitation District

M.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Sacramento Regional County Sanitation District (Regional San/District), a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the base plan document. As such, all sections of the base plan, including the planning process and other procedural requirements apply to and were met by the Regional San. This Annex provides additional information specific to Regional San, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

M.2 Planning Process

As described above, the Regional San followed the planning process detailed in Section 3 of the base plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), Regional San formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table M-1. Additional details on plan participation and Regional San representatives are included in Appendix A.

Table M-1 Regional San Planning Team

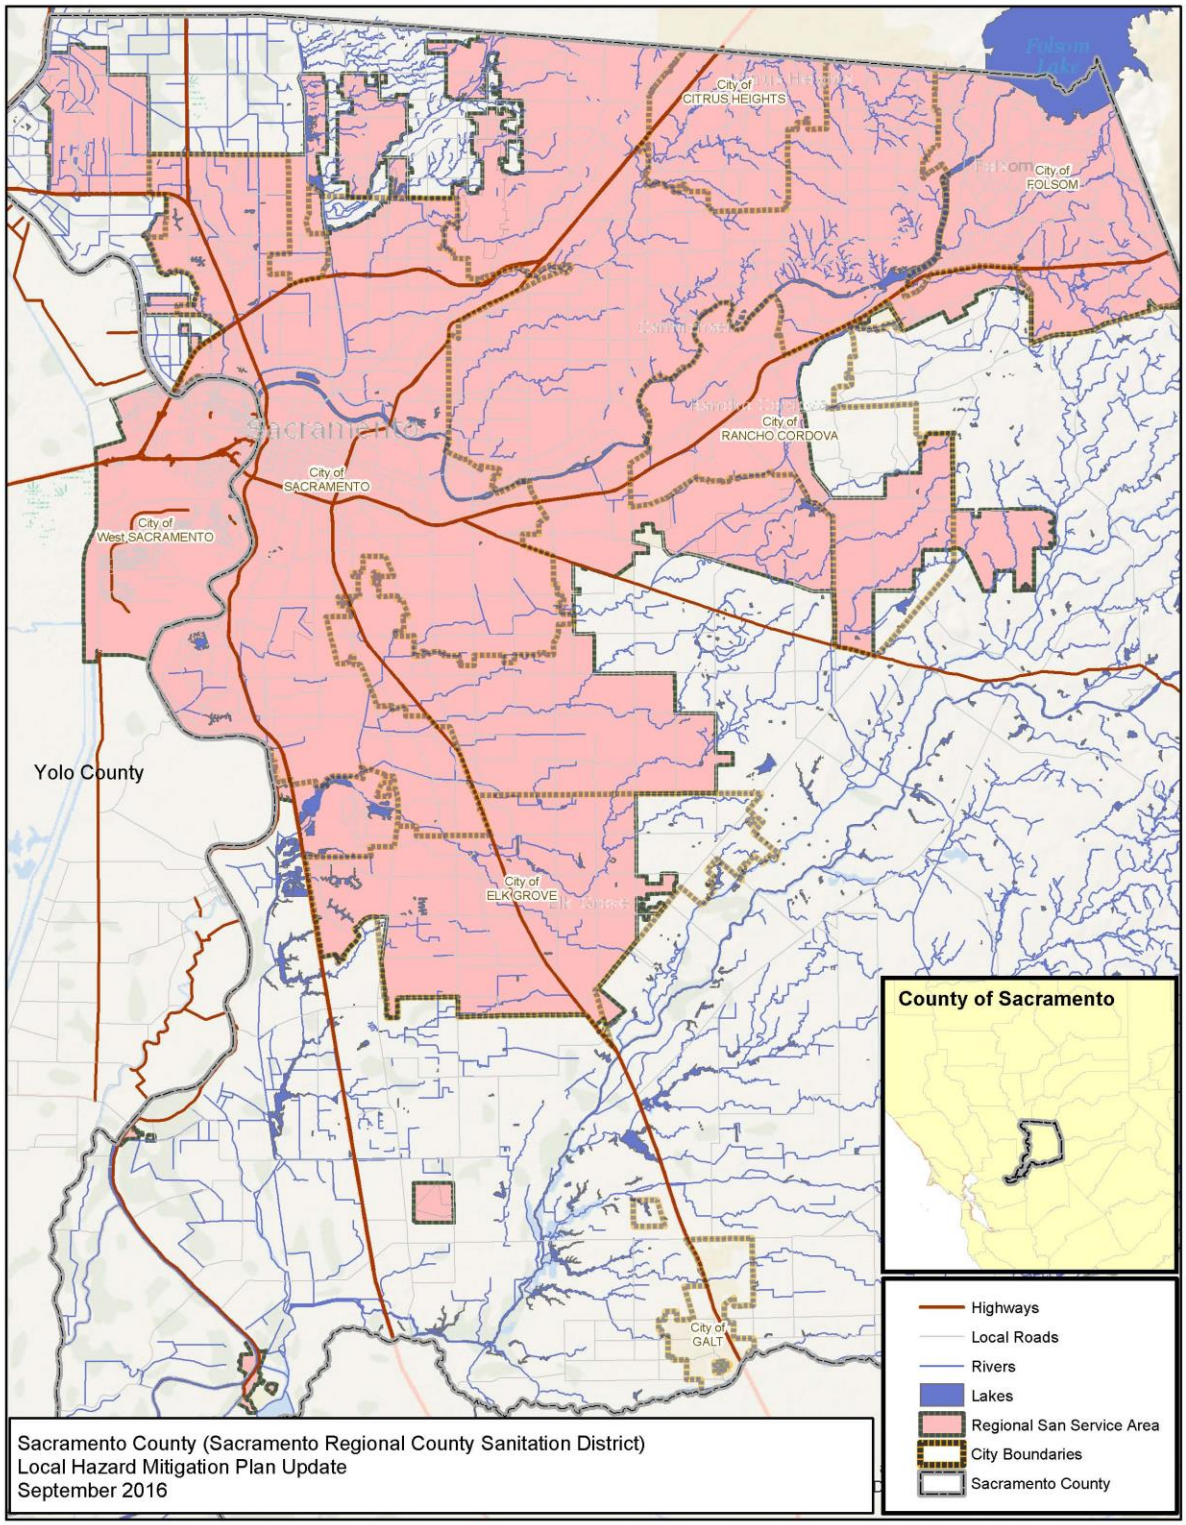
Name	Position/Title	How Participated
Steve Nebozuk	Civil Engineer	HMPC: collect data, draft text, review documents, attended meetings
Mike Donahue	Civil Engineer	Regional San Perimeter Levee: collect data, draft text, review document
Claudia Goss	Public Affairs Manager	Reviewer: review documents
Dave Ocenosak	Policy and Planning Section Manager	Reviewer: review documents
Raul Rodriguez	GIS Analyst	Identify Assets/Figures: collect data, prepare GIS figures
Bryan Young	Natural Resource Supervisor	Natural Resource Updates: draft text, review documents
William Yu	Civil Engineer	EchoWater Project: draft text, review documents

Source; Regional San

M.3 Community Profile

The community profile for the Regional San is detailed in the following sections. Figure M-1 displays a map and the location of Regional San boundaries within Sacramento County.

Figure M-1 Regional San Service Area



M.3.1. Regional San Overview, History and Background

The following is a brief history about the Sacramento Regional County Sanitation District.

Following World War II, the Sacramento region grew and wastewater treatment plants were built along the Sacramento and American Rivers to accommodate the population increase. In the early 1970s, 22 separate wastewater collection and treatment systems collected and treated the wastewater for the 600,000 residents of the Sacramento region. All of the plants discharged into local waterways, and many discharged into the American River.

In 1973, the County of Sacramento and the City of Sacramento joined forces and, together with the City of Folsom, formed the Sacramento Regional County Sanitation District. The Regional San assumed responsibility for wastewater treatment facilities, which were operated by the County's Water Quality Division. As a result, $460 million was invested in development of a regional wastewater collection and treatment program. A regional system of interceptor pipelines gathered sewage flow from various areas and conveyed the flow to the County Central Plant in Elk Grove.

In 1976, with one of the largest single grants in the nation under the Federal Water Pollution Control Act Amendments of 1972, commonly known as the Clean Water Act, the District upgraded the County Central Plant and entered into construction contracts to build the Sacramento Regional Wastewater Treatment Plant (SRWTP), the City Interceptor and the Emergency Storage Basins. Construction of the SRWTP was completed in 1982 and the facility began treating 136 million gallons per day. The SRWTP was designed to be a pure oxygen activated sludge treatment plant that provided secondary treatment and disinfection.

Regional San provides wastewater service to the cities of Sacramento, Citrus Heights, Folsom, Ranch Cordova and Elk Grove, and the unincorporated area of Sacramento County. In 2007, the City of West Sacramento, in Yolo County, connected to the Regional San system. In 2010 the Delta communities of Courtland and Walnut Grove were connected to the Regional San system.

December 9, 2010, the Central Valley Regional Water Quality Control Board adopted a new NPDES permit for the SRWTP. This permit mandates strict new standards for the SRWTP requiring nutrient removal and filtration. Regional San has initiated the EchoWater Project. Per the terms of the permit, the EchoWater Project has to be constructed and operational beginning in 2021 for nutrient removal and by 2023 for filtration. The estimated cost for the EchoWater Project is $1.7 billion. The cost of the new critical capital infrastructure will be updated in the 2021 LHMP Annex.

Today, as the only regional provider of sewer collection and treatment services for the greater Sacramento area, Regional San continues to maintain its status as a leader in environmental stewardship through quality service and efficient projects and programs.

M.3.2. Geography and Climate

The geography and climate for the Sacramento Regional County Sanitation District is identical to that of Sacramento County and Yolo County. Please refer to Section 1.3.2 Geography and Climate in the base plan document.

M.3.3. Economy

Regional San grows at the same rate as the communities that it serves.

M.3.4. Population

In 2016, the total population served by the Sacramento Regional County Sanitation District was estimated at 1.4 million. Regional San provides sewer service to the cities of Citrus Heights, Elk Grove, Folsom, Rancho Cordova, Sacramento, West Sacramento, the unincorporated areas of Sacramento County and portions of Yolo County.

M.4 Hazard Identification

Regional San's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to Regional San (see Table M-2).

Table M-2 Regional San—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Limited	Likely	Critical	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Significant	Likely	Limited	Low
Dam Failure	Significant	Unlikely	Catastrophic	Medium
Drought and Water Shortage	Extensive	Likely	Limited	Low
Earthquake	Limited	Occasional	Critical	Low
Earthquake: Liquefaction	Limited	Unlikely	Critical	Low
Flood: 100/200/500-year	Significant	Occasional	Critical	High
Flood: Localized Stormwater Flooding	Limited	Highly Likely	Limited	Low
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Significant	Likely	Critical	High
River/Stream/Creek Bank Erosion	Limited	Highly Likely	Limited	Low
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Likely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Negligible	Low
Severe Weather: Fog	Extensive	Highly Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Critical	Low
Severe Weather: Wind and Tornadoes	Limited	Likely	Limited	Low
Subsidence	Significant	Highly Likely	Limited	Low
Volcano	Limited	Unlikely	Limited	Low
Wildfire:(Burn Area/Smoke)	Limited	Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

M.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile Regional San's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to the District is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

M.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section M.5.3, includes a description as to how the hazard affects the Regional San and information on past occurrences. The intent of these sections is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

M.5.2. Vulnerability Assessment

This section identifies Regional San's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the Department's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table M-3 lists particular critical facilities and other District assets identified by the Regional San's planning team as important to protect in the event of a disaster. Regional San's physical assets, valued at over $3.4 billion, consist of the buildings and infrastructure to support the Regional San operations.

Table M-3 Regional San's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Underground Pipeline, Structures, Equipment and Appurtenances(2)	Essential	215 miles of pipelines, force mains (1), pipe structures & appurtenances (2)	$1,826,040,275	Dam failure, Levee failure, Flood
S94 – Regional Wastewater Treatment Plant	Essential		$925,517,080	Dam failure, Levee failure, Flood
SRWTP Perimeter Levee	Essential		$9,407,241	Dam failure, Levee failure, Flood
SRWTP Outfall Facility	Essential		$13,756,812	Dam failure, Levee failure, Flood
N50 – South River Pump Stn	Essential		$103,501,785	Dam failure, Levee failure, Flood
N51 – New Natomas Pump Stn	Essential		$89,631,950	Dam failure, Levee failure, Flood
N40 – Iron Point Pump Stn	Essential		$13,011,990	Dam failure, Levee failure, Flood
N52 – Power Inn Pump Stn	Essential		$7,886,866	Dam failure, Levee failure, Flood
N19 – Arden Pump Stn	Essential		$35,877,916	Dam failure, Levee failure, Flood
N53 – Van Maren Pump Stn	Essential		$21,828,647	Dam failure, Levee failure, Flood
N27 – Sump 55 Facility	Essential		$15,206,272	Dam failure, Levee failure, Flood
N28 – Sump 119 Facility	Essential		$14,612,029	Dam failure, Levee failure, Flood
N29 – Sump 2/2A Facility	Essential		$8,304,103	Dam failure, Levee failure, Flood
N35 – Sump 76 Facility	Essential		$3,308,012	Dam failure, Levee failure, Flood
N43 – Roseville/Watt Liquid Waste Disposal Facility	High Potential Loss		$3,575,531	Dam failure, Levee failure, Flood
S30 – Old Natomas Pump Stn	High Potential Loss		$4,006,130	Dam failure, Levee failure, Flood
S33 – Cordova Pump Stn	Essential		$15,340,337	Dam failure, Levee failure, Flood
S55 – Northeast Pump Stn	Essential		$1,80929551	Dam failure, Levee failure, Flood
N15, N16 – Northeast Siphon	Essential		$8,516,570	Dam failure, Levee failure, Flood
Bufferlands and Environmental Mitigation Lands	Natural Resource		$10,028,251	Fire, Dam failure, Levee failure, Flood

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Sims Ranch	Historic Resource		(3)	Fire, Dam failure, Levee failure, Flood
Nicolaus Dairy	Historic Resource		(3)	Fire, Dam failure, Levee failure, Flood
Regional San Archeological Site CA-SAC-83	Cultural Resource		(3)	Fire, Dam failure, Levee failure, Flood
Real Property, Land and Easements	Essential		$58,399,339	
Buildings	Essential		$184,101,805	
TOTAL			**$3,372,951,493**	

Source: Regional San Finance, Engineering, and Policy and Planning Offices

(1) Asset value includes facility, site structures, site equipment, mobile equipment, miscellaneous items that may have soft cost components, some associated adjacent pipeline components. Values taken from Regional San 2010 Comprehensive Annual Financial Report, and engineering project reports. Values from the 2011 LHMP have been escalated 4% per year for inflation.

(2) Pipelines include gravity and force mains ranging in size from 36-inch to 120-inch. Structures and appurtenances include valves, vaults, junction structures, flow meters, and roller gates, etc.

(3) Costs for these sites have not been estimated.

An inventory of critical facilities in the Regional San is provided in Table M-4 and shown in Figure M-2.

Table M-4 Regional San Critical Facilities: Summary Table

CF Definition Category	Type	Total by Location
Essential Services Facilities	Sewer Pipelines(1)	215 miles
Essential Services Facilities	Pipe Structures & Appurtenances(2)	27
Essential Services Facilities	Sewer Pump Stations	13
Essential Services Facilities	Siphon	1
Essential Services Facilities	Regional Wastewater Treatment Plant	1
Essential Services Facilities	SRWTP Perimeter Levee	1
Essential Services Facilities	SRWTP Outfall Facility	1

Source: Regional San

(1) Pipelines include gravity-flow pipes and force main pipes and range in size from 36-inch to 120-inch.

(2) Appurtenances include underground valves, vaults, junction structures, flow meters, and roller gates.

Source: Regional San

Natural Resources

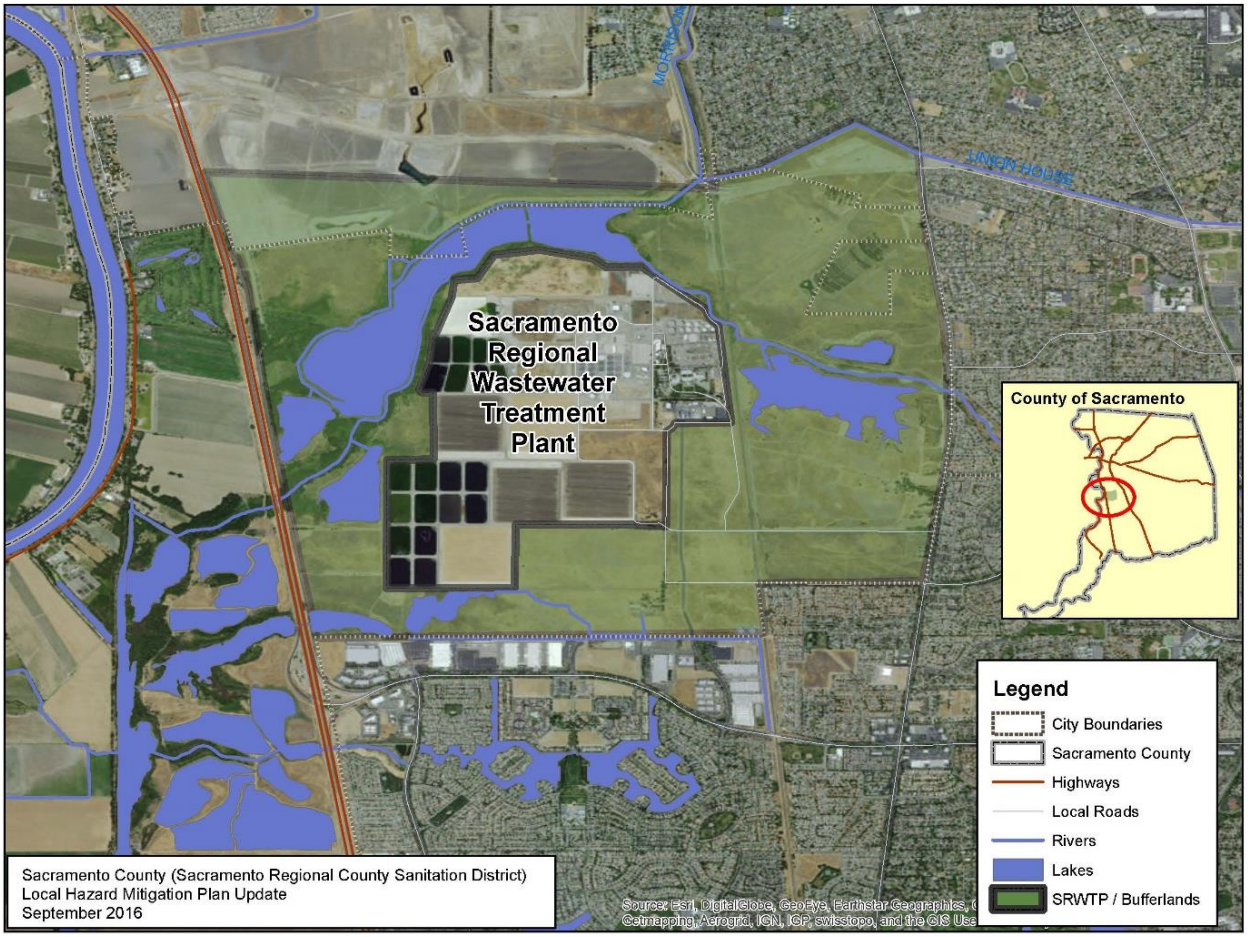
It is important for Regional San to operate its regional wastewater treatment facility in a manner so as to provide efficient and reliable service while minimizing impacts of the facility to the adjacent communities. In the 1970s, the District planned a large undeveloped buffer area between the Sacramento Regional Wastewater Treatment Plant and the surrounding residential neighborhoods in southern Sacramento County. That farsighted decision led to conservation of increasingly scarce wetlands, grasslands and riparian forest habitats on Regional San's 2,150 acres of Bufferlands.

The District has the following natural resources of value to the local communities;

Regional San Bufferlands: Surrounding the Sacramento Regional Wastewater Treatment Plant in Elk Grove is the Bufferlands. This 2,150-acre expanse, shown in Figure M-3, of open space minimizes the potential for odor and other nuisances that could impact the surrounding neighborhoods. The Bufferlands has been developed into an important natural area that provides a large contribution of high quality wildlife habitat, farmland and open space. It provides a varied mix of upland and wetland habitats and important wildlife area, supporting over 235 species of birds, 25 species of mammals and several dozen native fish, amphibians and reptiles. The Bufferlands is also home to more than 20 species of rare plants (Table M-5) and animals (Table M-6) including several threatened and endangered species such as Swainson's hawks, vernal pool fairy shrimp and giant garter snakes.

Through grant funding and mitigation efforts, Regional San has restored or created approximately 250 acres of managed seasonal wetlands, 100 acres of open water and emergent marsh, 350 acres of native grasslands, and the establishment of over 30,000 trees in restored riparian forests and oak woodlands covering nearly 200 acres. These restoration efforts augment the upland, wetland, and forest habitat that previously existed on the Bufferlands, including Laguna, Unionhouse, and Morrison Creeks, four small lakes, nearly 25 acres of vernal pools, approximately 50 acres of mature riparian forest, and hundreds of acres of annual grassland. Approximately 700 acres of the Bufferlands is leased for agricultural production. Row crop, hay crop, and rangeland leases are all managed to be compatible with conservation efforts occurring throughout the Bufferlands.

Figure M-3 Regional San Bufferlands



Source: Regional San

Table M-5 Special Status Plant Species that Occur or that May Occur on the Bufferlands

Species	Status*Federal/ State/CNPS	Habitats	Flowering Period
Dwarf downingia *Downingia pusilla*	X/X/2	Vernal pools and vernally wet areas in annual grasslands	March–May
Stinkbells *Fritillaria agrestis*	X/X/4	Clay depressions or other areas with heavy soils in chaparral, cismontane woodland, and annual grassland	March–April
Bogg's Lake hedge-hyssop *Gratiola heterosepala*	X/E/1B	Shallow water and margins of vernal pools	April–June
Ahart's dwarf rush *Juncus leiospermus var. ahartii*	X/X/1B	Margins of vernal pools	March–May
Legenere *Legenere limosa*	X/X/1B	Vernal pools and other vernally wet areas	May–June
Pincushion navarretia *Navarretia myersii*	X/X/1B	Vernal pools	May

Species	Status*Federal/ State/CNPS	Habitats	Flowering Period
Slender orcutt grass *Orcuttia tenuis*	T/E/1B	Vernal pools	May–June
Sacramento orcutt grass *Orcuttia viscida*	E/E/1B	Vernal pools	May–June
Sanford's arrowhead *Sagittaria sanfordii*	X/X/1B	Ponds, ditches, marshes, and other shallow freshwater habitats	May–August

* Status explanations
Federal
E = listed as endangered under the federal Endangered Species Act.
T = listed as threatened under the federal Endangered Species Act.
SC =species of concern (species for which existing information may warrant listing but for which substantial biological information to support a proposed rule is lacking).
X = no status definition
State
E = listed as endangered under the California Endangered Species Act
X = no status definition
California Native Plant Society
1B = List 1B species (rare, threatened, or endangered in California and elsewhere).
2 = List 2 species (rare, threatened, or endangered in California but more common elsewhere).
4 = List 4 species (plants of limited distribution).

Table M-6 Special Status Wildlife Species that Occur or that May Occur on the Bufferlands

Species	Status* Federal/State	Habitats	Potential for Occurrence
Vernal pool fairy shrimp *Branchinecta lynchi*	T/X	Common in vernal pools; also found in sandstone rock outcrop pools.	Present
Vernal pool tadpole shrimp *Lepidurus packardi*	E/X	Vernal pools and ephemeral.	Present
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	T/X	Riparian and oak savanna habitats with elderberry shrubs; elderberries are host plant.	Present
Northwestern pond turtle *Clemmys marmorata marmorata*	SC/SSC	Woodlands, grasslands, and open forests; occupies ponds, marshes, rivers, streams, and irrigation canals that have muddy or rocky bottoms and contain watercress, cattails, water lilies, or other aquatic vegetation	Present
Giant garter snake *Thamnophis gigas*	T/T	Sloughs, canals, and other small water-ways where there is a prey base of small fish and amphibians; requires grassy banks and emergent vegetation for basking and areas of high ground protected from flooding during winter	Present
White-tailed kite *Elanus leucurus*	X/FP	Low foothills and valley areas with valley or live oaks, riparian areas, and marshes; requires access to open grasslands for foraging	Present

Species	Status* Federal/State	Habitats	Potential for Occurrence
Northern harrier *Circus cyaneus*	X/SSC	Grasslands, meadows, marshes, and seasonal and agricultural wetlands providing tall cover	Present
Swainson's hawk *Buteo swainsoni*	X/T	Nests in oaks or cottonwoods in or near riparian habitats; forages in grasslands, irrigated pastures, and grain fields.	Present
Ferruginous hawk *Buteo regalis*	SC/SSC	Open terrain in plains and foothills where ground squirrels and other prey are available.	Present
Golden Eagle *Aquila chrysaetos*	X/FP	Forages in grasslands, deserts and other open terrain.	Present
Bald Eagle *Haliaeetus leucocephalus*	X/E	Forages near lakes, rivers, and coastlines where prey is abundant.	Present
American peregrine falcon *Falco peregrinus anatum*	E/E	Nests and roosts on protected ledges of high cliffs, usually adjacent to lakes, rivers, or marshes that support large populations of other bird species	Present
Greater sandhill crane *Grus canadensis tabida*	X/T	Summers in open terrain near shallow lakes or freshwater marshes; winters on plains and in valleys near bodies of fresh water.	Present
Lesser sandhill crane *Grus canadensis tabida*	X/SSC	Summers in open terrain near shallow lakes or freshwater marshes; winters on plains and in valleys near bodies of fresh water.	Present
Least Tern *Childonias niger*	E/E	Nests on gravel roads around wastewater treatment ponds.	Present
Western yellow-billed cuckoo *Coccyzus americanus occidentalis*	X/E	Wide, dense riparian forests with a thick understory of willows for nesting; prefers sites with a dominant cottonwood overstory for foraging; may avoid valley-oak riparian habitats where scrub jays are abundant	Low
Western burrowing owl *Athene cunicularia hypugea*	SC/SSC	Rodent burrows in sparse grassland, desert, and agricultural habitats	Present
Long-eared owl *Asio otus*	X/SSC	Dense riparian stands of willows, cottonwoods, live oaks, or conifers; uses adjacent open lands for foraging. Nests in abandoned crow, hawk, or magpie nests	Present
Short-eared owl *Asio flammeus*	X/SSC	Freshwater and salt marshes, lowland meadows, and irrigated alfalfa fields; needs dense tules or tall grass for nesting and for daytime roosting	Present

Species	Status* Federal/State	Habitats	Potential for Occurrence
Little willow flycatcher *Empidonax traillii brewsteri*	SC/E	Riparian areas and large, wet meadows with abundant willows for breeding; usually found in riparian habitats during migration	Present
Purple martin *Progne subis*	X/SSC	Nests in abandoned woodpecker holes in valley oak and cottonwood forests; also nests in vertical drainage holes under elevated freeways and highway bridges. Requires open areas for feeding	Low
Bank swallow *Riparia riparia*	X/T	Nests in bluffs or banks, usually adjacent to water, where the soil consists of sand or sandy loam that allows digging	Present
Loggerhead shrike *Lanius ludovicianus*	X/SSC	Prefers open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches	Present
Least Bell's vireo *Vireo bellii pusillus*	E/E	Riparian thickets either near water or in dry portions of river bottoms; may also be found using mesquite and arrow weed in desert canyons. Nests along margins of bushes and forages near the ground	Present
California yellow warbler *Dendroica petechia brewsteri*	X/SSC	Nests in riparian areas dominated by willows, cottonwoods, sycamores, or alders or in mature chaparral; may also use oaks, conifers, and urban areas near streamcourses.	Present
Yellow-breasted chat *Icteria virens*	X/SSC	Nests in dense riparian habitats dominated by willows, alders, Oregon ash, tall weeds, blackberry vines, and grapevines	Present
Tricolored blackbird *Agelaius tricolor*	SC/C	Nests in dense colonies in emergent marsh vegetation, such as tules and cattails, or at upland sites with blackberries, nettles, thistles, and grainfields; nesting habitat must be large enough to support 50 pairs. Probably requires water at or near the nesting colony. Requires large foraging areas where insect prey is abundant, such as marshes, pastures, agricultural wetlands, dairies, and feedlots	Present
Pallid bat *Antrozous pallidus*	X/SSC	Rocky outcrops, cliffs, and crevices for Low roosting; requires access to open habitats for foraging	Low

* Status explanations

Federal

E = listed as endangered under the federal Endangered Species Act.

T = listed as threatened under the federal Endangered Species Act.

C = species for which U.S. Fish and Wildlife Service has on file sufficient information on biological vulnerability and threat(s) to support issuance of a proposed rule to list, but issuance of the proposed rule is precluded.
SC = species of concern (species for which existing information may warrant listing but for which substantial biological information to support a proposed rule is lacking).
X = no status definition.
State
E = listed as endangered under the California Endangered Species Act.
T = listed as threatened under the California Endangered Species Act.
C = Candiadte species for listing under California Endangered Species Act.
FP = fully protected under the California Fish and Game Code.
SSC = species of special concern in California.
X = no status definition.

South River Pump Station Habitat Area: To the north and west of the South River Pump Station in Yolo County, Regional San owns approximately 26-acres of open space. This property was previously used as a private hunting and fishing reserve. The property contains approximately 10 acres of wetlands including the northern tip of Glide Lake, consisting primarily of open water with emergent marsh on the margins. Additionally, there are several acres of mature valley oak woodland and several mature elderberry shrubs on the site.

Regional San Parkway Site: A 29 acre site within the American River Parkway in the vicinity of William B Pond is owned by Regional San. This site is predominately landscaped with irrigated turf grass. Mature native and non-native trees within the landscape provide habitat for the wide variety of wildlife that utilize the parkway.

Historic and Cultural Resources

The Sacramento Regional County Sanitation District has several significant historic and cultural resources on the Bufferlands surrounding the Sacramento Regional Wastewater Treatment Plant.

- Regional San Archeological Site CA-SAC-83: An archeologically significant prehistoric and archeological site designated CA-SAC-83 exists in the Bufferlands west of the SRWTP. Artifacts including beads, shell, obsidian, slate, backed clay, charcoal, and human bone provide evidence that a Plains Miwok village once existed in this area.
- Nicolaus Dairy and Sims Ranch: Two post-European settlement resources are located on the Bufferlands. The historic Sims Ranch is located on the eastern side of the Bufferlands. This large ranch was established in 1850. While none of the original structures remain on this property, two houses built by the grandsons of the original property settler, Joseph Sims, remain at the site. These houses are regarded as excellent examples of Minimal Tradition style construction that speak to the frugal, no-frills era of the Great Depression. Both houses meet the criteria for listing in the National and California Register of Historic Places. The Nicolaus Dairy occurs in the southern portion of the Bufferlands. The Craftsman-style residence on this property dates back to 1914. While no longer in operation, the Nicolaus Dairy retains elements of a small scale 1949 dairy which contributes to its importance to local history. The historic core of this ranch also meets the criteria for listing within the National and California Register of Historic Places.

Growth and Development Trends

Growth and development trends within the contributing agencies including the Cities of Citrus Heights, Elk Grove, Folsom, Rancho Cordova, Sacramento, West Sacramento (in Yolo County), and the unincorporated portions of Sacramento County may result in increased flows to the Sacramento Regional Wastewater Treatment Plant, owned and operated by the Regional San. The District's growth and development trends typically mirror those of Sacramento County, portions of Yolo County, and the surrounding communities served by Regional San as described in the base plan. However in recent years, with all the water conservation efforts that have been implemented in the District's service area, influent flows have not increased at the typical rate of development.

Development since the 2011 Plan

Regional San has seen minor increase in their service area population since the 2011 plan, but the population served remains at approximately 1.4 million.

In order to comply with new permit regulations (as discussed in Section L.3.1) Regional San has initiated the EchoWater Project at the Sacramento Regional Wastewater Treatment Plant and will share the same hazard categories as described previously in the document and as shown in Table M-7, below. The project should not cause a significant change in vulnerability of the District to identified priority hazards.

Table M-7 Regional San Development by Year and Hazard Areas since 2011

Asset Type	Year Built	Outside of Known Hazard Area	1% Annual Chance Flood	Area Protected by Levee	Wildfire Risk Area[1]	Other
EchoWater Project	2014-2023	0	1	1	1

M.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table M-2 as high or medium significance hazards. Impacts of past events and vulnerability of the Regional San to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the base plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the base plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee and dam inundation areas, such as older facilities that may be constructed with unreinforced masonry and structures built prior to the introduction of modern building codes. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

An estimate of the vulnerability of the Regional San to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Methodology

Sacramento Regional County Sanitation District's GIS has mapped the four specific hazard areas identified within its service area. The four specific hazards are: 100- and 500-year flood, levee failure, dam failure, and wildfire. GIS was used to determine the possible impacts of these specific hazards to Regional San facilities, and how the risk varies across its service area. The following methodology was followed in

determining the Regional San assets at risk to the 1% (100-year flood) and 0.2% (500-year flood) annual chance flood event, levee failure, dam failure, and wildfire event.

Regional San asset records, engineering and construction reports, and financial data and reports were used as the basis for determining asset value by individual asset or by asset class. County GIS data/hazard layers were used and included Sacramento County and Yolo County DFIRMs, dam failure inundation zones, and wildfire threat areas. The FEMA Preliminary DFIRM, made available on June 16, 2015 was used as the hazard layers for the 100- and 500-year flood zones, and levee failure analysis.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–Medium

Hazard Profile and Problem Description

Dam failures can result from a number of natural or manmade causes such as earthquakes, erosion of the face or foundation, improper siding, rapidly rising flood waters, structural/design flaws, and deliberate human actions. Folsom Dam is the major dam which affects the Regional San and the populations in the inundation areas. Folsom Dam is owned by the US Bureau of Reclamation. The flood waters from a dam failure would likely affect the Sacramento Regional Sanitation District's service area. Flood waters could inundate sewer pump stations, regional collector pipes, underground structures, and equipment, resulting in the inability to access or operate Regional San's facilities within the flooded areas. A severe flood could jeopardize the operation of the regional sewer treatment plant. Access to the regional sewer treatment plant, affected pipe systems and pump station facilities to assess and restore operation could be limited until such time that the flood waters receded.

The ability to warn downstream communities in the event of a flood event caused by a dam failure is generally dependent on conditions such as the frequency of inspections for the dam's structural integrity, the flood wave arrival time (the time it takes for the flood wave to reach its maximum distance of inundation), or the ability to notify persons downstream and their ability to evacuate or take preventative actions to minimize damage to utilities or infrastructure. The existence and frequency of updating and exercising an evacuation plan that is site-specific assists in warning and evacuation functions.

A dam failure will cause loss of life, damage to property, and other ensuing hazards, as well as the displacement of persons residing in the inundation path. Damage to sewer collection, conveyance and treatment facilities would likely impact communities outside the immediate hazard areas by disrupting sewer collection and treatment services.

Past Occurrences

The Planning Team noted no past occurrences that have affected Regional San.

Vulnerability to Dam Failure

According to the Sacramento County General Plan Background report, there are four major and two minor dams which, if they fail, may impact the people and resources of this District. The major dams are comprised of Shasta on the Sacramento, Oroville on the Feather, Comanche on the Mokelumne and Folsom on the American. The minor dams include Nimbus and Rancho Seco. Regional San has no records indicating that previous dam failures have impacted its assets.

Scenario for Evaluating Values at Risk

Sacramento County provided inundation as a GIS layer for the Folsom Dam system, as part of the following breaks:

- Folsom Right Wing
- Folsom Mormon
- Folsom Dike 4
- Folsom Dike 5
- Folsom Dike 6
- Folsom Dike 7
- Folsom Dike 8
- Folsom Dam

Description of Folsom Dam Facilities

The Folsom Dam and Reservoir Project is located on the American River, about 20 miles upstream of the City of Sacramento, California. I t was designed and built by the Corps of Engineers during the period 1948 to 1956, and is now owned and operated by the U.S. Bureau of Reclamation. The reservoir has a storage capacity of 1 million acre-ft at gross pool. The project includes about 4.5 miles of man-made water retaining structure that have a crest elevation of 480.5ft above sea level.

Purpose of Study

As described in Section 4.3.6 of the based plan, the Bureau of Reclamation performed a study in an attempt to determine the magnitude of flooding that would result from various breach scenarios of structures located around the reservoir. The structures are Folsom Dam itself, its right wing dam, dikes 4, 5, 6, 7, 8, and Mormon Island. The results of hydrodynamic simulations are used to generate potential inundation maps that can aid in the development of emergency actions plans.

Assets at Risk

The values for each of the assets were taken from the 2010 Comprehensive Annual Financial Report for the Fiscal Years Ended June 30. 2010 and 2009, asset lists, and engineering and construction reports to populate the 2011 LHMP tables. For this update, asset values have been escalated 4% per year for inflation. The tables included in this plan itemize assets into asset categories such as land and easements, structures, pipes, and other works of improvement that include equipment, and structures. The recent asset value, if available, was used directly with a pre-determined inflation value. If not available, the value was estimated based on similar asset types and values. The asset values were not depreciated.

Regional San has identified the following assets in Table M-8 as being potentially affected if the Folsom Dam were to have a catastrophic failure.

Table M-8 Regional San Assets and Values at Risk in the Folsom Dam Inundation Zone

Facility #	Facility Name	Asset Value(1)
FM003	SRWTP South Trunk Inflow Flow Meter	$1,094,988
FM050	SRWTP Water Reclamation Flow Meter	$243,311
FM066	SRWTP Bradshaw/Central Interceptor Inflow Flow Meter	$729,992
FM067	SRWTP City Interceptor Inflow Flow Meter	$486,661
FM075	SRWTP Laguna/Elk Grove Trunk Inflow Flow Meter	$729,992
FM166	Freeport Flow Meter	$486,661
FM339	SRWTP Central Trunk Inflow Flow Meter	$729,992
N11	City Interceptor Valve Structure	$2,433,306
N12	City Interceptor Oxygen Structure	$2,433,306
N13	City Interceptor Air Intake Structure	$1,824,979
N20	Arden Force Main Oxygen Structure	$2,798,302
N41	City Water Line to the SRWTP	$425,829
RG01	Roller Gate Structure 1 (N24-RG0027A)	$2,433,306
RG02	Roller Gate Structure 2 (N24-RG0008A)	$2,433,306
RG03	Roller Gate Structure 3 (N21-RG0061A)	$3,041,632
RG04	Roller Gate Structure 4 (N21-RG0044A)	$3,041,632
RG05	Roller Gate Structure 5 (N21-RG0028A)	$3,041,632
RG07	Roller Gate Structure 7 (N21-RG0007A)	$3,041,632
RG08	Roller Gate Structure 8 (N17-RG0024A)	$1,824,979
RG09	Roller Gate Structure 9 (N33-RG0017A)	$1,094,988
RG10	Roller Gate Structure 10 for Sump 82 (N17-SG0015B)	$1,459,983
S29	Mission Trunk Control	$948,989
N15&N16	Northeast Siphon Inlet & Outlet Structures	$8,516,570
N19	Arden Sewage Pumping Station	$35,877,916
N27	Sump 55 Sewage Pumping Station	$15,206,272
N28	Sump 119 Sewage Pumping Station	$14,612,029
N29	Sump 2/2A Sewage Pumping Station	$8,304,103
N35	Sump 76 Sewage Pumping Station	$3,308,012
N40	Iron Point Sewage Pumping Station	$13,011,990
N51	New Natomas Sewage Pumping Station	$89,631,950
N52	Power Inn Sewage Pumping Station	$7,886,866
S30	Old Natomas Sewage Pumping Station	$4,006,130
S33	Cordova Sewage Pumping Station	$15,340,337

Facility #	Facility Name	Asset Value(1)
S55	Northeast Sewage Pumping Station	$1,092,551
S94	Sacramento Regional Wastewater Treatment Plant	$925,517,080
Total		$1,179,091,224

Source: Regional San Finance, Engineering, and Policy and Planning Offices

(1) Asset value includes facility, site structures, site equipment, mobile equipment, miscellaneous items that may have soft cost components, some associated adjacent pipeline components. Values taken from Regional San 2010 Comprehensive Annual Financial for the 2011 LHMP and escalated 4% per year for inflation for the LHMP 2016 update.

Critical Facilities at Risk

The Regional San critical facility inventory was compared with the Folsom Dam failure inundation layer using GIS. Facility locations that were within the hazard area were selected and sorted by critical facility definition category; the summary results of this analysis are show in Table M-9. A detailed critical facility table is included in the base plan as Appendix E. The dam failure hazard column on the right-hand side of Appendix E denotes whether a particular facility is considered to be vulnerable to dam failures.

Table M-9 Regional San Critical Facilities at Risk in the Folsom Dam Inundation Zone

Critical Facility Definition	Count
Essential Services Facilities	35
High Potential Loss Facility	1
Transportation & Lifeline	0
Total	**36**

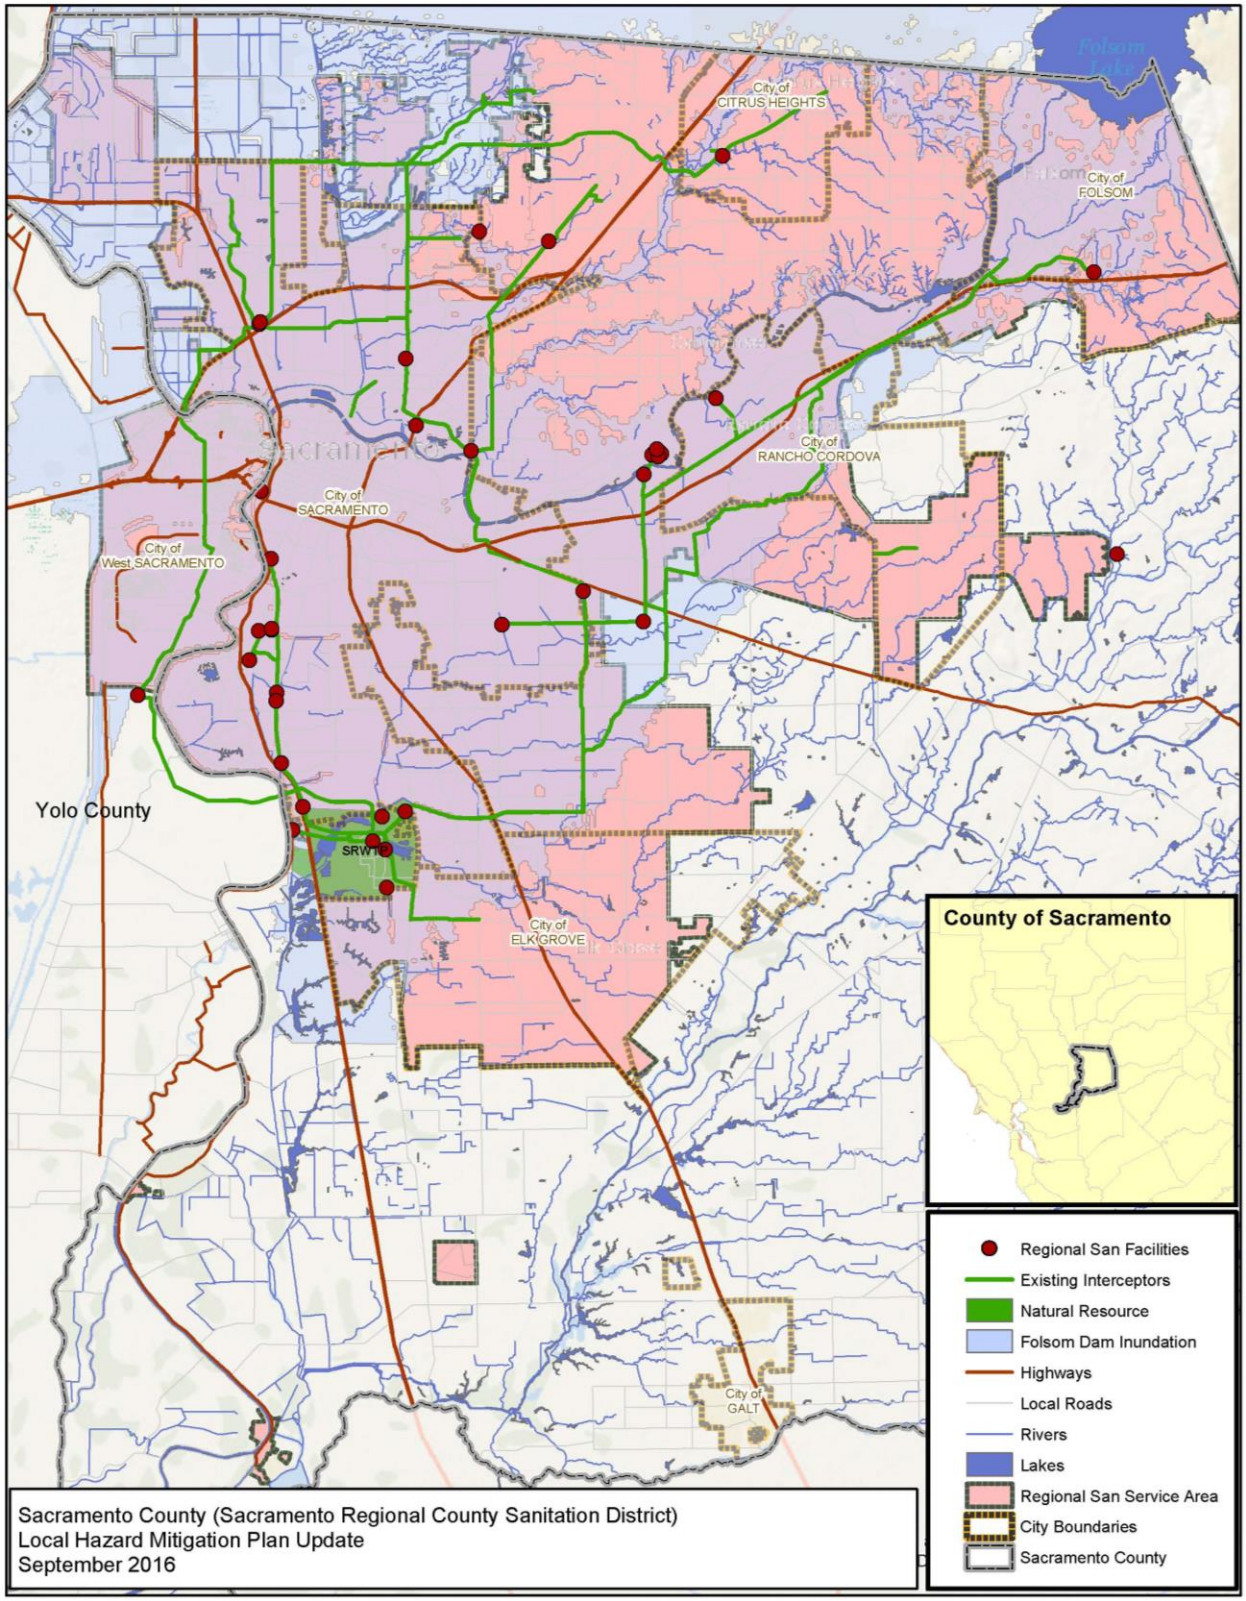
Figure M-5 Regional San Critical Facilities in the Folsom Dam Inundation Area



Source: Regional San

Regional San Owned Dams and Levees

SRWTP Perimeter Levee. The Sacramento Regional Wastewater Treatment Plant is protected by an earthen perimeter levee system that is owned by Regional San. The Perimeter Levee was originally designed to mitigate the risk of immediate failure of a local levee along the Sacramento River while the river is at flood stages (elevation 25 ft – 33 feet above mean sea level). Recent levee improvement efforts along the Sacramento River and the American River reduced the risk of levee failure throughout all of the urban areas of Sacramento County. However, Sacramento River levee systems located along the east side at all points south of the Freeport area are still considered to present a risk of failure potential. Should one or more levees fail from Freeport south into the Delta area, it could contribute some water at elevations that could approach the SRWTP levee. In 1998, the perimeter levee was raised to an elevation that provides flood protection for 100, 200 and 400-year flood events based on recent studies within the Sacramento River floodplain which increased the predicted 100-year floodplain elevation approximately 2 feet above previous studies. The current SRWTP Perimeter Levee provides 100- and 200-year flood protection with approximately 3 feet of freeboard. The levee provides 400-year flood protection with no freeboard, which complies with US Army Corps of Engineers standards to ensure protection from a 400-year flood event with no overtopping.

During the 1986 storm, a 100-year storm event, there was no overtopping of the perimeter levee with peak water surface elevation predicted at 15.3 to 15.8-feet NVGD. During the 1995 series of storm events which lead to flooding in both the Sacramento and American River floodplains, Interstate 5 was temporarily closed in close proximity to the SRWTP due to flooding. During this event, none of the storm water in the combined floodplain reached the levee at the SRWTP.

Emergency Storage Basins A, B, C and D. The Emergency Storage Basins (ESBs) are structures at the Sacramento Regional Wastewater Treatment Plant that are used for "emergency" or occasional use. These basins, normally do not have liquids stored in them, and on the occasion when they are used the fluid levels are typically only one to two feet deep. Operational use allows a minimum of 5.5 feet of freeboard. A constructed spillway is designed to direct any excess fluid volume back into the wastewater treatment plant. During review of these basins, DSOD engineers concurred with Regional San engineers that there were no risk factors for downstream property or human life in the event of structure failure, and that a study was not required to determine the extent of property damage and/or risk to life resulting from a hypothetical facility failure. Thus, this facility meets the "Low Hazard" classification in that a failure would result in minimal property damage and loss of life is unlikely. This facility is currently listed on Table 4.18 Sacramento County Dam Inventory as a Hazard Class level of "High". Regional San disagrees with this classification and may, in the future, pursue a reclassification of this facility to a Hazard Class level of "Low". The next update to this LHMP annex will include information on modifications to the basin configuration and operation as part of the EchoWater Project.

Solids Storage Basin (SSB) Battery III Ponds CA01421. The SSB ponds operate with a minimum 3 feet of freeboard. The SSBs are also provided with an emergency overflow that directs any excess fluid volume back into the SRWTP. Any fluid volume that escaped the SSB structure would be contained within the SRWTP perimeter levee system. Thus a dam failure for this asset meets the "Low Hazard" classification in that a failure would result in minimal property damage and loss of life is unlikely. This facility is currently listed on Table 4.18 Sacramento County Dam Inventory as a Hazard Class level of "High". Regional San

disagrees with this classification and may, in the future, pursue a reclassification of this facility to a Hazard Class level of "Low".

Natural Resources at Risk

The Sacramento Regional County Sanitation District has significant historical, cultural, and natural resources located throughout and adjacent to the Bufferlands including the 2,650-acre wildlife habitat, farmland and open space at the SRWTP, the prehistoric and archeological site designated CA-SAC-83, the Nicolaus Dairy, the Sims Ranch. These sites may be vulnerable to flood water inundation caused by a dam failure. Potential losses include partial or complete loss of structures, natural habitat and species.

Historic and Cultural Resources at Risk

The Planning Team for Regional San noted that the Nicolaus Dairy and Sims Ranch are both at risk to dam failure.

Future Development

Future development at this time is focused on the SRWTP EchoWater Project. This project will add $1.6 to $2 billion dollars of critical facilities at the SRWTP by 2023. Therefore, dam failure could result in significant loss at the treatment plant. No other future development is anticipated at this time.

Flood

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Major surface waters in the vicinity of the Regional San service area include the American River, Nimbus Reservoir, Folsom Reservoir, Lake Natoma, the Sacramento River, and the Consumnes River. In the Regional San service area, the potential for flood damage would occur in the floodplains of the American River, Sacramento River, Cosumnes River, Mokeolumne River, Laguna Creek, Morrison Creek, Dry Creek and Strawberry Creek.

Past Occurrences

Regional San facilities are impacted by wet weather and flood events that affect the Sacramento Region including localized and regional flooding. Historical large rainfall events have been noted in 1986, 1995, and 2005/06. More information regarding these events can be found in Table M-10.

Table M-10 Regional San Historical Flood Events

Date	Facility	Performance Comments
1986 storm, a 100-year storm event	SRWTP Perimeter Levee	No overtopping of the perimeter levee with peak water surface elevation predicted at 15.3 to 15.8-feet NVGD

Date	Facility	Performance Comments
December 2005 / January 2006 storm events	SRWTP and local construction projects.	SRWTP operations were impacted by high inlet flows. These flows plus localized flooding at on-site construction project(s) resulted in the discharge of a mixture of fully treated and partially treated wastewater for two days. Effluent sampling demonstrated that the discharge was in compliance with NPDES permit limits.
December 2005 / January 2006 storm events		Heavy rains impacted construction sites and caused four sanitary sewer overflows in the regional sewer collection system. Some reimbursements received from FEMA for flood-related damages.
1986, Spring 1995, and December 2005 / January 2006 storm events	SRWTP Perimeter Levee	No impacts

Critical Facilities at Risk

The Regional San critical facility inventory was overlayed on the Sacramento and Yolo Counties DFIRM flood hazard layer using GIS. Facility locations that were within the hazard area were selected and sorted by critical facility definition category; the summary results of this analysis are show in Table M-13. A detailed critical facility table is included in the base plan as Appendix E; the flood hazard column on the right-hand side of that table denotes whether a particular facility is considered to be vulnerable to that hazard.

Table M-13 Regional San Critical Facilities at Risk in the Floodplain

Flood	Critical Facility Category	Count
1%	Essential Services Facilities	18
1%	High Potential Loss Facility	1
1%	Transportation & Lifeline	0
	Total 1%	**18**
0.2%	Essential Services Facilities	15
0.2%	High Potential Loss Facility	0
0.2%	Transportation & Lifeline	0
	Total 0.2%	**33**

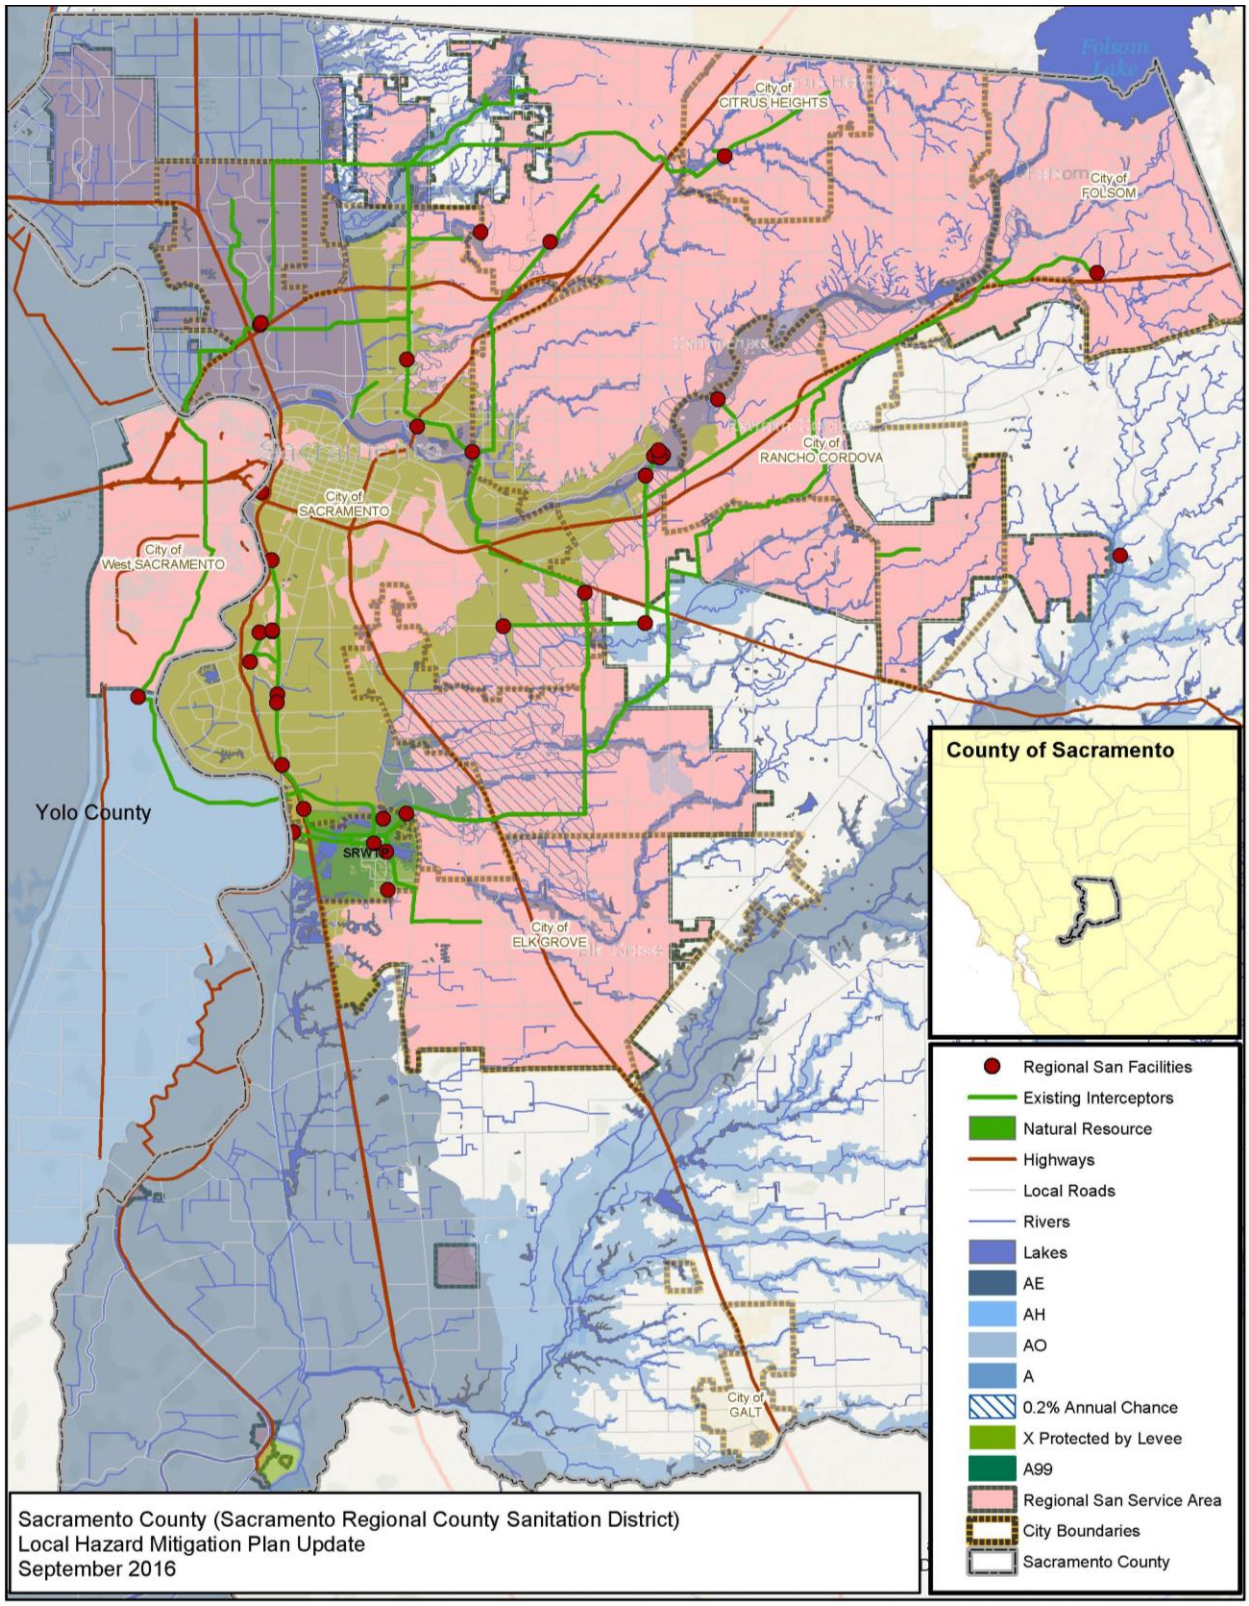
Figure M-7 Regional San Critical Facilities in the Floodplain



Source: Regional San

Natural Resources at Risk

The Sacramento Regional County Sanitation District has significant historical, cultural, and natural resources located throughout the Bufferlands. Vulnerability analysis of these individual resources specific to flood loss was not performed.

Historic and Cultural Resources at Risk

The Planning Team noted that the Nicolaus Dairy and Sims Ranch would both be at risk to flooding.

Future Development

None anticipated by the Regional San Planning Team.

Levee Failure

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Note: This section includes a discussion of levees that are not owned or maintained by Regional San.

Flooding caused by levee failure can occur as the result of partial or complete collapse of an impoundment, and often results from prolonged rainfall and flooding. The primary danger associated with dam or levee failure is the high velocity flooding of properties downstream of the breach. Section 4.2.17 Levee Failure in the base plan describes the levee inventory in the Sacramento County Planning Area.

Flooding caused by levee failure would vary in the District depending on which structure fails and the nature and extent of the failure and associated flooding. Flooding may present a threat to life and property depending on buildings or facilities flooded. Damage may include buildings, their contents and loss of critical services to the community. Large flood events can affect lifeline utilities (e.g., water, sewerage, and power), transportation, jobs, tourism, the environment, agricultural industry, and the local and regional economies.

Levee Flood Protection Zones estimate the maximum area that may be inundated if a project levee fails when water surface elevation is at the top of a project levee. Zones depicted on Figure 4.69 of the base plan do not necessarily depict areas likely to be protected from flow events for which project levees were designed. Figure 4.81 of the base plan illustrates the depths of flooding should a levee that protects that area fail.

Past Occurrences

Regional San does not have a documented history of impacts, damages or costs associated with previous levee failure in the Sacramento region.

Vulnerability to Levee Failure

Unincorporated Sacramento County and its incorporated jurisdictions have mapped flood hazard areas. This includes areas protected by levees. GIS was used to determine the possible impacts of flooding in areas protected by levee within the County, and how the risk varies across the Planning Area. The following methodology was followed in determining improved parcel counts and values at risk to levee failure. However, this analysis was performed based on the most current 2015 DFIRMs which still reflect some levees as providing 100-year level of protection. According to the County, all levees have since been decertified as not providing a 100-year level of protection, so this analysis is based solely on the information presented in the DFIRMs. Further it is important to note that many levee improvement projects are ongoing throughout the Planning Area, some of which will be providing certification of area levees to both a 100-year and 200-year levels depending on applicable requirements. Thus, this analysis reflects a moment in time and while it does provide information on areas developed behind levees, the X Protected by Levee flood zone will continue to change as these projects are completed and new certifications obtained.

Assets a Risk

Regional San has identified the following assets in Table M-14 as those potentially affected from a levee failure event.

Table M-14 Regional San Assets at Risk in the X Protected by Levee Zone

Facility #	Facility Name	Asset Value (1)
N11	City Interceptor Valve Structure	$2,433,306
N12	City Interceptor Oxygen Structure	$2,433,306
RG08	Roller Gate Structure 8 (N17-RG0024A)	$1,824,979
RG10	Roller Gate Structure 10 for Sump 82 (N17-SG0015B)	$1,459,983
N16	Northeast Siphon Outlet Structure	$8,516,570
N29	Sump 2/2A Sewage Pumping Station	$8,304,103
N35	Sump 76 Sewage Pumping Station	$3,308,012
N52	Power Inn Sewage Pumping Station	$7,886,866
X009	SRWTP Outfall	$13,756,812
FM067	SRWTP City Interceptor Inflow Flow Meter	$486,661
FM166	Freeport Flow Meter	$486,661
N13	City Interceptor Air Intake Structure	$1,824,979
N41	City Water Line to the SRWTP	$425,829
N27	Sump 55 Sewage Pumping Station	$15,195,322
N28	Sump 119 Sewage Pumping Station	$14,612,029
FM050	SRWTP Water Reclamation Flow Meter	$243,331
FM075	SRWTP Laguna/Elk Grove Trunk Inflow Flow Meter	$729,992
RG02	Roller Gate Structure 2 (N24-RG0008A)	$2,433,306
RG04	Roller Gate Structure 4 (N21-RG0044A)	$3,041,632

Facility #	Facility Name	Asset Value (1)
RG09	Roller Gate Structure 9 (N33-RG0017A)	$1,094,988
S29	Mission Trunk Control	$948,989
FM398	Santa Anna McClellan Flow Meter	$60,832
N43	Roseville/Watt Liquid Waste Disposal Facility	$3,575,531
	Total	**$95,094,970**

Source: Regional San Finance, Engineering, and Policy and Planning Offices

(1) Asset value includes facility, site structures, site equipment, mobile equipment, miscellaneous items that may have soft cost components, some associated adjacent pipeline components. Values taken from Regional San 2010 Comprehensive Annual Financial Report, and engineering project reports for the 2011 LHMP. Asset values for the 2016 LHMP update have been escalated 4% per year for inflation.

Critical Facilities at Risk

The Regional San critical facility inventory was overlayed on the Sacramento and Yolo Counties DFIRM - X Protected by Levee hazard layer using GIS. Facility locations that were within the hazard area were selected and sorted by critical facility definition category; the summary results of this analysis are show in Table M-15. A detailed critical facility table is included in the base plan as Appendix E; the levee failure hazard column on the right-hand side of that table denotes whether a particular facility is considered to be vulnerable to that hazard.

Table M-15 Regional San Critical Facilities at Risk in the X Protected by Levee Zone

Critical Facility Definition	Count
Essential Services Facilities	22
High Potential Loss Facility	1
Transportation & Lifeline	0
Total	**23**

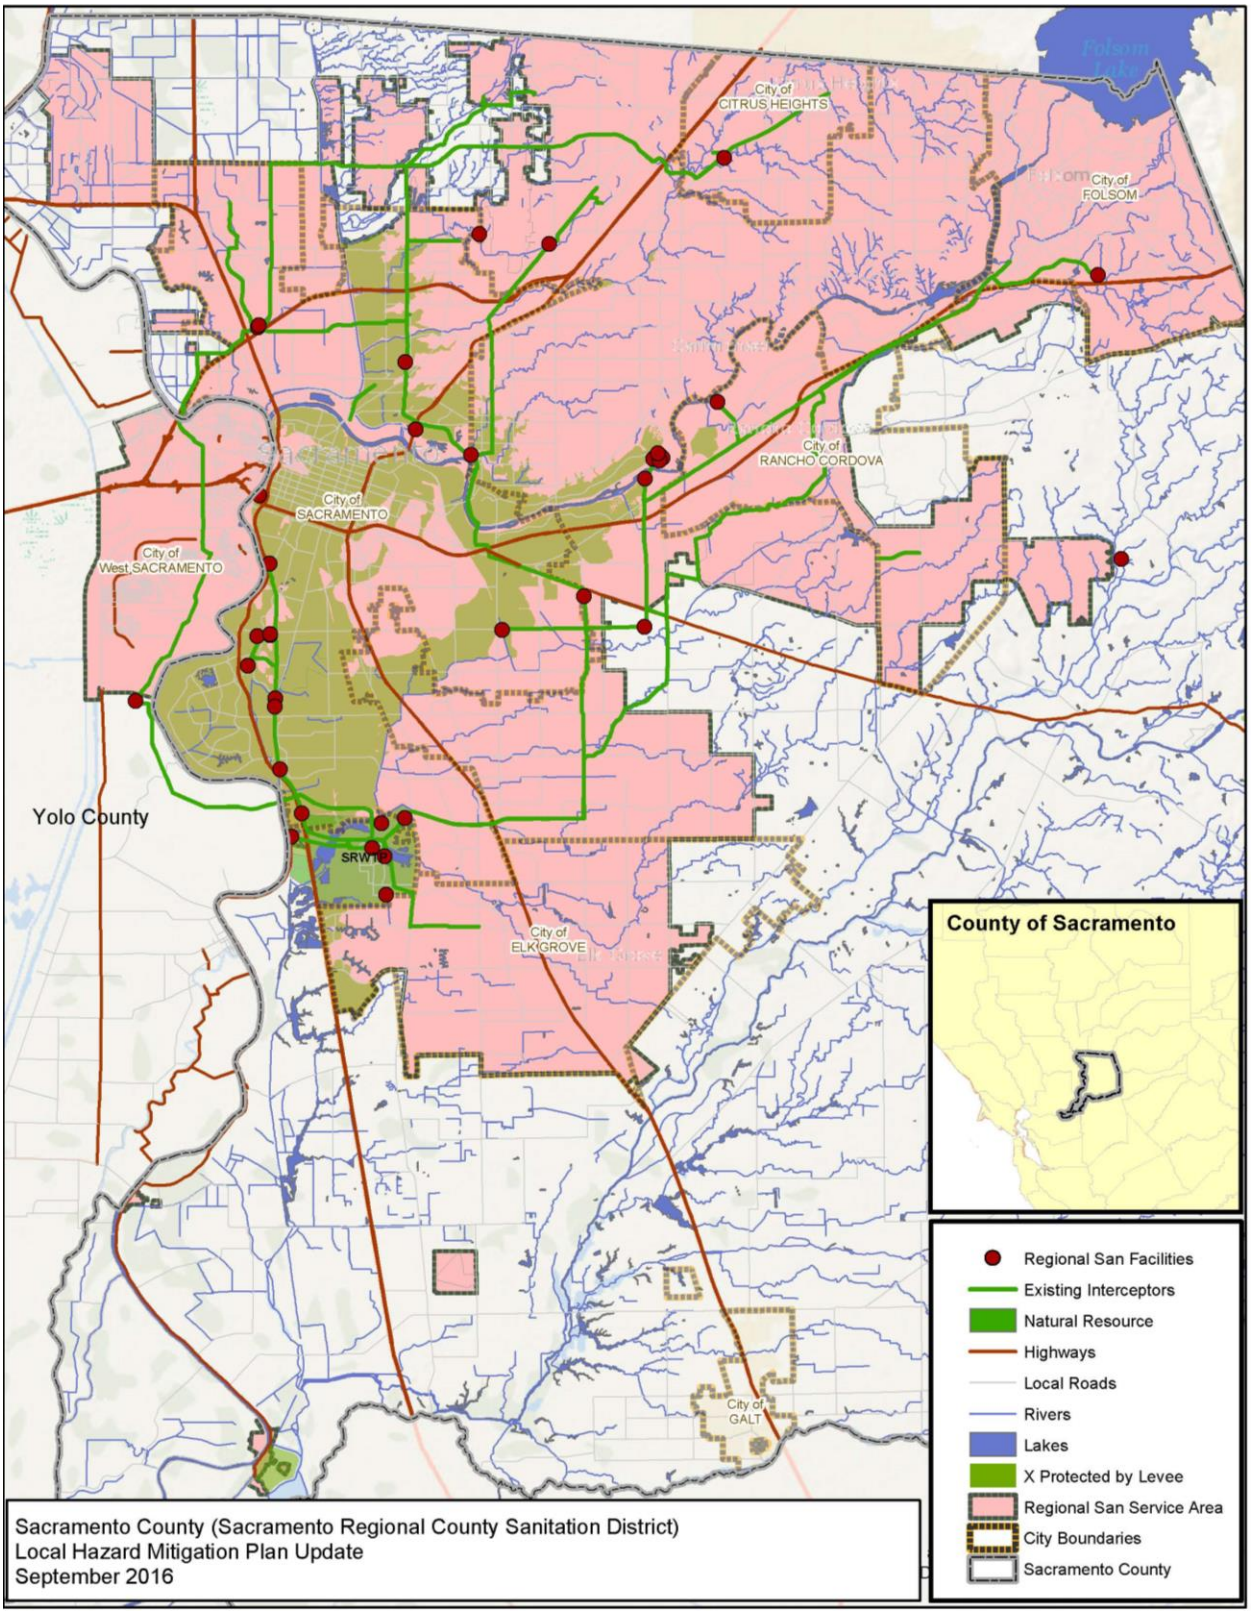
Figure M-8 Regional San Critical Facilities in the X Protected by Levee Zone



Source: Regional San

Natural Resources at Risk

The Sacramento Regional County Sanitation District has significant historical, cultural, and natural resources located throughout the Bufferlands as described in other sections of this document. Those assets include the Bufferlands, Sims Ranch, Nicolaus Dairy,South River Pump Station Habitat Area, and Regional San Architectural Site CA-SAC-83. Each of these sites is subject to damage during a flood event including floodwater inundation, erosion, structure and site damage, loss of vegetation and habitat, loss of species. A vulnerability assessment analysis for each individual site was not performed.

Historic and Cultural Resources at Risk

The Planning Team noted that the Nicolaus Dairy and Sims Ranch would both be at risk to levee failure flooding.

Future Development

No development is anticipated by the Regional San Planning Team.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Regional San has identified areas and District assets at risk to wildfire. The Bufferlands and the Sims Ranch structures are susceptible to wildfire and Regional San has a plan to mitigate those risks.

Past Occurrences

Regional San Bufferlands: The Bufferlands are subject to periodic grassfires which are extinguished by local firefighters. Damage estimates typically range from $1,000 to $5,000. Although the Bufferlands is not classified as a critical facility, it provides sensitive environmental habitat for many species and contains several historical buildings.

Nicolaus Dairy and Sims Ranch: There have not been any recorded fires affecting these historic structures, but since they are surrounded by native grasses they are subject to fires during the seasonally dry months.

Vulnerability to Wildfire

Assets a Risk

Regional San has identified the following assets in Table M-16 as being potentially affected from a wildfire event.

Table M-16 Regional San Assets at Risk in the Wildfire Threat Zone

Facility #	Facility Name	Asset Value (1)
Little or Moderate Fire Threat		
–	Regional San Bufferlands (2,650 acres)	$10,028,251
–	Historic Sims Ranch	(2)
–	Historic Nicolaus Dairy	(2)
–	Regional San Biological Site CA-SAC-83	(2)
Moderate Fire Threat		
N11	City Interceptor Valve Structure	$2,433,306
N12	City Interceptor Oxygen Structure	$2,433,306
N15&N16	Northeast Siphon	$8,516,570
N36	Sump 82 Sewage Pumping Station	$2,975,264
FM166	Freeport Flow Meter	$486,661
N41	City Water Line to the SRWTP	$425,829
FM050	SRWTP Water Reclamation Flow Meter	$243,331
RG02	Roller Gate Structure 2 (N24-RG0008A)	$2,433,306
RG04	Roller Gate Structure 4 (N21-RG0044A)	$3,041,632
S29	Mission Trunk Control	$948,989
N40	Iron Point Sewage Pumping Station	$13,011,990
FM398	Santa Anna McClellan Flow Meter	$60,833
N43	Roseville/Watt Liquid Waste Disposal Facility	$3,575,531
FM003	SRWTP South Trunk Inflow Flow Meter	$1,094,988
N20	Arden Fall Structure Bypass	$2,798,302
RG05	Roller Gate Structure 5 (N21-RG0028A)	$3,041,632
RG11	Roller Gate Structure 11 (Bradshaw-Central Junction Structure)	$2,433,306
FM066	SRWTP Bradshaw/Central Interceptor Inflow Flow Meter	$2,433,306
FM339	SRWTP Central Trunk Inflow Flow Meter	$729,992
RG07	Roller Gate Structure 7 (N21-RG0007A)	$3,041,632
N51	New Natomas Sewage Pumping Station	$89,631,950
S30	Old Natomas Sewage Pumping Station	$4,006,130
S55	Northeast Sewage Pumping Station	$1,092,551
RG06	Roller Gate Structure 6 (N21-RG0014A)	$2,433,306
N50	South River Sewage Pumping Station	$103,501,785
Total		**$266,853,676**

(1) Asset value includes facility, site structures, site equipment, mobile equipment, miscellaneous items that may have soft cost components, some associated adjacent pipeline components. Values taken from Regional San 2010 Comprehensive Annual Financial

Report, and engineering project reports for the 2011 LHMP. Asset values for the 2016 LHMP update have been escalated 4% per year for inflation.

(2) Costs for these sites have not been estimated.

Critical Facilities at Risk

The Regional San critical facility inventory was overlayed on the Sacramento and Yolo Counties wildfire hazard layer using GIS. Facility locations that were within the hazard area were selected and sorted by critical facility definition category and key asset type; the summary results of this analysis are show in Table M-17. A detailed critical facility table is included in the base plan as Appendix E; the wildfire hazard column on the right-hand side of that table denotes whether a particular facility is considered to be vulnerable to that hazard.

Table M-17 Regional San Critical Facilities in the Wildfire Threat Zone

Critical Facility Category	Fire Threat	Count
Historical Sites with multiple structures	Little or Moderate	1
Cultural Sites	Little or Moderate	2
Natural Resources (Bufferlands)	Little or Moderate	2,650-acre
Essential Services Facilities	Little or No Threat	18
Essential Services Facilities	Moderate	25
Essential Services Facilities	High	0
Essential Services Facilities	Very High	0
High Potential Loss Facility	Little or No Threat	0
High Potential Loss Facility	Moderate	0
High Potential Loss Facility	High	0
High Potential Loss Facility	Very High	0

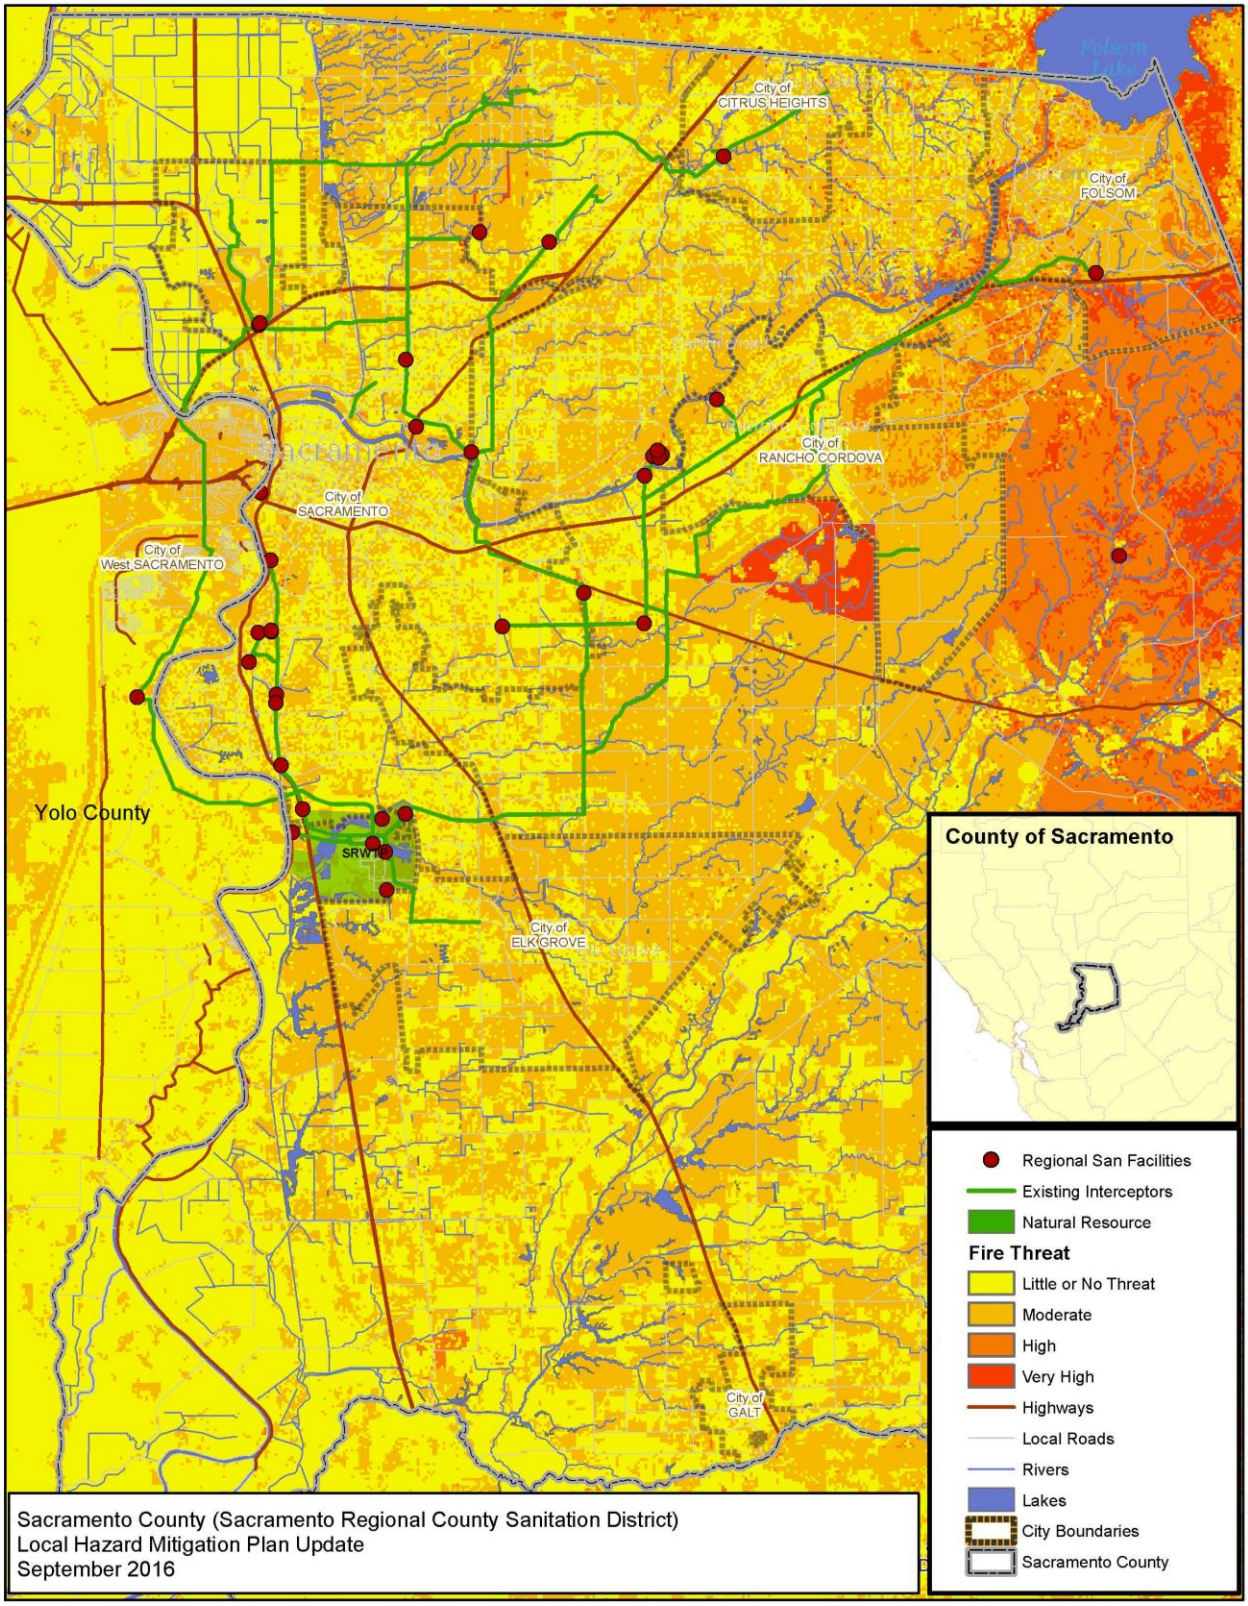
Figure M-9 Regional San Fire Threat and Critical Facilities



Source: Regional San

Natural Resources at Risk

The Sacramento Regional County Sanitation District has significant historical, cultural, and natural resources located throughout the Bufferlands. Vulnerability analysis of these individual resources specific to wildfire loss was not performed.

Historic and Cultural Resources

The Planning Team noted that the Nicolaus Dairy and Sims Ranch would both be at risk to wildfire.

Future Development

None anticipated by the Regional San Planning Team.

M.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

M.6.1. Regulatory Mitigation Capabilities

Table M-18 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the Regional San.

Table M-18 Regional San's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y	Regional San Emergency Response Plan (October 2009) SRWTP Flood Response Manual (October 2007) Sanitary Sewer Overflow Response Plan for Interceptor System (September 2007)
Capital Improvements Plan	Y	Rate and Fee Study (2009 and 2011) Capital Funding Needs Projections (Annual) SRWTP 2020 Master Plan 2000 Interceptor Master Plan 2009 Interceptor Sequencing Stud
Economic Development Plan	N	
Local Emergency Operations Plan	Y	SRWTP Administrative Operating Procedures (2011)
Continuity of Operations Plan	N	
Transportation Plan	N	

Stormwater Management Plan/Program	Y	Regional San requires compliance with Sacramento County Standard Construction Specifications Stormwater Compliance sections and State Water Resources Control Board Construction General Permit, Order 2009-0009-DWQ and Industrial General Permit, State Water Board Order No. 97-03-DWQ
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y	Regional San Flood Risk Evaluation for the South River Pump Station South River Pump Station Emergency Response Plan Pump Station Protection Plan for the South River Pump Station Flood Protection Project Draft Report
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	Y	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	Y	Rating: 3/9 (urban/rural)
Site plan review requirements	Y	Work in conjunction with the Sacramento Area Sewer District and other local jurisdictional authorities to review site plans to ensure code compliance for building, mechanical, plumbing, etc and to ensure compliance with local ordinances. County of Sacramento Construction Management and Inspection Division services are utilized during construction to ensure continued compliance.
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	Y	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	Y	Require compliance with Sacramento County Standard Construction Specifications Erosion and Sediment Control Compliance sections State Water Resources Control Board Construction General Permit, Order 2009-0009-DWQ
Other	Y	Use design standards for facilities. These standards include items such as fire protection systems, building alarms, etc. These standards are shown in Sewage Pump Station Design Manual (Feb ;2005); Interceptor Design Manual (October 2003); and SRWTP Guide Specifications (2006/07).

How can these capabilities be expanded and improved to reduce risk?

Source: Regional San

SCRSD Emergency Response Plan

The purpose of this Emergency Response Plan (ERP) is to provide the District with a response and recovery protocol to prepare for, minimize, and mitigate injury and damage resulting from emergencies or disasters of man-made or natural origin, while ensuring continuity of treatment plant and interceptor sewer collector system operations. This plan assigns roles and responsibilities to individuals for managing emergency response and support services. The ERP documents the steps needed to ensure reliable conveyance and treatment of wastewater during an emergency event. The ERP assists in meeting the following objectives:

- Provide for a safe and coordinated response to emergencies
- Ensure effective communication between local or regional responders to an emergency
- Ensure continuity of the wastewater collection system and treatment process
- Minimize wastewater system damage
- Minimize adverse effects on the environment
- Minimize negative impacts on public health and employee safety

SRWTP Flood Response Manual

The SRWTP Flood Response Manual was created in 1997 and is updated periodically to maintain up to date flood response procedures. The document provides recommended actions for possible flood scenarios at SRWTP. The document is meant to provide preventative measures to help prevent flooding of SRWTP as well as response procedures for responding to unavoidable flood situations. The plan contains recommended actions to help prevent the SRWTP from flooding and to minimize damages when preventing flooding is not possible. Each flood alert state has corresponding flood response actions.

Sanitary Sewer Overflow Response Plan

The Sanitary Sewer Overflow (SSO) Response Plan for the Interceptor System identifies measures to protect public health and the environment. It contains important information and resources that will be used during and after an SSO occurrence. The purpose of this plan is to identify the necessary procedures for notification, response, reporting, and clean-up of SSOs that may occur within the Interceptor System. Additionally, the document attempts to improve communication between satellite agencies and Regional San through the development and implementation of the practices described in this report.

Sewage Pump Station Design Manual

This manual was prepared as for use as an overall criteria or standard to ensure consistency for pump station design projects. The manual provides guidance for the most effective design practices for new pumping stations and is intended to:

- Establish design guidelines for new pump stations in interceptor conveyance and local trunk collection systems,
- Identify design functions required by a pump station design consultant,

- Provide an acceptable level of quality and uniformity in pump station design,
- Provide design consistency.

Interceptor Design Manual

The Regional San Interceptor Design Manual is used for design and construction of the interceptor system including ancillary components. This manual provides guidelines that are used for interceptor projects such as pipe design criteria, hydraulic analysis, geotechnical reports, right of way recommendations, surveying, construction techniques and materials, inspection, safety, project management and administration, and other topics that are standard to the Districts interceptor pipe projects. The manual provides clear guidance and direction for interceptor projects to set forth working relationships among the parties involved in the projects, establish criteria that will result in acceptable levels of quality and uniformity in procedure and finished project, and obtain cost savings in production of design and construction.

SRWTP Guide Specifications

The guide specifications provide standards for construction projects at the Sacramento Regional Wastewater Treatment Plant (SRWTP). These specifications provide guidance on bidding, contractor experience requirements, equipment and materials, general conditions, coordination with existing operations, etc. The guide specifications ensure that construction projects are completed so as to conform with SRWTP standards.

2000 Interceptor Master Plan

Long range planning is essential to managing expansion of the regional wastewater system in a cost-effective manner. Construction typically occurs only in response to actual growth and facilities constructed will have a projected 50-100 year service life. The Interceptor Master Plan is based on the master plans of surrounding cities, counties and communities within the service area. The Master Plan is intended to be a planning level tool to provide long term guidance for timely commitment of resources.

Flood Risk Evaluation for the South River Pump Station

This study included an evaluation and analysis of the pump station including a comprehensive evaluation of the current level of flood protection at the South River Pump Station and analysis of alternatives for improvements to provide additional flood protection. The study evaluated the impacts of the 100 and 200-year storm events caused by local flooding and levee failure on the Sacramento River in the vicinity of the South River Pump Station. The study also provided an assessment of potential damage to the facility caused by flooding.

South River Pump Station Emergency Response Plan

This plan provides the District with preparation and response procedures to ensure continued operation of the South River Pump Station in the event of major or minor flooding events.

West Sacramento Emergency Flow Plan

This plan provides procedures for operation of the South River Pump Station during flood events to maintain sewer service to the City of West Sacramento.

M.6.2. Administrative/Technical Mitigation Capabilities

Table M-19 identifies the department(s) responsible for activities related to mitigation and loss prevention for Regional San

Table M-19 Regional San's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission		
Mitigation Planning Committee		
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)		
Mutual aid agreements		
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	Y	
Community Planner	Y	
Civil Engineer	Y	
GIS Coordinator	Y

M.6.4. Mitigation Education, Outreach, and Partnerships

Table M-21 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table M-21 Regional San's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

M.6.5. Other Mitigation Efforts

Regional San will participate as required during activation of the Sacramento County Office of Emergency Services for local and emergency events to assist in emergency coordination and intends to look for funding required to continue and complete projects identified that are necessary to protect Regional San assets to allow continued service to local communities.

Some of Regional San's past or current hazard mitigation projects include:

- South River Pump Station Low Level Flood Protection Project: In 2009, Regional San completed a temporary flood mitigation project for the South River Pump Station (SRPS) located in Yolo County. When the SRPS was designed and constructed, the SRPS was shown on the Yolo County FIRM to be in the 500-year floodplain. Shortly afterwards, the surrounding levees were re-evaluated and the SRPS is now shown in the 100-year flood plain. The temporary flood mitigation project for the SRPS consisted of constructing a sealed, custom (no holes) 2-foot 8-inch K-Rail wall around the pump station perimeter at an estimated cost of $76,000. This temporary mitigation is effective against low-level flooding (i.e., 8 to 12 inches of water depth).
- Bufferlands Fire Break Maintenance (ongoing): Annually by the end May, Regional San uses a combination of mowing and disking to establish firebreaks on the Bufferlands as a fire control measure. The firebreak widths vary from 30-60 feet depending on the habitat types and fire risks.

M.7 Mitigation Strategy

M.7.1. Mitigation Goals and Objectives

Regional San adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

M.7.2. Mitigation Actions

The planning team for Regional San identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and

administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. South River Pump Station Flood Protection Project

Hazards Addressed: Flooding, Levee Failure

Goals Addressed: 1, 2, 3, 4

Issue/Background: The South River Pump Station (SRPS) is located at 30030 South River Road in Clarksburg, CA, in an undeveloped agricultural basin immediately south of the southern boundary of the City of West Sacramento in Yolo County. It was placed in service in 2007 and is a critical facility that provides service to West Sacramento and the northern portions of Sacramento County.

Changes in federal levee design and assessment criteria have impacted the overall protection ratings for levees in the Sacramento region. Although the exact level of flood protection is not known, based on previous studies in the region it is estimated that the SRPS basin has less than a 100-year level of flood protection.

Project Description: The SRPS Flood Protection Project will construct a new 200-year level of flood protection ring levee and a raised all weather access road for the facility. The ring levee and raised access road will consist of 22-foot-high, 160 feet wide bottom width, earthen embankment that will surround the SRPS and provide access from South River Road in the event that flooding occurs. The project requires 400,000 cubic yards of borrow material.

Other Alternatives:

- Do Nothing; unacceptable
- Wait for improvements to Sacramento River Levee in the area; unacceptable

Existing Planning Mechanisms through which Action will be Implemented: This project is listed on Regional San's capital improvements for implementation in 2017.

Responsible Office: Regional San Engineering

Priority (H, M, L): High

Cost Estimate: $10,000,000 for design, permitting, and construction

Potential Funding: FEMA grants

Benefits (avoided Losses): This pump station serves West Sacramento and the northern portions of Sacramento County. Loss of the SRPS due to flood would be catastrophic.

Schedule:

- Advertise for bid December 2016

- Award Contract February 2017
- Start Construction May 2017
- Complete Construction October 2017

Action 2. Reduction of Fire Hazard SRCSD Bufferlands

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: Hot, dry summers increase the likelihood of wildfire on the Bufferlands area surrounding the Sacramento Regional Wastewater Treatment Plant. While much of the habitat of the Bufferlands is fire adapted, high fuel loads associated with the prevalent annual herbaceous vegetation on the property puts some habitats, crops, and infrastructure at risk. To minimize the risk of wildfire on the Bufferlands, SRCSD annually establishes firebreaks between public roads and sensitive resources. Firebreaks are either disked to bare ground at a width of 30 feet or mowed to height of 4-inches or less at a width of 100 feet. Grazing leases are utilized to reduce summer fuel loads on a large portion of SRCSD upland habitat. Through lease agreements, SRCSD requires that agricultural tenants be responsible for establishing fire breaks around their sensitive crop areas.

Other Alternatives: None

Existing Planning Mechanisms through which Action will be Implemented: Annual O&M Planning.

Responsible Office: SRWTP Bufferlands Office

Priority (H, M, L): Medium

Cost Estimate: $50,000 annually

Benefits (Losses Avoided): Avoids fire damage to grasslands, tree mitigation lands, sensitive habitat area, crops, infrastructure.

Potential Funding: SRCSD funded annually. Tenants required to fund mitigation on tenant-occupied land.

Schedule: Annually.

Annex N Sacramento Area Sewer District

N.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Sacramento Area Sewer District (SASD), a new participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the Sacramento Area Sewer District. This Annex provides additional information specific to SASD, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

N.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), SASD formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table N-1. Additional details on plan participation and SASD representatives are included in Appendix A.

Table N-1 SASD Planning Team

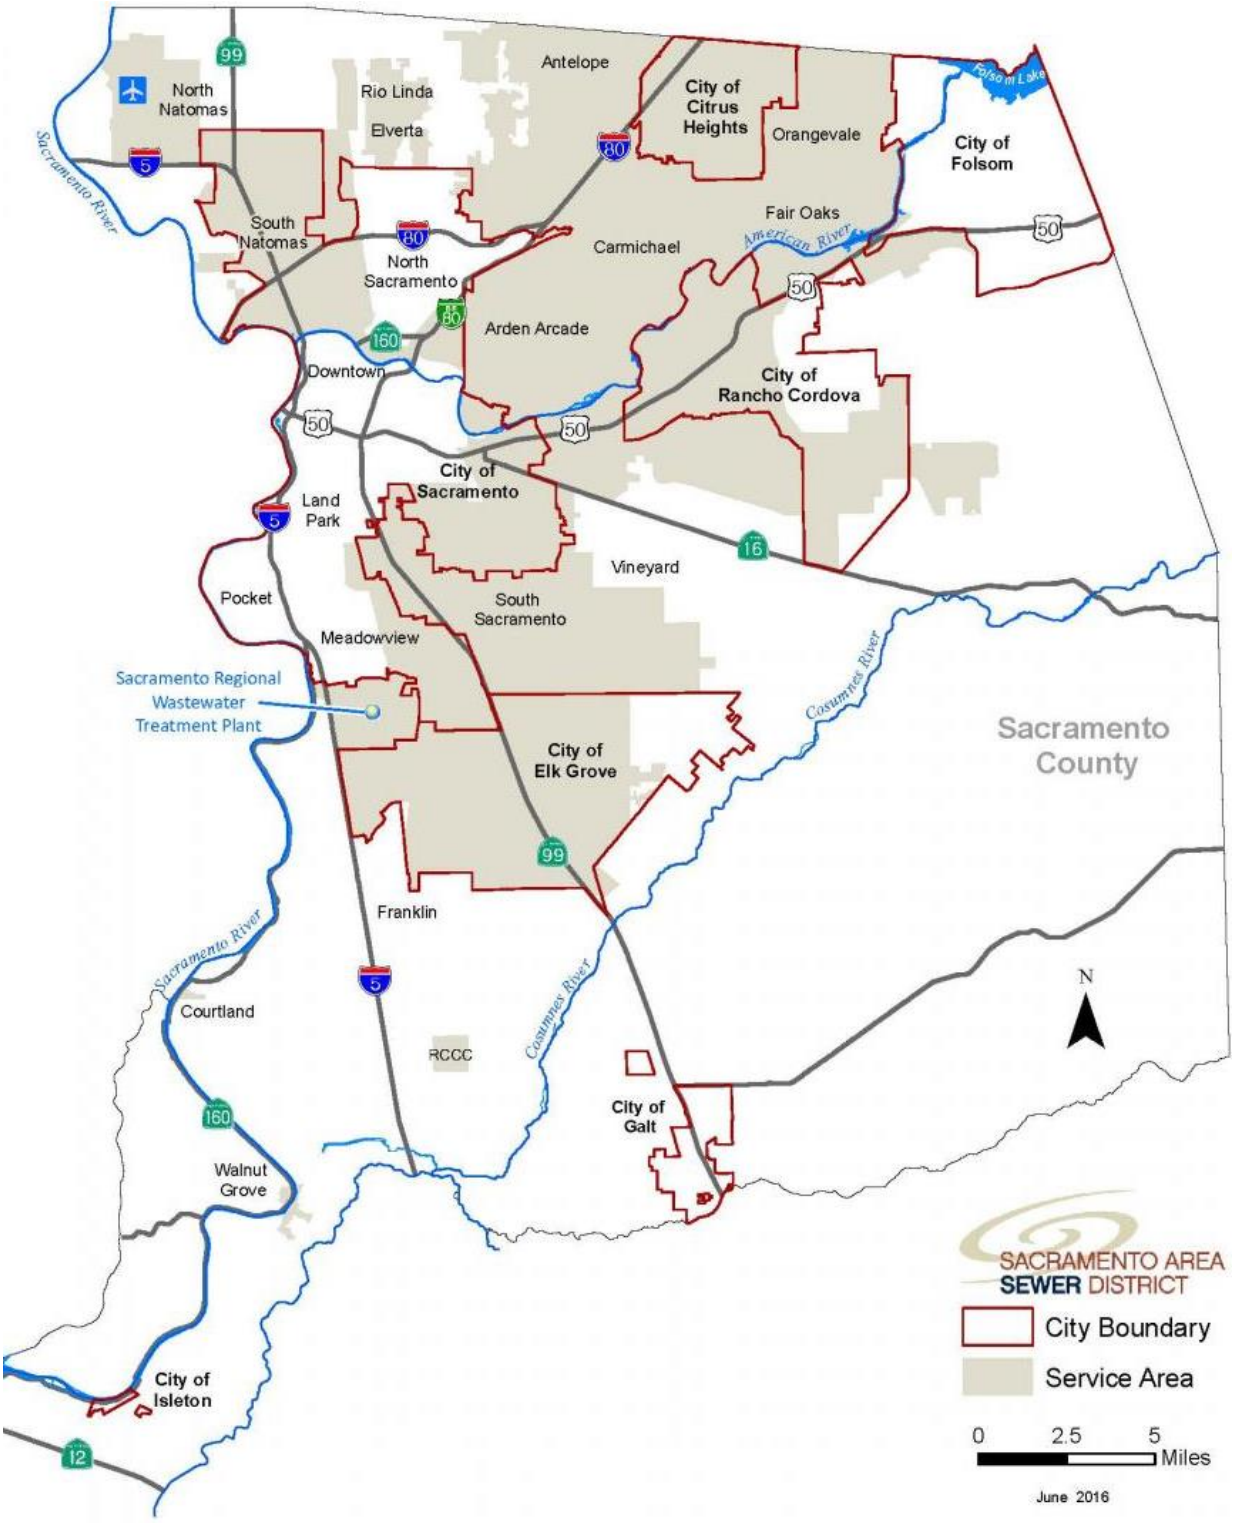
Name	Position/Title	How Participated
Matthew Doyle	Safety & Regulatory Compliance Manager	Gathered Information, Main point of contact, met with Engineering and M&O for data collection
John Hough	M&O Assistant Superintendent	Gathered Service Map, reviewed documents
Patrick Schroeder	Principle Engineer	Attended meeting, Reviewed documents
Raul Rodriguez	GIS Analyst III	GIS Mapping data
Steve Nebozuk	Civil Engineer	Attended HMPC meetings

Source: SASD

N.3 Community Profile

The community profile for SASD is detailed in the following sections. Figure N-1 displays a map and the location of SASD boundaries within Sacramento County.

Figure N-1 Sacramento Area Sewer District Map



Source: SASD

N.3.1. District Overview, History, and Background

The SASD is a sewer utility providing service to more than one million people in the Sacramento region, including the unincorporated areas of Sacramento County; the cities of Citrus Heights, Rancho Cordova, and Elk Grove; as well as portions of the cities of Folsom and Sacramento. The District serves residential, commercial and industrial customers.

SASD owns and operates thousands of miles of lower lateral and main line pipes and is responsible for the day-to-day operations and maintenance of these sewer pipes. Once collected in the system, sewage flows into the Regional San interceptor system, where it is conveyed to the Sacramento Regional Wastewater Treatment Plant near Elk Grove.

SASD was formed in 1978 and is governed by a 10-member Board of Directors representing the various city and county jurisdictions in the District's service area.

N.4 Hazard Identification

SASD's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to SASD (see Table N-2).

Table N-2 SASD—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Limited	Likely	Critical	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change				
Dam Failure	Significant	Unlikely	Catastrophic	High
Drought and Water Shortage	Extensive	Likely	Limited	Low
Earthquake	Limited	Occasional	Critical	Medium
Earthquake: Liquefaction				
Flood: 100/200/500-year	Significant	Occasional	Critical	High
Flood: Localized Stormwater Flooding	Limited	Highly Likely	Limited	Medium
Landslides	Limited	Unlikely	Negligible	Low
Levee Failure	Significant	Likely	Critical	High
River/Stream/Creek Bank Erosion	Limited	Highly Likely	Limited	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Likely	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Negligible	Low
Severe Weather: Fog	Extensive	Highly Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Limited	Low
Severe Weather: Wind and Tornadoes	Limited	Likely	Limited	Medium
Subsidence	Significant	Highly Likely	Limited	Low
Volcano	Limited	Unlikely	Limited	Low
Wildfire:(Burn Area/Smoke)	Limited	Likely	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

N.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile SASD's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Hazard Profiles and Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to SASD is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

N.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section N.5.3, includes a description as to how the hazard affects the SASD and information on past occurrences. The intent of these section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

N.5.2. Vulnerability Assessment

This section identifies SASD's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table N-3 lists particular critical facilities and other District assets identified by the SASD's planning team as important to protect in the event of a disaster. SASD's physical assets, valued at over $990 million, consist of the buildings and infrastructure to support the SASD operations.

Table N-3 SASD's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
SACY	Essential	10060 Goethe Rd Sacramento	$60,600,000	Minimal flood, airplane crash, fire

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
NACY	Essential	5026 Don Julio Sacramento	$26,800,000	Minimal flood, fire
Main Lines	Essential	3,000 miles of pipelines	$2,930,400,000	Minimal earthquake
Lower Laterals	Essential	1,400 miles of pipelines	$1,704,300,000	Minimal earthquake
Manholes	Essential	60,880 manholes	$1,704,300,000	Minimal earthquake
Pump Stations	Essential	105 pump stations	$97,200,000	Minimal fire, flood, earthquake

Source: SASD

Natural Resources

The District Planning Team noted Sacramento River, American River, creek habitats, and vernal pools are natural resources located in District boundaries.

Historic and Cultural Resources

The District Planning Team noted the City of Locke as a historic resource.

Growth and Development Trends

Population growth will accelerate over the next 5 years. Annual growth in the 2011 to 2016 period averages 1.5 percent per year.

N.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table N-2 as high or medium significance hazards. Impacts of past events and vulnerability of the SASD to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee and dam inundation areas. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

An estimate of the vulnerability of the SASD to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–High

Hazard Profile and Problem Description

Dam failures can result from a number of natural or manmade causes such as earthquakes, erosion of the face or foundation, improper siding, rapidly rising flood waters, structural/design flaws, and deliberate human actions. Folsom Dam is the major dam which affects the SASD and the populations in the inundation areas. Folsom Dam is owned by the US Bureau of Reclamation. The flood waters from a dam failure would likely affect the SASD's service area. Flood waters could inundate sewer pump stations, regional collector pipes, underground structures, and equipment, resulting in the inability to access or operate SASD's facilities within the flooded areas. A severe flood could jeopardize the operation of the regional sewer treatment plant. Access to the regional sewer treatment plant, affected pipe systems and pump station facilities to assess and restore operation could be limited until such time that the flood waters receded.

The ability to warn downstream communities in the event of a flood event caused by a dam failure is generally dependent on conditions such as the frequency of inspections for the dam's structural integrity, the flood wave arrival time (the time it takes for the flood wave to reach its maximum distance of inundation), or the ability to notify persons downstream and their ability to evacuate or take preventative actions to minimize damage to utilities or infrastructure. The existence and frequency of updating and exercising an evacuation plan that is site-specific assists in warning and evacuation functions.

A dam failure will cause loss of life, damage to property, and other ensuing hazards, as well as the displacement of persons residing in the inundation path. Damage to sewer collection, conveyance and treatment facilities would likely impact communities outside the immediate hazard areas by disrupting sewer collection and treatment services.

Past Occurrences

The District Planning Team noted no past occurrences of dam failure to affect SASD.

Vulnerability to Dam Failure

Assets/Critical Facilities at Risk

According to the Sacramento County General Plan Background report, there are four major and two minor dams which, if they fail, may impact the people and resources of this District. The major dams are comprised of Shasta on the Sacramento River, Oroville on the Feather River, Comanche on the Mokelumne River, and Folsom on the American River. The minor dams include Nimbus and Rancho Seco. SASD has no records indicating that previous dam failures have impacted its assets.

Scenario for Evaluating Values at Risk

Sacramento County provided inundation as a GIS layer for the Folsom Dam system, as part of the following breaks:

- Folsom Right Wing
- Folsom Mormon
- Folsom Dike 4
- Folsom Dike 5
- Folsom Dike 6
- Folsom Dike 7
- Folsom Dike 8
- Folsom Dam

Description of Folsom Dam Facilities

The Folsom Dam and Reservoir Project is located on the American River, about 20 miles upstream of the City of Sacramento, California. I t was designed and built by the Corps of Engineers during the period 1948 to 1956, and is now owned and operated by the U.S. Bureau of Reclamation. The reservoir has a storage capacity of 1 million acre-ft at gross pool. The project includes about 4.5 miles of man-made water retaining structure that has a crest elevation of 480.5 ft above sea level.

Purpose of Study

As described in Section 4.3.6 of the based plan, the Bureau of Reclamation performed a study in an attempt to determine the magnitude of flooding that would result from various breach scenarios of structures located around the reservoir. The structures are Folsom Dam itself, its right wing dam, dikes 4, 5, 6, 7, 8, and Mormon Island. The results of hydrodynamic simulations are used to generate potential inundation maps that can aid in the development of emergency actions plans.

Assets at Risk

SASD has identified the following assets in Table N-4 as being potentially affected if the Folsom Dam were to have a catastrophic failure.

Table N-4 SASD Assets and Values at Risk in the Folsom Dam Inundation Zone

Facility #	Facility Name	Asset Value(1)
S43	Rio Linda	$560,000
S53	Rio Linda Woods	$560,000
S125	Northborough	$1,200,000
S018	Westgate	$560,000
S139	Gateway	Just used as a flow through
S067	Landis	$560,000
S084	Rivergate	$560,000
S051	Larchmont Butterfield	$560,000
S006	American River Dr.	$560,000
S050	Goethe Rd	$560,000
S079	College Town	$680,000
S036	Alder Creek	$560,000
S129	Fruitridge Center	$4,700,000
S022	Antelope Village Unit #1	$560,000
S112	Parkway Greens	$560,000
S009	Rivergreen Ranch	$560,000
S002	Antelope North Area	$2,100,000
S054	Antelope Vista	$560,000
S080	Sunview	$560,000
S091	Mountain Ave	$560,000
S046	Woodgate #1	$560,000
S026	Northgate #5	$560,000
S110	Westborough Village #2	$560,000
S034	Mills Park	$560,000
S101	Bazely	$560,000
S100	Lemay	$560,000
S039	Routier Rd	$810,000
S107	Mather	$560,000
S099	Elder Creek	$801,000
S032	Rosemont	$2,000,000
S059	Arden Gold	$1,900,000
S111	Laguna-Stonelake	$1,200,000
S048	Whyte Ave	$7,500,000
S004	Country Club Cove	$560,000
S011	Bridge	$850,000
S001	Northbrook	$560,000

Facility #	Facility Name	Asset Value(1)
S082	Butterfield	Retired
S041	Willow Creek	$560,000
S090	West La Loma Pump Station	$810,000
S077	Capitola Pump Station	$560,000
S005	Arden and Fulton Pump Station	$560,000
S028	River Gardens Pump Station	$560,000
S124	College Oak Drive Pump Station	$810,000
S007	Tributary Point Unit #1 Pump Station	$560,000
S128	Bear Hollow Pump Station	$560,000

S071	Zinfandel Dr	$1,700,000
S150	Center Parkway	$810,000
S073	Sailor Bar	$2,400,000
S066	Bannister	$1,200,000

Source: SASD Finance Office, SASD Engineering, SASD Policy and Planning

(1) Asset value includes facility, site structures, site equipment, mobile equipment, miscellaneous items that may have soft cost components, some associated adjacent pipeline components. Values taken from SASD 2010 Comprehensive Annual Financial

Critical Facilities at Risk

The SASD critical facility inventory was compared with the Folsom Dam failure inundation layer using GIS. Facility locations that were within the hazard area were selected and sorted by critical facility

definition category; the summary results of this analysis are show in Table N-5. A detailed critical facility table is included in the Base Plan as Appendix E. The dam failure hazard column on the right-hand side of Appendix E denotes whether a particular facility is considered to be vulnerable to dam failures.

Table N-5 SASD Critical Facilities at Risk in the Folsom Dam Inundation Zone

Critical Facility Definition	Count
Essential Services Facilities	67
High Potential Loss Facility	0
Transportation & Lifeline	0
Total	**67**

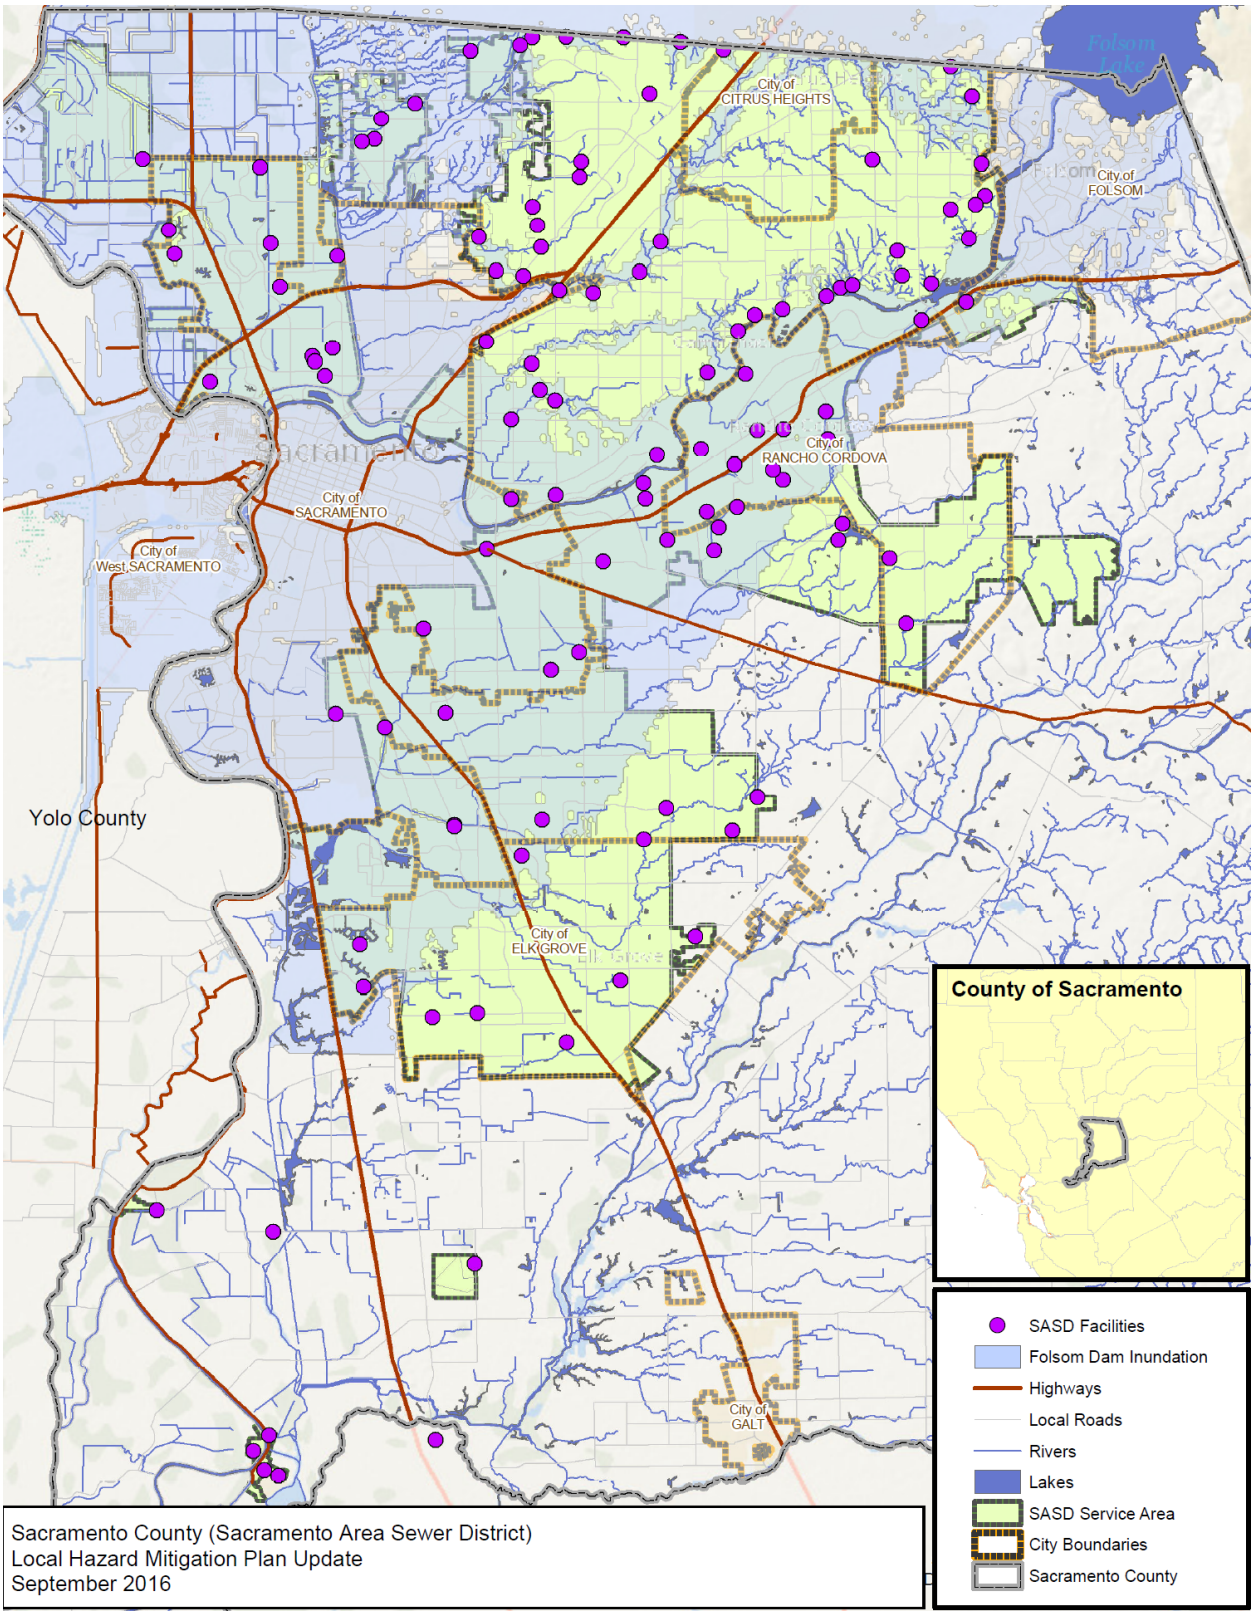
Figure N-2 SASD Critical Facilities in the Folsom Dam Inundation Area



Source: SASD

Natural Resources at Risk

The District Planning Team noted that the American River, Folsom Reservoir, Consumnes River, Sacramento River, and numerous creeks are natural resources in the District at risk from dam failure.

Historic and Cultural Resources at Risk

The District Planning Team noted no historic or cultural resources at risk in the District from dam failure.

Future Development

Any future development that falls in the Folsom Dam Inundation Area identified in Figure N-2.

Earthquake

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

SASD facilities are in a low risk area with no history of damage due to earthquakes.

Past Occurrences

There are no past occurrences affecting District SASD facilities.

Vulnerability to Earthquake

Assets/Critical Facilities at Risk

SASD assets at risk are pump stations, force mains, main lines, manholes, lower laterals, North Area Corp Yard, and the South Area Corp Yard.

Future Development

There is no additional risk to future development than what currently exists.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Major surface waters in the vicinity of the SASD service area include the American River, Nimbus Reservoir, Folsom Reservoir, Lake Natoma, the Sacramento River, and the Consumnes River. In the SASD service area, the potential for flood damage would occur in the floodplains of the American River,

Sacramento River, Cosumnes River, Mokelumne River, Laguna Creek, Morrison Creek, Dry Creek and Strawberry Creek.

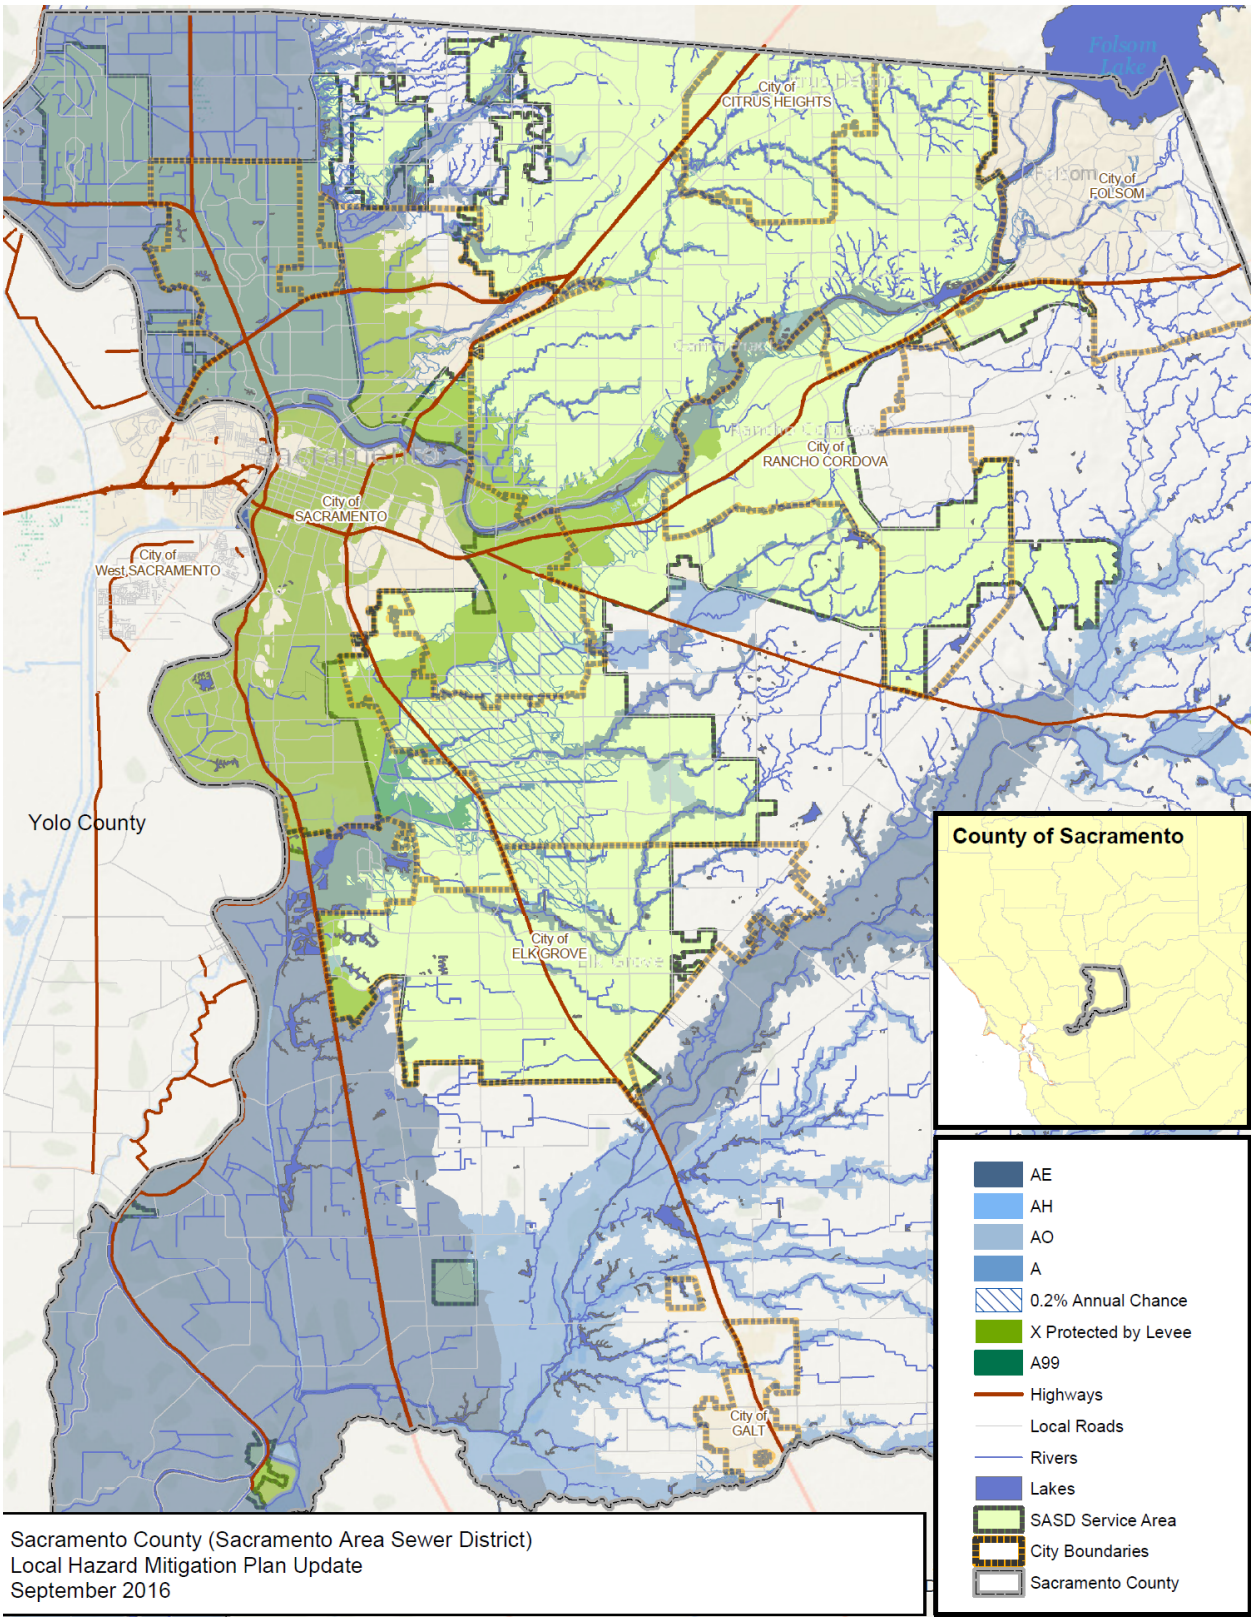
Past Occurrences

The District Planning Team noted no past occurrences of flooding in SASD.

Vulnerability to Flood

Figure N-3 shows the SASD service area overlaid on the DFIRM.

Figure N-3 Sacramento Area Sewer District Service Area and DFIRM



Source: SASD

Assets a Risk

SASD has identified the following assets as being potentially affected from a 100-year flood event, as shown in Table N-6.

Table N-6 SASD Assets at Risk in the 100-year Floodplain

Facility type	Facility Name	Asset Value(1)
Sub	S001 Northbrook Pump Station	$3000 @ 1' of water $560,000 total replacement
Sub	S006 American River Drive Pump Station	$100,000 at 1' water $560,000 Total replacement cost
WW/DW	S008 Hagginbottom Pump Station	$200,000 at 1' water $2 Million Total Replacement Cost
Sub	S012 RCCC Pump Station	$10,000 at 1' of water $1.5 Million Total Replacement Cost
Sub	S018 Westgate Pump Station	$1,000 @ 1' water $560,000 Total Replacement Cost
Sub	S025 Center Parkway Pump Station	$10,000 at 1' water $810,000 Total Replacement cost
Sub	S026 Northgate #5 Pump Station	$3,000 at 1' water $560,000 total replacement cost
WW/DW	S028 River Gardens Pump Station	$10,000 @ 1' water $560,000 Total Replacement Cos
WW/DW	S032 Rosemont Pump Station	$500,000 flood total $2 Million total Replacement Cost
Sub	S041 Willow Creek Pump Station	$4,000 at 1' of water $560,000 Total Replacement Cost
Sub	S046 Woodgate #1 Pump Station	$5,000 at 1' of water $560,000 Total Replacement Cost
Canned WW/DW	S049 Del Rio Pump Station	$1,000 at 1' of water $810,000 Total Replacement Cost
Canned WW/DW	S051 Larchmont Butterfield No.3 Pump Station	$3,000 at 1' water $560,000 total Replacement Cost
Sub	S053 Rio Linda Woods Pump Station	$4,000 at 1' of water $560,000 total replacement cost
Sub	S055 Northeast Pump Station	$100,000 total Flood replacement $750,000 Total replacement cost
Sub	S064 Walnut Grove Pump Station	$20,000 @ 1' Water $1.5 Million total Replacement Cost
Sub	S065 Clampett Tract Pump Station	$20,000 at 1' water $1.5 Million total Replacement Cost
Sub	S080 Sunview Pump Station	$6,000 at 1' of water $560,000 Total Replacement Cost
Sub	S084 Rivergate Pump Station	$5,000 at 1' of water $560,000 Total Replacement Cost

Facility type	Facility Name	Asset Value(1)
Sub	S090 West La Loma Pump Station	$100,000 at total flood damage $ 810,000 Total Replacement Cost
Sub	S110 Westborough Village No.2 Pump Station	$5,000 at 1' of water $560,000 Total Replacement Cost
Sub	S113 Metro Air Park Pump Station	$10,000 at 1' of water $560,000 Total Replacement Cost
Sub	S125 Northborough Pump Station	$10,000 at 1' of water $1.2 Million Total Replacement Cost
Multiple Grinder	S133 Locke Pump Station	No damage at 1' of water $200,000 total flood damage $980,000 Total Replacement Cos
Sub	S140 Hovnanian Drive Pump Station	$10,000 at 1' of water $560,000 Total Replacement Cost
Sub	S144 Wilson Road Pump Station	$500,000 flood total $1.5 Million total Replacement Cost
Sub	S145 Lambert Road Pump Station	$500,000 flood total $1.5 Million total Replacement Cost
Sub	S146 Walnut Grove Pump Station	$500,000 flood total $1.5 Million total Replacement Cost
Sub	S147 Cameron Road Pump Station	$500,000 flood total $1.5 Million total Replacement Cost
Sub	S150 Center Parkway Pump Station	$10,000 at 1' water $810,000 Total Replacement cost

(1) Asset value includes facility, site structures, site equipment, mobile equipment, miscellaneous items that may have soft cost components, some associated adjacent pipeline components. Values taken from SASD 2010 Comprehensive Annual Financial Report, and SASD engineering project reports. Some values have been escalated based on 3% to 5% inflation.

Critical Facilities at Risk

The SASD critical facility inventory was overlayed on the Sacramento County DFIRM flood hazard layer using GIS. Facility locations that were within the hazard area were selected and sorted by critical facility definition category; the summary results of this analysis are show in Table N-7. A detailed critical facility table is included in the Base Plan as Appendix E; the flood hazard column on the right-hand side of that table denotes whether a particular facility is considered to be vulnerable to that hazard.

Table N-7 SASD Critical Facilities at Risk in the Floodplain

Flood	Critical Facility Category	Count
1%	Essential Services Facilities	25
1%	High Potential Loss Facility	0
1%	Transportation & Lifeline	0
	Total 1%	**25**
0.2%	Essential Services Facilities	6

Flood	Critical Facility Category	Count
0.2%	High Potential Loss Facility	0
0.2%	Transportation & Lifeline	0
	Total 0.2%	**6**

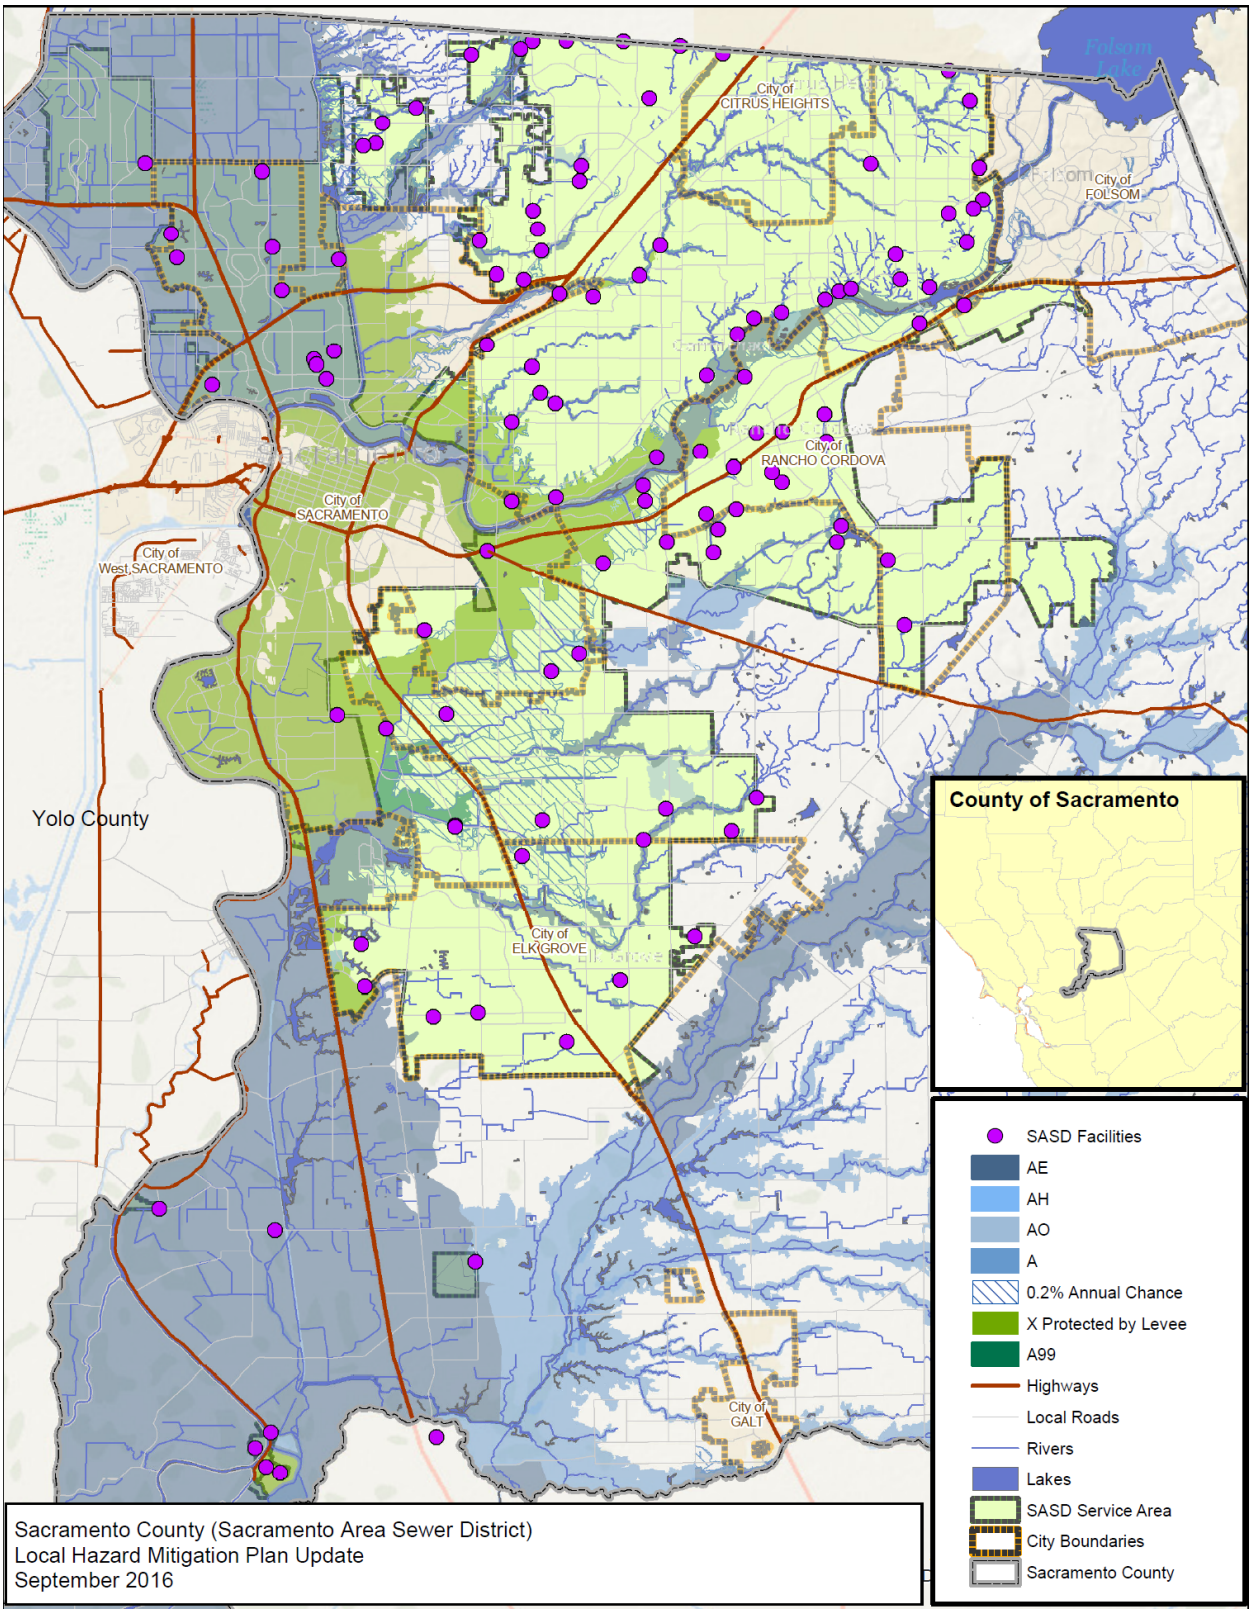
Figure N-4 SASD Critical Facilities in the Floodplain



Source: SASD

Natural Resources at Risk

The District Planning Team noted no natural resources at risk to flooding.

Historic and Cultural Resources at Risk

The District Planning Team noted no historic or cultural resources at risk to flooding.

Future Development

City and County jurisdictions determine what future development SASD will need. Facilities to be constructed in the floodplain identified in Figure N-4 may need to be replaced in case of a flood.

Flood: Localized Stormwater Flooding

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Localized flooding will have little effect to operations, however access to District assets may be temporarily limited.

Past Occurrences

Past occurrences of localized stormwater flooding are rare.

Vulnerability to Localized Flood

Assets/Critical Facilities at Risk

SASD assets at risk are pump stations and manholes.

Future Development

There is no additional risk to future development than what currently exists.

Levee Failure

Likelihood of Future Occurrence–Likely
Vulnerability–High

Hazard Profile and Problem Description

Note: This section includes a discussion of levees that are not owned or maintained by SASD.

Flooding caused by levee failure can occur as the result of partial or complete collapse of an impoundment, and often results from prolonged rainfall and flooding. The primary danger associated with dam or levee

failure is the high velocity flooding of properties downstream of the breach. Section 4.2.17 Levee Failure describes the levee inventory in the Sacramento County Planning Area.

Flooding caused by levee failure would vary in the District depending on which structure fails and the nature and extent of the failure and associated flooding. Flooding may present a threat to life and property depending on buildings or facilities flooded. Damage may include buildings, their contents and loss of critical services to the community. Large flood events can affect lifeline utilities (e.g., water, sewerage, and power), transportation, jobs, tourism, the environment, agricultural industry, and the local and regional economies.

Levee Flood Protection Zones estimate the maximum area that may be inundated if a project levee fails when water surface elevation is at the top of a project levee. Zones depicted on Figure 4.50 of the Base Plan do not necessarily depict areas likely to be protected from flow events for which project levees were designed. Figure 4.50 of the Base Plan illustrates the depths of flooding should a levee that protects that area fail.

Past Occurrences

SASD does not have a documented history of impacts, damages or costs associated with previous levee failure in the Sacramento region.

Vulnerability to Levee Failure

Unincorporated Sacramento County and its incorporated jurisdictions have mapped flood hazard areas. This includes areas protected by levees. GIS was used to determine the possible impacts of flooding in areas protected by levee within the County, and how the risk varies across the Planning Area. The following methodology was followed in determining improved parcel counts and values at risk to levee failure. However, this analysis was performed based on the most current 2015 DFIRMs which still reflect some levees as providing 100-year level of protection. According to the County, all levees have since been decertified as not providing a 100-year level of protection, so this analysis is based solely on the information presented in the DFIRMs. Further it is important to note that many levee improvement projects are ongoing throughout the Planning Area, some of which will be providing certification of area levees to both a 100-year and 200-year levels depending on applicable requirements. Thus, this analysis reflects a moment in time and while it does provide information on areas developed behind levees, the X Protected by Levee flood zone will continue to change as these projects are completed and new certifications obtained.

Assets a Risk

ASD assumes that the assets at risk in the X Protected by Levee Zone are the same assets at risk in the 100-year floodplain. Please see Table N-6.

Critical Facilities at Risk

The SASD critical facility inventory was overlayed on the Sacramento County DFIRM - X Protected by Levee hazard layer using GIS. Facility locations that were within the hazard area were selected and sorted by critical facility definition category; the summary results of this analysis are show in Table N-8. A

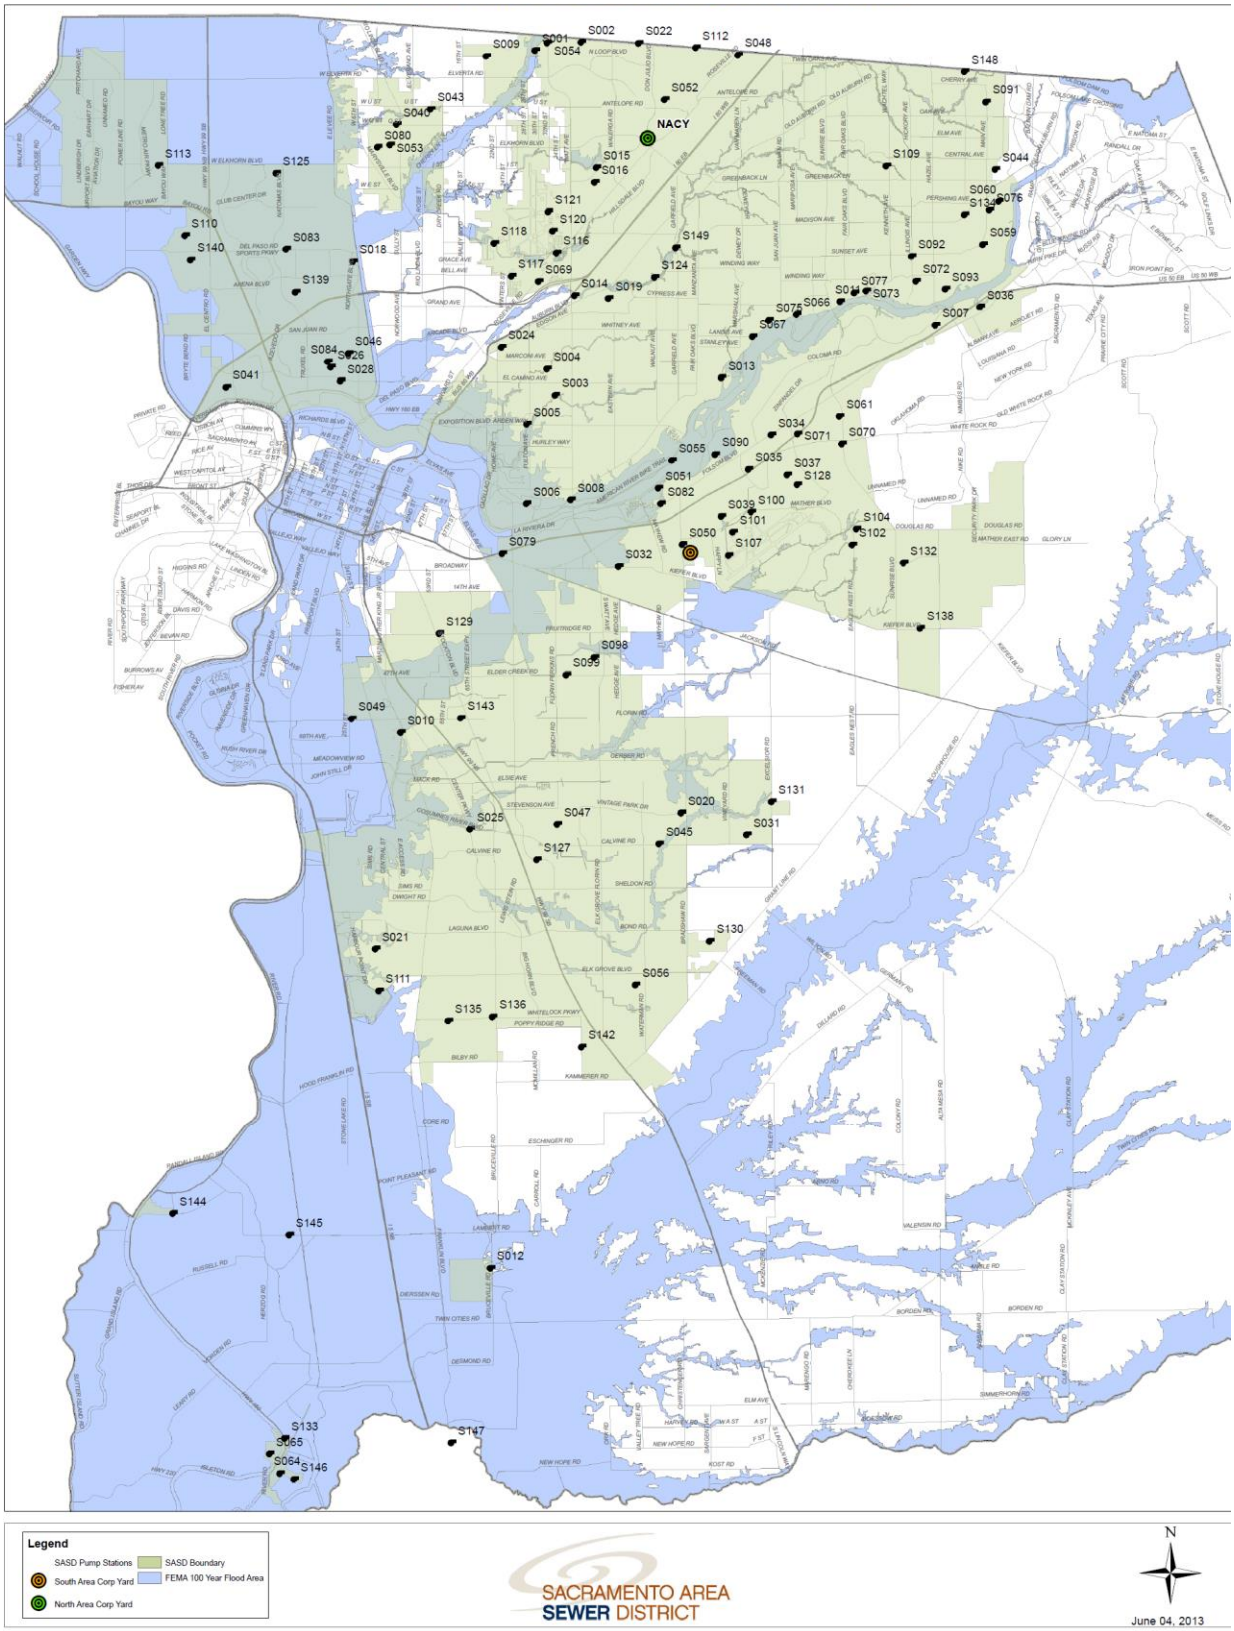
detailed critical facility table is included in the Base Plan as Appendix E; the levee failure hazard column on the right-hand side of that table denotes whether a particular facility is considered to be vulnerable to that hazard.

Table N-8 SASD Critical Facilities at Risk in the X Protected by Levee Zone

Critical Facility Definition	Count
Essential Services Facilities	108
High Potential Loss Facility	0
Transportation & Lifeline	0
Total	**108**

Source: SASD GIS

Figure N-5 SASD Critical Facilities in the X Protected by Levee



Source: SASD

Natural Resources at Risk

The District Planning Team noted no natural resources at risk to levee failure.

Historic and Cultural Resources at Risk

The District Planning Team noted no historic or cultural resources at risk to levee failure.

Future Development

City jurisdiction determines what future development SASD will need. Facilities to be constructed in the floodplain identified in Figure N-5 may need to be replaced in case of a levee failure.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Heavy rains and storm runoff is collected and conveyed in local creeks and channels. The District has approximately 700 creek crossings that could be impacted by this hazard.

Past Occurrences

SASD has had a few occurrences in which erosion has damaged assets.

Vulnerability to Erosion

Assets/Critical Facilities at Risk

SASD assets at risk are force mains, main lines, manholes, and lower laterals.

Future Development

There is no additional risk to future development than what currently exists.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

High winds cause power and communication outages that can affect multiple pump stations at once.

Past Occurrences

SASD has had occasional power outages during periods of high wind.

Vulnerability to Severe Weather: Wind and Tornadoes

Assets/Critical Facilities at Risk

SASD assets at risk are pump stations.

Future Development

There is no additional risk to future development than what currently exists.

Wildfire

Likelihood of Future Occurrence–Likely
Vulnerability–Medium

Hazard Profile and Problem Description

SASD has identified areas and District assets at risk to wildfire. Please reference Figure N-6 for details. The fire threat is based on the combined influence of the built environment, fuels, and topography

Past Occurrences

The District Planning Team noted no past wildfire occurrences.

Vulnerability to Wildfire

Assets a Risk

SASD has identified the following assets in Table N-9 as being potentially affected from a wildfire event.

Critical Facilities at Risk

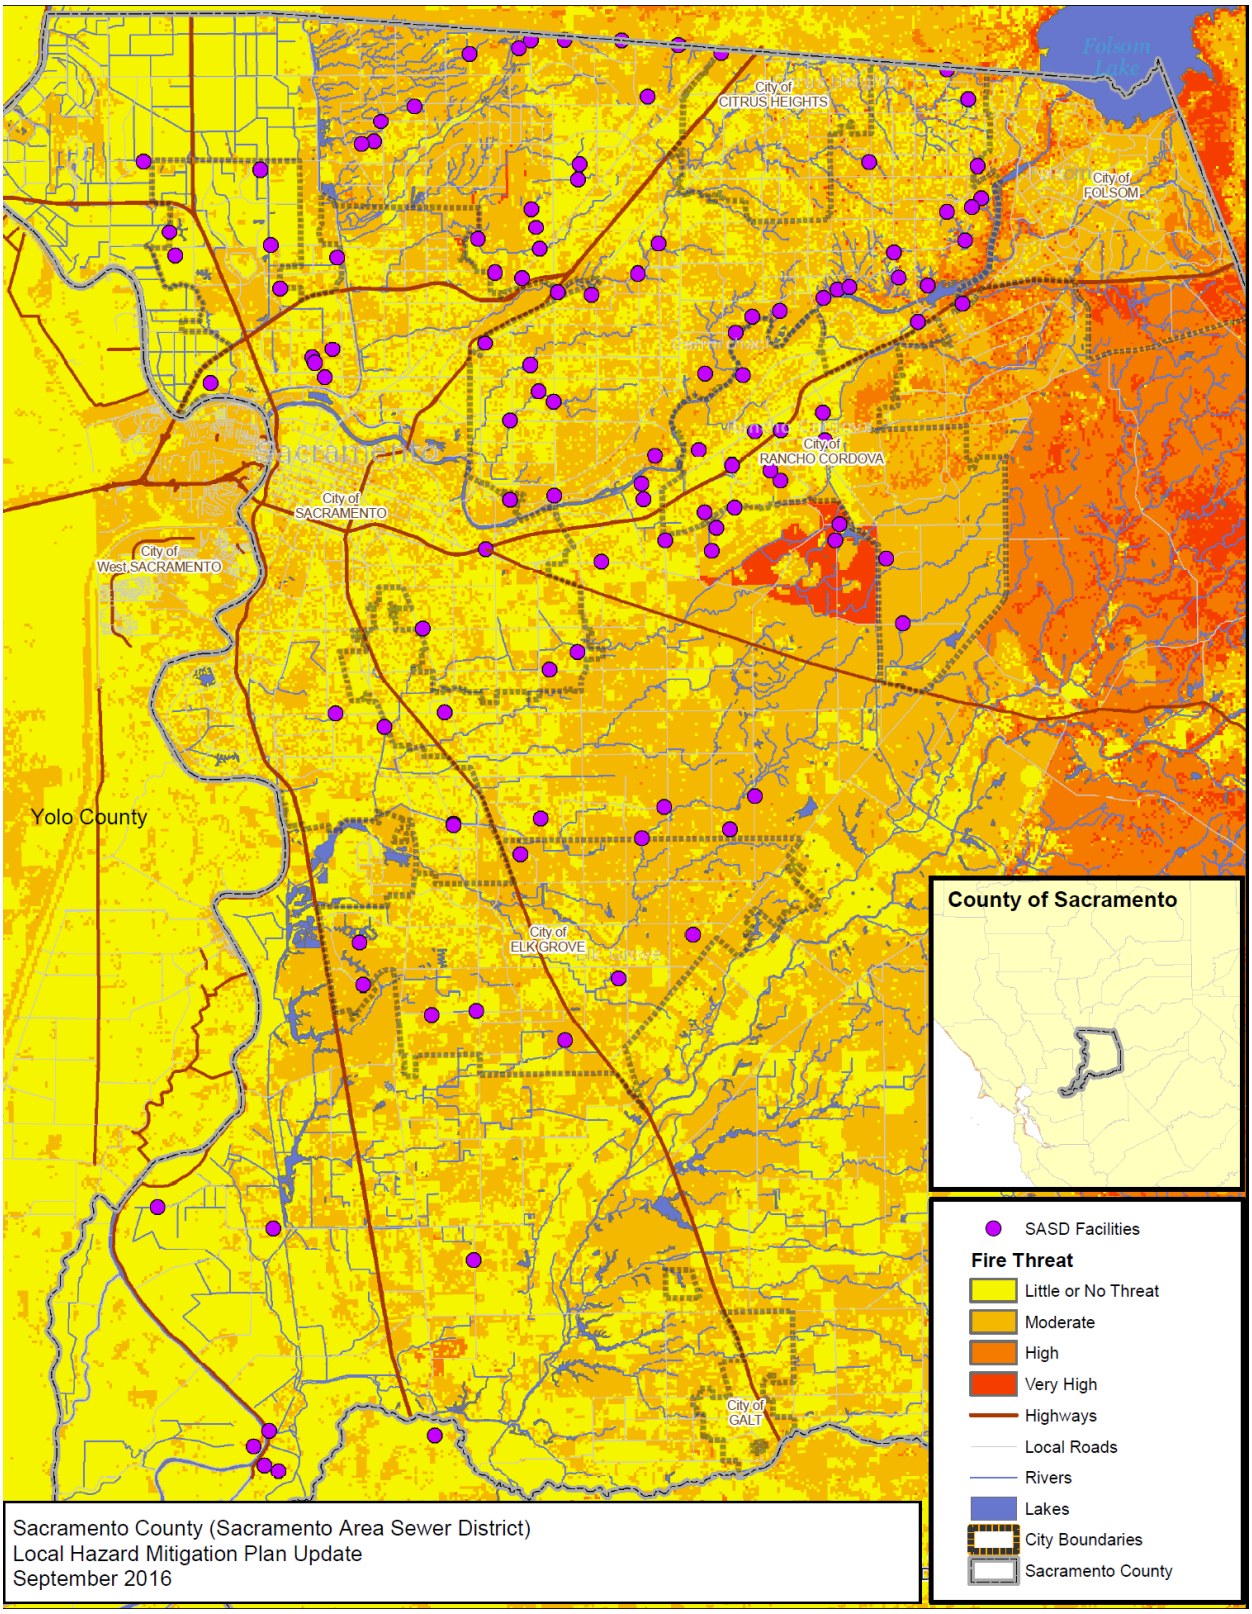
The SASD critical facility inventory was overlayed on the Sacramento County wildfire hazard layer using GIS. Facility locations that were within the hazard area were selected and sorted by critical facility definition category and key asset type; the summary results of this analysis are show in Table N-9. A detailed critical facility table is included in the Base Plan as Appendix E; the wildfire hazard column on the right-hand side of that table denotes whether a particular facility is considered to be vulnerable to that hazard.

Table N-9 SASD Critical Facilities in the Wildfire Threat Zone

Critical Facility Category	Fire Threat	Count
Historical Sites with multiple structures	Little or Moderate	0
Cultural Sites	Little or Moderate	0
Natural Resources (Bufferlands)	Little or Moderate	0
Essential Services Facilities	Little or No Threat	38
Essential Services Facilities	Moderate	56
Essential Services Facilities	High	7
Essential Services Facilities	Very High	9
High Potential Loss Facility	Little or No Threat	0
High Potential Loss Facility	Moderate	2
High Potential Loss Facility	High	0
High Potential Loss Facility	Very High	0

Source: SASD

Figure N-6 SASD Fire Threat and Critical Facilities



Source: SASD

Natural Resources at Risk

The District Planning Team noted no natural resources at risk in the District.

Historic and Cultural Resources

The District Planning Team noted no historic or cultural resources at risk in the District.

Future Development

City jurisdiction determines what future development SASD will need. Facilities to be constructed in the fire threat zones identified in Figure N-6 may need to be replaced in case of a wildfire.

N.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

N.6.1. Regulatory Mitigation Capabilities

Table N-10 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the SASD.

Table N-10 SASD's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N/A	
Capital Improvements Plan	N/A	
Economic Development Plan	N/A	
Local Emergency Operations Plan	N/A	
Continuity of Operations Plan	Y May 2015	Plan addresses hazards and provides a likelihood of occurrence.
Transportation Plan	N/A	
Stormwater Management Plan/Program	N/A	
Engineering Studies for Streams	N/A	
Community Wildfire Protection Plan	N/A	

Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N/A	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N/A	Score:
Fire department ISO rating:	N/A	Rating:
Site plan review requirements	N/A	
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts?** **Is the ordinance adequately administered and enforced?**
Zoning ordinance	N/A	
Subdivision ordinance	N/A	
Floodplain ordinance	N/A	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N/A	
Flood insurance rate maps	N/A	
Elevation Certificates	N/A	
Acquisition of land for open space and public recreation uses	N/A	
Erosion or sediment control program	N/A	
Other	N/A	
How can these capabilities be expanded and improved to reduce risk?

Sacramento Area Sewer District Continuity of Operations Plan (May 2015)

SASD prepared a Continuity of Operations Plan (COOP) to ensure continuity of essential SASD functions in the event of a major emergency or disaster affecting the community that the SASD serves. This plan was prepared using an all-hazards approach. The plan provides the decision-making framework and key information to be used by SASD personnel to implement business continuity operations, to restore essential functions within defined Recovery Time Objectives (RTO), and to sustain operations for up to 30 days following an event. This COOP incorporates best practices from the federal, state, and local levels and shall remain a living document with regular updates to ensure currency and relevance.

This plan supports SASD's vision, mission, and values and applies to SASD and its personnel. The COOP applies to potential hazards identified by SASD staff and uses an all-hazards continuity of operations strategy. This plan discusses the COOP's relationship to other SASD emergency response plans and the SASD Incident Command System, the different personnel types that are involved in a COOP implementation and the four phases that comprise continuity of operations:

- Phase 0: Normal Operations (Tan)
- Phase I: Alert (Yellow)
- Phase II: Activation (Orange)
- Phase III: Response (Red)
- Phase IV: Recovery (Green)

The COOP is used to restore essential SASD functions and support critical services as quickly as possible and to sustain these services for up to 30 days following an event.

N.6.2. Administrative/Technical Mitigation Capabilities

Table N-11 identifies the department(s) responsible for activities related to mitigation and loss prevention for SASD.

Table N-11 SASD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	Pump Station Maintenance
Mutual aid agreements	Y	CalWARN
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	FT	Yes
Floodplain Administrator	PT	Part time duty of various positions Facilities/GIS/Safety
Emergency Manager	PT	Part time duty of Safety
Community Planner	N	
Civil Engineer	FT	Part Time duties of current Engineering Dept staff
GIS Coordinator	FT	Full time GIS staff on site trained on Hazards
Other	FT	PIO and Communication specialists
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	Reverse 911 and employee hotline
Hazard data and information	Y	Identified in COOP
Grant writing	Y	Policy & Planning Department
Hazus analysis	Y	COOP identified hazard analysis
Other		

How can these capabilities be expanded and improved to reduce risk?

N.6.3. Fiscal Mitigation Capabilities

Table N-12 identifies financial tools or resources that the SASD could potentially use to help fund mitigation activities.

Table N-12 SASD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	Y	
Impact fees for new development	Y	
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	
Incur debt through private activities	N	
Community Development Block Grant	N	
Other federal funding programs	N	
State funding programs	N	
Other	N	
How can these capabilities be expanded and improved to reduce risk?

N.6.4. Mitigation Education, Outreach, and Partnerships

Table N-13 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table N-13 SASD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N/A	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N/A	
Natural disaster or safety related school programs	N/A	
StormReady certification	N/A	
Firewise Communities certification	N/A	
Public-private partnership initiatives addressing disaster-related issues	N/A	
Other	N/A	
How can these capabilities be expanded and improved to reduce risk?		

N.6.5. Other Mitigation Efforts

Purchased redundant backup generators at our critical facilities.

N.7 Mitigation Strategy

N.7.1. Mitigation Goals and Objectives

SASD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

N.7.2. Mitigation Actions

The planning team for SASD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. MOU for Dedicated Cell Phone Tower and Cell Phone Pack

Hazards Addressed: Multi-hazard – Improve disaster prevention and minimization of impacts

Goals Addressed: 1, 2, 3

Issue/Background: Ensure communication capabilities in an emergency

Other Alternatives: Use of existing radios

Existing Planning Mechanisms through which Action will be Implemented:

Responsible Office: IT, Safety & Regulatory Compliance Sections

Priority (H, M, L): Medium

Cost Estimate: 10,000 per year

Potential Funding: Internal, Federal Grant

Benefits (avoided Losses): Communication within DOC

Schedule: Review capabilities, review vendors and possible MOU for emergency communication tower and bank of dedicated cell phones.

Annex O Southgate Recreation and Park District

O.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Southgate Recreation and Park District (Southgate RPD), a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the Southgate Recreation and Park District. This Annex provides additional information specific to Southgate RPD, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

O.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), Southgate RPD formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table O-1. Additional details on plan participation and Southgate RPD representatives are included in Appendix A.

Table O-1 Southgate RPD Planning Team

Name	Position/Title	How Participated
Juanita Cano	Temporary Planner I	Collected Data, Drafted Text
Paula Hansen	Administration Manager	Provided Data, Reviewed draft documents
Scott Hokama	Parks Manager	Provided information on impacts to District
Vincent King	Planner II	Attended Meetings, Reviewed draft document
Shalini Singh-Martin	Planner I	Attended Meetings
Erick Jones	Planner II	Reviewed draft document

Source: Southgate RPD

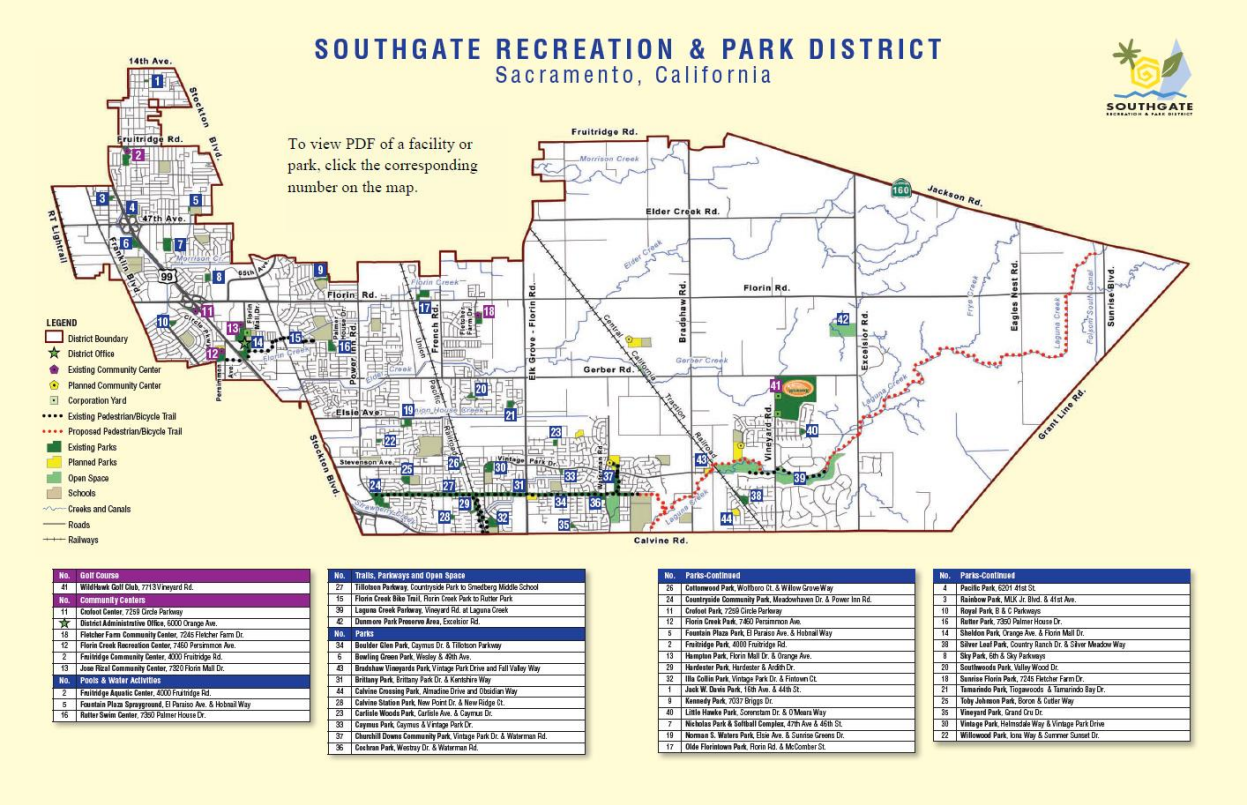
O.2.1. Coordination with Other District Planning Efforts

Coordination with other District planning efforts is paramount to the successful implementation of this plan. This Section provides information on how the District integrated the previously-approved 2011 Plan into existing planning mechanisms and programs. Southgate RPD did not incorporate the 2011 LHMP into any planning mechanism since 2011 as no hazard specific planning has been done since that time.

O.3 Community Profile

The community profile for Southgate RPD is detailed in the following sections. Figure O-1 displays a map and the location of Southgate RPD boundaries within Sacramento County. The District lies east of Sacramento, south of Rancho Cordova and north of Elk Grove. The District's eastern boundary extends to Grant Line Road.

Figure O-1 Southgate Recreation and Park District Map



O.3.1. District Overview, History and Background

Southgate Recreation and Park District is an independent special district established in 1956 under the Public Resources Code. The District provides park and recreation services to 100,000 taxpayers in the rapidly urbanizing southeast area of Sacramento County, California. The District is managed by an elected five-member Board of Directors.

For over fifty years Southgate Recreation & Park District has been acquiring and developing parks and recreational facilities. The District encompasses a 52-square mile area of unincorporated South Sacramento County. In this area, the District currently maintains 47 parks, 6 community centers, 2 aquatic facilities and numerous landscape corridors and nature preserves. The District's primary goal and its public charge is to provide recreation and park services to the 120,000 residents it serves. The District employs professional management and staff who manage the diverse services and facilities for the South Sacramento community.

Over the next twenty years we expect to add approximately 500 acres of park land and green space as new subdivision development occurs. Our strong tradition of Parks, Programs & Partnerships will continue to guide us, enabling us to continue serving the park and recreation needs of our socially, economically and culturally diverse community.

O.4 Hazard Identification

Southgate RPD's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to Southgate RPD (see Table O-2).

Table O-2 Southgate RPD—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Limited	Unlikely	Limited	Low
Bird Strike	Limited	Unlikely	Negligible	Low
Climate Change	Limited	Unlikely	Limited	Low
Dam Failure	Extensive	Occasional	Critical	Low
Drought and Water Shortage	Limited	Unlikely	Negligible	Medium
Earthquake	Limited	Unlikely	Limited	Low
Earthquake: Liquefaction	Limited	Occasional	Limited	Low
Flood: 100/200/500-year	Limited	Occasional	Limited	Medium
Flood: Localized Stormwater Flooding	Limited	Unlikely	Negligible	Low
Landslides	Significant	Occasional	Limited	High
Levee Failure	Limited	Occasional	Negligible	High
River/Stream/Creek Bank Erosion	Limited	Likely	Negligible	Low
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Occasional	Limited	Low
Severe Weather: Extreme Temperatures – Heat	Extensive	Highly Likely	Critical	Medium
Severe Weather: Fog	Significant	Likely	Limited	Low
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Catastrophic	Medium
Severe Weather: Wind and Tornadoes	Limited	Unlikely	Limited	Low
Subsidence	Limited	Unlikely	Negligible	Low
Volcano	Limited	Unlikely	Negligible	Low
Wildfire:(Burn Area/Smoke)	Significant	Occasional	Negligible	Low

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

O.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile Southgate RPD's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Hazard Profiles and Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to Southgate RPD is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

O.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section O.5.3, includes a description as to how the hazard affects the Southgate RPD and information on past occurrences. The intent of these section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

O.5.2. Vulnerability Assessment

This section identifies Southgate RPD's assets at risk, including values at risk, critical facilities and infrastructure, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table O-3 lists particular critical facilities and other District assets identified by the Southgate RPD's planning team as important to protect in the event of a disaster. Southgate RPD's physical assets, valued at over $125 million, consist of the buildings and infrastructure to support the Southgate RPD operations.

Table O-3 Southgate RPD's Critical Facilities, Infrastructure, and Other District Assets

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Corporation Yard Bldgs.	Maintenance Shop		$611,040	Levee Failure, Tornado, Severe Storm
Crofoot Clubhouse	Recreation Center		$1,215,905	Levee Failure, Tornado, Severe Storm
Florin Creek Recreation Center	Recreation Center		$1,850,904	Levee Failure, Flood, Tornado, Severe Storm
Fruitridge Aquatic Center	Swim Pool		$2,153,554	Tornado, Severe Storm
Fruitridge Community Center	Community Center		$2,132,636	Tornado, Severe Storm
Rizal Community Center	Community Center		$4,173,730	Levee Failure, Tornado, Severe Storm
Rutter Swim Center	Swim Pool		$1,945,466	Levee Failure, Tornado, Severe Storm
Vineyard Community Center (Under Construction)	Community Center		$7,102,050	Tornado, Severe Storm
Vineyard Community Aquatic Center (Under Construction)	Swim Pool		$4,310,950	Tornado, Severe Storm
Sheldon Headquarters	Office		$2,539,000	Levee Failure, Tornado, Severe Storm
Fletcher Farm Community Center	Community Center		$1,045,000	Tornado, Severe Storm
WildHawk Golf Club	Clubhouse		$1,839,200	Tornado, Severe Storm
WildHawk Golf Club – Cart Barn	Cart Storage		$2,200,000	Tornado, Severe Storm
WildHawk Golf Club – Maintenance Bldg.	Maintenance Shop		$600,000	Tornado, Severe Storm
WildHawk Golf Course	Golf Course		$4,500,000	Drought, Flood, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Gerry Green Head Start Facility	Preschool		$1,705,858	Tornado Severe Storm
Boulder Glen Park	Park		$833,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Bowling Green Park	Park		$2,682,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Bradshaw Vineyards	Park		$1,280,000	Drought, Flood, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Brittany Park	Park		$525,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Calvine Crossing Park	Park		$1,960,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Calvine Station Park	Park		$1,019,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Carlisle Woods Park	Park		$1,325,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Caymus Park	Park		$931,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Churchill Downs Community Park	Park		$4,278,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Cochran Park	Park		$2,492,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Cottonwood Park	Park		$1,655,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Countryside Community Park	Park		$3,183,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Crofoot Park	Park		$906,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Florin Creek Park	Park		$3,870,000	Drought, Flood, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Fountain Plaza Park	Park		$1,378,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Fruitridge Park	Park		$3,412,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Hampton Park	Park		$3,430,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Hardester Park	Park		$2,204,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Illa Collin Park	Park		$3,060,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Jack W. Davis Park	Park		$483,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Kennedy Park	Park		$1,159,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Little Hawke Park	Park		$1,363,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Nicholas Park	Park		$3,461,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Norman S. Waters Park	Park		$2,611,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Olde Florintown Park	Park		$3,192,000	Drought, Flood, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Pacific Park	Park		$508,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Rainbow Park	Park		$1,408,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Royal Park	Park		$976,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Rutter Park	Park		$2,306,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Sheldon Park	Park		$3,822,000	Drought, Flood, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Silver Leaf Park	Park		$2,063,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Sky Park	Park		$1,582,000	Drought, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Southwoods Park	Park		$1,374,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Sunrise Florin Park	Park		$2,540,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Tamarindo Park	Park		$1,543,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Toby Johnson Park	Park		$2,143,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Vineyard Park	Park		$618,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Vineyard Creek Park	Park		Future Park	Drought, Flood, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Vineyard Point Park	Park		Future Park	Drought, Flood, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Vineyard Springs Community Park	Park		Future Park	Drought, Flood, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Vintage Park	Park		$2,960,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
WildHawk West Park	Park		Future Park	Drought, Flood, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Willowood Park	Park		$1,099,273	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Florin Creek Trail	Ped/Bike Trail		$950,400	Drought, Flood, Levee Failure, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat

Name of Asset	Facility Type	Address	Replacement Value	Hazard Info
Tillotson Parkway	Ped/Bike Trail		$5,552,000	Drought, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat
Laguna Creek Parkway	Ped/Bike Trail		$938,572	Drought, Flood, Insects/Pests, Severe Storms, Tornadoes, Extreme Heat, Wildfire

Source: Southgate RPD

Natural Resources

The Southgate Recreation & Park District has a variety of natural resources of value to the community:

- Laguna Creek Parkway (125.5 acres)
- Bradshaw Vineyards Open Space Preserve (3.08 Acres)
- Elder Creek Open Space Preserve (15.29 acres)
- Gerber Creek Open Space Preserve (4.93 acres)
- Kingsbridge Open Space Preserve (29.36 acres)
- Dunmore Park Preserve (32.87 acres)
- Gene Andal Park Preserve (Sacramento County)
- Various mitigation banks and conservancies also identified as the Vernal Pool Prairie Preserve not owned by Southgate

Historic and Cultural Resources

There are no nationally recognized landmarks but there are still a few scattered pre-world war II buildings along Florin Rd. The area previously known as Florin was a flourishing Japanese community of Issei and Nisei immigrant farmers. One of those buildings includes Florin East Grammer School which became a segregated school for kids of oriental decent in 1923 and is now owned by the County of Sacramento and operated by Southgate RPD under a lease agreement.

Growth and Development Trends

Growth within the Southgate RPD has increased. Planning areas such as the Vineyard Springs Comprehensive Plan, North Vineyard Station Specific Plan, Florin Vineyard Community Plan, Old Florin Town Special Planning Area, and the West Jackson Highway Master Plan accommodate new growth in the Southgate RPD.

Development since the 2011 Plan

The Southgate RPD has seen an increase in their service area population since the 2011 plan. Specifically, this includes:

- Population has increased from 110,000 in 2011 to over 123,000 residents.
- A Southgate RPD Support Facility is under construction and is expected to be completed early 2017. The project will include an approximate 6,500 sq. ft. building. This project will be included into the

master plan for the development of the entire Churchill Downs North Community Park site. The project also includes a Community Center & Aquatic Center.

- Florin Creek Park was expanded and converted into a multi-use basin to provide good control for areas within the 100-year flood plain of Florin Creek and improve recreational benefits at the park site. A parcel on Orange Avenue was purchased for future park land or open space. Jack Davis Park, Hampton Park, and Fruitridge Park gained additional acreage due to acquisition of new parkland and will be expanded.

Southgate RPD implemented several development projects since 2011 increasing the numbers and capacity of District assets. New development tracked by totals and hazard risk areas are shown in Table O-4. All development in the identified hazard areas, including the 1% annual chance floodplains, areas protected by levees, and high wildfire risk areas, were completed in accordance with all current and applicable development codes and standards and should be adequately protected. Thus, with the exception of more people recreating in District areas potentially exposed to natural hazards, this growth should not cause a significant change in vulnerability of the District to identified priority hazards.

Table O-4 Southgate RPD Total Development Since 2011

Asset Type	Year Built	Outside of Known Hazard Area	1% Annual Chance Flood	Area Protected by Levee	Wildfire Risk Area[1]	Other
Florin Creek Park Multi-Use Basin	2016		X	X		
Vineyard Community Center	2016\17	X				
Vineyard Aquatic Center	2016\17	X				
Vineyard Support Facility	2016\17	X				
Vineyard Point Park	2016\17		X			
WildHawk Estates West	2016\17		X			
Total

[1]Moderate or higher wildfire risk area

O.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table O-2 as high or medium significance hazards. Impacts of past events and vulnerability of the Southgate RPD to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. In general, the most vulnerable structures are those located within the floodplain or within levee and dam inundation areas, such as older facilities that may be constructed with unreinforced masonry and buildings built prior to the introduction of modern building codes. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

In general, the most vulnerable District assets include the levees and supporting structures that the District owns.

An estimate of the vulnerability of the Southgate RPD to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.
- **Extremely High**—Very widespread with catastrophic impact.

Drought and Water Shortage

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Drought would impact all of the vegetation of the parks and open space areas within the District and could potentially result in closure of aquatic facilities. Restrictions on water use would severely impact the maintenance of the parks, landscape corridors, aquatic facilities, and the golf course.

Past Occurrences

Recent drought conditions have had a significant impact on operations. There were four years of below average rainfall. In January, 2014 the Governor of California declared a State of Emergency projecting that 2014 would be the driest on record and asked Californians to conserve at least 20%. May, 2015 the State Water Resource Control Board required a 25% reduction in water use. The Southgate RPD reduced water consumption and irrigation to meet the requirements. The parks, golf course and landscape corridors were more dry than usual. The Southgate RPD owns and maintains over 12,000 trees. Because of the severe drought hundreds of trees died and were removed.

Vulnerability to Drought

The vulnerability is high because of the type of facilities the Southgate RPD owns and maintains which require lots of water in order to maintain them green, usable, and viable for recreational use by the community.

Assets/Critical Facilities at Risk

All park sites, parkways and landscape corridor vegetation; open space vegetation and wetlands; WildHawk Golf Club course; Fruitridge and Rutter aquatic centers.

Future Development

Future park development and maintenance practices have been changed in order to minimize water usage.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Flooding risks along Morrison Creek, Elder Creek, Gerber Creek, Florin Creek, and Laguna Creek could potentially impact several District facilities. Potential damages from flooding and flood debris would impact trees and landscaping of the parks, open spaces and the WildHawk golf course. Flood damage to park site structures and buildings could also occur.

Past Occurrences

The District Planning team noted that there have not been any flooding occurrences in that past 5 years.

Vulnerability to Flood

The western urbanized area of the Southgate RPD has historically been vulnerable to flooding from high water events in the Sacramento-San Joaquin Delta as well as high flows on Morrison Creek, Florin Creek, Elder Creek, and Gerber Creek.

Assets/Critical Facilities at Risk

WildHawk Golf Club, Florin Creek Recreation Center and Park, Florin Creek Trail, Laguna Creek Parkway Open Space and Trail, Bradshaw Vineyards Park and Open Space Preserve.

Natural Resources

Natural resources at risk in the District to flood include:

- Laguna Creek Parkway
- Bradshaw Vineyards Open Space Preserve
- Elder Creek Open Space Preserve
- Gerber Creek Open Space Preserve

Historic and Cultural Resources

None.

Future Development

Future developme at risk to flood includes Vineyard Creek Park, Vineyard Point Community Park, Wildhawk West Park and any proposed multi-use trails that go in along the Elder Creek, Gerber Creek, Laguna Creek, and Florin Creek.

Levee Failure

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

According to the California Department of Water Resources Levee Flood Protection Zone maps, levee failure would significantly impact the western portion of the District. Potential damages from flooding and flood debris would impact trees and landscaping of the parks. Flood damage to park site structures, equipment within the corporation yard and buildings could also occur.

Past Occurrences

The District Planning Team noted that there have not been any levee failures in the past 5 years.

Vulnerability to Levee Failure

Assets/Critical Facilities at Risk

Pacific Park, Bowling Green Park, Sky Park, Fountain Plaza Sprayground, Crofoot Park, Crofoot Clubhouse, Hampton Park, Rizal Community Center, Sheldon Park, Sheldon Headquarters, Florin Creek Park, Florin Creek Recreation Center, Florin Creek Trail, Corporation Yard, Kennedy Park, Rutter Park, and Rutter Swim Center.

Natural Resources at Risk

None.

Historic and Cultural Resources at Risk

None.

Future Development

The District Planning Team noted no future development at risk to levee failure.

Severe Weather: Extreme Temperatures – Heat

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Extreme Heat could potentially impact parks maintenance workers, recreational programs participants, WildHawk Golf Club customers, and vegetation. Poor air quality also resulting from extreme heat would impact any recreational programs held outdoors, WildHawk Golf customers and parks maintenance workers. Rolling blackouts due to extreme heat would also impact district facilities.

Extreme heat impacts air quality on Spare the Air Days. Outdoor programs can be suspended or cancelled. Extreme heat also intensifies the need to water park sites, parkways and landscape corridors, and can also affect the ability to do outdoor work for maintenance staff. Extreme heat also aggravates the drought situation that is already affecting the amount of water available for watering.

Past Occurrences

The District Planning Team noted no extreme heat events in the past 5 years.

Vulnerability to Extreme Heat

Assets/Critical Facilities at Risk

Parks, landscape corridors, and open space vegetation; outdoor recreational programs; WildHawk Golf Club and park maintenance employees.

Future Development

Any future parks, landscape corridors, open space vegetation, and all outdoor activities are at risk.

Severe Weather: Heavy Rain and Storms

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

Severe storms could potentially impact park structures, shade shelters and vegetation. In January 2009, a severe storm resulted in extensive damage and loss of trees throughout the District. Severe storms could also impact building structure features such as roofing and windows.

Past Occurrences

The District Planning Team noted that there has not been major damage from severe weather in the past 5 years.

Vulnerability to Heavy Rains

Assets/Critical Facilities at Risk

Parks, landscape corridors, and open space vegetation; park site play structures and shelters; all building structures and WildHawk Golf Club course.

Future Development

All future developments of buildings, parks, parkways, trails, and open spaces can be at risk for heavy rains.

O.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capability assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

O.6.1. Regulatory Mitigation Capabilities

Table O-5 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the Southgate RPD.

Table O-5 Southgate RPD's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	N	
Capital Improvements Plan	N	
Economic Development Plan	N	
Local Emergency Operations Plan	N	
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	N	
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	N	
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)		

Building Code, Permitting, and Inspections	Y/N	Are codes adequately enforced?
Building Code	N	Version/Year:
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score:
Fire department ISO rating:	N	Rating:
Site plan review requirements	Y	District standards and specifications reviewed and updated on a regular basis
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Is the ordinance adequately administered and enforced?**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	Y	District Policy Manual
How can these capabilities be expanded and improved to reduce risk?		

Source: Southgate RPD

O.6.2. Administrative/Technical Mitigation Capabilities

Table O-6 identifies the department(s) responsible for activities related to mitigation and loss prevention for Southgate RPD.

Table O-6 Southgate RPD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	Y	The District has maintenance crews.
Mutual aid agreements	N	
Other		

Staff	Y/N FT/PT	Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	N	
Community Planner	N	
Civil Engineer	N	
GIS Coordinator	Y	
Other	Y	Parks Manager
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	N	
Hazard data and information	N	
Grant writing	Y	
Hazus analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: Southgate RPD

O.6.3. Fiscal Mitigation Capabilities

Table O-7 identifies financial tools or resources that the Southgate RPD could potentially use to help fund mitigation activities.

Table O-7 Southgate RPD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	
Authority to levy taxes for specific purposes	N	
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	
Storm water utility fee	N	
Incur debt through general obligation bonds and/or special tax bonds	Y	
Incur debt through private activities	Y	
Community Development Block Grant	Y	
Other federal funding programs		

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
State funding programs		
Other		Assessment Districts
How can these capabilities be expanded and improved to reduce risk?		

Source: Southgate RPD

O.6.4. Mitigation Education, Outreach, and Partnerships

Table O-8 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table O-8 Southgate RPD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	N	
Natural disaster or safety related school programs	N	
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

O.6.5. Other Mitigation Efforts

The District works with both the County Department of Water Resources (DWR) and SAFCA related to creek and stream drainage issues as well as stormwater detention. The District currently has several joint-use detention basins planned with DWR that are either on District park sites or adjacent to them. These basins provide the County with adequate basins for storm water detention but at the same time during non-storm periods that land can be used for passive and active recreational purposes.

O.7 Mitigation Strategy

O.7.1. Mitigation Goals and Objectives

Southgate RPD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

O.7.2. Mitigation Actions

The planning team for Southgate RPD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. Drought Mitigation Actions/Drought Contingency Plan

Hazards Addressed: Drought and Water Shortage

Goals Addressed: 1, 2, 3, 4

Issue/Background: In 2015 California entered its fourth year of a record-breaking drought creating an extremely parched landscape. Governor Jerry Brown declared a drought State of Emergency in January 2015 and imposed strict conservation measures statewide. Gov. Jerry Brown demanded a 25 percent cut in urban water usage due to a severe drought affecting much of California and the West.

Project Description: Southgate RPD identifying water-saving measures and taking steps to use water more efficiently. Hope this helps, let me know if you need additional information.

Other Alternatives: Institute minimum reductions

Existing Planning Mechanism(s) through which Action Will Be Implemented: The Southgate RPD will continue with the implemented state mandated water conservation regulations. The Southgate RPD stopped watering by ET (evapo-transportation, i.e irrigating based on weather data). Also, with new parks and landscape development the District is "specing" drought tolerant vegetation, less turf areas, less water using sprinkler systems (i.e. netafim, subterranean drip system, internet based controllers, and MP rotators.) All of which promote water conservation.

Responsible Office/Partners: Southgate RPD – Park Maintenance Dept.

Project Priority: High

Cost Estimate: TBD

Benefits (Losses Avoided): Potential Fines

Potential Funding: Unknown

Timeline: Ongoing

Action 2. Flood Mitigation Actions/Land Acquisition

Hazards Addressed: Flood: 100/200/500-year

Goals Addressed: 1, 2, 3, 4

Issue/Background: Areas to the West of Southgate RPD have historically been vulnerable to flooding from high water flows on Morrison Creek, Florin Creek, and Elder Creek.

Project Description: Park lands within the North Vineyard Station Specific Plan area have been designated in locations adjacent to Elder Creek, Gerber Creek and Laguna Creek. The park sites will have storm water detentions basins with water quality treatment functions, and trail facilities. In addition there is also a proposed park with an integrated multi-use storm water detention basin with soccer fields adjacent to Laguna Creek within the Vineyard Springs Comprehensive Plan area. In 2016 Florin Creek Park was expanded and converted to a multi-use basin for recreational use. The basin will provide flood control for areas within the 100-year flood plain of Florin Creek and improve recreational benefits at the park site. Southgate RPD continues to pursue the acquisition of open space land when it makes geographic and economic sense and proves beneficial to Southgate RPD's long term acquisition goals.

Other Alternatives: Do nothing

Existing Planning Mechanism(s) through which Action Will Be Implemented: As new development comes along Southgate RPD will continue to pursue the acquisition of open space, and parkland, and seek joint-use opportunities with partner agencies.

Responsible Office/Partners: SAFCA, Southgate RPD, City of Sacramento, County of Sacramento, FEMA, Corps of Engineers, State Department of Water Resources

Project Priority: Medium

Cost Estimate: Unknown

Benefits (Losses Avoided): Potential flooding in urbanized areas.

Potential Funding: TBD

Timeline: Continuous

Action 3. Conservation Easements

Hazards Addressed: Protect open space and preserve critical habitat.

Goals Addressed: 1, 2, 3, 4

Issue/Background: Development has encroached into agricultural lands, and wetlands are being lost. Southgate RPD is making an effort to acquire those lands that are considered to contain rare wildlife habitat in order to limit certain types of uses or prevent development from taking place by protecting the land for future generations.

Project Description: Southgate RPD is in the process of acquiring property within the North Vineyard Station Specific Plan – Elder Creek and Gerber Creek open space preserve area associated with current subdivision developments and as a required by the U.S. Army Corps of Engineers. A conservation easement will be granted over each portion of the Preserve. The conservation easement will run with the land and protect the Preserve as wetland and wildlife habitat in perpetuity, subject to the long term management responsibilities of Southgate RPD and drainage maintenance responsibilities of Water Resources for the purpose of flood control maintenance. Wildlife Heritage Foundation will hold the Conservation Easement over the Preserve areas. Southgate RPD will manage and maintain the preserve as outline in the Open Space Preserve Operations and Management Plan for the North Vineyard Station Specific Plan – Elder and Gerber Creek.

Other Alternatives: Reduce General Plan open space requirements and increase developable land.

Existing Planning Mechanism(s) through which Action Will Be Implemented: As new development comes along Southgate RPD will continue to pursue the acquisition of open space, and parkland, and seek joint-use opportunities with partner agencies.

Responsible Office/Partners: Southgate RPD, Corps of Engineers, Sacramento County

Project Priority: Low

Cost Estimate: Unknown

Benefits (Losses Avoided): Provide permanent guarantee that the land will not be developed.

Potential Funding: TBD

Timeline: Ongoing

Action 4. Multi-jurisdictional Cooperation within Watersheds

Hazards Addressed: Flood: Localized Stormwater Flooding, Flood: 100/200/500-year, Severe Weather: Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: The Sacramento Area Flood Control Agency is proposing to construct flood control improvements at Florin Creek Park that will provide a minimum 100-year level of flood protection to residents in the Parkway Estates area. Once completed, these improvements, combined with improvements the U.S. Army Corps of Engineers is constructing along Florin Creek, will provide a higher level of flood protection and financial relief to over 450 property owners paying high-cost flood insurance.

Project Description: Southgate RPD has participated with SAFCA "Sacramento Area Flood Control Agency" to construct a multi-use basin at Florin Creek Park to provide flood control for areas within the 100-year flood plain of Florin Creek. The improvements included the reconstruction of a paved trail along the Florin Creek channel that connects Sheldon Park and Florin Creek Park. The U.S. Army Corps of Engineers proposed the construction of improvements to the creek in conjunction with SAFCA, the State Department of Water Resources, City of Sacramento and County of Sacramento.

Other Alternatives: Do nothing

Existing Planning Mechanism(s) through which Action Will Be Implemented: As new development comes along Southgate RPD will continue to pursue the acquisition of open space, and parkland, and seek joint-use opportunities with partner agencies.

Responsible Office/Partners: SAFCA, FEMA, City of Sacramento, County of Sacramento, Southgate RPD

Project Priority: Medium

Cost Estimate: Unknown

Benefits (Losses Avoided): Better flood control and improved recreational benefits at Florin Creek park.

Potential Funding: TBD

Timeline: January 2017

Action 5. Storm Water Management Practices – Implement Storm Water Management Practices as identified in Stormwater Quality Design Manual

Hazards Addressed: Flood: Localized Stormwater Flooding, Flood: 100/200/500-year, Severe Weather: Heavy Rains and Storms

Goals Addressed: 1, 2, 3, 4

Issue/Background: Heavy rains and severe storms occur during the fall, winter and spring. The heavy storms can cause flooding as well as extensive localized drainage issues. There is a lot of growth in some areas of Southgate RPD and if not planned accordingly there may be a lack of adequate drainage systems.

Project Description: Southgate RPD works collaboratively with the Sacramento County Department of Water Resources (DWR) to plan and design joint-use facilities that will provide both storm water management and recreation use to Southgate RPD residents. These types of projects keep creek drainage corridors in their natural state and provide storm water detention basins with compatible recreational uses such as trails and sports fields. These types of projects help improve the storm water quality and drainage capacity in our neighborhoods while at the same time providing additional recreation opportunities in the community. An example of these joint-use facilities includes the Laguna Creek Parkway open space which has preserved a 130 acre portion of the 100 year flood plain of Laguna Creek while providing a multi-use

trail and open space corridor for residents to enjoy. A similar joint-use open space corridor is planned for the Elder and Gerber Creek drainage corridors that traverse Southgate RPD. The Southgate RPD is also in the process of designing two storm water detention projects with the County DWR that will accommodate soccer fields within the basin areas.

Other Alternatives: Do nothing

Existing Planning Mechanism(s) through which Action Will Be Implemented: As new development comes along Southgate RPD will continue to pursue the acquisition of open space, and parkland, and seek joint-use opportunities with partner agencies.

Responsible Office/Partners: Sacramento County Department of Water Resources (DWR), Southgate RPD

Project Priority: Medium

Cost Estimate: Unknown

Benefits (Losses Avoided): Flooding in mitigated in new areas and adds protection to existing areas.

Potential Funding: Unknown

Timeline: Ongoing

Action 6. Severe Weather: Heavy Rains and Storms Mitigation Actions/Tree Management

Hazards Addressed: Severe Weather: Heavy Rains and Storms

Issue/Background: Heavy rains and storms have caused trees to fall over especially when the ground becomes very saturated and the tree is weak or diseased. In past years many trees have died from the drought and will need to be removed before a big rain storm comes through and causes them to fall over or create a major hazard.

Goals Addressed: 1, 2, 3, 4

Project Description: In 2012 the Southgate RPD received a grant from the Urban Forestry Program Entitled, "An Urban Forest for Every City". This Program Grant funded the development and implementation of a management plan for our urban forest which determined reasonable maintenance goals and set a standard maintenance cycle to help the District proactively manage our forest in a way that reflects the values of our community within a set budget. The grant was used to conduct a tree inventory as the first step in better understanding the needs and distribution of its trees and the value of its forest asset. A consulting arborist and certified tree risk assessor provided an inventory of all the trees in the parks, parkways, open space and landscape corridors in the Southgate RPD. The inventory noted the location, species, size, health, and potential for infrastructure conflicts and hazards for each tree on Southgate RPD owned property as well as noting empty planting locations. High risk trees were identified and most have

been removed. Southgate RPD is still in the process of developing an Urban Forest Management Plan that aims to identify actions that will support a healthy and regenerative urban forest.

Other Alternatives: Do nothing

Existing Planning Mechanism(s) through which Action Will Be Implemented:

- Southgate RPD – Maintenance Dept.
- GIS inventory
- Planting trees with Sac Tree Foundation
- Implementing the Urban Forest Management Plan

Responsible Office/Partners: Southgate RPD

Project Priority: Medium

Cost Estimate: Unknown

Benefits (Losses Avoided): Those trees identified in poor condition can be removed in a timely manner to avoid a hazardous and dangerous situation at a later time.

Potential Funding: Unknown

Timeline: Ongoing

Annex P Twin Rivers School District

P.1 Introduction

This Annex details the hazard mitigation planning elements specific to the Twin Rivers School District (TRSD), a previously participating jurisdiction to the Sacramento County Local Hazard Mitigation Plan (LHMP) Update. This Annex is not intended to be a standalone document, but appends to and supplements the information contained in the Base Plan document. As such, all sections of the Base Plan, including the planning process and other procedural requirements apply to and were met by the Twin Rivers School District. This Annex provides additional information specific to the TRSD, with a focus on providing additional details on the planning process, risk assessment, and mitigation strategy for this District.

P.2 Planning Process

As described above, the District followed the planning process detailed in Section 3 of the Base Plan. In addition to providing representation on the Sacramento County Hazard Mitigation Planning Committee (HMPC), TRSD formulated its own internal planning team to support the broader planning process requirements. Internal planning participants, their positions, and how they participated in the planning process are shown in Table P-1. Additional details on plan participation and TRSD representatives are included in Appendix A.

Table P-1 TRSD Planning Team

Name	Position/Title	How Participated
Greg Rash	Director/Business	Information Gathering/Report drafting. Attended HMPC meetings.
Beth Brose	General Services Consultant	Information Gathering/Mitigation Projects Author. Attended HMPC meetings.
Bill McGuire	Deputy Superintendent	Document Review
Kimberly Barnett	Executive Director General Services	Document Review

Source: TRSD

P.2.1. Coordination with Other District Planning Efforts

Coordination with other District planning efforts is paramount to the successful implementation of this plan. This Section provides information on how the District integrated the previously-approved 2011 Plan into existing planning mechanisms and programs. Specifically, TRSD incorporated into or implemented the 2011 LHMP through other plans and programs shown in Table P-2.

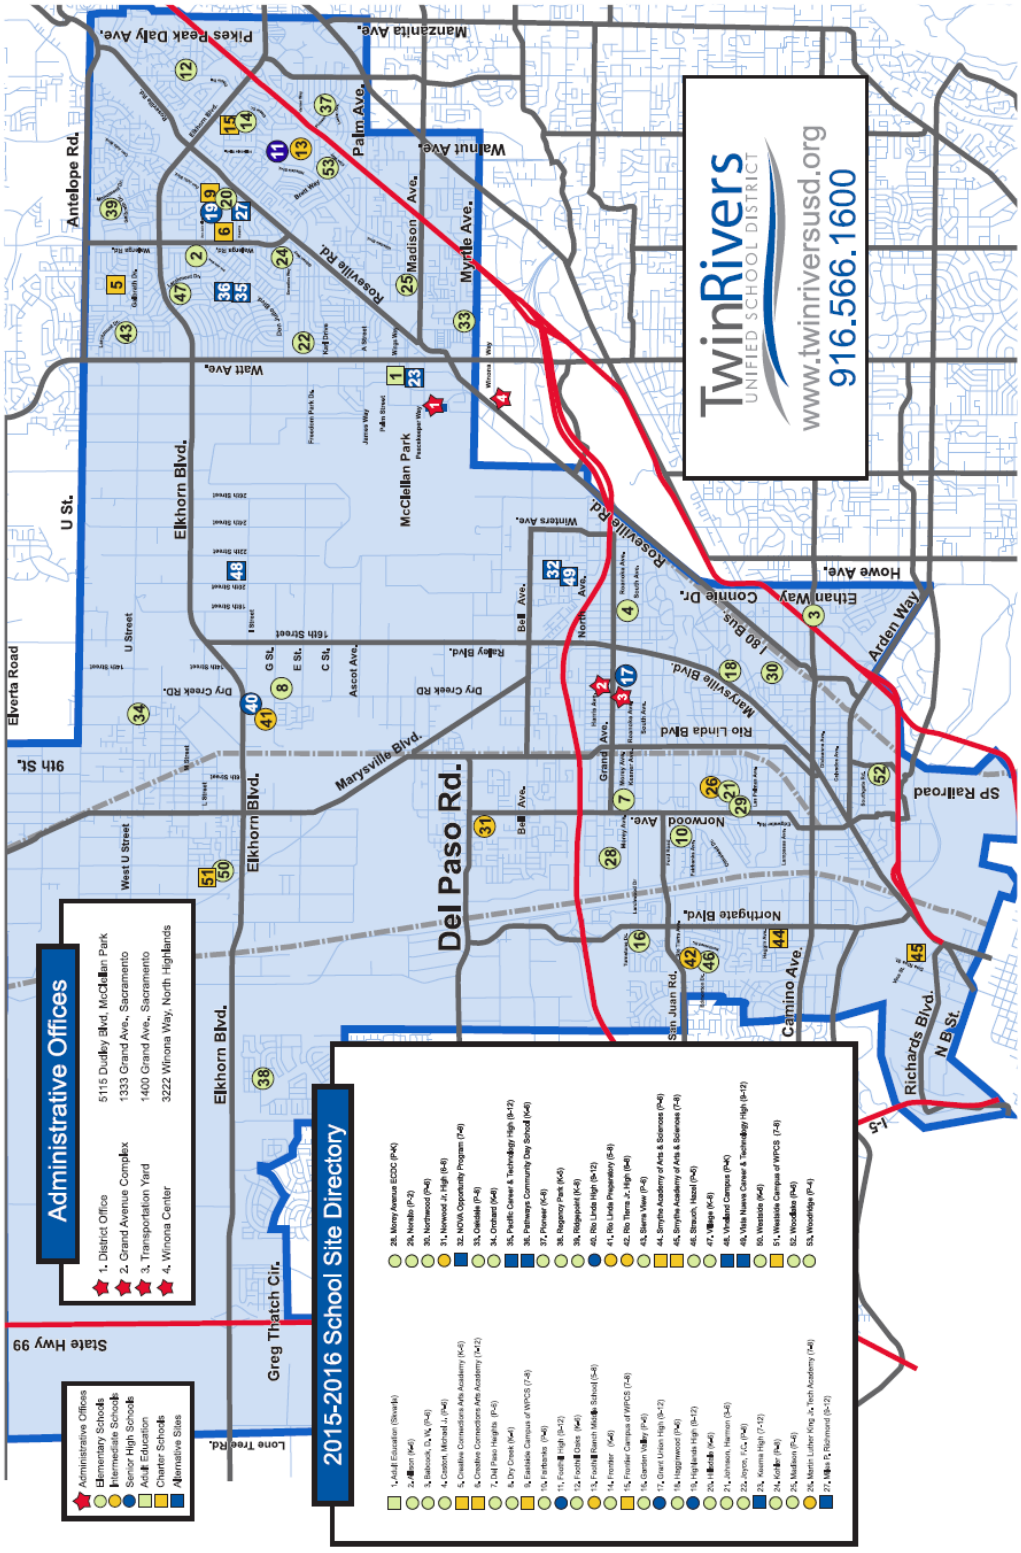
Table P-2 2011 LHMP Incorporation

Planning Mechanism 2011 LHMP Was Incorporated/Implemented In.	Details?
Emergency Operations Plan	Plans/Teams/Responses for most probable contingencies
Master Plan	Consideration for future designs

P.3 District Profile

The community profile for TRSD is detailed in the following sections. Figure P-1 displays a map and the location of TRSD boundaries within Sacramento County.

Figure P-1 Twin Rivers School District Map



P.3.1. District Overview, History and Background

The small community school districts that evolved in the North Sacramento communities were long a topic of discussion and debate. While most of the country's students receive a fully articulated and unified educational experience in preschool through 12th grade systems, students in the North Sacramento area attended a variety of schools and districts depending on their neighborhood and grade level. Many educational leaders saw the need for more consistency, financial stability, and realignment of resources, but others worried that a larger system would take away a family-friendly culture the smaller districts enjoyed. In the late 1990s, a small group of community members and educators embarked upon a vision to unify the north area districts. After more than 60 years and seven attempts, voters finally approved this new vision for unification involving four of the six area school districts: Grant Joint Union High School District, North Sacramento School District, Rio Linda Union School District, and Del Paso Heights School District. On November 7, 2007, the voters overwhelmingly adopted the unification proposal.

The voters chose a new board of trustees to lead this new unified district. They selected one trustee from each of seven geographic regions in the boundary area. The board requested that the community name our new district. After a month-long promotional contest and more than 500 suggestions, Twin Rivers Unified School District became the official name. On July 1, 2008, with much excitement and positive enthusiasm, the Twin Rivers Unified School District officially became the newest unified district in California.

The District is comprised of 760 acres utilizing over 3.4 million square feet of space, located in Sacramento County, in the northern region of the greater Sacramento area. Bordering Natomas district to the south and west, Sacramento City district to the south and San Juan district to the east, the District holds a total of 32,000 students in over 60 different schools. The District also owns a variety of other properties and buildings to house a variety of support facilities that include administrative offices, maintenance buildings, and park lands.

P.4 Hazard Identification

TRSD's planning team identified the hazards that affect the District and summarized their geographic extent, probability of future occurrences, potential magnitude/severity, and significance specific to TRSD (see Table P-3).

Table P-3 TRSD—Hazard Identification

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Agricultural Hazards	Limited	Occasional	Limited	Low
Bird Strike	Limited	Likely	Limited	Low
Climate Change	Extensive	Likely	Limited	Low
Dam Failure	Significant	Unlikely	Catastrophic	Medium
Drought and Water Shortage	Extensive	Likely	Limited	Low
Earthquake	Limited	Occasional	Critical	Medium
Earthquake: Liquefaction	Limited	Unlikely	Limited	Low
Flood: 100/200/500-year	Limited	Occasional	Limited	High
Flood: Localized Stormwater Flooding	Significant	Occasional	Critical	Medium
Landslides	Limited	Highly Likely	Limited	Low
Levee Failure	Limited	Unlikely	Negligible	High
River/Stream/Creek Bank Erosion	Significant	Occasional	Catastrophic	Medium
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Occasional	Limited	Medium
Severe Weather: Extreme Temperatures – Heat	Limited	Highly Likely	Negligible	Medium
Severe Weather: Fog	Extensive	Occasional	Limited	Medium
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, and Lightning)	Extensive	Highly Likely	Limited	Medium
Severe Weather: Wind and Tornadoes	Extensive	Highly Likely	Critical	Medium
Subsidence	Limited	Likely	Limited	Low
Volcano	Significant	Highly Likely	Limited	Low
Wildfire:(Burn Area/Smoke)	Limited	Occasional	Limited	Medium

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

P.5 Hazard Profile and Vulnerability Assessment

The intent of this section is to profile TRSD's hazards and assess the District's vulnerability separate from that of the Planning Area as a whole, which has already been assessed in Sections 4.2 and 4.3 Hazard Profiles and Vulnerability Assessment in the main plan. The hazard profiles in the main plan discuss overall impacts to the Planning Area and describes the hazard problem description, hazard extent, magnitude/severity, previous occurrences of hazard events and the likelihood of future occurrences. Hazard profile information specific to TRSD is included in this Annex. This vulnerability assessment analyzes the property, population, critical facilities, and other assets at risk to hazards ranked of medium or high significance specific to the District. For more information about how hazards affect the County as a whole, see Chapter 4 Risk Assessment in the main plan.

P.5.1. Hazard Profiles

Each hazard vulnerability assessment in Section P.5.3, includes a description as to how the hazard affects the TRSD and information on past occurrences. The intent of these section is to provide jurisdictional specific information on hazards and further describe how the hazards and risks differ across the Planning Area.

P.5.2. Vulnerability Assessment

This section identifies TRSD's assets at risk, including values at risk, critical facilities and infrastructure, population at risk, economic assets, natural resources, historic and cultural resources, and growth and development trends.

Assets at Risk and Critical Facilities

This section considers the District's assets at risk, with a focus on key District assets such as critical facilities, infrastructure, and other District assets and their values. With respect to District assets, the majority of these assets are considered critical facilities as defined for this plan:

> *Any facility (a structure, infrastructure, equipment or service), that is adversely affected during a hazardous event may result in interruption of services and operations for the District at any time before, during and after the hazard event. A critical facility is classified by the following categories: (1) Essential Services Facilities, (2) At-risk Populations Facilities, and (3) Hazardous Materials Facilities.*

Table P-4 lists particular critical facilities and other District assets identified by the TRSD's planning team as important to protect in the event of a disaster. TRSD's physical assets, valued at over $715 million, consist of the buildings and infrastructure to support the TRSD operations.

Table P-4 TRSD's Critical Facilities, Infrastructure and Other District Assets

Source: TRSD

Populations at Risk

Table P-4 above includes information on the occupancy for each identified asset. This represents the potential population that may be within the TRSD buildings during operational hours. Accordingly, nearly 30,000 students and staff are in District facilities on any given day, but generally Monday through Friday during school hours.

Natural Resources

The area is home to a number of endangered species and in fact, is included in the Natomas Habitat Conservation Plan. While these species are not necessarily on the existing school grounds, they do exist in undeveloped areas nearby and within district boundaries.

Historic and Cultural Resources

The Planning Team for the District noted that there are sites that originated in the 1930's and 1940's, but they are not currently on the historical registry.

Growth and Development Trends

During the process of unification, a master plan was prepared outlining future growth potential. The area of growth will be minimal and will be contained within the western section of the District.

While there were no new schools planned for the immediate future, two new properties were purchased, known as Terrace Park and Greenbriar. At some point in the next five years, pending financing, the district intends to begin the planning process for these sites. During that planning, the district will implement the new district standards that will clearly define the new building techniques and guidelines for building in potentially natural hazard zones, such as flooding, earthquake and tornado.

In addition, there are tentative plans to reconfigure sites and to adjust grade levels. During the planning for this work, the district should be able to provide standards to any design professional to implement safer and more substantial buildings.

Development since the 2011 Plan

The Planning Team for the District noted that no new facilities been built since 2011.

P.5.3. Vulnerability to Specific Hazards

This section provides the vulnerability assessment, including any quantifiable loss estimates, for those hazards identified above in Table P-3 as high or medium significance hazards. Impacts of past events and vulnerability of the TRSD to specific hazards are further discussed below (see Section 4.1 Hazard Identification in the Base Plan for more detailed information about these hazards and their impacts on the Sacramento County Planning Area). Methodologies for calculating loss estimates are the similar to those described in Section 4.3 of the Base Plan and are based on data provided by the District as described further below. The most vulnerable district assets to natural hazards would be the sites and properties within the Rio Linda area that are in close proximity to waterways, are situated on flat ground and are prone to flood. Buildings that contain electronic or electrically operated equipment are also vulnerable to flood inundation.

An estimate of the vulnerability of the TRSD to each identified priority hazard, in addition to the estimate of probability of future occurrence, is provided in each of the hazard-specific sections that follow. Vulnerability is measured in general, qualitative terms and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential. It is categorized into the following classifications:

- **Extremely Low**—The occurrence and potential cost of damage to life and property is very minimal to nonexistent.
- **Low**—Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**—Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**—Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have occurred in the past.

- **Extremely High**—Very widespread with catastrophic impact.

Dam Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–Medium

Hazard Profile and Problem Description

Dam failures can result from a number of natural or man made causes such as earthquakes, erosion of the face or foundation, improper siding, rapidly rising flood waters, structural/design flaws, and deliberate human actions. Folsom Dam is the major dam which affects the District and the student populations in the inundation areas. Of prime concern are the failures of the Folsom Dam, which is owned by the US Bureau of Reclamation. The flood waters from the dam would affect the District.

Other dams could affect the District, but inundation zones for the following dams were not mapped for this plan. The Sacramento Municipal Utility District (SMUD) inundation map indicates that a failure of the Rancho Seco Dam would flow to the Laguna Creek Basin and stop approximately at Stockton Boulevard. Failure of Shasta Dam would affect populations south along the Sacramento River basin to about Knights Landing where the water would lose momentum. An Oroville Dam failure would impact populations southwest along the Feather River basin to about the Yolo Bypass.

Warning ability is generally determined by the frequency of inspections for structural integrity, the flood wave arrival time (the time it takes for the flood wave to reach its maximum distance of inundation), or the ability to notify persons downstream and their ability to evacuate. The existence and frequency of updating and exercising an evacuation plan that is site-specific assists in warning and evacuation functions. A failure of the Folsom Dam would leave little time for evacuation of District properties downstream.

The Folsom Dam is currently being worked on to increase capacity, and lower the risk of dam failure.

Past Occurrences

The Planning Team for the District, noted that there have been no past occurrences of dam failure that have affected the District.

Vulnerability to Dam Failure

A dam failure will cause loss of life, damage to property, and other ensuing hazards, as well as the displacement of persons residing in the inundation path. Damage to electric generating facilities and transmission lines could also impact life support systems in communities outside the immediate hazard areas.

A catastrophic dam failure, depending on size of dam and population downstream, could exceed the response capability of local communities. Damage control and disaster relief support would be required from other local governmental and private organizations, and from the state and federal governments.

Figure 4.71 in Section 4.3.6 in the Base Plan shows the areas of Sacramento County at risk to a dam failure of the Folsom Dam.

Assets at Risk

Sacramento County provided inundation as a GIS layer for the Folsom Dam system, as part of the following breaks:

- Folsom Right Wing
- Folsom Mormon
- Folsom Dike 4
- Folsom Dike 5
- Folsom Dike 6
- Folsom Dike 7
- Folsom Dike 8
- Folsom Dam

GIS was used to determine the possible impacts of dam failure flooding to District facilities. The methodology described in Section 4.3.6 of the Base Plan was followed in determining structures and values at risk in potential dam inundation areas. Table P-5 shows the property name, address, occupancy, and total values and estimated loss of parcels that fall in an inundation zone in the District.

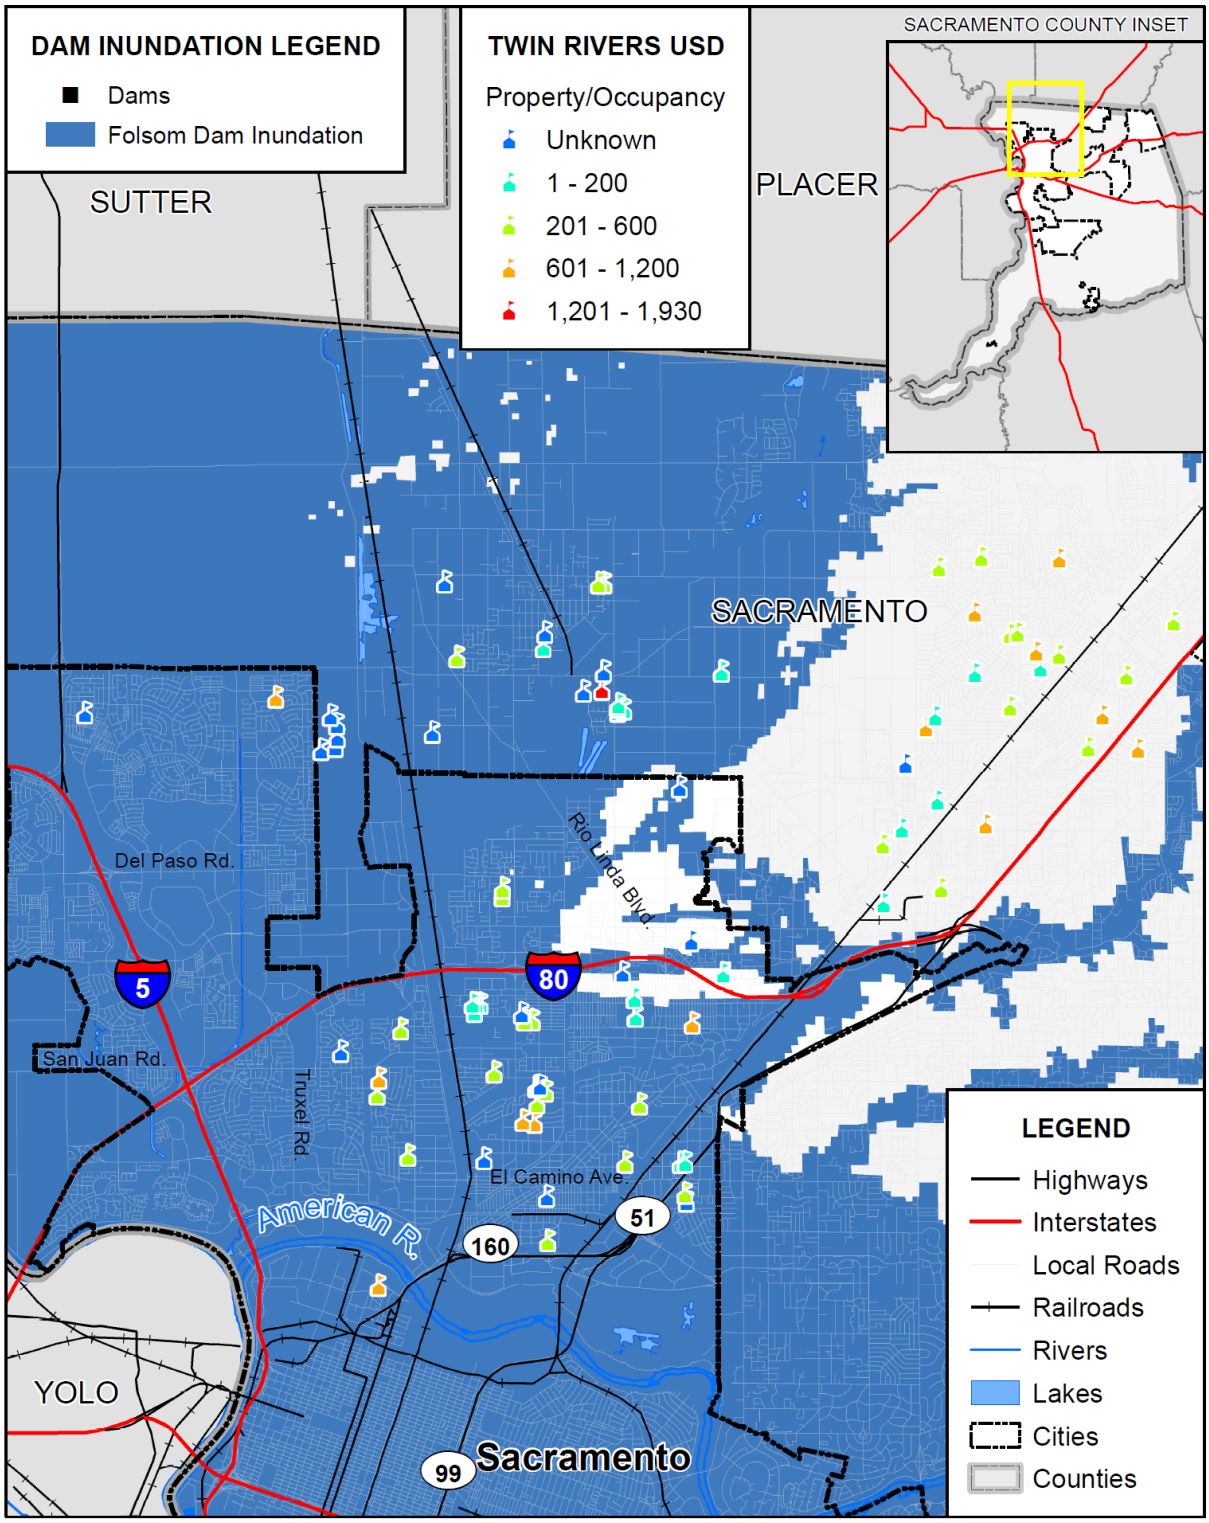
Source: Sacramento County 2016 Parcel/2015 Assessor's Data

Figure P-2 Twin Rivers School District – Buildings in Dam Inundation Zone



Data Source: Twin Rivers Unified School District, Sacramento County GIS, Cal-Atlas, National Inventory of Dams; Map Date: 05/2016.

Natural Resources

Historic and Cultural Resources

Most of the existing school sites built prior to 1950. While not on a historical registry, the oldest school in the district was built around 1938.All other historic and cultural resources in the District would be at risk to dam inundation.

Future Development

Any future development in the District could be affected by a Folsom Dam failure.

Earthquake

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Ground shaking is the primary earthquake hazard. Many factors affect the survivability of structures and systems from earthquake-caused ground motions. These factors include proximity to the fault, direction of rupture, epicenter location and depth, magnitude, local geologic and soils conditions, types and quality of construction, building configurations and heights, and comparable factors that relate to utility, transportation, and other network systems. Ground motions become structurally damaging when average peak accelerations reach 10 to 15 percent of gravity, average peak velocities reach 8 to 12 centimeters per second, and when the Modified Mercalli Intensity Scale is about VII (18-34 percent peak ground acceleration), which is considered to be very strong (general alarm; walls crack; plaster falls).

Past Occurrences

The Planning Team for the District noted no past occurrences that have affected the District.

Vulnerability to Earthquake

Assets at Risk

Earthquake losses will vary across the District depending on the source and magnitude of the event and the nature and type of building construction. A map showing peak ground accelerations in Sacramento County and the District is shown in Figures4-32 and 4-33 of the Base Plan. The earthquake scenario run for the 2011 LHMP for Sacramento County provides a good estimate of loss to the Planning Area based on a realistic earthquake scenario. The results of this scenario are described in Section 4.3.8 of the Base Plan. Specific damages to facilities owned by the District were not available in this analysis.

Natural Resources

Earthquake could affect water sources by damaging underground natural springs and wells, trees and landscape.

Historic and Cultural Resources

Most of the existing school sites were built prior to 1950. While not on a historical registry, the oldest school in the district was built around 1938 and has not been retrofit to updated seismic requirements.

Future Development

While there are no immediate plans for new schools or structures; any future development, albeit seismically considered, has the potential of damage during an earthquake.

Flood: 100/200/500-year

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

The District is traversed by several stream systems and is at risk to both riverine flooding and localized stormwater flooding. Flooding is of primary concern in the low, flat areas that exist in the TRUSD boundaries. As shown in the plan, there are 50-100 year flood zones, creeks, waterways and tributaries that have the potential to create a hazardous and possibly catastrophic situation. The name of the district, "Twin Rivers" is suggestive to this issue. Located near the apex of two major rivers; the Sacramento and American Rivers, flooding is always a concern.

Past Occurrences

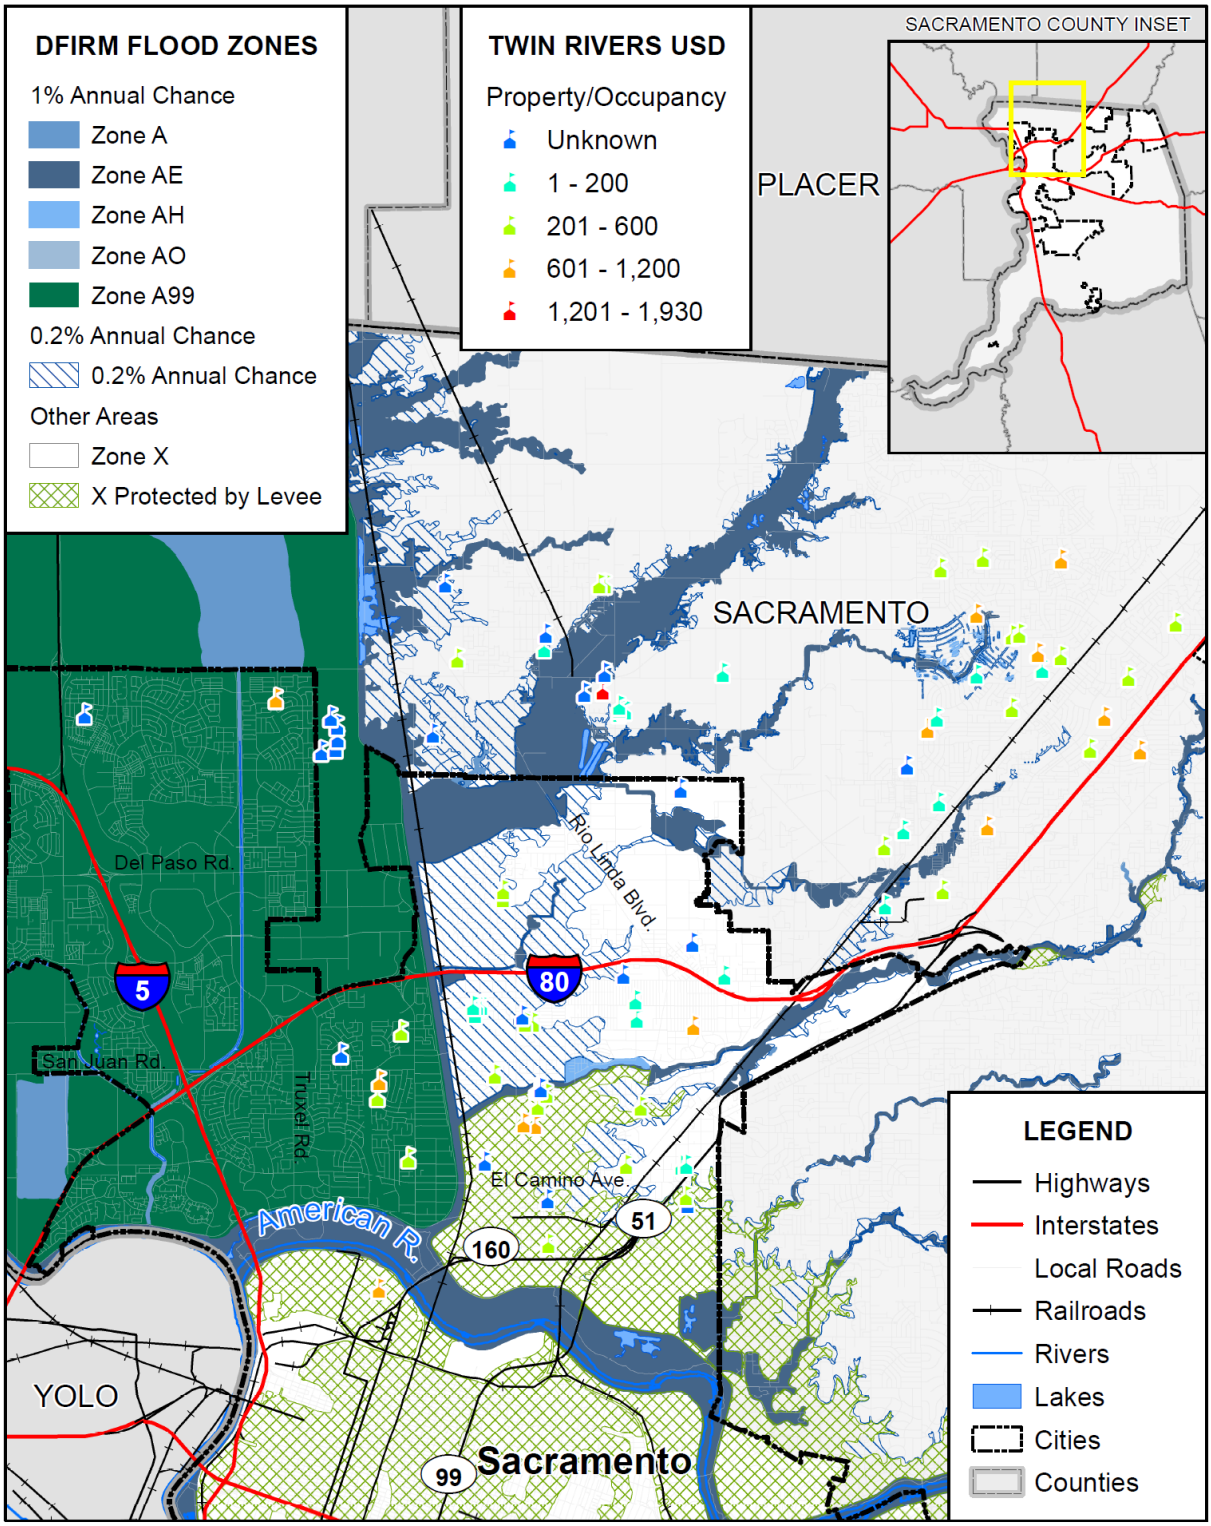
Flood waters in 1986 and 1998 caused damage to roads, structures and district properties. The many creeks and tributaries are still a risk for downstream flooding, in spite of corrections to local levees and upriver dams. While some damage occurred at this time, the records indicating repairs and corrections are not available. Twin Rivers USD is the culmination of four school districts, which unified in 2008. Records prior to this time are not available.

Vulnerability to Flood

Assets at Risk

The District's school locations were used as the basis for this analysis. The District provided occupancy and building values for each school. GIS was used to create a centroid, or a point representing the center of the School's parcel polygon. DFIRM flood data was then overlaid on the school centroids. For the purposes of this analysis, the flood zone that intersected a school centroid was assigned the flood zone for the entire school. District properties by DFIRM zones are shown on Figure P-3 and in Table P-6.

Figure P-3 Twin Rivers School District – Properties in DFIRM Flood Zones



Data Source: Twin Rivers Unified School District, Sacramento County GIS, Cal-Atlas, FEMA NFHL 04/16/2016; Map Date: 05/2016.

Source: TRUSD, FEMA 4/16/2016 DFIRM

National Flood Insurance Program and Repetitive Loss Properties

TRUSD is not an eligible community for purposes of the National Flood Insurance Program and thus does not participate in the program. The NFIP defines a community for purposes of the NFIP as, "any State or area or political subdivision thereof, or any Indian Tribe or authorized tribal organization, or Alaska Native Village or authorized native organization, which has the authority to adopt and enforce floodplain management regulations for the areas within its jurisdiction." The TRUSD does not have authority to establish floodplain regulations within District boundaries, but instead follows the regulations of the City or unincorporated area in which District property is located.

The District did not identify any District-owned repetitive loss or severe repetitive loss properties.

Natural Resources

All natural resources including grounds, wells, trees, landscaping are at risk to flooding.

Historic and Cultural Resources

Flood risks the historical integrity of some of the original schools in this district. Some built in the 1930's and 1940's would not withstand major flooding.

Future Development

While there are no immediate plans for new schools, and this issue has been considered in the new Master Plan, any future development has the potential for damage during flood.

Flood: Localized Stormwater

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

Historically, the District has been at risk to flooding primarily during the spring months when river systems in the County swell with heavy rainfall.

Past Occurrences

Flood waters in 1986 and 1998 caused considerable damage to roads, structures and district properties. The many creeks and tributaries are still a risk for downstream flooding, in spite of corrections to local levees and upriver dams.

Vulnerability to Localized Flood

Localized flooding also occurs throughout the Planning Area at various times throughout the year with several areas of primary concern unique to the District.

Assets at Risk

Mapping of these areas is an ongoing effort by the County and countywide maps that include the area covered by the District should be available by the next plan update. However, known affected localized flood areas and associated values identified by the County are included in Section 4 of the Base Plan. The District floods easily and each year during storm season, sand bags are pulled out. These instances are only recorded by work orders carried out by the maintenance department. The District could not provide any specific data on areas of localized flooding that directly affect District properties.

Natural Resources

All natural resources including grounds, wells, trees, landscaping are at risk to flooding

Historic and Cultural Resources

Stormwater/localized flooding risks the historical integrity of some of the original schools in this district. Some built in the 1930's and 1940's would not withstand major flooding.

Future Development

The risk of stormwater/localized flooding to future development can be minimized by accurate recordkeeping of repetitive localized storm activity. Mitigating the root causes of the localized stormwater will reduce future risks of losses due to stormwater/localized flooding.

Levee Failure

Likelihood of Future Occurrence–Unlikely
Vulnerability–High

Hazard Profile and Problem Description

Generally, levees fail due to overtopping or collapse. A catastrophic levee failure resulting from collapse probably will occur very quickly with relatively little warning. Such a failure would occur where the levee is saturated and the high hydrostatic water pressure on the river side, coupled with erosion of the levee from high water flows or an inherent defect in the levee that causes an almost instant collapse of a portion of the levee. Under such circumstances, structures located relatively near the break will suffer immediate and

extensive damage. Several hundred yards away from the break the energy of the flood waters will be dispersed sufficiently to reduce, but not eliminate, flooding damage to structures in its path. The flood water will flow in a relatively shallow path toward any low point in the affected area. Flood water will collect in these low areas and the levels will rise as the flow continues. When the rivers are high, it is not possible to close or repair a levee break until the water surface in the river and the flooded area equalize.

Past Occurrences

Other than the levee failure in 1986 and the floods of 1998, there are no other past occurrences.

Vulnerability to Levee Failure

Floods can threaten the District from several sources. Usually, the possibility of flooding can be anticipated from eight to twenty hours before the "Emergency Period" is reached. However, as demonstrated in Linda, California, in February 1986, it is possible for a levee to collapse with little or no warning when there are still four or more feet of freeboard available. Sections 4.2.17 and 4.3.12 of the Base Plan provides additional information on levees within the Sacramento County Planning Area. Although Folsom Dam and surrounding levees have been improved, there is still the risk of failure.

Unincorporated Sacramento County and its incorporated jurisdictions have mapped flood hazard areas. This includes areas protected by levees. GIS was used to determine the possible impacts of flooding in areas protected by levee within the County, and how the risk varies across the Planning Area. The following methodology was followed in determining improved parcel counts and values at risk to levee failure. However, this analysis was performed based on the most current 2015 DFIRMs which still reflect some levees as providing 100-year level of protection. According to the County, all levees have since been decertified as not providing a 100-year level of protection, so this analysis is based solely on the information presented in the DFIRMs. Further it is important to note that many levee improvement projects are ongoing throughout the Planning Area, some of which will be providing certification of area levees to both a 100-year and 200-year levels depending on applicable requirements. Thus, this analysis reflects a moment in time and while it does provide information on areas developed behind levees, the X Protected by Levee flood zone will continue to change as these projects are completed and new certifications obtained.

Assets at Risk

The District's school locations were used as the basis for this analysis. The District provided occupancy and building values for each school. GIS was used to create a centroid, or a point representing the center of the School's parcel polygon. DFIRM flood data was then overlaid on the school centroids to determine if the centroid lies in and X Protected by Levee Zone. For the purposes of this analysis, the flood zone that intersected a school centroid was assigned the flood zone for the entire school. District properties in DFIRM X Protected by Levee zones are shown on Figure P-3 and in Table P-7.

Table P-7 Twin Rivers School District – Properties in DFIRM Levee Protected Flood Zones

School Property	Physical Address	Occupancy	Structure Value
Babcock Park	2400 Cormorant Way, Sacramento, 95815	0	N/A

School Property	Physical Address	Occupancy	Structure Value

Source: TRUSD, FEMA 4/16/2016 DFIRM

Natural Resources

All natural resources including grounds, wells, trees, landscaping are at risk to flooding.

Historic and Cultural Resources

Flood risks the historical integrity of some of the original schools in this district. Some built in the 1930's and 1940's would not withstand major flooding.

Future Development

Future development would be in the northern section of the District, where small streams and tributaries abound, as well as levees. Although recently improved, there is still a risk of failure.

River/Stream/Creek Bank Erosion

Likelihood of Future Occurrence–Occasional
Vulnerability–Medium

Hazard Profile and Problem Description

The District is situated on a thermal belt in a relatively flat area, as is much of the central California area, resulting in flooding and erosion in the spring. The District Planning Team noted that there are many creeks and tributaries of the Sacramento and American rivers that traverse the District.

Past Occurrences

There are no records showing damage from erosion. Most improvements were done during the course of "maintenance" work.

Vulnerability to Erosion

Since the Districts is located in a relatively flat area, the District has experienced a number of problems, including flooding due to eroded stream banks. The Rio Linda area, specifically Rio Linda High, Dry Creek ES, Rio Linda Prep are bordered by creeks (Dry Creek & Linda Creek) that are subject to overflow and bank erosion. The District intends, as a matter of policy, to address these issues in the hazard mitigation plan and as a matter of course for district procedure.

Section 4.2.18 of the Base Plan provides additional information on the erosion hazard within the Sacramento County Planning Area.

Assets at Risk

The District Planning Team noted that buildings in the Rio Linda area have some risk to erosion. Specific details on this were unavailable.

Natural Resources

The District Planning Team noted that a loss of vegetation and erosion in parkways in District areas may occur.

Historic and Cultural Resources

The Planning Team for the District noted no risk to historic and cultural resources from erosion.

Future Development

The District Planning Team noted that only buildings to be constructed in northern section would be at risk; but will be designed with this risk considered.

Severe Weather: Extreme Temperatures – Cold and Freeze

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Extreme cold often accompanies a winter storm or is left in its wake. It is most likely to occur in the winter months of December, January, and February. Prolonged exposure to the cold can cause frostbite or hypothermia and can become life-threatening. Infants and the elderly are most susceptible. Pipes may freeze and burst in buildings that are poorly insulated or without heat. Extreme cold can disrupt or impair communications facilities.

Past Occurrences

The District Planning Team noted that there is no list showing damage from freeze, although there have been broken water pipes, damaged equipment and lost vegetation. Repairs were done during the course of "maintenance" work.

Vulnerability to Cold and Freeze

Vulnerability to winter storms and extreme cold is difficult to quantify, as these are not mapped or geographically specific hazards. Most losses in the District associated with this hazard come in the form of power outages or and bursting pipes. Severe ice is often associated with winter storms. An icy roadway on a bridge or in a busy intersection threatens the safety of students on buses. Delays in emergency response services and a halt of public utilities' services are of concern.

In the event of a severe winter storm or extreme cold, populations with special needs such as elementary school students are of particular concern; as they are most vulnerable to adverse conditions and temperatures. Approximately 16,570 students in elementary or pre-kindergarten these would be at risk to severe weather.

Section 4.2.2 of the Base Plan provides additional information on freeze within the Sacramento County Planning Area.

Assets at Risk

The District Planning Team noted that specific assets at risk to cold and freeze are the agriculture classrooms and livestock associated with them. In addition, tanks, well components, and various building components on older buildings would be at risk.

Natural Resources

The District Planning Team noted that vegetation and agricultural areas in the District are at risk from cold and freeze.

Historic and Cultural Resources

The District Planning Team noted no risk to historic and cultural resources in the District from cold and freeze.

Future Development

The District Planning Team noted that there is a negligible risk to future properties – future development will consider this risk.

Severe Weather: Extreme Temperatures – Heat

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

The District is situated on a thermal belt in a relatively flat area, as is much of the central California area, resulting in excessive heat during late spring and early fall seasons. Due the age of most schools, the HVAC equipment has long since passed it's intended usage. The district continues to install new equipment, when able. This has been a very real problem in the district for years, due to the extreme temperatures, over 100 degrees in the beginning and end of the school year.

Past Occurrences

The district has had to provide fans, temporary AC units and other devices to cool classrooms during extreme heat.

Vulnerability to Heat

As a result of the flat central California area and resulting heat, the District has experienced a number of problems, including a death from heat exhaustion. In the event of extreme heat, populations with special needs such as elementary school students are of particular concern; as they are most vulnerable to extreme temperatures. Approximately 16,570 students in elementary or pre-kindergarten these would be at risk to extreme heat. The District intends, as a matter of policy, to address these issues in the hazard mitigation plan and as a matter of course for district procedure.

Section 4.2.3 of the Base Plan provides additional information on the extreme heat within the Sacramento County Planning Area.

Assets at Risk

The District Planning Team noted that all facilities are at risk to extreme temperatures. While the structures themselves do not have risk from heat, the students who use them do.

Natural Resources

The extreme heat has killed many trees and planted areas. Along with the drought, the extreme heat has exacerbated these issues over the past few years

Historic and Cultural Resources

There are historic (not registered) buildings that currently have no AC systems, that become damaged in the extreme heat. The district allows various groups and communities, such as Hmong, to participate in neighborhood garden programs. The extreme heat and drought have impacted this.

Future Development

Future development will have little risk as this will be considered in new designs however; extreme temperatures have a tendency to prematurely age roofs/equipment/buildings.

Severe Weather: Fog

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

The District is situated on a thermal belt in a relatively flat area, as is much of the central California area, resulting in fog in the winter.

Past Occurrences

The District Planning Team noted that no past occurrences of fog have affected the District since 2011.

Vulnerability to Fog

The District has experienced a number of problems, including fog-related accidents. In the event of fog, transporting children to and from elementary school students is of particular concern. Approximately 16,570 students in elementary or pre-kindergarten these would be at risk to transportation incidents resulting from fog. The District intends, as a matter of policy, to address these issues in the hazard mitigation plan and as a matter of course for district procedure.

Section 4.2.4 of the Base Plan provides additional information on the fog within the Sacramento County Planning Area.

Assets at Risk

The District Planning Team noted that fog is a safety issue for those who drive their children to school, as well as for bus drivers and passengers traveling to and from District schools.

Natural Resources

The District Planning Team noted no issues related to fog and natural resources.

Historic and Cultural Resources

The District Planning Team noted no issues related to fog and historic and cultural resources.

Future Development

The District Planning Team noted no issues related to fog and future development.

Severe Weather: Heavy Rain and Storms

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

According to historical hazard data, severe weather is an annual occurrence in the District and Sacramento County as a whole. Damage and disaster declarations related to severe weather have occurred and will continue to occur in the future.

Past Occurrences

Heavy rains have created drainage and flooding problems and damaged structures.

Vulnerability to Heavy Rains

Heavy rain and thunderstorms are the most frequent type of severe weather occurrences in the District. Wind and lightning often accompany these storms and have caused damage in the past. However, actual damage associated with the primary effects of severe weather has been limited. It is the secondary hazards caused by weather, such as floods and fires that have had the greatest impact on the District.

Sections 4.2.5 and 4.3.15 of the Base Plan provides additional information on heavy rains and storms within the Sacramento County Planning Area.

Assets at Risk

The District Planning Team note that all District assets are at risk to heavy rains leading to probable flooding.

Natural Resources

As shown in the plan, there are 50- and 100-year flood zones, creeks, waterways and tributaries that have the potential to create a hazardous and possibly catastrophic situation in heavy rain conditions.

Historic and Cultural Resources

The District allows various groups and communities, such as Hmong, to participate in neighborhood garden programs. As with extreme heat and drought, heavy rains have impacted these types of ventures.

Future Development

Future development will be designed to withstand heavy rains better than older buildings, however, there is still the risk of flood and damage due to this weather condition.

Severe Weather: Wind and Tornadoes

Likelihood of Future Occurrence–Highly Likely
Vulnerability–Medium

Hazard Profile and Problem Description

All District properties are at risk to wind and tornadoes. When the randomness of tornado location and the random location of schools within the District are considered, the planning team does not consider any one area at a greater risk to tornadoes than any other. Thus, the risk of tornadoes is the same across the District. The risk does not vary from school to school. This is because tornadoes are just as likely to hit one location as another within the District.

Past Occurrences

The District Planning Team noted no past occurrences of tornado or high winds causing damage in the District.

Vulnerability to Tornadoes

The exposure to tornadoes does vary from school to school, as indicated by the building values and occupancy differences in each school. The area that tornadoes strike is random, depending upon the location of the weather system spawning them.

Tornadoes need to be given serious consideration in this assessment, because if and when they do strike a school, the impact can be devastating. Tornadoes can impact the District by destroying buildings and infrastructure within seconds. Tornadoes can cause numerous human injuries or fatalities. They can create tremendous debris removal problems, overwhelm building departments, and psychologically scar students, faculty, and staff.

There are limited things that can be done to reduce the damages caused by tornadoes – though recently, significant strides have been made to improve life safety during these events – most notably through improved warning systems and the building of designated shelters.

Section 4.2.6 of the Base Plan provides additional information on tornadoes within the Sacramento County Planning Area.

Assets at Risk

The District Planning Team noted that any District building, particularly the many portable buildings within this District have risk from wind and tornadoes.

Natural Resources

The District Planning Team noted that there are old growth trees, natural landscaping and wells that could be affected.

Historic and Cultural Resources

There are many historical buildings in the District which are culturally sensitive.

Future Development

Although the damage lessens with newer construction, any new buildings, signage, structures with height are at risk to tornadoes.

Wildfire

Likelihood of Future Occurrence–Occasional
Vulnerability–High

Hazard Profile and Problem Description

Major fires are generally categorized as either a conflagration or wildland/forestland. A conflagration may involve residential or commercial areas and spreads across both natural and constructed barriers. Wildland is associated with open range grasslands and into the foothills of a particular area. Because of development in rural areas adjacent to and within the District, a third classification is emerging, the Wildland Urban Interface (WUI) wildfire. The WUI wildfire is one that burns along the urban/rural interface and can result in major losses of property and structures. The WUI wildfire hazard is what is addressed in this LHMP.

A number of factors affect the behavior of wildland and interface fires, including terrain, weather, wind, fuels and seasons. It is well known that fire travels faster uphill than down and is more difficult to fight on steep slopes than on level ground. When weather is hot and the humidity is low, wildland fires can explode with intensity of rapid combustion. Even in the absence of strong winds, a fast-moving fire can generate its own updrafts, particularly in canyons, causing burning brands to be carried high in the air and drop a long distance ahead. This results in spot fires over a wide radius as the wind changes its direction.

Past Occurrences

The District Planning Team noted that there are no records of wildfire impacts that have occurred in the District.

Vulnerability to Wildfire

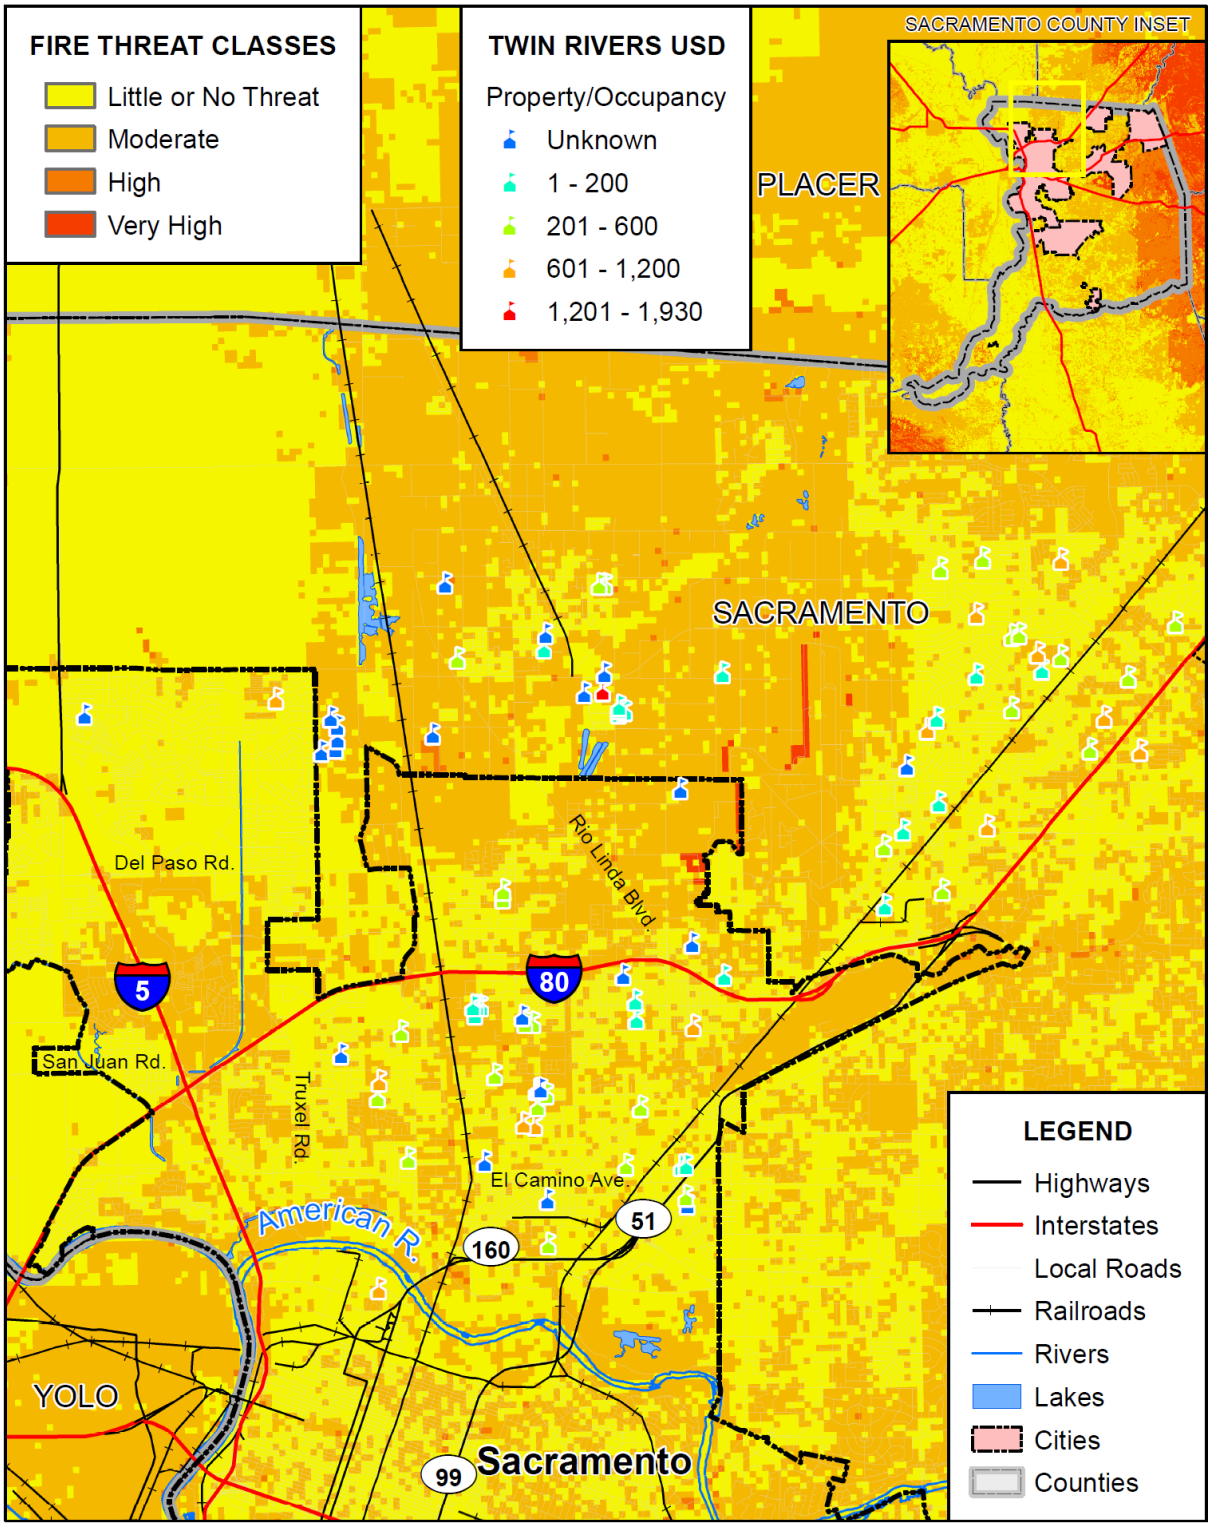
The District is not immune to numerous types of grass and brush fires and any one of them may accelerate into a large urban interface wildfire. Such a situation could lead to evacuation of large portions of the population and the potential for significant loss of personal property, structures and rangeland. The natural fuels available near District properties vary greatly in the rate and intensity of burning. Fires in heavy brush and stands of trees burn with great intensity but more slowly than in dry grass and leaves. Dense fuels will propagate fire better than sparse fuels. The local fire season generally extends from June through late September or early October.

During extremely windy conditions, both small and large-scale fires will generate enough smoke to necessitate the closing of key transportation routes. It may be necessary to close streets and/or re-route traffic to maintain traffic lanes and access for firefighting apparatus. Large parking areas may be cordoned off for the staging of various types of resources needed during large-scale emergencies. All of these may affect busing and transportation of students, faculty, and staff to and from District schools.

Assets at Risk

The District's school locations were used as the basis for this analysis. The District provided occupancy and building values for each school. GIS was used to create a centroid, or a point representing the center of the School's parcel polygon. Cal Fire's Fire Threat layer was then overlaid on the school centroids. For the purposes of this analysis, the fire threat zone that intersected a school centroid was assigned the fire threat zone for the entire school. District properties by Fire Threat Zones s are shown on Figure P-4 and in Table P-8.

Figure P-4 Twin Rivers School District – Properties by Fire Threat Zones



Data Source: Twin Rivers Unified School District, Sacramento County GIS, Cal-Atlas, Cal-Fire 2004 Fire Threat Data; Map Date: 05/2016.

Table P-8 Twin Rivers School District – Properties by Fire Threat Zones

Source: TRUSD, CAL FIRE

Natural Resources

The District Planning Team noted that the District covers a large area, with many old growth trees, natural park areas that would be affected by wildfire.

Historic and Cultural Resources

The District Planning Team noted that there are many old, historical buildings that would be considered an historic loss in event of fire.

Future Development

The District Planning Team noted that there is minimal risk, as new building will be constructed to avoid this issue.

P.6 Capability Assessment

Capabilities are the programs and policies currently in use to reduce hazard impacts or that could be used to implement hazard mitigation activities. This capabilities assessment is divided into five sections: regulatory mitigation capabilities, administrative and technical mitigation capabilities, fiscal mitigation capabilities, mitigation education, outreach, and partnerships, and other mitigation efforts.

P.6.1. Regulatory Mitigation Capabilities

Table P-9 lists regulatory mitigation capabilities, including planning and land management tools, typically used by local jurisdictions to implement hazard mitigation activities and indicates those that are in place in the TRSD.

Table P-9 TRSD's Regulatory Mitigation Capabilities

Plans	Y/N Year	Does the plan/program address hazards? Does the plan identify projects to include in the mitigation strategy? Can the plan be used to implement mitigation actions?
Comprehensive/Master Plan	Y 2009	District Organization and Implementation Planning Process
Capital Improvements Plan	Y	Facilities master plan
Economic Development Plan	N	

Local Emergency Operations Plan	Y	Emergency Management Plan
Continuity of Operations Plan	N	
Transportation Plan	N	
Stormwater Management Plan/Program	Y	TRUSD SWWP-continuously updated
Engineering Studies for Streams	N	
Community Wildfire Protection Plan	Y	Natomas Habitat Conservation Plan
Other special plans (e.g., brownfields redevelopment, disaster recovery, coastal zone management, climate change adaptation)	Y	Safety Plan
Building Code, Permitting, and Inspections	**Y/N**	**Are codes adequately enforced?**
Building Code	N	Dept. of State Architect / Title 24
Building Code Effectiveness Grading Schedule (BCEGS) Score	N	Score: unknown
Fire department ISO rating:	N	Rating: unknown
Site plan review requirements	Y	By CDE as required and to verify preventative measures established. By DSA for final plan check.
Land Use Planning and Ordinances	**Y/N**	**Is the ordinance an effective measure for reducing hazard impacts? Y** **Is the ordinance adequately administered and enforced? Y**
Zoning ordinance	N	
Subdivision ordinance	N	
Floodplain ordinance	N	
Natural hazard specific ordinance (stormwater, steep slope, wildfire)	N	
Flood insurance rate maps	N	
Elevation Certificates	N	
Acquisition of land for open space and public recreation uses	N	
Erosion or sediment control program	N	
Other	Y	District Policy Manual
How can these capabilities be expanded and improved to reduce risk?		

Source: TRSD

P.6.2. Administrative/Technical Mitigation Capabilities

Table P-10 identifies the department(s) responsible for activities related to mitigation and loss prevention for TRSD.

Table P-10 TRSD's Administrative and Technical Mitigation Capabilities

Administration	Y/N	Describe capability Is coordination effective?
Planning Commission	N	
Mitigation Planning Committee	N	
Maintenance programs to reduce risk (e.g., tree trimming, clearing drainage systems)	N	
Mutual aid agreements	N	
Other		
Staff	**Y/N FT/PT**	**Is staffing adequate to enforce regulations? Is staff trained on hazards and mitigation? Is coordination between agencies and staff effective?**
Chief Building Official	N	
Floodplain Administrator	N	
Emergency Manager	Y FT	Risk Manager
Community Planner	N	
Civil Engineer	Y FT	Facilities/Planning – Director of Facilities & Construction
GIS Coordinator	Y	Facilities/Planning
Other		
Technical		
Warning systems/services (Reverse 911, outdoor warning signals)	Y	IT Department
Hazard data and information	N	
Grant writing	N	
Hazard analysis	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: TRSD

P.6.3. Fiscal Mitigation Capabilities

Table P-11 identifies financial tools or resources that the TRSD could potentially use to help fund mitigation activities.

Table P-11 TRSD's Fiscal Mitigation Capabilities

Funding Resource	Access/ Eligibility (Y/N)	Has the funding resource been used in past and for what type of activities? Could the resource be used to fund future mitigation actions?
Capital improvements project funding	Y	Used for all types of improvement projects
Authority to levy taxes for specific purposes	Y	School Impact Fees
Fees for water, sewer, gas, or electric services	N	
Impact fees for new development	Y	Developer Fees used on various projects
Storm water utility fee		
Incur debt through general obligation bonds and/or special tax bonds	Y	Bonds-for specific site improvements
Incur debt through private activities	Y	Private Loans
Community Development Block Grant	N	
Other federal funding programs	Y	Grants
State funding programs	Y	Modernization Funding
Other		
How can these capabilities be expanded and improved to reduce risk?		

Source: TRSD

In addition, there are a number of Federal sources of funding for hazard mitigation projects, including;

- Federal Emergency Management Agency (FEMA)
- Housing and Urban Development (HUD)
- US Army Corps of Engineers (USACE)
- Small Business Administration (SBA)
- US Department of Agriculture (USDA)
- Natural Resource Conservation Service (NRCS)
- National Oceanic and Atmospheric Administration (NOAA)
- Federal Homeland Security Grants
- Bureau of Land Management (BLM)
- CA Dept. of Water Resources Flood Safe Program

P.6.4. Mitigation Education, Outreach, and Partnerships

Table P-12 identifies education and outreach programs and methods already in place that could be/or are used to implement mitigation activities and communicate hazard-related information.

Table P-12 TRSD's Mitigation Education, Outreach, and Partnerships

Program/Organization	Yes/No	Describe program/organization and how relates to disaster resilience and mitigation. Could the program/organization help implement future mitigation activities?
Local citizen groups or non-profit organizations focused on environmental protection, emergency preparedness, access and functional needs populations, etc.	N	
Ongoing public education or information program (e.g., responsible water use, fire safety, household preparedness, environmental education)	Y	Safe Schools, Energy Management; solar and water retention programs.
Natural disaster or safety related school programs	Y	In Emergency Plan
StormReady certification	N	
Firewise Communities certification	N	
Public-private partnership initiatives addressing disaster-related issues	N	
Other		
How can these capabilities be expanded and improved to reduce risk?		

P.6.5. Other Mitigation Efforts

The district is in the process of partnering with appropriate agencies, such as the California Department of Natural Resources, County of Sacramento, Rio Linda/Elverta Water Department, Sacramento Regional Flood Control Agency, Arcade Creek Parks and Recreation and neighborhood efforts to minimize loss of property and casualties of potential catastrophic event.

The district works closely with the local efforts to monitor ongoing efforts to provide safe levee systems. The district also works closely with neighboring water districts to minimize flooding and provide adequate drainage at sites within flood zones. The district plans to prepare and activate a community protection/assistance initiative for the area most critical.

The County of Sacramento, Rio Linda/Elverta Water Department, SAFCO, Arcade Creek Parks and Recreation and Sacramento County Libraries will become partners in mitigation efforts.

The District is in the process of implementing an assessment and protection plan based on National Clearinghouse of Educational Facilities (NCEF) guidelines. In addition to this, the District has made efforts to compile emergency supplies such as emergency communications, power, fuel and water as a part of the Emergency Preparedness Plan.

The District is creating District Standard Construction Specifications, outlining in detail the mandatory building procedures and techniques that will be implemented in all future building. These "standards" will include raised foundations, drainage systems and detention ponds, earthen berms and other natural resource

protection, structural systems designed for high winds or tornados and "safe areas" in a particular building where staff and students will collect during catastrophic events, natural or by man.

In 2007, during the construction of a new school compound known as ENEC, various mitigation efforts were implemented in the design. Detention ponds were constructed on a larger than needed scale to be included as infrastructure for surrounding areas and adjacent development.

Drainage from the building and site flowed directly into the detention ponds with overflow going directly into the County flood channels. This project was designed and constructed in partnership with SAFCA (Sacramento Area Flood Control Agency), the County of Sacramento and local developers.

P.7 Mitigation Strategy

P.7.1. Mitigation Goals and Objectives

TRSD adopts the hazard mitigation goals and objectives developed by the HMPC and described in Chapter 5 Mitigation Strategy.

P.7.2. Mitigation Actions

The planning team for TRSD identified and prioritized the following mitigation actions based on the risk assessment. Background information and information on how each action will be implemented and administered, such as ideas for implementation, responsible office, potential funding, estimated cost, and timeline are also included.

Action 1. New drainage plans to sites within the flood areas including, site drainage, storm drain upgrades and re-grading fields to shed water (on-site) away from buildings

Hazards Addressed: Flooding/Drainage

Goals Addressed: 1, 2, 3, 4

Issue/Background: Many of the Northern area schools within the Rio Linda community and Eastern schools within the Natomas community have been designated as potential catastrophic flood zones and do not have adequate drainage. The District is in the planning phases of identifying those specific areas, assessing the existing drainage systems and prioritizing the potential risk. The District intends to begin work with civil engineers to begin design and planning to engage in this work in the 2017/18 school year. The current District is a culmination of five smaller districts that incorporated in 2008, therefore, paper records are difficult to trace, but there is evidence of damage in the surrounding communities that prove difficulties during heavy storms and rains. Once this action is completed and depending upon adequate funding, the District will begin the design process for upgrading and increasing drainage systems.

Other Alternatives: During the assessment process, the District will identify drainage systems that require interim maintenance such as removing debris, clearing perimeter drains and verifying that the existing drains are working as well as possible.

Existing Planning Mechanisms through which Action will be Implemented: The District Facilities Services and Maintenance departments will work in tandem to create a workable plan.

Responsible Office: Facility Services

Priority (H, M, L): High

Cost Estimate: $2,250,000

Benefits (Losses Avoided): Reduction of District property and life safety

Potential Funding: FEMA Funding, TRUSD facility funding/CDE, any other grant or funding programs available.

Schedule: The District is currently planning the improvements and will begin this portion of work as soon as possible.

Action 2. ***Work with City/County/Water departments to create defensible spaces at sites where nearby creeks are prone to flooding. Build-up earthen berms (off-site) to shed water away from critically located schools.***

Hazards Addressed: Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: Many of the district sites are located in the County of Sacramento and are within the perimeter of various water districts and city and county agencies, particularly Sacramento Regional Flood Control Agency, County of Sacramento and Rio Linda/Elverta Water District. TRUSD intends to participate in any improvement discussions led by the various agencies, to provide perimeter protection including levee rebuilding. This will be a partnering effort to create a program of corrective and preventative measures for reducing flood damage.

Other Alternatives: The District will build earthen berms and provide grading to shed overflow water away from sites to adjacent storm drainage.

Existing Planning Mechanisms through which Action will be implemented: The Facilities Services Department is in the assessment phases of determining which sites will be best suited for this type of work

Responsible Office: Facility Services

Priority (H, M, L): High

Cost Estimate: $2,800,000

Benefits (Losses Avoided): Loss of property and personal safety.

Potential Funding: FEMA funding, local agency participation, other district sources, if available.

Schedule: ASAP

Action 3. Working with the Department of the State Architect (DSA) on Earthquake Retrofit Plan on all sites.

Hazards Addressed: Earthquakes

Goals Addressed: 1, 2, 3, 4

Issue/Background: There are a number of buildings within the TRUSD District boundaries that were construction prior to 1970. Those building require earthquake retrofitting or structural enhancement to make buildings safe during earthquake. It is the District's intention to assure that all buildings are safe for students, staff and visitors and to eliminate potentially disastrous property loss should an earthquake occur. The Facility Services Department will work closely with the Department of the State Architect to provide facility assessment and determine best cause of action.

Other Alternatives: The Facility Services Department will undergo a facility assessment with the use of a Structural Engineer to determine potentially dangerous buildings and areas, costs to correct and schedule action. The Risk Management Department will verify adequate earthquake insurance and verify that emergency plans and subsequent materials are in place should earthquake occur.

Existing Planning Mechanisms through which Action will be implemented: The Facility Services Department has been in touch with DSA to begin the process of Earthquake Retrofit.

Responsible Office: Facility Services and Risk Management.

Priority (H, M, L): Medium

Cost Estimate: Unknown to $10,000,000.00

Benefits (Losses Avoided): Property and life.

Potential Funding: FEMA, Department of the State Architect, California Department of Education, California Earthquake Authority, District Funds (if available) any available grant programs.

Schedule: The District intends to contact DSA for this in the 2016/17 school year, after current projects start. It is anticipated that funding may become available to proceed with improvements.

Action 4. Revise and update district-wide Storm Water Prevention Plan

Hazards Addressed: Drainage/Erosion/Flooding

Goals Addressed: 1, 2, 3, 4

Issue/Background: The District practices storm water prevention during construction projects as mandated by the state and federal agencies. The District would like to implement these same procedures

in the Hazard Mitigation Plan and as a matter of policy to deter debris from drainage systems, circumvent flooding to protect land and property.

Other Alternatives: N/A

Existing Planning Mechanisms through which Action will be implemented: The Facility Services Department including Maintenance and Operations is determining the best way to create a procedural manual and implement this policy.

Responsible Office: Facilities Services with Maintenance & Operations.

Priority (H, M, L): Medium

Cost Estimate: $150,000

Benefits (Losses Avoided): Property, environment and life safety.

Potential Funding: FEMA, any state or other agency with grant funds.

Schedule: In process now.

Action 5. Create defensible perimeter space – for fire areas. Trees trimmed and vegetation removed to minimize impact during fire season.

Hazards Addressed: Wildfire

Goals Addressed: 1, 2, 3, 4

Issue/Background: Various schools in the District are in less densely populated areas where the threat of fire risk due to excessive vegetation is high. While the District attempts to minimize this risk, it has been not been accomplished as a priority. It is the intention of the District to create and implement new policy and procedures and to purchase the tools and equipment necessary to minimize these concerns.

Other Alternatives: Prepare a recurring work order that stipulates drain proper tree trimming and vegetation removal as part of a program and on an annual basis.

Existing Planning Mechanisms through which Action will be Implemented: The Grounds section of the Facility Services Department is preparing a work plan and equipment list to accomplish this goal.

Responsible Office: Facility Services and Grounds.

Priority (H, M, L): M

Cost Estimate: $75,000

Benefits (Losses Avoided): Protection of life and property

Potential Funding: FEMA, TRUSD Deferred Maintenance funds for yearly

Schedule: The M&O department has initiated this work as part of the Preventative Maintenance Plan and has begun the work for the 2016 season. As funding allows, the District will continue this as part of the bi-yearly preventative plan.

Appendix A Planning Process

A.1 Sacramento County Step 1: Organize to Prepare a Plan

(a). Involvement of Community Land Use and Comprehensive Planning

In addition to attending meetings, providing draft text for inclusion in the plan, reviewing plan documents, and coordinating input from other departments and stakeholders, Sacramento County planners also provided information on development since the last plan, mapping and details on future development areas, input on current mitigation capabilities, coordination with other planning mechanisms, and in-progress modifications to the General Plan and associated documents specific to Sacramento County's floodplain management provisions for regulating to the 200-year level of flood protection.

Sacramento County Planners

- Todd Taylor – Associate Planner, Community Development Department
- Mike Winter – Senior Planner, Community Development Department

City of Sacramento Planners

- Remi Mendoza – Associate Planner, Community Development Department/Long Term Planning

Other planners to the process included Jeanine Foster and Chris Morrison, professional planners with Foster Morrison, the consultant for this LHMP Update, as well as other planners and staff from the incorporated communities and other participating jurisdictions involved in future land use development decisions for the Sacramento County Planning Area.

(b). Staff of Community Departments on HMPC with Expertise on CRS Step 7 Activities

In order to promote the integration of CRS into this planning process, the representatives from the County were selected based on their areas of expertise relative to the CRS mitigation categories as detailed in Table A-1.

(c) Sacramento County Resolution formally recognizing and establishing the planning process/planning committee

APPROVED
BOARD OF SUPERVISORS
BY RESO# 2016-0091
FEB 09 2016
BY Florence Evans
Clerk of the Board

COUNTY OF SACRAMENTO
CALIFORNIA

26

For the Agenda of:
February 9, 2016

To: Board of Supervisors

From: Department of Water Resources

Subject: Authorization To Apply For And Accept A Federal Emergency Management Agency (FEMA) Grant To Update The Local Hazard Mitigation Plan

Supervisorial District(s): All

Contact: George Booth, Senior Civil Engineer 874-6484

Overview
The Department of Water Resources (DWR) applied through the California Office of Emergency Services (OES) for a Pre-Disaster Mitigation Program grant from FEMA, to update the multi-jurisdictional Local Hazard Mitigation Plan (Plan). This action seeks approval for the Plan update, authorization to apply for and accept the FEMA grant, and designation of the applicant's agent authorized to execute the grant using the special resolution form required by OES.

Recommendations
1. Approve the Resolution authorizing the Director of the Department of Water Resources to update the Local Hazard Mitigation Plan and to apply for and accept the FEMA grant to fund the update.
2. Approve the OES resolution form (Attachment 1) designating the applicant's agent(s).

Measures/Evaluation
Not applicable to this item.

Fiscal Impact
The Plan update will cost $145,000 and the FEMA grant amount will be $108,750, with a required 25 percent local (non-federal) cost share totaling $36,250. The local share will be split between the City of Sacramento ($12,600) and Sacramento County Water Agency (SCWA) Zone 13 ($23,650). The cost of the update is included in the Fiscal Year 2015-16 SCWA Zone 13 Adopted Budget.

BACKGROUND

The Robert T. Stafford Disaster Mitigation Act of 2000 (Stafford Act) requires communities to prepare a local hazard mitigation plan and to update that plan every five years in order to be eligible for federal disaster mitigation grants.

The current Plan was approved by the Board of Supervisors and by the Sacramento County Water Agency Board of Directors on December 6, 2011, by resolutions 2011-0886 and WA2818, respectively. FEMA approved the Plan on April 11, 2012, therefore setting the 5-year Plan update to be completed April 2017.

DISCUSSION

Maintaining an updated Plan is a federal requirement encouraged by the FEMA Community Rating System, critical for applying for hazard mitigation grant funding, and assists in attracting disaster assistance funds if the County experiences a declared disaster requiring federal assistance. Local hazard mitigation plans are important for:

- Identifying natural hazards, their risks, and actions to help mitigate those risks
- Engaging the public in a dialogue regarding natural hazards
- Identifying and reducing risks from natural hazards
- Improving community standing in the FEMA Community Rating System
- Providing policy guidance for decision makers

A local hazard mitigation plan should address all natural hazards that could affect the community and contain risk and vulnerability assessments that describe susceptibility in terms of the types and numbers of existing buildings, infrastructure, and critical facilities located in the plan area.

As flood hazards are a significant concern in Sacramento County, the County's Plan update must incorporate all the floodplain management changes and changes to the flood risks in Sacramento County that have occurred since the creation of the current Plan including:

- Changes to levee accreditations and floodplain map revisions
- Construction of the Folsom Dam spillway
- Revision to the National Flood Insurance Program motivating many property owners to consider mitigation measures
- Issuance of 2015 Executive Order, E.O. 13690, establishing a federal flood risk management standard as part of a national policy on resilience and risk reduction consistent with the President's Climate Action Plan calling for assessment of flood risk associated with climate change.

The Plan will contain modules with up-to-date hazard mitigation information tailored for those communities who choose to participate in the Plan update.

Input from the stakeholders and public will be gathered in an open and inclusive manner. Each city and special district will be invited to participate in the update and widespread public outreach will be conducted. The update process will include review of the 2011 document and will apply new updated hazard data regarding changes in land use, and development trends in order to update the calculation of the resulting risk assessment. The risk mitigation measures will also be discussed in several open public forums to gather comments and suggestions for additional prioritizing of risk mitigation measures.

By approving the attached Resolutions, the Board will affirm its support of the update of the Local Hazard Mitigation Plan, authorize the Director of the Department of Water Resources to apply for and accept the FEMA grant funds to fund the update, and designate the applicant's agents authorized to execute the FEMA grant.

FINANCIAL ANALYSIS

The Plan update will cost $145,000 and the FEMA grant amount will be $108,750, with a required 25 percent local (non-federal) cost share totaling $36,250. The local share will be split between the City of Sacramento ($12,600) and Sacramento County Water Agency (SCWA) Zone 13 ($23,650). The cost of the update is included in the Fiscal Year 2015-16 SCWA Zone 13 Adopted Budget.

Respectfully submitted,

MICHAEL L. PETERSON, Director
Department of Water Resources

Resolution
ATT 1 – Cal OES form designating the Applicant's Agents

COUNTY OF SACRAMENTO

RESOLUTION NO. 2016-0091

AUTHORIZATION TO APPLY FOR AND ACCEPT A FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) GRANT TO UPDATE THE LOCAL HAZARD MITIGATION PLAN

WHEREAS, Sacramento County (County) is subject to natural hazards including floods, earthquakes, wildfires, high wind, drought, and pestilence; and

WHEREAS, hazard mitigation planning will create a framework for reducing losses from these hazards; and

WHEREAS, natural disaster mitigation planning is a requirement of the federal Robert T. Stafford Disaster Mitigation Act of 2000 (Act) including a requirement for updates every five years; and

WHEREAS, the current Sacramento County Local Hazard Mitigation Plan (Plan) was approved December 6, 2011, by Resolution 2011-0886; and

WHEREAS, updating the Plan is required in order to maintain eligibility for certain sources of federal mitigation funding programs aimed at reducing damage due to natural hazards; and

WHEREAS, unincorporated County is a community in good standing with FEMA and the Community Rating System (CRS) within the National Flood Insurance Program (NFIP) and maintaining a current Plan is a requirement of CRS; and

WHEREAS, in accordance with the Act, a multi-jurisdictional and public planning committee, led by a consultant with expertise in developing hazard mitigation plans, will analyze the hazards that threaten our community, determine our vulnerability to those hazards, and evaluate alternatives to minimize or eliminate their impacts; and

WHEREAS, the cost will be offset by a FEMA grant with a required local cost share equal to or greater than 25 percent of the grant amount.

AUTHORIZATION TO APPLY FOR AND ACCEPT A FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) GRANT TO UPDATE THE LOCAL HAZARD MITIGATION PLAN

BE IT RESOLVED AND ORDERED that the Chair of the Board of Supervisors hereby

1. Supports the hazard mitigation planning effort as it works through the hazard data and analyzes risk with inter-departmental and inter-agency coordination input; and
2. Supports inclusion of members of the public in the planning effort; and
3. Supports the responsibilities of the planning effort, which include the following activities:
    a. Identifying each natural hazard that affects the County,
    b. Analyzing the risks posed by each hazard,
    c. Assessing the community's vulnerability to the hazards,
    d. Reviewing and evaluating appropriate local regulations, programs, and policies in terms of their effectiveness towards mitigating the impacts of the identified natural hazards,
    e. Developing a hazard mitigation strategy with goals and objectives,
    f. Implementing the hazard mitigation strategies with annual evaluation; and
4. Authorizes the Director of the Department of Water Resources to apply for and to accept a FEMA grant in the amount of $108,750 to fund the Local Hazard Mitigation Plan update; and
5. Designates the Director of Water Resources, Michael Peterson; the Division Chief of Water Resources, Cecilia Jensen; and Principal Civil Engineer, Todd Peterson to act as the authorized agents to further the FEMA Pre-Disaster Mitigation grant program.

AUTHORIZATION TO APPLY FOR AND ACCEPT A FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) GRANT TO UPDATE THE LOCAL HAZARD MITIGATION PLAN

ON A MOTION by Supervisor Kennedy, and seconded by Supervisor Nottoli, the foregoing resolution was passed and adopted by the Board of Supervisors of the County of Sacramento, State of California, this 9th day of February, 2016, by the following vote, to wit:

AYES: Supervisors, Kennedy, Nottoli, Peters, Serna, MacGlashan

NOES: Supervisors, None

ABSENT: Supervisors, None

ABSTAIN: Supervisors, None

RECUSAL: Supervisors, None
(PER POLITICAL REFORM ACT (§ 18702.5.)

Roberta MacGlashan

DESIGNATION OF APPLICANT'S AGENT RESOLUTION
Hazard Mitigation Grant Program and Pre-Disaster Mitigation Program

BE IT RESOLVED BY THE Board of Supervisors (Governing Body) OF THE County of Sacramento (Name of Applicant)

THAT Michael L. Peterson, Director, Department of Water Resources (Title of Authorized Agent), OR

Cecilia Jensen Chief, Department of Water Resources (Title of Authorized Agent), OR

Todd Peterson Principal Engineer, Department of Water Resources (Title of Authorized Agent)

is hereby authorized to execute for and on behalf of the County of Sacramento, Department of Water Resources (Name of Applicant), a public entity established under the laws of the State of California, this application and to file it with the California Governor's Office of Emergency Service. for the purpose of obtaining certain federal financial assistance under Public Law 93-288 as amended by the Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988, and/or state financial assistance under the California Disaster Assistance Act.

THAT the County of Sacramento, Department of Water Resources (Name of Applicant) a public entity established under the laws of the State of California, hereby authorizes its agent(s) to provide to the California Governor's Office of Emergency Service for all matters pertaining to such state disaster assistance the assurances and agreements required.

Please check the appropriate box below:

☒ This is a universal resolution and is effective for all open and futures Disasters/Grants up to three (3) years following the date of approval below.

☐ This is a Disaster/Grant specific resolution and is effective for only Disaster/Grant name/number(s) _____

Passed and approved this 9th day of February, 2016

Phil Serna District 1 Supervisor
(Name and Title of Governing Body Representative)

Patrick Kennedy District 2 Supervisor
(Name and Title of Governing Body Representative)

Susan Peters District 3 Supervisor
(Name and Title of Governing Body Representative)

Roberta MacGlashan District 4 Supervisor, Chair
(Name and Title of Governing Body Representative)

Don Nottoli District 5 Supervisor, Vice Chair
(Name and Title of Governing Body Representative)

CERTIFICATION

I, Florence Evans (Name), duly appointed and Interim Clerk of the Board (Title) of the County of Sacramento (Name of Applicant), do hereby certify that the above is a true and correct copy of a Resolution passed and approved by the Board of Supervisors (Governing Body) of the County of Sacramento (Name of Applicant)

on the 9th day of February, 2016.

Florence Evans

Subject: 2016 LHMP Update - Invitation for Planning Committee Participation

Robert B. Leonard
Chief Deputy County Executive

Department of Water Resources
Michael L. Peterson, Director

Navdeep S. Gill
Interim County Executive

You are Invited to the
Sacramento County Local Hazard Mitigation Plan Update: Kickoff meeting

Sacramento, CA: Sacramento County and City of Sacramento will begin the process for the 2016 Local Hazard Mitigation Plan update.

We request your participation in this County-wide effort to update the Multi-jurisdictional Local Hazard Mitigation Plan. This Plan must be updated every five years, therefore, this April we will begin the process again and we hope you'll join us in making recommendations for the 2016 Plan.

By participating in this process your agency may be eligible for FEMA grants to mitigate natural hazards that are identified in the Plan and have an opportunity to combine efforts on local projects.

There will be five meetings held between April and October. Please confirm your participation or forward contact information for those that will represent your agency on the planning committee if other than those individuals on this email..

Your commitment would involve the following:

- Attending 5 afternoon meetings over the next 6 months
- Reviewing and providing comments on the plan drafts via email

Kickoff meetings will be held in the following locations; please select the date and location that works best for you.

April 5, 2016
Planning Committee 2pm-5pm
Laguna Town Hall
3020 Renwick Ave,
Elk Grove, CA 95758

April 6, 2016
Planning Committee 2pm-5pm
South Natomas Community Center, Room
2921 Truxel Rd,
Sacramento, CA 95833

Planning Committee Meeting will be followed by an informational evening meeting for the general public from 6:00 to 7:30. You are welcome to attend the evening meetings as well, but your attendance is not required.
Please RSVP and plan on attending this important planning process. For additional information, contact Celine Livengood at 916-874-3130 or email at livengood@saccounty.net.

For more information and a copy of the Hazard mitigation Plan, please go to Saccounty.net and type Local Hazard Mitigation Plan in the search window at the top of the page.

Subject: Local Hazard Mitigation Plan Update - Committee Participation - Reminder

Hello to you all.

Attached is the updated informational sheet about next week's kick-off meeting(s) for the LHMP update. Please note, meetings will held in two different locations, April 5th and 6th to make it more convenient for you to attend.

If you haven't already done so, please send an email to confirm that you will be attending so we know the reserved room will accommodate everyone.

If you would like more information on benefits to your agency from participation in this process, please give me a call.

Thank you and I look forward to seeing you all next week.
Best regards, Celine

Celine Livengood

Subject: Media Release: Sacramento County Local Hazard Mitigation Plan Update: Kickoff meeting

Good morning,

The following announcement will be sent to the media today. The City, in partnership with Sacramento County and surrounding cities, is updating the countywide Local Hazard Mitigation Plan.

--

Sacramento County Local Hazard Mitigation Plan Update: Kickoff meeting

FEMA defines Hazard Mitigation as any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards. While natural hazards cannot be prevented, a Hazard Mitigation Plan forms the foundation for a community's long-term strategy to reduce disaster losses by breaking the repeated cycle of disaster damage and reconstruction.

Sacramento County is partnering with the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Isleton, Rancho Cordova and several special districts to update their countywide 2010 Local Hazard Mitigation Plan (LHMP).

Communities with a FEMA- approved LHMP are eligible for FEMA pre- and post-disaster grant funding and for lower costs of flood insurance to residents through the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

The 2016 LHMP Update is a multi-jurisdictional effort being developed by a planning committee comprised of representatives from various County and City departments; neighboring jurisdictions, key federal state and local agency stakeholders, and the public.

To be part of our planning committee your commitment would involve the following:

- Attending 5 afternoon meetings over the next 6 months

- Reviewing and providing comments on the plan drafts via email

Kickoff meetings will be held in the following locations; please select the date and location that works best for you.

April 5, 2016
Planning Committee 2pm-5pm
Laguna Town Hall
3020 Renwick Ave,
Elk Grove, CA 95758

April 6, 2016
Planning Committee 2pm-5pm
South Natomas Community Center, Room
2921 Truxel Rd,
Sacramento, CA 95833

Planning Committee Meeting will be followed by an informational evening meeting for the general public from 6:00 to 7:30. You are welcome to attend the evening meetings as well, but your attendance is not required.

Please RSVP and plan on attending this important planning process. For additional information, contact Celine Livengood at 916-874-3130 or email at livengood@saccounty.net.

For more information and a copy of the Hazard mitigation Plan, please go to Saccounty.net and type Local Hazard Mitigation Plan in the search window at the top of the page.

HMPC & Steering Committee Meeting #2 – Risk Assessment Meeting

Email Invite to Risk Assessment Meeting

From: Livengood. Celine [mailto:LivengoodC@saccounty.net]
Sent: Friday, June 03, 2016 8:44 AM
Subject: 2016 LHMP Update - June Meeting Date(s)
Importance: High

Hello all.

In an earlier email, we asked that you save the dates of June 21st and 22nd for the next LHMP committee meetings. As a committee member you only need to attend one. These are duplicate meetings offering the same agenda, yet the input attendees offer will, of course, vary.

The times and venues are as follows;

Tuesday, June 21st: 1:00 pm – 4:00 pm
Laguna Creek High School - Career Room
9050 Vicino Dr., Elk Grove, CA 95758

Wednesday, June 22nd: 1:00 pm – 4:00 pm
Bannon Creek Elementary School - Multi-Purpose Room
2775 Millcreek Drive, Sacramento, CA 95833

Thank you and I look forward to seeing you there.

Celine Livengood
Principal Engineer Tech - Drainage | Department of Water Resources
827 Seventh Street, Room 301 | Sacramento, CA 95814

www.waterresources.saccounty.net
SACRAMENTO COUNTY

Flyer for Risk Assessment Meeting

Local Hazard Mitigation Plan Update 2016

Sacramento County is in the process of updating the 2011 Local Hazard Mitigation Plan (LHMP). Partnering with the County in this effort are the incorporated communities of the City of Sacramento, Elk Grove, Galt, Isleton, Rancho Cordova and Citrus Heights along with many local Districts. A copy of the 2011 plan can be reviewed at:
http://www.waterresources.saccounty.net/pages/LocalHazardMitigationPlan2010.aspx

Meeting Schedule

Duplicate meetings will be held in the following locations for your convenience:

Tuesday, June 21st:	Wednesday, June 22nd:
1:00 pm – 4:00 pm	1:00 pm – 4:00 pm
Laguna Creek High School - Career Room	Bannon Creek Elementary School - Multi-Purpose Room
9050 Vicino Dr., Elk Grove, CA	2775 Millcreek Drive, Sacramento, CA

The Stafford Disaster Mitigation Act of 2000 requires that local governments have a Hazard Mitigation Plan in place to be eligible for pre– and post-disaster funding. The LHMP identifies potential natural disasters, such as flood and fire risks, and ways to protect people from those dangers through mitigation.
With your knowledge of local hazards, your input is critical to our success.
Please join us for this important meeting.

Subject: Special Public Meeting for Emergency Action Plan and 2016 Local Hazard Mitigation Plan Update
Importance: High

Hello all.

Attached is a flyer for a special meeting in the Delta area. We hope to see many of you there to participate in the conversation with the community.

This meeting will be held **Tuesday, June 21st, 6:00pm to 7:30 at the Courtland Fire House on Hood Franklin Road**.
Please see the attached flyer.

Because this meeting will take place very soon, we need help in spreading the word. Attached is a flyer about the meeting.

If possible, please forward to people in the community or print and put it anywhere it will get noticed.

Thank you so much. Celine

Subject: Special Community Meeting - Emergency Action Plan & Local Hazard Mitigation Plan

Hello all.

Attached is a flyer for a special meeting in the Delta area to be held Tuesday, June 21st, 6:00pm to 7:30 at the Courtland Fire House on Hood Franklin Road. Please see the attached flyer. I apologize for the last minute notice, but it was only decided on a week ago.

The purpose of the meeting is to get the word out about the update of the Local Hazard Mitigation Plan. The identified natural hazards in this plan is the critical document for pre and post disaster funding from FEMA.

Additionally, we will discuss the Emergency Action Plan which focuses on the Delta area and what actions will take place during an emergency. This will be the reference document for emergency response teams during a disaster.

Please spread the word by forwarding this email to neighbors, friends and family that live in the Delta.

Thank you so much. Celine

SACRAMENTO COUNTY

Flyer for Delta Risk Assessment Meeting

Special Community Meeting; June 21 2016

Local Hazard Mitigation Plan and Emergency Action Plan

Sacramento County is in the process of updating the 2011 **Local Hazard Mitigation Plan (LHMP)** AND developing a new **Emergency Action Plan (EAP)** for flood emergencies in the Delta area. Partnering with the County on the Emergency Action Plan are the Delta Reclamation Districts and, for LHMP, the Districts along with the incorporated cities of Elk Grove, Isleton, Rancho Cordova, Citrus Heights and the City of Sacramento.

Tuesday, June 21 6:00-7:30pm

Courtland Fire House

1125 Hood Franklin Road

The Stafford Disaster Mitigation Act of 2000 requires that local governments have a Hazard Mitigation Plan in place to be eligible for pre– and post-disaster funding. The LHMP identifies potential natural disasters, such as flood and fire risks, and ways to protect people from those dangers through mitigation.

With your knowledge of local hazards, your input is critical to our success. Please join us for this important meeting.

For futher information, contact: Mark Rains Phone: 916 - 874 - 8649 E-mail: rainsm@saccounty.net

Subject: LHMP Update - Committee) Meetings #3 and #4

Hello to you all.

The upcoming July meetings are #3 and #4 which are the two most important meetings for this LHMP Update. Goals and objectives will be updated and mitigation projects identified and prioritized.
The time commitment in July is necessary to complete the LHMP requirements. The meetings will take place over two days, with the same information offered in the morning and the afternoon for convenience in attending your choice of location.

For committee members, attendance is required at one 3-hour meeting block on June 12th for the Goals Meeting and one 3-hour meeting block on June 13th for the Mitigation Alternatives/Projects Meeting. Individuals from the general public are welcome and encouraged to participate also. Meeting times and locations are as follows;

Tuesday July 12th – Meeting #3	**Wednesday July 13th – Meeting #4:**
8:30 — 11:30 **Bannon Creek Elementary School - Multi-Purpose Room** **2775 Millcreek Drive, Sacramento, CA** ***Or*** **1:00 pm – 4:00 pm** **Laguna Creek High School - Career Room** **9050 Vicino Dr., Elk Grove, CA**	**8:30 — 11:30** **Bannon Creek Elementary School - Multi-Purpose Room** **2775 Millcreek Drive, Sacramento, CA** ***Or*** **1:00 pm – 4:00 pm** **Laguna Creek High School - Career Room** **9050 Vicino Dr., Elk Grove, CA**

Key County and City departmental Staff, District staff, as well as community groups and members of the public with recommendations for mitigation projects to address identified natural hazards should attend these meetings. Your input is critical to success of this important document. Please forward this email or distribute the attached flyer to anyone who may be interested in contributing to the Plan.

If you haven't attended previous meetings, please RSVP so we have enough seating for all attendees. We look forward to seeing you then and hearing your thoughts.

Subject: Local Hazard Mitigation Plan Update - July Meetings

Hello to you all.

Thank you for attending the recent meeting we had in your community to discuss the hazard mitigation planning. It was great to see the turnout and hear your thoughts on the natural hazards facing your community.

We hope to receive more information from you on local natural hazards and your thoughts on how to mitigate those dangers. Attached is a worksheet for your use in considering hazards and offering input on any that apply. Input on natural hazards will be included in the Plan update.

Additionally, a flyer for the upcoming July meetings is attached for your use in getting others to participate.

The LHMP July meetings, #3 and #4 of the LHMP process, are the two most important meetings for this update. Goals and objectives will be updated and mitigation projects identified and prioritized., Individuals from the general public are welcome and encouraged to participate also. Meeting times and locations are as follows;

Tuesday July 12th – Meeting #3	**Wednesday July 13th – Meeting #4:**
8:30 — 11:30 **Bannon Creek Elementary School - Multi-Purpose Room** **2775 Millcreek Drive, Sacramento, CA** ***Or*** **1:00 pm – 4:00 pm** **Laguna Creek High School - Career Room** **9050 Vicino Dr., Elk Grove, CA**	**8:30 — 11:30** **Bannon Creek Elementary School - Multi-Purpose Room** **2775 Millcreek Drive, Sacramento, CA** ***Or*** **1:00 pm – 4:00 pm** **Laguna Creek High School - Career Room** **9050 Vicino Dr., Elk Grove, CA**

These meetings will take place over two days, with the same information offered in the morning and the afternoon for convenience in attending your choice of location or time. If you don't want to attend, yet would like to contribute information, you may send me the Hazard Worksheet or an email with your input on local natural hazards.

This fall, you will be notified when the draft Plan is available for review and a meeting will be scheduled in your community for commenting on the Plan.

Thank you for your time and help in this effort.

Cc: Jeanine Foster <jeanine.foster@fostermorrison.com>; Booth. George <boothg@SacCounty.NET>; Rains. Mark <rainsm@SacCounty.NET>
Subject: Sacramento County - Local Hazard Mitigation Plan Update

Hello and good day to you.

You are receiving this email because you participated in the 2011 update of Sacramento County's (multi-jurisdictional) Local Hazard Mitigation Plan (Plan). Under the Stafford Disaster Mitigation Act of 2000, jurisdictions are required to have a hazard mitigation plan in place to be eligible for Federal assistance with pre- and post- disaster funding. This Plan forms the long-term strategy to reduce disaster losses throughout Sacramento County.

Also required under the Disaster Mitigation Act is that the Plan be updated every five years. Therefore, we are in the process of updating the 2016 LHMP and we want you to have the opportunity to participate.

Communities participating in the update are represented by various city and county departments, federal, state and local agency stakeholders and the public. Several meetings will be taking place next week for the purpose of gathering input and direction for the update. As residents are most aware of local conditions, your input is important to us. We hope you will attend one or more of the meetings.

Please refer to the attached LHMP Overview Flyer for a detailed description on the purpose and process of this update and the Committee Meetings Flyer for meeting schedule and location.

The current plan can be viewed at www.stormready.org.

For questions about the Plan or the upcoming meetings, please contact me or Mark Rains (916)-874-8649, rainsm@saccounty.net.

Thank you.

Flyer for Goals and Mitigation Strategy Meetings

Local Hazard Mitigation Plan Update 2016

Please plan on attending the Hazard Mitigation Planning Committee meetings #3 and #4 when we will update objectives and prioritize projects. For committee members attendance is required at one 3-hour meeting on June 12th for discussion on Goals and Objectives and one 3-hour meeting on June 13th for discussion on Mitigation Alternatives and Priorities. The general public is welcome and encouraged to attend.

Meeting Schedule

Duplicate meetings will be held each day for your convenience:

Tuesday July 12th – *Meeting #3*

8:30 – 11:30
Bannon Creek Elementary School - Multi-Purpose Room
2775 Millcreek Drive, Sacramento, CA

Or

1:00 pm – 4:00 pm
Laguna Creek High School - Career Room
9050 Vicino Dr., Elk Grove, CA

Wednesday July 13th – *Meeting #4:*

8:30 – 11:30
Bannon Creek Elementary School - Multi-Purpose Room
2775 Millcreek Drive, Sacramento, CA

Or

1:00 pm – 4:00 pm
Laguna Creek High School - Career Room
9050 Vicino Dr., Elk Grove, CA

HMPC & Steering Committee Meetings– LHMP Process Overview/Mitigation Strategy/Annex Development Meetings DELTA Reclamation Districts

Email Invite to Delta Area Meeting

From: Livengood. Celine [mailto:LivengoodC@saccounty.net]
Sent: Thursday, August 18, 2016 10:11 AM
To: daniel@Kaydix.com; Cosio@mbkengineers.com; msvls@cwo.com; Cosio@mbkengineers.com

Subject: Offer to Prepare Annex for your District - LHMP

Hello to you all.

This is a follow up to the phone messages and conversations from this morning regarding the importance of your annex to the LHMP.

To make the process of starting an annex for your District easy for you, our consultant can prepare the paperwork, all in one quick sitting, if you will meet with her. She will be available to do this on September 9th and will come to the Delta area, likely to be held at the Courtland Firehouse. Otherwise, she can meet you in the City of Sacramento that day.

Having your District represented in the LHMP has great importance in Federal assistance, for disaster relief and mitigation grants. When flood events cause major damage, those entities that participate in the Plan are entitled to Federal disaster relief at a reduced cost, from 25% to 6% match…a match that may equate to millions of dollars.

Please let me know if you can take an hour to have the annex prepared for your District.
Thank you for your time.

Subject: 2016 LHMP Update - Final Meeting(s)

Hello to you all.

The upcoming meetings in November are the last to complete the LHMP 5-year update! Once again, there will be two meetings on subsequent days, with the same information offered each day. This is for your convenience in attending your choice of location or day.

Attendance from committee members is required at one of the meetings. Individuals from the general public are welcome and encouraged to participate also. If you know of people in the general public that would like to attend a meeting, there will be two evening meetings, of which you are not required to attend.

Please forward this email to anyone who may be interested in contributing to the Plan.

Your attendance at one of the final committee meetings is critical for ensuring FEMA participation requirements are met.

The meetings are scheduled as follows;

Hazard Mitigation Planning/Steering Committee Meetings–

Committee Members - November 16th 9:00-11:00 AM at South Natomas Community Center, Conference Room
2921 Truxel Rd, Sacramento, CA 95833

Committee Members - November 17th 9:00-11:00 AM at Hood/Courtland Fire House (Station 2)
1125 Hood Franklin RD, Hood, CA 95639

Public Meetings -

General Public - November 15th 6:00-7:30 PM at South Natomas Community Center, Conference Room
2921 Truxel Rd, Sacramento, CA 95833

General Public - November 16th 6:00-7:30 PM at Laguna Creek High School, Career Room
9050 Vicino Dr., Elk Grove, CA 95758

While you are welcome to come and support the public meetings, please plan on attending one of the final Planning/Steering Committee meetings to provide input on the Draft LHMP and to address public comments. After the review and comment period, the LHMP will be submitted to Cal OES/FEMA for approval and subsequently will be adopted by the governing boards for each participating jurisdiction.

Please let me know if you have questions. In addition to your attendance at one of the final planning/steering committee meetings, you can also provide written comments on the public review draft by:

- Email comments to Jeanine.foster@fostermorrison.com or LivengoodC@saccounty.net
- Bring comments to one of the meetings

For all participating jurisdictions, Jeanine will be in touch with you this week to provide a final punch list of any outstanding items for your Annexes.

Thank you for all your time and commitment to this important document.

Subject: Sacramento County Hazard Mitigation Planning/Steering Committee:

Hello to you all.

A draft of the Local Hazard Mitigation Plan LHMP Update has just been released for public and stakeholder review and comment. The Draft document includes annexes for the participating Cities and Districts The draft is now available online at: Department of Water Resources website.

A hardcopy of the draft LHMP update will be available for public review by October 20th at the reference desks of the following Sacramento County libraries:

More information on the library locations and hours are located at:

Fair Oaks Branch, 11601 Fair Oaks Blvd, Fair Oaks, CA 95628

Main Branch, 828 I St, Sacramento, CA 95814

Your final input is needed on this document. .

- Email comments to Jeanine.foster@fostermorrison.com or LivengoodC@saccounty.net
- Bring comments to the meeting you attend in November (schedule will be sent by next week).

For all participating jurisdictions, Jeanine will be in touch with you this week to provide a final punch list of any outstanding items.

I appreciate everyone's participation and efforts on this LHMP Update Project.

Thank you very much again.

Sacramento County Hazard Identification Table (Jurisdiction)

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance
Ag Hazards: Insect Pests				
Bird Strike				
Climate Change				
Dam Failure				
Drought and Water Shortage				
Earthquake				
Earthquake: Liquefaction				
Flood: 100/200/500–year				
Flood: Localized/Stormwater				
Landslide and Debris Flows				
Levee Failure				
River/Stream/Creek Bank Erosion				
Severe Weather: Extreme Heat				
Severe Weather: Fog				
Severe Weather: Freeze				
Severe Weather: Heavy Rains and Storms				
Severe Weather: Tornadoes				
Subsidence				
Volcano				
Wildfire				

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

Mitigation Strategy

Sacramento County 2011 Goals

- Goal 1: Minimize the loss of life, injury, and property damage from natural hazards (reduce the risk and vulnerability of the community to hazards through mitigation efforts)
- Goal 2: Enhance public awareness of the effects of natural hazards and public understanding of disaster preparedness
- Goal 3: Improve the capabilities of the community to mitigate or reduce losses from natural hazards
- Goal 4: Position Jurisdictions for Federal and State Grant Funding

Sacramento County 2011 Actions

Table 1 Sacramento County 2011 Actions Table

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Multi-Hazard Mitigation Actions					
Enhance Public Awareness of the Effects of Natural Hazards and Public Understanding of Disaster Preparedness	Sacramento County				
CRS Public Information Pilot Program	Sacramento County, City of Sacramento				
Integrate Local Hazard Mitigation Plan into Safety Element of General Plan	Sacramento County City of Citrus Heights City of Elk Grove City of Folsom City of Galt City of Rancho Cordova City of Sacramento				
Flood Insurance Promotion	Sacramento County				
Evaluation and Mitigation of Critical Facilities in Identified Hazard Areas	Sacramento County				
Finalize and Implement the Actions of the South Sacrament Habitat Conservation Plan	Sacramento County City of Elk Grove City of Galt City of Rancho Cordova Sacramento Regional County Sanitation District Sacramento County Water Agency, Southeastern Connector				
SAFELY OUT™ Evacuation Preparedness	Sacramento County Citizen Voice				
Public Education Program	City of Elk Grove				
Alerts and Warning System	City of Elk Grove				

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Emergency Operation Center (EOC)	City of Elk Grove				
Critical Facilities Database Development and Data Maintenance Processes	City of Elk Grove				
Increase Redundancy/ Functionality of Water Wells and Sewer Lift Stations	City of Galt				
Increase Data Capacity of Emergency Frequencies	City of Galt				
Evaluation and Mitigation of Critical Facilities in Identified Hazard Areas	City of Sacramento				
Data Center Disaster Recovery Improvement	Los Rios Community College District				
Community Emergency Response Training (CERT)	Los Rios Community College District				
Update the critical facilities identified during this DMA planning effort with the City's GIS technical group to support emergency management efforts.	City of Sacramento				
Bird Strike Mitigation Actions					
Wildlife Hazard Management Plan	Sacramento County Airport System				
Dam Failure Mitigation Actions					
Mather Dam Improvements	Sacramento County				
Alder Creek Miners Dam	Sacramento County				
Improved Flood Inundation and Evacuation Plan for Probable maximum flow from New Spillway at Folsom Dam	Sacramento County				
Folsom Dam Joint Federal Project	SAFCA				
Folsom Dam Raise	SAFCA				
Drought Mitigation Actions					
Drought Contingency Plan	Southgate Park & Recreation District				
Earthquake Mitigation Actions					
Hughes Stadium Renovation at Sacramento City College	Los Rios Community College District				
Flood Mitigation Actions					
Improve County ALERT (Automated Local Evaluation in Real Time) system of stream and rain gages	Sacramento County				
Elevation Projects to Mitigate Flood Risk	Sacramento County				

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Arcade Creek Corridor Plan	Sacramento County				
Elevate up to Three Homes on Long Island (Grand Island Road, Sacramento River)	Sacramento County				
Mitigation Projects for Repetitive Loss Structures/Areas	Sacramento County				
Improve Strawberry Creek Basins at East Stockton Blvd	Sacramento County				
Triangle Detention Basin	Sacramento County				
Unionhouse Detention Basin Upstream of East Stockton Blvd Partnering with Park District and SAFCA	Sacramento County				
Unionhouse Creek Joint Use Detention Basins – Park Active or Passive Joint Use	Sacramento County				
South Sacramento Stream Group Detention Basins	Sacramento County				
Elder and Gerber Creek	Sacramento County				
Florin Creek Basins –Florin Vineyard Drainage Master Plan	Sacramento County				
Joint Use Detention-Park Basins on Laguna Creek	Sacramento County				
Pasa Robles Drive - Concrete Channel Lining Rehabilitation	Sacramento County				
Chicken Ranch Slough - Concrete Channel Lining Rehabilitation	Sacramento County				
Morrison Creek - Concrete Channel Lining Rehabilitation	Sacramento County				
Mayhew Slough - Concrete Channel Lining Rehabilitation	Sacramento County				
Strong Ranch Slough - Concrete Channel Lining Rehabilitation	Sacramento County				
Keep Watershed Management Plan Current CRS Activity 450 (county and cities)	Sacramento County				
Woodside Condominiums Repetitive Flood Loss Property	Sacramento County				
Conversion to NAVD88 vertical datum (from NGVD29)	Sacramento County				
Mitigation projects to reduce flood risk to critical facilities.	Sacramento County				
Hydrologic and Hydraulic Modeling in Compliance with 2012 Central Valley Flood Protection Plan	Sacramento County				

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Delta Area Fire Station Needs to be Elevated or Flood Proofed to Protect Against Levee Breach Flooding to Assure Function in that Disaster Event.	Sacramento County				
Update and Adopt Floodplain Management Ordinance in Light of Levee De-accreditation	Sacramento County				
Mitigate Peak Flow on Dry Creek and Tributaries (including Sacramento County and City of Roseville)	Sacramento County				
Repetitive Loss Church Building on Dry Creek	Sacramento County				
Determine Cause and Mitigate Mercury and Methyl Mercury Coming from Tributaries of American River	Sacramento County				
Pump Stations	Sacramento County				
Public Outreach Mailers	Sacramento County				
Drainage improvements to reduce flooding on key evacuation routes	Sacramento County				
South Branch Arcade Creek – Gum Ranch Basin (with Fair Oaks Park District)	Sacramento County				
Dry Creek Flood Hazard Mitigation Acquisitions with County Park Dept	Sacramento County				
Arcade Creek at Evergreen Estates Floodwall improvements	Sacramento County				
Linda Creek Peak Flow Mitigation	Sacramento County				
Improve flood protection and/or Evacuation Planning for Mobile Home/RV Park at Manzanita/Auburn. Alternatively, the park Should Establish Flood Warning and Evacuation Procedures.	Sacramento County				
Capital Improvement Projects – Pipelines (2012-13)	Sacramento County				
Capital Improvement Projects – Pipelines (2014-15)	Sacramento County				
New City Sump 90 Operation Plan	Sacramento County				
Land Acquisition	Southgate Park & Recreation District				
Conservation Easements	Southgate Park & Recreation District				
Multi-jurisdictional Cooperation within Watersheds	Southgate Park & Recreation District				
South Sacramento Streams Group	SAFCA				

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
American River Common Features	SAFCA				
CVFPP - Flood Emergency Plan	City of Sacramento				
Adopt Additional Floodplain Development Standards	City of Sacramento				
Update the General Plan to include the requirements of the CVFPP	City of Sacramento				
Historic Magpie Creek Study	City of Sacramento				
South Sacramento Streams Project: Union Pacific Railroad Flood Wall	City of Sacramento				
Natomas Levee Improvement Project (NLIP)	City of Sacramento				
Retrofit of Repetitive Loss Properties	City of Sacramento				
Preferred Risk Policy (PRP) Outreach Campaign	City of Sacramento				
Drainage Projects for Repetitive Loss Properties	City of Sacramento				
Unionhouse Creek Existing Conditions LOMR and Channel Improvements	City of Sacramento				
Emergency Notification and Evacuation Planning	City of Sacramento				
Drainage Projects from the City's Priority Drainage Project List	City of Sacramento				
Riconada Flood Wall	City of Citrus Heights				
Storm Debris Removal	City of Elk Grove				
Drainage and Flood Control Programs	City of Elk Grove				
LID Rain Garden Plaza	City of Elk Grove				
School Street Alley Drainage Improvements	City of Elk Grove				
Elk Grove Creek Outfalls	City of Elk Grove				
Elk Grove Creek Restoration	City of Elk Grove				
Waterman Road Culvert Repair and Replacement	City of Elk Grove				
Waterman Road Culvert Replacement	City of Elk Grove				
Elk Grove Creek Flood Protection and Clean Water	City of Elk Grove				
Elk Grove Watershed Recommended Improvements	City of Elk Grove				
Multi-Functional Drainage Corridor for Shed C	City of Elk Grove				
9816 Sheldon Road – Enlarge Culverts	City of Elk Grove				
Sheldon Road Drainage Project	City of Elk Grove				

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Sleepy Hollow Detention Basin Retrofit	City of Elk Grove				
Sleepy Hollow Lane Drainage Improvements	City of Elk Grove				
East Elk Grove Area/ Rural Region Improvements	City of Elk Grove				
Sheldon Road Ditch Improvements and Multi-Use Trails	City of Elk Grove				
Laguna Creek Watershed Improvements (New Pipeline and Enlarge Existing Pipelines)	City of Elk Grove				
Deer Creek Watershed Improvements (New Detention Basins)	City of Elk Grove				
SCADA System for the Stormwater Pump Stations	City of Elk Grove				
Dry Well Installation at Kent Street and St. Anthony Court	City of Elk Grove				
Elk Crest Drive Pipes	City of Elk Grove				
Strawberry Creek Detention Basin Retrofit	City of Elk Grove				
Laguna Creek and Whitehouse Creek Multi-Functional Corridor Enhancement	City of Elk Grove				
Whitehouse Creek Watershed Improvements	City of Elk Grove				
Grant Line Channel Improvements (Pump Station and Enlarge Pipes)	City of Elk Grove				
Alder Creek Watershed Council	City of Folsom				
Redevelopment Area Drainage Improvements	City of Folsom				
Drainage System Maintenance Tax Assessment	City of Folsom				
Floodplain Mapping	City of Folsom				
Drain Inlet Retrofit Capital Improvement Plan (CIP)	City of Galt				
Creek/Streams Vegetation Management Plan	City of Galt				
Sunrise Boulevard Widening Kiefer to Jackson	City of Rancho Cordova				
Flood Response Equipment	Cosumnes Community Services District Fire Department				
Flood Response Training	Cosumnes Community Services District Fire Department				

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
Coordinate with SAFCA, CA-DWR, USACE, and Sacramento County on Proposed Flood Control projects on Magpie Creek	City of Sacramento				
Storm Water Management Practices - Implement Storm Water Management Practices as identified in Stormwater Quality Design Manual	Southgate Park & Recreation District				
Main Drainage Canal Bank Stabilization and Sediment Removal	Reclamation District #1000				
Security of District Facilities	Reclamation District #1000				
South River Pump Station Flood Protection Project	Sacramento Regional County Sanitation District				
SRCSD Critical Facilities Flood Study (Planning)	Sacramento Regional County Sanitation District				
Levee Failure Mitigation Actions					
Hydromodification and Stormwater Quality countywide	Sacramento County				
Ring Levees to Protect Delta Historic Villages	Sacramento County				
Levee Breach Scenario, Inundation, Evacuation, and Recovery Planning for Rural Areas South of Freeport	Sacramento County				
Improved Flood Inundation and Evacuation Plan for Structural Flood Control System Failure Scenarios in Urban Areas	Sacramento County				
Human Vertical Evacuation Structures in Areas of Widespread Flood Hazard	Sacramento County				
Livestock Vertical Evacuation Mounds in Areas of Widespread Flood Hazard	Sacramento County				
Implement the Recommended Actions of the Sherman Island Five Year Plan	Reclamation District #341				
Highway 16 Levee Rehabilitation Project	Reclamation District #800				
Bank and Levee erosion	Reclamation District #1000				
Severe Weather: Heavy Rains and Storms Mitigation Actions					
Public Education/Outreach Extreme Weather	City of Folsom				
Heating and Cooling Centers for Extreme Weather	City of Folsom				

Mitigation Action	Lead Jurisdiction	Complete	Ongoing	Not Started	Project in 2016 Update
District Wide Roofing Renovations	Los Rios Community College District				
Tree Management	Southgate Park & Recreation District				
Wildfire Mitigation Actions					
Fuels Reduction in the American River Parkway	City of Sacramento/Sacramento Metropolitan Fire District				
Coordinate with SAFCA on completion of South Sacramento Streams Group (includes Florin and Morrison Creeks) Projects in 2005. Provide greater than 100-year protection by improving conveyance and raising levees.	City of Sacramento				
Fuel Reduction and Modification	City of Folsom				
Wildfire Prevention Outreach	City of Folsom				
Wildfire Hazard Identification	City of Folsom				
Arson Prevention & Control Outreach	City of Folsom				
Ignition Resistant Building Construction Upgrades	City of Folsom				
Reduction of Fire Hazard SRCSD Bufferlands	Sacramento Regional County Sanitation District				

Sacramento County 2016 Hazards

- Ag Hazards
- Bird Strike
- Dam Failure
- Drought and Water Shortage
- Climate Change
- Earthquake
- Earthquake: Liquefaction
- Flood: 100/200/500–year
- Flood: Localized/Stormwater
- Landslide
- Levee Failure
- River/Stream/Creek Bank Erosion
- Severe Weather: Extreme Temperatures - Extreme Heat
- Severe Weather: Extreme Temperatures - Extreme Cold/Freeze
- Severe Weather: Fog
- Severe Weather: Heavy Rains and Storms (includes thunderstorms with hail/lightning/wind)
- Severe Weather: Winds and Tornadoes
- Subsidence
- Volcano
- Wildfire

Sacramento County Historic Hazard Worksheet (Past Occurrences)

Name of Jurisdiction: _____

Please fill out one sheet for each significant hazard event with as much detail as possible. Attach supporting documentation, photocopies of newspaper articles, or other original sources.

Type of event	
Nature and magnitude of event	
Location	
Date of event	
Injuries	
Deaths	
Property damage	
Infrastructure damage	
Crop damage	
Business/economic impacts	
Road/school/other closures

SACRAMENTO COUNTY

AGENDA
Sacramento County
Local Hazard Mitigation Plan (LHMP) Update
Risk Assessment Meetings: June 21 & 22, 2016

1. Introductions
2. Status of the DMA Planning Process
3. Review of Risk Assessment
4. Data Needs
5. Questions
6. Next Steps

Table 1 Sacramento County Planning Area Hazard Identification Table

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance	Climate Change Influence
Agricultural Hazards	Limited	Likely	Critical	Low	Low
Bird Strike	Limited	Highly Likely	Critical	Medium	Low
Climate Change	Significant	Likely	Limited	Medium	–
Dam Failure	Significant	Unlikely	Catastrophic	Medium	High
Drought and Water Shortage	Extensive	Highly Likely	Limited	Medium	High
Earthquake	Limited	Occasional	Critical	Medium	None
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium	None
Flood: 100/200/500-year	Significant	Occasional	Catastrophic	High	High
Flood: Localized Stormwater Flooding	Limited	Highly Likely	Limited	Medium	High
Landslides	Limited	Unlikely	Negligible	Low	Medium
Levee Failure	Significant	Occasional	Catastrophic	High	High
River/Stream/Creek Bank Erosion	Limited	Highly Likely	Limited	Medium	High
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Likely	Limited	Low	High
Severe Weather: Extreme Temperatures - Heat	Extensive	Highly Likely	Limited	Medium	High
Severe Weather: Fog	Extensive	Highly Likely	Limited	Low	Medium
Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning)	Extensive	Highly Likely	Critical	Medium	High
Severe Weather: Wind and Tornadoes	Limited	Likely	Limited	Low	Medium
Subsidence	Significant	Highly Likely	Limited	Low	Medium
Volcano	Limited	Unlikely	Limited	Low	None
Wildfire	Limited	Likely	Limited	Medium	High

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

Risk Assessment Methodology

Calculating Likelihood of Future Occurrence

The frequency of past events is used in this section to gauge the likelihood of future occurrences. Based on historical data, the likelihood of future occurrence is categorized into one of the following classifications:

- **Highly Likely**: Near 100% chance of occurrence in next year, or happens every year.
- **Likely**: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
- **Occasional**: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
- **Unlikely**: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Calculating Vulnerability

Vulnerability is measured in general, qualitative terms, and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential:

- **Extremely Low**: The occurrence and potential cost of damage to life and property is very minimal to non-existent.
- **Low**: Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**: Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**: Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have already occurred in the past.
- **Extremely High**: Very widespread and catastrophic impact.

Defining Significance (Priority) of a Hazard

Defining the significance or priority of a hazard to a community is based on a subjective analysis of several factors. This analysis is used to focus and prioritize hazards and associated mitigation measures for the plan. These factors include the following:

- **Past Occurrences**: Frequency, extent, and magnitude of historic hazard events.
- **Likelihood of Future Occurrences**: Based on past hazard events.
- **Ability to Reduce Losses through Implementation of Mitigation Measures**: This looks at both the ability to mitigate the risk of future occurrences as well as the ability to mitigate the vulnerability of a community to a given hazard event.

Risk Assessment Summary: Sacramento County Planning Area

Agricultural Hazard

- Most agricultural disasters in Sacramento County associated with severe weather events, including heavy rains, floods, heat, and drought; insects and noxious weeds also a concern.
- According to the 2014 crop report, despite the severe drought conditions of 2014, Sacramento County's 2014 crop production value of $495,379,000 is the highest ever recorded for the county and represents a 7. 7% increase over the 2013 crop production value.
- 28 USDA disaster declaration from 1982-2015, most associated with severe weather events
- WHAT ARE THE BIGGEST AG ISSUES?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: High
- Priority Hazard

Bird Strike

- The County of Sacramento operates five airports, which have a collective economic impact in excess of $3 billion annually (2008 dollars)
- The FAA data shows 2,812 bird strike incidents for Sacramento County since 1990
- ANY INPUT ON NOTABLE BIRD STRIKE INCIDENTS?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Non-Priority Hazard?

Climate Change

- The 2013 State of California Multi-Hazard Mitigation Plan stated that climate change is already affecting California. Sea levels have risen by as much as seven inches along the California coast over the last century, increasing erosion and pressure on the state's infrastructure, water supplies, and natural resources. The State has also seen increased average temperatures, more extreme hot days, fewer cold nights, a lengthening of the growing season, shifts in the water cycle with less winter precipitation falling as snow, and both snowmelt and rainwater running off sooner in the year. Climate Change has the potential to alter the nature and frequency of most hazards.
- ANY HMPC INPUT ON CLIMATE CHANGE ISSUES IN SACRAMENTO?
- Likelihood of Future Occurrence: Likely
- Vulnerability: Medium
- Non-Priority Hazard?

Dam failure

- There are 27 dams in Sacramento County constructed for flood control, storage, electrical generation, and recreational purposes. Of the 27 dams, 16 are rated as High Hazard, 5 as Significant Hazard, 5 as Low Hazard, and 1 was not rated.
- 8 high hazard dams located in neighboring counties also have the potential to impact the Sacramento County Planning Area

- A search of the National Performance of Dams database data shows two dam failure incidents for Sacramento County since 1994, both related to the Folsom Dam. However, these incidents were limited in scope and since the incidents occurred, improvements to the Folsom Dam system have been made.
- Likelihood of Future Occurrence: Jurisdictional Dams: Unlikely/Smaller, non-jurisdictional Dams: Occasional
- Vulnerability: Extremely High
- Priority Hazard

Drought and Water Shortage

- Historical drought data for the Sacramento County Planning Area and region indicate there have been 5 significant droughts in the last 84 years.
- Since 2012, snowpack levels in California have dropped dramatically, with an increase in 2015.
- 1 federal disaster declarations in 1977; 1 state disaster declaration in 2008; 1 drought State of Emergency in 2014
- HMPC – CAN YOU PROVIDE DAMAGES OR RESTRICTIONS THAT HAVE OCCURRED IN THE COUNTY RECENTLY DUE TO THE CURRENT DROUGHT. WHAT HAS BEEN IMPACTED THE MOST? WHAT IS THE PRIMARY SOURCE OF WATER AND HOW HAS WATER SUPPLY BEEN AFFECTED IN THE COUNTY?
- Likelihood of Future Occurrence: Likely
- Vulnerability: High to Extremely High?
- Priority Hazard

Earthquake

- Geological literature indicates that no major active faults transect the County; however, there are several subsurface faults in the Delta.
- There have been two disaster declarations in Sacramento County: 1989 Loma Prieta; 2014 Napa
- There have been several felt occurrences in the County from area earthquakes, with limited damages to the County: USGS reports 13 earthquakes of 5.0 magnitude or greater within 90 miles of Sacramento County since 1975.
- WERE THERE ISSUES IN THE COUNTY FROM THE MORE RECENT EARTHQUAKES?
- Likelihood of Future Occurrence: Unlikely – large, damaging earthquake; Occasional – minor earthquake
- Vulnerability: Medium – High?
- Priority Hazard

Earthquake: Liquifaction

- Sacramento County has two areas that have been suggested as posing potential liquefaction problems due to loose sandy soils and silt and presence of faults- the downtown area and the Delta.
- Although no historic examples of seismically induced levee failure are known in the Delta, the modern levee network has not been subjected to strong shaking.
- HAVE THERE BEEN ANY ISSUES IN THE COUNTY ASSOCIATED WITH LIQUEFACTION?
- Likelihood of Future Occurrence: Occasional
- Vulnerability: Medium – High?

- Priority Hazard

Flood Hazards

100/200/500 year

- Historically, portions of Sacramento County have always been at risk to flooding because of its annual percentage of rainfall and the number of watercourses and miles of levees that traverse the County.
- Multiple state and federal disaster declarations related to heavy rains and flooding.
- Likelihood of Future Occurrence: 100-Occasional; 200-Unlikely; 500-Unlikely
- Vulnerability: High to Extremely High
- Priority Hazard

Localized/Stormwater flooding

- Significant localized flood history in the County – occurs annually
- Each jurisdiction is updating this information.
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium?
- Priority Hazard

Landslides and Debris Flows

- The NCDC contains no records of landslides in the County. There have been no disaster declarations associated with landslides in Sacramento County.
- The topography of the majority of Sacramento County is relatively flat and not subject to landslide. In Sacramento County, only a narrow strip along the eastern boundary, from the Placer County line to the Cosumnes River, is considered to have landslide potential. However, future slides on these slopes are expected to be minor in nature and do not pose a large scale threat to life or property. The American River Bluffs downstream from Folsom and in Fair Oaks and Carmichael are considered stable and are generally not subject to fracture or landslides. TRUE? OTHER AREAS? PAST OCCURRENCES?
- Likelihood of Future Occurrence: Unlikely
- Vulnerability: Low
- Non-Priority Hazard

Levee Failure

- Over 500 miles of levees throughout the County. CORRECT?
- There have been two federal disaster declarations in Sacramento County related to levee failure: 1980 Delta Levee Break and 1972 Andrus Island Levee Break.
- Although numerous documented levee breaks in the Delta area since 1900, most were prior to 1990 and do not reflect future failure potential due to extensive levee improvements in the area.
- All levees in the Sacramento Area have been decertified (although not reflected in current DFIRMs), but many are undergoing significant improvements to certify levees to the 200 year+ level of protection
- Likelihood of Future Occurrence: Occasional?
- Vulnerability: Extremely High
- Priority Hazard

Severe weather

Extreme Temperatures: Cold and Freeze

- Annual occurrences of winter weather
- The NCDC data recorded 22 cold and freeze incidents for Sacramento County since 1993.
- No state or FEMA disaster declarations related to cold or freeze.
- ANY NOTABLE EXTREME COLD/FREEZE EVENTS SINCE 2011 PLAN?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Non-Priority Hazard

Extreme heat

- Annual occurrences – it gets hot every summer
- The NCDC data shows 32 extreme heat incidents for Sacramento County since 1993.
- ANY NOTABLE EXTREME HEAT EVENTS SINCE 2011? HOW MANY TIMES WERE COOLING CENTERS OPENED?
- Climate change might affect this hazard in the future
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Low – Medium?
- Priority Hazard? (This was a low priority hazard last time)

Fog and Freezing Fog

- Annual occurrences of fog events
- The NCDC data shows 6 fog incidents for Sacramento County since 1993
- ANY NOTABLE FOG EVENTS SINCE 2011?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Low
- Non-Priority Hazard

Heavy rains and storms (Thunderstorms, Hail, Lightning)

- Significant County history: annual occurrences
- Multiple state and federal disaster declarations associated with Heavy Rains and Storms
- The NCDC data shows 33 extreme heavy rains and storm events for Sacramento County since 1950.
- Severe storms/heavy rains are the primary cause of most major flooding
- ANY NOTABLE HEAVY RAINS/STORM EVENTS SINCE 2011?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: High
- Priority Hazard

Wind and Tornadoes

- Annual occurrences of wind events

- The NCDC data shows 52 high wind events for Sacramento County since 1993
- The NCDC data shows 18 tornado events (6 funnel clouds, 8 F0s, 3 F1s, 1 F2) for Sacramento County since 1993
- ANY NOTABLE HIGH WINDS OR TORNADO EVENTS SINCE 2011?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Low
- Non-Priority Hazard

River/Stream/Creek Bank Erosion

- Due to the high number of linear feet of levees and creek banks, erosion and deposition are occurring continually at varying rates over the planning area.
- USACE/DWR maintain an inventory program to identify and repair erosion sites. As areas are fixed, new areas are identified.
- ARE THERE ANY KEY AREAS THAT SHOULD BE A NOTED CONCERN?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Medium
- Priority Hazard

Subsidence

- Subsidence in the Delta has been a historical problem, occurring on an annual basis. Areas with peat thickness over 10 feet have a great potential for continued subsidence.
- ANY NOTABLE AREAS OF CONCERN BOTH IN OUR OUTSIDE OF THE DELTA AREA?
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: Low
- Non-Priority Hazard

Volcano

- Of the approximately 20 volcanoes in the California, only a few are active and pose a threat. Of these, Long Valley Caldera and Lassen Peak are the closest to Sacramento County.
- According to the State Multi-Hazard Mitigation Plan, Sacramento County is not considered to be vulnerable to eruption and/or ash from these volcanoes.
- Likelihood of Future Occurrence: Unlikely
- Vulnerability: Extremely Low
- Non-Priority Hazard

Wildfire

- Wildfires occur on an annual basis in the Sacramento County Planning Area
- Any ignition has the potential to become an out of control wildfire.
- Likelihood of Future Occurrence: Highly Likely
- Vulnerability: High
- Priority Hazard

Outstanding Items and Next Steps

Participating Jurisdictions

- Return first draft of Annexes ASAP
- Return Mitigation Action Strategy Status Updates

Mitigation Strategy Meetings

- July 12 &13 (plan on attending both days)

Draft LHMP Update out for HMPC Review

- August 2016

Sacramento County
2016 Local Hazard Mitigation Plan Update
Sacramento County: Vulnerability Worksheets

Name of Jurisdiction: _____

Hazard Risk, and Vulnerability Questions

Localized/Stormwater Flooding

The following is from the 2011 LHMP.

Table 1 identifies the number of parcels and roads by watersheds affected by localized flooding throughout the unincorporated County. Parcels were identified by the County based on those parcels historically affected by localized flooding issues. Affected roads are estimated based on those roads fully within 50 feet of a parcel with historical flooding problems. Maps of these localized flooding areas are still under development by the County. (HAVE THEY BEEN DEVELOPED YET?) The Watershed Master Plan included as an appendix to this LHMP also addresses these flood prone areas falling outside of the established 100- and 500-year floodplains.

Table 1 Unincorporated Sacramento County Localized Flooding Areas

Watershed	# of Parcels Affected	# of Road Segments Affected
Buffalo Creek	63	686
Morrison Creek	1,102	366
Chicken Ranch Slough	421	221
Cosumnes River	335	211
Laguna Creek	1042	202
North Delta	769	199
Linda Creek	379	199
Florin Creek	715	191
Arcade Creek	347	182

Sunrise Creek	0	0
Whitehouse Creek	0	0
Willow Creek (Middle)	0	0
Total	**10,034**	**5,216**

Source: Sacramento County

Earthquake Vulnerability

1. Number of unreinforced masonry buildings. If available, please provide an inventory of URM buildings specific to your jurisdiction. Include any tables and/or maps. Is this a layer available in GIS?

Special Populations

1. Describe any hazard-related concerns or issues regarding the vulnerability of special needs populations, such as the elderly, disabled, low-income, or migrant farm workers.

Development since 2011 Plan

USE THE BELOW SECTION TO IDENTIFY DEVELOPMENT SINCE THE LAST PLAN.

As shown in Table 2, Sacramento County has seen a gain of 3.4% of population between 2010 and January 1, 2015.

Table 2 Sacramento County Population Changes Since 2011

Year	Population	Change	% Change
2010[1]	554,554	–	–
2015[2]	573,513	18,959	3.4%

Source: [1]US Census Bureau, [2]California Department of Finance

BASED ON INFORMATION PROVIDED BY YOUR BUILDING DEPARTMENT, PERMITS ISSUED, POPULATE THE FOLLOWING TABLES DESCRIBING DEVELOPMENT SINCE THE 2011 PLAN IN TOTAL AND BY KNOWN HAZARD AREAS. USE THE "OTHER" COLUMN TO DESCRIBE OTHER HAZARD AREAS TRACKED BY YOUR JURISDICTION. MODIFY TEXT ACCORDINGLY.

The Sacramento County Building Department and Planning Department tracked total building permits issued since 2011 for the County. These are tracked by total development, property use type, and hazard risk area. These are shown in Table 3 and Table 4. All development in the identified hazard areas, including the 1% annual chance floodplains, areas protected by levees, and high wildfire risk areas, were completed in accordance with all current and applicable development codes and standards and should be adequately protected. Thus, with the exception of more people living in the area potentially exposed to natural hazards, this growth should not cause a significant change in vulnerability of the County to identified priority hazards.

Table 3 Sacramento County Total Development Since 2011

Incorporation of Hazard Mitigation Plan into Other Plans

Since the creation of the 2011 Sacramento County Local Hazard Mitigation Plan, other plans have been created. This includes General Plans, CWPPs, EOPs, other fire plans, or any other planning process. Was the 2011 LHMP incorporated into or implemented through any of these other plans?

Jurisdiction	Planning Mechanism 2010 LHMP Was Incorporated/Implemented In. Details?

Past Occurrences since 2011 LHMP

Populate the table with any significant past occurrences by hazard since the 2011 Plan. Give some description of the event, along with damages, injuries, and deaths if known.

Hazard	Description of Event (date and text about what happened)	Damages	Injuries	Deaths
Agricultural Hazards				
Bird Strike				
Climate Change				

Hazard	Description of Event (date and text about what happened)	Damages	Injuries	Deaths
Dam Failure				
Drought and Water Shortage				
Earthquake				
Earthquake: Liquefaction				
Flood: 100/200/500-year				
Flood: Localized Stormwater Flooding				
Landslides				
Levee Failure				
River, Stream, Creek Bank Erosion				
Severe Weather: Extreme Temperatures – Cold/Freeze				
Severe Weather: Extreme Temperatures - Heat				
Severe Weather: Fog				

Hazard	Description of Event (date and text about what happened)	Damages	Injuries	Deaths
Severe Weather: Heavy Rains and Storms (Thunderstorms, Hail, Lightning)				
Severe Weather: Wind and Tornadoes				
Subsidence

HMPC Handouts HMPC #3/#4

Please see Appendix C for these handouts.

SACRAMENTO COUNTY

2016 LHMP Update
Final HMPC Meetings: November 16 & 17, 2016

2011 Maintenance Evaluation Process

Evaluation of progress can be achieved by monitoring changes in vulnerabilities identified in the plan. Changes in vulnerability can be identified by noting:

- Decreased vulnerability as a result of implementing recommended actions;
- Increased vulnerability as a result of failed or ineffective mitigation actions; and/or
- Increased vulnerability as a result of new development (and/or annexation).

Updates to this plan will:

- Consider changes in vulnerability due to action implementation;
- Document success stories where mitigation efforts have proven effective;
- Document areas where mitigation actions were not effective;
- Document any new hazards that may arise or were previously overlooked;
- Incorporate new data or studies on hazards and risks;
- Incorporate new capabilities or changes in capabilities;
- Incorporate growth and development-related changes to infrastructure inventories; and
- Incorporate new action recommendations or changes in action prioritization.

Summary of Significant Changes to Current Conditions, Planning Area Vulnerability, and Hazard Mitigation Priorities

This section provides a summary by hazard of significant changes in current conditions, planning area vulnerability, and any resulting modifications to the community's mitigation program priorities since the 2011 LHMP:

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Agricultural Hazards			X

- Recent drought conditions stressed crops making them more susceptible to insect infestation
- Reduced water supply resulted in land being left out of production reducing overall crop yields
- Noxious weeds are more drought tolerant – better able to compete for water over local crops
- Drought increased the tree mortality in the County further impacting the wildfire hazard.
-
-

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Bird Strike		X	

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Climate Change			

-
-

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Dam Failure	X		

- Folsom Dam Improvement projects are near completion that will allow releases at a lower flood stage so the Dam can hold more water for enhanced flood control. This decreases the overall vulnerability in the Folsom Dam inundation areas.
- Jurisdictional dams generally have no change in vulnerability as they are highly regulated. However, with more people moving into dam inundation areas, the vulnerability increases due to an increase in potentially affected population, but not due to an increased risk of dam failure.
- Non-jurisdictional dams pose the biggest risk and, over time with little regular maintenance and often located in remote areas with little security, result in an increase in vulnerability to Sacramento.
-
-
-

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Drought and Water Shortage			X

- Since the 2011 planning process, current drought conditions, including water supply issues, have had a significant impact on the Sacramento County planning area and California. As a result the drought hazard has become a significant priority for mitigation planning.
- As previously mentioned, the drought has contributed to an increase in vulnerability of the County due to increase tree mortality issues and general increase in wildfire conditions.
- Water Supply?
- Over the last few years, the drought has had a significant economic impact on recreation in the County, with rivers running substantially lower, less people have been vacationing and undertaking water dependent recreational activities, such as boating.
-
-
-

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Earthquakes		X	

- The primary factor that might change the earthquake vulnerability, is additional development and more people moving to the area.
- Lake County had a 5.2 earthquake on a previously unknown fault. There is the potential for effects from earthquakes and volcanic activity in the adjacent and nearby counties.
-

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Earthquake Liquefaction			

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Floods:100-/200-/500-year		X	

- With the issuing of new FEMA flood maps (2015 DFRIMs), flood depths have been established in some areas and the regulatory Special Flood Hazard Area has changed. With these changes, flood mitigation projects, including flood insurance promotion and continued participation in the NFIP's CRS program, is a priority.
- Although the FEMA mapped floodplains have changed based on new data, the risk and vulnerability of 100/200/500-year flood remains somewhat constant. Ongoing implementation of regional flood control projects and effective land use planning and requirements for development in identified floodplains have minimized additional exposure to this hazard in the County.
- All new development in the floodplain has been completed in accordance with current and applicable codes and standards, thus these new development areas should be protected from future flooding.

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Floods: Localized Flooding		X	

- Increased development in unmapped flood hazard areas could result in a net increase in vulnerability should these areas experience increased stormwater/localized flooding. However, development requirements that require mitigation of stormwater runoff effectively mitigates this hazard.
- Climate change issues may result in more localized flooding as the climate warms and the wetter storms create more runoff.

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Landslide and Debris Flows			X

- Over the last couple of years, with the severe drought, much of the vegetation along slopes areas is failing to thrive, thus there is a lack of vegetation to hold soil contributing to the landslide/mudslide potential.

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Levee Failure			

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
River/Stream/Creek Bank Erosion			X

- Drought conditions have increase the occurrence of stream bank erosion, with soils drying out and becoming more friable, they tend to slough off the banks causing increased areas of erosion.

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Severe Weather: Extreme Temperatures - Heat			X

- Climate change issues create the potential for additional heat related impacts in the future.

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Severe Weather: Extreme Temperatures- Cold and Freeze			

- Over the last five years of mild winters, there has been a notable decrease in vulnerability of Sacramento County to freeze and severe winter storms.

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Severe Weather: Fog		X	

- This low priority hazard has not changed over the last five years.

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Severe Weather: Heavy Rains and Storms	X		

- Over the last five years of mild winters, there has been a notable decrease in vulnerability of Sacramento County to heavy rains and storms. However, climate change bring renewed concern moving forward for heavy rains, storms and associated issues to the County.
-
-
-

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Winds and Tornadoes			

-

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Subsidence			

- Drought conditions have contributed to increased subsidence statewide. In Sacramento County, this is likely more of a Delta issue where subsidence concerns have actually decreased with the implementation of better farming practices over the years.
-

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Volcano		X	

- This low priority hazard has not changed over the last five years.

2016 LHMP Update Hazards	Decrease in Vulnerability	No Change in Vulnerability	Increase in Vulnerability
Wildfire			X

- Compounded by current drought conditions, the wildfire hazard has substantially increased and is no longer just a seasonal issue. The wildfire season, including the potential for a catastrophic wildfire, is now a year around concern.
- The vulnerability of Sacramento County to increased occurrence of a devastating wildfire has increased as exacerbated by the recent drought, increases in tree mortality, and overall increase in wildfire conditions.
- The increased development in WUI areas within the County also contributes to an increase in vulnerability.
-
-
-

Multi-hazard Considerations

- With new areas of development identified within the County and within the incorporated communities, requirements for new development will consider various hazard constraints and mitigation measures to govern ultimate development and buildout of these areas. Changes in development that have occurred in hazard prone areas and have increased or decreased the vulnerability of the Planning Area,

development planned or under the consideration of the participating jurisdictions, and other conditions that may affect the risks and vulnerabilities of the Planning Area such as climate change variables are documented and considered in this Plan Update.

A.2 Sacramento County Step 2: Involve the Public

Multiple efforts were made to engage the public during the creation of this plan, including direct outreach efforts such as phone calls, emails, direct mailings, and face-to-face meetings, in addition to the broader outreach efforts such as e-newsletters, website postings, newspaper advertisements and articles, and leveraging other community events to communicate and invite participation in the LHMP Update project. A key element of public participation is including members of the public and other public-type stakeholders (at 50% participation) on the Hazard Mitigation Planning Committee as part of the Steering Committee to the HMPC.

b) and c) Public Meetings

Meeting Type	Meeting Topic	Meeting Date	Meeting Locations
Early Public Meetings	1) Intro to DMA, CRS and mitigation planning 2) 2016 LHMP Update Process	4/5 & 6, 2016	South Natomas Community Center, Sacramento and Laguna Town Hall, Elk Grove
Delta HMPC/Community Meeting	1) Introduction to DMA and the planning process 2) Risk assessment overview and work session 3) Emergency Action Planning Status	6/21, 2016	Courtland Fire House, Hood/Courtland
Final Public Meetings	1)Presentation of Draft LHMP and solicitation of public and stakeholder comments	10/ 15 & 16, 2016	Courtland Fire House, Hood/Courtland and Laguna Creek High School, Elk Grove

Press Release for Early Public Meeting

Robert B. Leonard
Chief Deputy County Executive

Department of Water Resources
Michael L. Peterson, Director

Navdeep S. Gill
Interim County Executive

County of Sacramento

Sacramento County Local Hazard Mitigation Plan Update: Kickoff meeting

HELP YOUR COMMUNITY TO BE HAZARD-READY

Sacramento, CA: Sacramento County is partnering with the City of Sacramento, other local incorporated cities and special districts to update their joint Local Hazard Mitigation Plan (LHMP). Flood and fire are just two of the hazards to our local communities. A LHMP forms the foundation for a community's long-term strategy to reduce disaster losses by breaking the repeated cycle of disaster damage and reconstruction. Communities with a FEMA- approved LHMP are eligible for pre- and post-disaster FEMA grant funding and for lower costs of flood insurance to residents through in the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

The people most aware of potential hazards are the people that live and work in the affected communities- *like you.* We are seeking members of the public to participate on our LHMP update planning committee. Your commitment would involve the following:

- Attending 5 afternoon meetings over the next 6 months
- Reviewing and providing comments on the plan drafts via email

Initial Planning Committee and public information meetings will be held in the following locations; please select the date and location that works best for you.

April 5, 2016
Planning Committee 2pm-5pm
Public Information Meeting 6pm-7:30pm
Laguna Town Hall
3020 Renwick Ave,
Elk Grove, CA 95758

April 6, 2016
Planning Committee 2pm-5pm
Public Information Meeting 6pm-7:30pm
South Natomas Community Center, Room
2921 Truxel Rd,
Sacramento, CA 95833

If you are interested in volunteering as a Planning Committee member, please send your RSVP to Celine Livengood at 916-874-3130 or email at livengood@saccounty.net. You may also contact Celine if you have any questions.
For more information and to review the current Hazard Mitigation Plan document, please go to StormReady.org and follow the link to Local Hazard Mitigation Plan 2016.

LHMP Kickoff Meeting Public Notifications and Invites

Subject: Media Release: Sacramento County Local Hazard Mitigation Plan Update: Kickoff meeting
Date: Thursday, March 31, 2016 10:18:40 AM

Good morning,

The following announcement will be sent to the media today. The City, in partnership with Sacramento County and surrounding cities, is updating the countywide Local Hazard Mitigation Plan.

--

Sacramento County Local Hazard Mitigation Plan Update: Kickoff meeting

FEMA defines Hazard Mitigation as any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards. While natural hazards cannot be prevented, a Hazard Mitigation Plan forms the foundation for a community's long-term strategy to reduce disaster losses by breaking the repeated cycle of disaster damage and reconstruction.

Sacramento County is partnering with the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Isleton, Rancho Cordova and several special districts to update their countywide 2010 Local Hazard Mitigation Plan (LHMP).

Communities with a FEMA- approved LHMP are eligible for FEMA pre- and post-disaster grant funding and for lower costs of flood insurance to residents through the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

The 2016 LHMP Update is a multi-jurisdictional effort being developed by a planning committee comprised of representatives from various County and City departments; neighboring jurisdictions, key federal state and local agency stakeholders, and the public.

To be part of our planning committee your commitment would involve the following:

- Attending 5 afternoon meetings over the next 6 months
- Reviewing and providing comments on the plan drafts via email

Kickoff meetings will be held in the following locations; please select the date and location that works best for you.

April 5, 2016
Planning Committee 2pm-5pm
Laguna Town Hall
3020 Renwick Ave,
Elk Grove, CA 95758

April 6, 2016
Planning Committee 2pm-5pm
South Natomas Community Center, Room
2921 Truxel Rd,
Sacramento, CA 95833

Planning Committee Meeting will be followed by an informational evening meeting for the general public from 6:00 to 7:30. You are welcome to attend the evening meetings as well, but your attendance is not required.

Please RSVP and plan on attending this important planning process. For additional information, contact Celine Livengood at 916-874-3130 or email at livengood@saccounty.net.

For more information and a copy of the Hazard mitigation Plan, please go to Saccounty.net and type Local Hazard Mitigation Plan in the search window at the top of the page.

CEOs, activists urge N. Carolina to repeal new transgender law

The Associated Press

RALEIGH, N.C.

North Carolina's governor met Thursday with gay-rights advocates bearing a letter signed by more than 100 corporate executives urging him to repeal the nation's first state law limiting the bathroom options for transgender people.

The law also excludes lesbian, gay, bisexual and transgender people from anti-discrimination protections, and it blocks municipalities from adopting their own anti-discrimination and living wage rules.

The governor "appreciated the opportunity to sit down and deal with these complex issues through conversation and dialogue as opposed to political threats and economic retaliation," his spokesman, Josh Ellis, said in a statement.

The advocates declined to describe Gov. Pat McCrory's response.

Some companies are already reconsidering doing business in the country's ninth-largest state.

New Jersey-based Braeburn Pharmaceuticals said it is "re-evaluating our options based on the recent, unjust legislation" whether to build a $20 million manufacturing and research facility in Durham County. The 50 new jobs paying an average of nearly $76,000 a year were announced two weeks ago.

Lionsgate, the California-based entertainment company, had been lining up hotel and equipment rentals and hiring more than 100 workers in North Carolina but decided to shoot its pilot episode for a comedy series in Canada instead, said Jennifer Irvine, a Charlotte production coordinator.

Charlotte convention officials and the organizers of one of the world's largest furniture markets say some customers have pulled out, also citing the new law.

Changing business plans is much more difficult for companies with existing investments in buildings, equipment and people, but the outsized lobbying power of major corporations could reshape how prospective talent and investors perceive North Carolina as a place they want to be, business observers said.

City of
SACRAMENTO
Get Involved!
HELP YOUR COMMUNITY BE HAZARD-READY

Sacramento, CA: The regional Local Hazard Mitigation Plan will be updated by a coordinated effort between the County of Sacramento, the City of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Isleton, Rancho Cordova and many special districts within the County. Flood, drought, fire, earthquakes, and severe weather are just a few of the hazards to Sacramento communities. While natural hazards such as these cannot be prevented, a Hazard Mitigation Plan forms the foundation for a community's long-term strategy to reduce disaster losses by breaking the repeated cycle of disaster damage and reconstruction. Additionally, only communities with a FEMA-approved Hazard Mitigation Plan are eligible to apply for both pre- and post-disaster grant funding.

Another benefit of this plan update is to enhance the floodplain management programs of Sacramento communities which can help reduce the costs of flood insurance to residents of the City of Sacramento and Sacramento County through participation in the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

The people most aware of potential hazards are the people that live and work in the affected communities. In addition to plan participation by local, state and federal agencies, the community is seeking enthusiastic, community-minded residents to be part of our Local Hazard Mitigation Plan Update. We encourage attendance and participation from the general public in both our planning and public meetings.

The initial planning and public meetings will be held at the following locations. Please select the date and location that works best for you.

April 5, 2016
Planning Committee 2pm-3pm
Public Meeting 6pm-7:30pm
Laguna Town Hall
3020 Renwick Ave,
Elk Grove, CA 95758

April 6, 2016
Planning Committee 2pm-3pm
Public Meeting 6pm-7:30pm
South Natomas Community Center, Conference Room
2921 Truxel Rd,
Sacramento, CA 95833

You also have the opportunity to volunteer as a planning committee member for our Plan update. As a committee member, your commitment would involve the following:

- Attending 5 afternoon meetings over the next 6 months
- Reviewing and providing comments on the plan drafts via email

If you are interested in volunteering as a Planning Committee member, please send your RSVP to Celine Livengood at 916-874-3130 or email at livengoodc@saccounty.net

For more information and to review the current Hazard Mitigation Plan document, please go to StormReady.org and follow the link to Local Hazard Mitigation Plan, 2016.

Final Public Meeting Press Release

Comment on Your Community's Local Hazard Mitigation Plan!

HELP YOUR COMMUNITY BE HAZARD-READY

Sacramento County is partnering with the City of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Isleton, Rancho Cordova and several special districts to update their multi-jurisdictional Local Hazard Mitigation Plan (Plan). Flood, drought, fire, earthquakes, and severe weather are just a few of the hazards to Sacramento communities. While natural hazards such as these cannot be prevented, a Hazard Mitigation Plan forms the foundation for a community's long-term strategy to reduce disaster losses by breaking the repeated cycle of disaster damage and reconstruction. Additionally, only communities with a FEMA- approved Hazard Mitigation Plan are eligible to apply for both pre- and post-disaster grant funding.

Another benefit of this plan update is to enhance the floodplain management programs of Sacramento communities. This can help reduce the costs of flood insurance to residents through a jurisdiction's participation in the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

The process began in April 2016 with an initial public meeting and the establishment of a planning committee comprised of participating jurisdictions; local, state, and federal agencies; and other key stakeholders and members of the public. The plan is scheduled to be finalized and submitted to Governor's Office of Emergency Services and Federal Emergency Management Agency in November 2016.

Public Review Draft

The Public Review Draft of the LHMP Update is available (in printed copy) at the following Sacramento area libraries: Central Branch and Fair Oaks Branch. The address of the libraries and library hours are located at: www.saclibrary.org. The Public Review Draft is also available online (pdf format), go to StormReady.org and follow the link to Local Hazard Mitigation Plan, 2016.

Open Public and Planning Team Meetings

Final meetings to review and provide comments on the Public Review Draft LHMP Update are scheduled as follows:

Public Meetings:

November 15, 2016, 6:00-7:30 pm
South Natomas Community Center
Conference Room
2921 Truxel Road
Sacramento, CA 95833

November 16, 2016, 6:00-7:30 pm
Laguna Creek High School, Career Room
9050 Vicino Drive
Elk Grove, CA 95758

Planning Team Meetings:

November 16, 2016, 9:00-11:00 am
South Natomas Community Center
Conference Room
2921 Truxel Road
Sacramento, CA 95833

November 17, 2016, 9:00-11:00 am
Hood/Courtland Fire House (Station 2)
1125 Hood Franklin RD
Hood, CA 95639

Pitt seeking joint custody in split from Jolie Pitt

LOS ANGELES

Brad Pitt is asking a judge to grant him joint custody of his six children in his split from Angelina Jolie Pitt, according to a divorce filing Friday.

The actor's request was included in his response to Jolie Pitt's Sept. 20 petition to end their two-year mar-

vestigation by a child welfare agency in Los Angeles is ongoing.

The outcome of the investigation could impact how a judge determines custody arrangements, although courts in California generally favor awarding joint custody. The actors could also reach a private agreement.

Singer Chesney: 'I Love Beyonce!'

NASHVILLE, TENN.

Country singer Kenny Chesney wants the Beyhive to know they've got it wrong – he loves Beyonce.

Some viewers watching the 50th annual Country Music Association Awards on Wednesday targeted the country star for his facial expression during her performance of "Daddy Lessons" with the Dixie Chicks. Many fans said online that he didn't appear to be very impressed.

Comment on Your Community's Local Hazard Mitigation Plan!
HELP YOUR COMMUNITY BE HAZARD-READY

Sacramento County is partnering with the City of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Isleton, Rancho Cordova and several special districts to update their multi-jurisdictional Local Hazard Mitigation Plan (Plan). Flood, drought, fire, earthquakes, and severe weather are just a few of the hazards to Sacramento communities. While natural hazards such as these cannot be prevented, a Hazard Mitigation Plan forms the foundation for a community's long-term strategy to reduce disaster losses by breaking the repeated cycle of disaster damage and reconstruction. Additionally, only communities with a FEMA- approved Hazard Mitigation Plan are eligible to apply for both pre- and post-disaster grant funding.

Another benefit of this plan update is to enhance the floodplain management programs of Sacramento communities. This can help reduce the costs of flood insurance to residents through a jurisdiction's participation in the National Flood Insurance Program's (NFIP) Community Rating System (CRS).

The process began in April 2016 with an initial public meeting and the establishment of a planning committee comprised of participating jurisdictions, local, state, and federal agencies; and other key stakeholders and members of the public. The plan is scheduled to be finalized and submitted to Governor's Office of Emergency Services and Federal Emergency Management Agency in November 2016.

Public Review Draft

The Public Review Draft of the LHMP Update is available (in printed copy) at the following Sacramento area libraries: Central Branch and Fair Oaks Branch. The address of the libraries and library hours are located at: www.saclibrary.org. The Public Review Draft is also available online (pdf format), go to StormReady.org and follow the link to Local Hazard Mitigation Plan, 2016.

Open Public and Planning Team Meetings

Final meetings to review and provide comments on the Public Review Draft LHMP Update are scheduled as follows:

Public Meetings:
November 15, 2016, 6:00-7:30 pm
South Natomas Community Center
Conference Room
2921 Truxel Road
Sacramento, CA 95833

November 16, 2016, 6:00-7:30 pm
Laguna Creek High School, Career Room
9050 Vicino Drive
Elk Grove, CA 95758

Planning Team Meetings:
November 16, 2016, 9:00-11:00 am
South Natomas Community Center
Conference Room

(d) Other Public Outreach Efforts

Due to the multijurisdictional nature of this plan update, all public outreach activities described in this section were conduction in coordination with and on behalf of all participating jurisdictions, including the Sacramento County and the City of Sacramento, the two current CRS communities and other incorporated Sacramento communities considering participation in the CRS program.

Effort	Description
Public Outreach Flyer	An initial public outreach flyer was developed for use at all public events and meetings. A second public outreach flyer was developed for public outreach on the draft plan and prior to final HMPC and public meetings. These flyers are referenced below in these other public outreach activities.
Article in Newspaper	An article was published in the Elk Grove Citizen after the Kickoff meetings to make citizens in the County aware of the hazard mitigation update process and invite participation and attendance at upcoming HMPC and Public Meetings
Survey	A public survey was posted on the County's website at the beginning of the planning process inviting the public to comment on how prepared both the County and individuals are for a possible natural disaster, including flood events
Sacramento County LHMP Update Website	Information on the Plan update process and location of documents, and final HMPC and public meeting locations were posted on the County website. Links to the County website were placed on websites from the other incorporated communities. This website also included a link to the Survey.
Delta Area Community & HMPC Meeting	This meeting was held in the Delta area at the Courtland Fire House to provide a local forum for both the participating Delta RDs and the community members to participate in the LHMP Update process.
SAFCA Assessment Meetings – Joe Mims Jr. Comm. Center, May 11, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, representatives of the American River Flood Control District, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
SAFCA Assessment Meetings – George Sim Comm. Center, May 11, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
SAFCA Assessment Meetings – Johnson Comm. Center, May 12, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, representatives of the American River Flood Control District, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
SAFCA Assessment Meetings – South Natomas Comm. Center, May 12, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, RD 1000, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
SAFCA Assessment Meetings – Heron School, May 17, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, RD 1000, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.

Effort	Description
SAFCA Assessment Meetings – Clunie Comm. Center, May 17, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, American River Flood Control District, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
SAFCA Assessment Meetings – Elks Lodge #6, May 18, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
SAFCA Assessment Meetings – Samuel Pannell Comm. Center, May 18, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
SAFCA Assessment Meeting – Sierra 2 Center, May 19, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
SAFCA Assessment Meeting – Sierra Oaks Elementary School, May 19, 2016	Targeted community meeting to discuss flood control assessment and discuss flood risk to the community. This meeting was attended by City of Sacramento Staff, SAFCA staff, American River Flood Control District, and the Public. Information (Public Outreach Flyer) on the LHMP Update process and how to get involved was distributed at these meetings.
Bay Stone Lake Community Meeting	This meeting was held in the Bay Stone Lake Community area on August 30th, 2016 to discuss mitigation options for area residents in flood prone areas. The meeting started with a discussion of the LHMP Update and mitigation options such as home elevation.
Sacramento County Storm Water Quality Division Exhibit at State of California, Green Fair Event	Sacramento Water Quality Division had an exhibit at the State of California, Department of Technology, Green Fair Event in Rancho Cordova. This meeting targeted state employees. The exhibit included information on the LHMP Update process and how to get involved. The public information flyer was included as a handout.
Public Outreach at Sacramento County Public Library, Sacramento County Main Library location	The County placed the draft plan in the reference section at the Sacramento County Public Library, Main Library location. Invitations were placed on Facebook, the County website, and as part of the advertisement for public meetings to let the public know that the documents were there for review and input.
Public Outreach at Sacramento County Public Library, Sacramento County Elk Grove Library location	The County placed the draft plan in the reference section at the Sacramento County Public Library, Elk Grove Library location. Invitations were placed on Facebook, the County website, and as part of the advertisement for public meetings to let the public know that the documents were there for review and input.
Supervisor Kennedy's Public Meeting Fern Bacon Middle School, October 27, 2016	A brief overview of the LHMP plan update was given by the Sacramento County Department of Water Resources at this Supervisor's public meeting and the LHMP public information flyer was provided to meeting attendees. This flyer provided information on where and how the Public Review Draft could be reviewed, information on upcoming public meetings on the draft plan, and how to provide comments. County DWR also provided 500 Storm Ready Kits to attendees.
Directed email Outreach to Sacramento Residents	November 2, directed email to Sacramento residents previously showing interest in the LHMP Update process. This email requested a review and comment on the LHMP Public Review Draft and participation in the Hazard Survey.

Public Outreach Flyer

SACRAMENTO COUNTY

Help Reduce Disaster Losses in Your Community by Participating in the Sacramento County Local Hazard Mitigation Plan Update

Sacramento County is developing a Local Hazard Mitigation Plan (LHMP) Update to their 2011 plan. The purpose of this LHMP Update is to assess risk to natural hazards, implement actions to reduce future losses, and maintain eligibility for federal mitigation funds in accordance with the Disaster Mitigation Act of 2000. Partners in this planning effort include the incorporated communities of the City of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Isleton, and Rancho Cordova and many special districts throughout the County.

What is Hazard Mitigation?

Hazard mitigation means any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards.

Why is Natural Hazard Mitigation Important?

Most people who live or work in Sacramento County have been affected by natural hazards in one way or another. Sacramento County and its residents are vulnerable to a variety of hazards including floods, levee failure, drought, wildfire, and other severe weather events.

The rising costs associated with disaster response and recovery have focused the attention of federal, state, and local governments on addressing natural hazards before they occur. Obviously, torrential rains and floods cannot always be prevented from occurring. Planning for natural hazards and implementing mitigation measures, however, can reduce the impact of such events when they do occur. Emergency response and recovery costs; property damage; personal injury and loss of life; and the overall economic and social impact on the community can all be reduced, and in some instances eliminated through natural hazard mitigation.

Hazard Mitigation Plan and Plan Update Process

After securing Federal Emergency Management Agency (FEMA) mitigation grant funding, Sacramento County is using the funds to support an update of the 2011 LHMP. This LHMP Update is being developed by a Hazard Mitigation Planning Committee comprised of representatives from various County and City departments; neighboring jurisdictions, key federal, state, and local agency stakeholders and the public.

The plan will address an updated list of hazards, will assess the likely impacts of these hazards to the people and assets of the Sacramento County planning area, and will also establish updated goals and prioritize projects to reduce the impacts of future disasters on people and property as well as to critical facilities and infrastructure.

Another benefit of mitigation planning is that it can also help lessen the cost of flood insurance to the residents of Sacramento County and the City of Sacramento through FEMA's National Flood Insurance Program's (NFIP) Community Rating System.

National Flood Insurance Program's Community Rating System

The National Flood Insurance Program's (NFIP) Community Rating System (CRS) is a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed the minimum NFIP requirements. As a result, flood insurance premium rates are discounted to reflect the reduced flood risk resulting from the community actions in meeting the goals of the CRS Program. The reduction in flood insurance premium rates is provided according to a community's CRS classification. Sacramento County is currently a CRS Class 3, which provides a 35 percent discount on flood insurance for those located within the special flood hazard area (SFHA) and a 10 percent discount for those located in non-SFHA areas. The City of Sacramento is a CRS Class 5 providing a 25 percent discount on residents located in the SFHA and also a 10 percent discount for non –SFHA areas. Participation by these communities in CRS results in over $2.5 million in annual savings to area residents on the cost of their flood insurance premiums.

Opportunities for Input

Members of the community have a very important role in this process. A draft of the LHMP Update will be available mid October 2016 for review and comment by the public and all interested stakeholders on the County website and in select public libraries. Public meetings on the Draft Plan and final planning team meetings will also occur in early November 2016. All interested stakeholders and members of the public are welcome to attend.

For more information on this project and how you can get involved, go to **StormReady.org** and follow the link to Local Hazard Mitigation Plan, 2016 or contact the following individuals:

Celine Livengood/Mark Rains	**Jeanine Foster**

City joins hazard mitigation plan update

Photo by Lance Armstrong - Jeanine Foster discusses the importance of updating the Local Hazard Mitigation Plan.

By Lance Armstrong - Citizen Staff Writer

Published: Friday, April 8, 2016 10:13 AM PDT

Elk Grove on April 5 joined other Sacramento County cities and special districts in the preliminary steps to update the Local Hazard Mitigation Plan.

The Federal Emergency Management Agency (FEMA) describes hazard mitigation as "any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards."

The local plan, which forms the foundation for a long-term strategy to reduce disaster losses, is required by FEMA under the Disaster Mitigation Act of 2000.

The act requires state and local governments to have a hazard mitigation plan in place.

One of the primary reasons for that requirement is for those cities and districts to maintain their eligibility for FEMA grants and mitigation funding.

Also included among the partners in this planning effort are the incorporated communities of the city of Sacramento, Galt, Isleton, Rancho Cordova, Citrus Heights, Folsom, and many special districts throughout the county.

The current multi-jurisdictional plan was created in 2005 and was last updated in 2010 and 2011. Another requirement of the Disaster Mitigation Act is that the plan be updated every five years.

An essential part of that process is the hosting of Hazard Mitigation Planning Committee and public meetings for the purpose of gathering input and direction for the update.

The committee consists of representatives from various city and county departments, neighboring jurisdictions, federal, state and local agency stakeholders and the public.

Weather patterns relating to such things as floods, and droughts are among the things that influence update changes.

Additionally, many people in the county are vulnerable to the threat of levee failure.

Current efforts consist of impact assessments of an updated list of hazards such as insects and pests pertaining to agriculture, dam failures and earthquakes.

Mitigation planning can also benefit residents in certain parts of the county by lowering the cost of flood insurance through FEMA's National Flood Insurance Program's Community Rating System.

Due to the costs associated with natural disasters, local, state and federal governments have placed much emphasis on addressing preventive measures against these disasters.

Although prevention against such occurrences as torrential rains and floods are not always successful, strategic planning can reduce their impacts, and as a result decrease economic and social effects that they have on communities.

Jeanine Foster, who led the first of the committee and public meetings at Laguna Town Hall on April 5, said that although the update process is early, the public has already showed its interest in providing their input to this project.

"The public is interested, they're concerned about where they live and the effects of these hazards and they're interested in this process," she said. "The indication is they would like to be part of this plan development process. So, the county and the cities and the districts are really opening this planning process up to input from the public so they can help guide some of the resulting mitigation measures for the plan."

The update process will take about six to 12 months to complete, and the document will eventually be reviewed for approval by the Federal Emergency Management Agency.

Subject: EAP & LHMP - Public Meeting

Hello to you all.

With the LHMP Update and the Emergency Action Plan for the south County area going forward concurrently, we want to be certain the Delta community is aware of each process and as involved as they would like to be. Therefore we are planning to host a public meeting in the Delta area the night of Tuesday, June 21st after the LHMP committee meeting. This extra meeting with the public will be held from 6:00pm to 7:30 at the Courtland Fire House on Hood Franklin Road.

Because this meeting will take place very soon and each of you best know the residents and places to put flyers…I'm asking for help in getting the word out about this meeting. I'll have a flyer prepared soon and send it as attachment that you can forward to people or print and pin up in stores, libraries, the marinas or anywhere where it will get noticed.

We'll also try to get a notice in a local paper.

Thank you. Celine

www.waterresources.saccounty.net
SACRAMENTO COUNTY

All,

I just wanted to clarify the Local Hazard Mitigation Plan meetings for next week and attendance by Reclamation Districts.

We have scheduled two planning team meetings for June 21 and June 22 as follows:

Tuesday, June 21st: 1:00 pm – 4:00 pm
Laguna Creek High School - Career Room
9050 Vicino Dr., Elk Grove, CA 95758

Wednesday, June 22nd: 1:00 pm – 4:00 pm
Bannon Creek Elementary School - Multi-Purpose Room
2775 Millcreek Drive, Sacramento, CA 95833

We have added a third meeting that is a combined planning team/public meeting:

Tuesday, June 21st, 6:00pm to 7:30
Courtland Fire House on Hood Franklin Road

As an RD participating in the LHMP Update, you only need to attend one of these three meetings to get coverage for the LHMP. These meetings will all cover similar information. We are offering multiple meeting times and locations to accommodate everyone's varying schedules.

And, since the meeting Tuesday evening at the Courtland Fire House is also a public meeting for Delta area residents, please encourage anyone from the area to attend.

Please let me know if you have questions.

Thanks very much and hope to see everyone at one of these meetings.

Subject: Special Public Meeting for Emergency Action Plan and 2016 Local Hazard Mitigation Plan Update
Importance: High

Hello all.

Attached is a flyer for a special meeting in the Delta area. This meeting is not a requirement for the LHMP, yet we
hope to see many of you there to participate in the conversation with the community.

This meeting will be held **Tuesday, June 21st, 6:00pm to 7:30 at the Courtland Fire House on Hood Franklin Road**.
Please see the attached flyer.

Because this meeting will take place very soon, we need help in spreading the word. Attached is a flyer about the meeting.

If possible, please forward to people in the community or print and put it anywhere it will get noticed.

Thank you so much. Celine

SACRAMENTO COUNTY

Flyer for SAFCA Meetings – 5/11/2016 to 5/19/2016

City of SACRAMENTO

Help Reduce Disaster Losses in Your Community by Participating in the Sacramento County Local Hazard Mitigation Plan Update

Sacramento County is developing a Local Hazard Mitigation Plan (LHMP) Update to their 2011 plan. The purpose of this LHMP Update is to assess risk to natural hazards, implement actions to reduce future losses, and maintain eligibility for federal mitigation funds in accordance with the Disaster Mitigation Act of 2000. Partners in this planning effort include the incorporated communities of the City of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt, Isleton, and Rancho Cordova and many special districts throughout the County.

What is Hazard Mitigation?

Hazard mitigation means any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards.

Why is Natural Hazard Mitigation Important?

Most people who live or work in Sacramento County have been affected by natural hazards in one way or another. Sacramento County and its residents are vulnerable to a variety of hazards including floods, levee failure, drought, wildfire, and other severe weather events.

The rising costs associated with disaster response and recovery have focused the attention of federal, state, and local governments on addressing natural hazards before they occur. Obviously, torrential rains and floods cannot always be prevented from occurring. Planning for natural hazards and implementing mitigation measures, however, can reduce the impact of such events when they do occur. Emergency response and recovery costs; property damage; personal injury and loss of life; and the overall economic and social impact on the community can all be reduced, and in some instances eliminated through natural hazard mitigation.

Hazard Mitigation Plan and Plan Update Process

After securing Federal Emergency Management Agency (FEMA) mitigation grant funding, Sacramento County is using the funds to support an update of the 2011 LHMP. This LHMP Update is being developed by a Hazard Mitigation Planning Committee comprised of representatives from various County and City departments; neighboring jurisdictions, key federal, state, and local agency stakeholders and the public.

The plan will address an updated list of hazards, will assess the likely impacts of these hazards to the people and assets of the Sacramento County planning area, and will also establish updated goals and prioritize projects to reduce the impacts of future disasters on people and property as well as to critical facilities and infrastructure.

Another benefit of mitigation planning is that it can also help lessen the cost of flood insurance to the residents of Sacramento County and the City of Sacramento through FEMA's National Flood Insurance Program's (NFIP) Community Rating System.

National Flood Insurance Program's Community Rating System

The National Flood Insurance Program's (NFIP) Community Rating System (CRS) is a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed the minimum NFIP requirements. As a result, flood insurance premium rates are discounted to reflect the reduced flood risk resulting from the community actions in meeting the goals of the CRS Program. The reduction in flood insurance premium rates is provided according to a community's CRS classification. Sacramento County is currently a CRS Class 3, which provides a 35 percent discount on flood insurance for those located within the special flood hazard area (SFHA) and a 10 percent discount for those located in non-SFHA areas. The City of Sacramento is a CRS Class 5 providing a 25 percent discount on residents located in the SFHA and also a 10 percent discount for non –SFHA areas. Participation by these communities in CRS results in over $2.5 million in annual savings to area residents on the cost of their flood insurance premiums.

Opportunities for Input

Members of the community have a very important role in this process. A draft of the LHMP Update will be available early fall 2016 for review and comment by the public and all interested stakeholders on the County and City websites and other identified locations. Planning team and public stakeholder meetings will also occur throughout the plan development process. All interested stakeholders and members of the public are welcome to attend.

For more information on this project and how you can get involved, go to **StormReady.org** and follow the link to Local Hazard Mitigation Plan, 2016, or contact the following individuals:

Hello to you all.

You are receiving this email because you were interested in receiving additional communication from our agency in regards to the topics discussed at the August 30th community meeting.

Specifically, information on potential mitigation options and grant opportunities, notification when the draft Local Hazard Mitigation Plan update (LHMP)is released for review and to receive the meeting minutes from the August 30th meeting.

Attached to this email are the meeting minutes from the August 30th meeting.

The LHMP update is anticipated to be ready for release in two weeks. You will receive another email at that time with a link to the document. There will be a two week comment period for the draft document.

In addition, our agency is requesting input on local natural hazards you are aware of through an online public survey at the following website;

http://www.waterresources.saccounty.net/stormready/Pages/Hazard-Mitigation-Planning-Committee-2016-Plan-Update.aspx.

Thank you so much for your time and interest, and feel free to contact me with any questions.

SACRAMENTO COUNTY

Meeting Minutes
Beach Stone Lake (BSL) Community Meeting
August 30, 2016 6:00 – 7:30pm

The following notes are topics discussed in summary along with questions (Q) from the audience and the answers (A) to each. Questions and general statements (S) from the audience are in *Italics*. The dialogue contained in these notes is not a verbatim account but instead a compilation of general discussion points.

Introductions and other County Information

Celine Livengood explained that the purpose of the meeting; to offer residents information on changes to flood insurance premiums and options to help protect their homes from flooding. She also explained what the Local Hazard Mitigation Plan (LHMP) Update is (a document listing known natural hazards in Sacramento County and mitigation options for each hazard), the benefits the LHMP provides to the County and its residents and that the Draft LHMP will be available in mid-September. She told attendees she would be taking notes during the meeting and if they provide their email address, she will send the meeting minutes and a notice when the Draft LHMP is posted for review and comment. She introduced the speakers, George Booth (County), Edie Lohman (Federal Emergency Management Agency -FEMA), Irene Sabourin (Insurance broker) and Mark Rains (County).

Background

George Booth gave a brief history of BSL floodplain and the current FEMA Flood Insurance Rate Map (FIRM).Mr. Booth also talked about the McCormick-Williamson Weir Project and its likely effect on the current BFE. He said that a study was under way with preliminary modeling that shows the weir would effectively lower BFEs in the BSL area. However, there are mapping concerns associated with the Sacramento River de-accredited levees.

Q – [Considering the vertical datum change, on the 2012 Flood Insurance Rate Map,] Did the Elevation Certificate (EC) change by 2.4 feet? Does that mean the elevation of my home on the EC is 2.4' higher?

A - For elevation certificates that were produced using NGVD 29 (the datum is shown on the EC), the increase to the Finished Floor Elevation and base flood elevation (BFE) will be 2.43 feet higher due to a change in the vertical datum from NGVD to NAVD. The base flood elevation changes by the same amount so the floor is the same compared to the BFE.

Q - What happened to the Sacramento River?

Subject: Draft Local Hazard Mitigation Plan Update - Public Review and Hazard Survey

Hello to you all.

You are receiving this email because you were interested in receiving notification on release of the Draft Local Hazard Mitigation Plan update (LHMP), now ready for review. The document is available on line at the following link:

http://www.waterresources.saccounty.net/stormready/Pages/Hazard-Mitigation-Planning-Committee-2016-Plan-Update.aspx

If you have trouble in using this link, the second option is to go the County's home page, then 'Government', 'Departments', 'Water Resources'…at the bottom, left of that page click on 'Storm Ready'. Under the 'rain drop' is the link to the LHMP 2016.

Additionally, this document is available in hardcopy at two Sacramento County libraries, at Main Branch located at 828 I Street and at the Fair Oaks Branch located at 11601 Fair Oaks Blvd.

The comment period ends November 18th. Please send comments to me via email or to the fax number listed below.

In addition, our agency is requesting input on local natural hazards you are aware of through an online public survey. This survey, titled HMP (Hazard Mitigation Plan) Survey, is at the same web site as the Draft document. Click on the link just under the next meeting dates to participate.

Thank you so much for your time and interest, and feel free to contact me with any questions.

SACRAMENTO COUNTY

A.3 Sacramento County Step 3: Coordinate

This planning step credits coordinating with other agencies and key stakeholders and incorporating other plans and other agencies' efforts into the floodplain management plan or LHMP. Other agencies and organizations were contacted to determine if they have studies, plans and information pertinent to the floodplain management plan, to determine if their programs or initiatives may affect the community's program, and to see if they could support the community's efforts in this LHMP Updare. Coordination efforts with these other agencies are documented in Table A 3 below.

Due to the multijurisdictional nature of this plan update, all agency coordination efforts described in this section were conduction in coordination with and on behalf of all participating jurisdictions, including the Sacramento County and the City of Sacramento, the two current CRS communities and other incorporated Sacramento communities considering participation in the CRS program.

Table A-2 List of Agencies and Key Stakeholders Coordinated with Through the LHMP Update Process

Agency Name/ Contact	Mechanism	Contacted via Mail/email	Contacted via Phone	Contacted Face-to Face	Topics Discussed
Kate Meis, Executive Director Sacramento Local Government Commission	Direct contact with Capital Region Climate Readiness Collaborative, Local Government Commission, and other climate change initiative agencies	X		X	Invited LHMP participation and input on the Climate Change and other components of the LHMP
Jenny Woods, Sacramento Local Government Commission	Direct contact with Capital Region Climate Readiness Collaborative, Local Government Commission, and other climate change initiative agencies	X		X	Invited LHMP participation and input on the Climate Change and other components of the LHMP
Larry Green, Sacramento Metropolitan Air Quality District	Direct contact with Capital Region Climate Readiness Collaborative, Local Government Commission, and other climate change initiative agencies & Risk Assessment Meeting	X		X	Invited LHMP participation and input on air quality and wildfire issues, the Climate Change hazard, and other components of the LHMP.
Shelly Jiang, Sacramento Metropolitan Air Quality District	Direct contact with Capital Region Climate Readiness Collaborative, Local Government Commission, and other climate change initiative agencies & Risk Assessment Meeting	X		X	Invited LHMP participation and input on air quality and wildfire issues, the Climate Change hazard, and other components of the LHMP. She developed air quality text for the risk assessment.

Subject: RE: Copies of Printed Health Docs BRACE

Hi Celine
This morning was very beneficial. Thank you and George

CRC Members already planning to attend meetings are: Curtis, Meg, possibly Kathleen and myself. CRC members to include in emails are:
Curtis Alling (curtis.alling@ascentenvironmental.com)
Kate Meis (kmeis@lgc.org)
Kathleen Ave (Kathleen.Ave@smud.org)
Meg Arnold (Meg.Arnold@valleyvision.org)
Larry Greene (LGreene@airquality.org)
Jenny Woods jwoods@lgc.org
Amber Mace (mace.ucdavis@gmail.com)

I am copying Curtis and Erik from Ascent Environmental as they are the consultants doing the County's Climate Action/Adaptation Plan. Curtis, Erik and I had a conversation this afternoon and there are some things they can do that will be important to the LHMP. Coordination (like we discussed this morning) is one of them, providing climate adaptation info is another. We discussed that we need to have a coordination meeting ASAP with you, Planning and Ascent in order to get needed information into the LHMP in the short timeframe. We're all on the same page ☺

Subject: Re: 2016 Multi-jurisdictional Local Hazard Mitigation Plan Update (LHMP) - Committee Participation

Celine,

Tanks so much for reaching out, and I'm pleased that Jeanine mentioned Valley Vision and our Business Resiliency Initiative (BRI). I very much appreciate the invitation to join the nascent Sacramento LHMP update process, and I'd be happy to be part of the planning committee, especially because a key part of the BRI encourages businesses to become involved with, and informed about, the public sector preparedness efforts. I'd be interested to try to establish LHMP forums that could foster exactly that public/private interaction, and provide good input into the resulting LHMP.

Thanks,

- Meg

Subject: 2016 Multi-jurisdictional Local Hazard Mitigation Plan Update (LHMP) - Committee Participation

Hello Meg.

This morning your name was mentioned by our consultant, Jeanine Foster of the Foster- Morrison Group, in reference to disaster mitigation planning. I see from the web site that Valley Vision helps businesses to be prepared for natural disasters, so I'm certain your input would be valuable to this Plan.

Last week our agency, Sacramento County DWR, received a FEMA Disaster Mitigation Assistance grant for the 2016 LHMP update. This April we will begin the process to update the (existing) Plan by identifying regional natural hazards and mitigation for those hazards. As staff with SCDWR, I will be coordinating the update process between the participants and the consultant..

Along with the County, the planning committee consists of seven incorporated cities (within the County), many Districts, other agencies and individuals representing their communities are committed to this effort. There will be five meetings held between April and October, with the kick-off anticipated in the first week in April (dates pending) and, thereafter, one per month. A formal invitation will be sent, but for now I am completing a list of Planning Committee participants. Please let me know, at your earliest convenience, if you or someone from your agency would like to be on the planning committee.

I hope you'll join us.

Best regards, Celine

I agree, and added this comment in response to your question for me Jenny - sorry for the delay.

In the case of the King Fire, production from the UARP was disrupted for 2 weeks, requiring an additional unbudgeted $37 million for replacement power, by far the largest cost compared to the approximately $4M in immediate physical damage. I'd be inclined to call this one a "Critical" because the additional air quality & commercial impacts can be so widespread KA

Hi Judy, Jenny,

Attached are my comments, which focus on creating a separate column for "Climate Change Influence" on the other hazards. I believe this is the way to address climate vulnerabilities in a LHMP, i.e., it's not a hazard, itself, but is woven through the other hazards.

Thanks,

Thanks Judy!
Celine & Jeanine – Please let us know what kind of air quality data you need for the LHMP. We'd be happy to help and are excited that the Sacramento County LHMP is going to be one of the first to look at climate change. We can also send someone to the next planning committee meeting and can help contribute to the air quality and climate change sections of the LHMP.

Best wishes,

Shelley

Subject: RE: Air quality data for Sacramento County's Local Hazard Mitigation Plan update

Thanks Shelley
This is another great reason why the Air District needs to be participating in the Planning meetings. Your district is a critical and important source of air quality information and identifying harmful levels and days/conditions when folks need to remain indoors. Your district has more accurate information on the local front than anywhere else and it needs to be included in the LHMP. Specifically what the consultant needs I'm not sure of but Janine is copied in this email as are the project manager and staff. Please contact Janine with questions you may have. Thanks so much for helping with this important work.

Subject: Air quality data for Sacramento County's Local Hazard Mitigation Plan update

Hi Janice and Stephen,
The County of Sacramento is conducting the five-year update of its Local Hazard Mitigation Plan (LHMP) right now, and for the first time, climate change is going to be included (per new legislation SB 379).

The consultant is including air quality and smoke (from wildfires) as part of the climate change section, and to inform this process it would be good to provide them with data for Sacramento County on PM 2.5, wildfire smoke impacts, and ozone (if possible correlated with extreme heat). And do you have projections of future PM 2.5 and ozone trends for the County? I'm copying on this email Judy Robinson from the County, who was at the initial planning meeting for the LHMP update, in case she has more details about the information they're looking for.

Thank you!

Shelley

Meeting Record

Project: LHMP Sacramento County	**Date**: May 5, 2016
Meeting Purpose: Coordination between LHMP Update and Climate Adaptation Plan (CAP) (new)	

Attendees		
Name	**Title**	**Contact Phone**
Erik de Kok	Sr. Planner – Ascent Environmental	916-842-3164
Curtis Alling	Planner – Ascent Environmental	
Mike Winter	Sr. Planner – Sac County	
Todd Taylor	Associate Planner – Sac County	916) 874-3125
Celine Livengood	Principal Engineer Tech - SCDWR	916-874-3130
Heidi Huber	Assistant Engineer - SCDWR	(916) 874-8650
George Booth	Sr. Civil Engineer - SCDWR	(916) 874-6484
Jeanine Foster (phoned in)	LHMP consultant – Principal of Foster Morrison Group	(303) 717-7171

Items Discussed
AB 379 – Climate Adaptation Plan (State mandate) and timeline (2018), Sac Co is ahead of deadline with completion scheduled for 2017. Consultants will share information between documents for efficiency and better data. Clarification on which document should expand and support the other and how and when to best coordinate. Discussed air quality, vector control, temps, weather (as a result of hazards or as the hazard itself , depending on which document.

Follow-up – Ascent Environmental and Foster Morrison Group will coordinate and share information with the next phone conference anticipated in late June, after the LHMP committee meeting on vulnerability

Subject: FW: 2016 July - LHMP

Hi Jeanine.

On Tuesday July 12th, I gave a presentation on the LHMP process to the County Green Team. The talking points I shared are attached. Shared discussion and how various departments and outside agencies can participate and add projects (hazards) went on for about 20 minutes + - and I suspect we'll have some follow up involvement with new participants.

Those in attendance were as follows;

Judy Robinson, Todd Taylor, John Lundgren, Tiffany Pham (Airports), Dana Booth (storm water quality), Dan Shoeman (DOT), Brenda Bongiorno

Please add this to our CRS outreach log.
Thanks so much.

Subject: 2016 July - LHMP

Hi Judy.

Attached is the outline of, (my talking points), the LHMP requirements and brief overview of CRS. I thought it important to mention that program and how it ties in with the set criterion to qualify.

Please let everyone know they can contact me with any questions or to discuss any potential hazards.

Thank you for including us in the meeting.

Subject: RE: Quarterly Green Team Meeting - July 12

Hi Everyone
I wanted to make sure you all were aware of the Local Hazard Mitigation Plan (LHMP) that is currently underway, under the leadership of County Dept of Water Resources.
http://www.waterresources.saccounty.net/stormready/Pages/Hazard-Mitigation-Planning-Committee-2016-Plan-Update.aspx

Two Planning sessions have been held, most recently this past week. I have not seen much representation from County Departments at these meetings so I am reaching out to you all to make sure your departments are aware of this work going on and participate. Types of plans and projects could be those that help to mitigate climate events especially those that can help reduce flood risks, urban heat island, drought, wildfire, etc. Creek naturalization projects could help reduce flood risks with secondary groundwater recharge benefits. Open space acquisition that can serve as a wildfire buffer, to urban areas or that mitigate flood impacts or provide groundwater recharge are examples of acceptable projects. Of course they also want the projects that you will want FEMA reimbursement for during various storm or disaster events. George Booth is the Project Lead, along with Mark Rains and Celine Livengood. They are on a tight time line to wrap this up before the end of the year. **There are some important meetings coming up July 12 & 13 that you will want to make sure you/your department participates in – if you have interest in having plans and/or projects included in the LHMP**. The LHMP is updated every 5 years and Climate Change was merely referenced in the last update. Climate Change and mitigation projects will be included in the current LHMP effort underway, but it's up to you to bring these projects forward.

Please contact George, Mark or Celine for more information or how to participate if your department is not already.

Subject: 2016 LHMP Update - June Meeting Date(s)
Importance: High

Hello all.

In an earlier email, we asked that you save the dates of June 21st and 22nd for the next LHMP committee meetings. As a committee member you only need to attend one. These are duplicate meetings offering the same agenda, yet the input attendees offer will, of course, vary.

The times and venues are as follows;

Tuesday, June 21st: 1:00 pm – 4:00 pm
Laguna Creek High School - Career Room
9050 Vicino Dr., Elk Grove, CA 95758

Wednesday, June 22nd: 1:00 pm – 4:00 pm
Bannon Creek Elementary School - Multi-Purpose Room
2775 Millcreek Drive, Sacramento, CA 95833

Thank you and I look forward to seeing you there.

Subject: Sacramento County Flood Insurance Data

Hello,

I am working with Sacramento County and incorporated communities, in the update of their Local Hazard Mitigation Plan. I would like to request updated flood insurance information. Specifically I would like to obtain printouts to include:

- Community Overview
- Insurance Overview
- Insurance Occupancy
- Insurance Zone
- Insurance Pre/Post FIRM
- Community Repetitive Loss

We would like the requested data for:
Sacramento County,
City of Sacramento
City of Citrus Heights
City of Elk Grove
City of Folsom
City of Galt
Town of Isleton
City of Rancho Cordova

Please let me know if you have questions or need additional information.

Thanks very much,

Subject: Cal OES State Disaster Decs

Victoria,

Often we get State of California Disaster Declarations from the State Plan (Annex M in 2013). Is there a way to get them through Cal OES? We are working on Sacramento County now, and were looking to get them from 2011 to present?

Let me know when you have a chance!

Subject: Re: FW: 2016 LHMP Update - RFI

Hi Celine~
This is not something I have been asked to do in the past. I supply the Storm Data information, and you all at the county assess the impacts from the storm events and input those into your LHMP.

I realized after looking at the report I had forgotten to click a few of the elements you had requested. I ran it again and you can get a copy of it here: https://verification.nws.noaa.gov/stormdat/downloads/data/qunzcdtyzu35uypjryyvem3d-08-17-2016-15-58.pdf

Sincerely,
Michelle

Hi Jeanine,
I'm still waiting to hear back from the study, which examines recent wildfire smoke trends in the last few years, but in the meantime I have revised what you sent me from Placer County for a more general Sacramento description. Here it is. I am hoping to get an update about the study soon and will try to provide that information if it works with your timeline. In the meantime this can serve as a placeholder.

Thanks!

Shelley

Hi Shelly,

I had previously given you some text about the wildfire and the smoke/air quality issue that we did for Placer County and asked if you had wanted to edit it for Sacramento given your general concerns with wildfires and smoke (outside of the climate change issue). It sounded like you were waiting for a report to come with updated information.
Anyway, if you would like to include some information on the District's concerns with smoke and air quality, you are welcome to. Just let us know as we have a placeholder

Thanks,
Jeanine

Subject: LHMP Update - Committee) Meetings #3 and #4

Hello to you all.

The upcoming July meetings are #3 and #4 which are the two most important meetings for this LHMP Update. Goals and objectives will be updated and mitigation projects identified and prioritized.
The time commitment in July is necessary to complete the LHMP requirements. The meetings will take place over two days, with the same information offered in the morning and the afternoon for convenience in attending your choice of location.

For committee members, attendance is required at one 3-hour meeting block on June 12th for the Goals Meeting and one 3-hour meeting block on June 13th for the Mitigation Alternatives/Projects Meeting. Individuals from the general public are welcome and encouraged to participate also. Meeting times and locations are as follows;

Tuesday July 12th – Meeting #3	**Wednesday July 13th – Meeting #4:**
8:30 — 11:30 **Bannon Creek Elementary School - Multi-Purpose Room** **2775 Millcreek Drive, Sacramento, CA** ***Or*** **1:00 pm – 4:00 pm** **Laguna Creek High School - Career Room** **9050 Vicino Dr., Elk Grove, CA**	**8:30 — 11:30** **Bannon Creek Elementary School - Multi-Purpose Room** **2775 Millcreek Drive, Sacramento, CA** ***Or*** **1:00 pm – 4:00 pm** **Laguna Creek High School - Career Room** **9050 Vicino Dr., Elk Grove, CA**

Key County and City departmental Staff, District staff, as well as community groups and members of the public with recommendations for mitigation projects to address identified natural hazards should attend these meetings. Your input is critical to success of this important document. Please forward this email or distribute the attached flyer to anyone who may be interested in contributing to the Plan.

If you haven't attended previous meetings, please RSVP so we have enough seating for all attendees. We look forward to seeing you then and hearing your thoughts.

Hi Judy,

Thanks for the edits. We will go through them and incorporate.

Also do you know if we will have any input on the Wildfire and Smoke issue? And also the City of Sacramento was inquiring to see if the Air Quality District had any project they were interested in including on the wildfire/smoke issue. Is there a project anyone is interested in including? The City was interested in doing some type of focused public outreach on this and wondered what else is being considered.

Thanks,

Jeanine

Hi Jeanine
Thanks for allowing the extra time to submit comments. Here are the comments/edits that incorporate my comments and that of the Capital Region Climate Readiness Collaborative. Thank you in advance for including them in this important document. I/we also realize the timing constraints with the LHMP and the Climate Action Plan schedules and appreciate all you can do within these and other limitations. Please let me know if/how we can be of further assistance. Thanks again.

Subject: 2016 LHMP Update - Final Meeting(s)

Hello to you all.

The upcoming meetings in November are the last to complete the LHMP 5-year update! Once again, there will be two meetings on subsequent days, with the same information offered each day. This is for your convenience in attending your choice of location or day.

Attendance from committee members is required at one of the meetings. Individuals from the general public are welcome and encouraged to participate also. If you know of people in the general public that would like to attend a meeting, there will be two evening meetings, of which you are not required to attend.

Please forward this email to anyone who may be interested in contributing to the Plan.

Your attendance at one of the final committee meetings is critical for ensuring FEMA participation requirements are met.

The meetings are scheduled as follows;

Hazard Mitigation Planning/Steering Committee Meetings–

Committee Members - November 16th 9:00-11:00 AM at South Natomas Community Center, Conference Room
2921 Truxel Rd, Sacramento, CA 95833

Committee Members - November 17th 9:00-11:00 AM at Hood/Courtland Fire House (Station 2)
1125 Hood Franklin RD, Hood, CA 95639

Public Meetings -

General Public - November 15th 6:00-7:30 PM at South Natomas Community Center, Conference Room
2921 Truxel Rd, Sacramento, CA 95833

General Public - November 16th 6:00-7:30 PM at Laguna Creek High School, Career Room
9050 Vicino Dr., Elk Grove, CA 95758

While you are welcome to come and support the public meetings, please plan on attending one of the final Planning/Steering Committee meetings to provide input on the Draft LHMP and to address public comments. After the review and comment period, the LHMP will be submitted to Cal OES/FEMA for approval and subsequently will be adopted by the governing boards for each participating jurisdiction.

Please let me know if you have questions. In addition to your attendance at one of the final planning/steering committee meetings, you can also provide written comments on the public review draft by:

- Email comments to Jeanine.foster@fostermorrison.com or LivengoodC@saccounty.net
- Bring comments to one of the meetings

For all participating jurisdictions, Jeanine will be in touch with you this week to provide a final punch list of any outstanding items for your Annexes.

Thank you for all your time and commitment to this important document.

Subject: LHMP Planning Team Review Draft Document

Hello,

We are providing a link to the Planning Team Review DRAFT 2016 Sacramento County LHMP Update document:

There are three sets of pdf documents on the Dropbox:

- a complete document of the Base Plan and all Jurisdictional Annexes
- a Base Plan document (chapters 1-7)
- a document containing all Jurisdictional Annexes.

https://www.dropbox.com/sh/myhrggxifggb3my/AADAE8XNA7UX3MGGDq5-7Wr1a?dl=0

Please distribute to the entire planning team for their review and comment. A couple things to note:

1. Some areas in the Base Plan and Annexes are still in process: There are areas highlighted in yellow where we still need input from the planning team. Everyone, send your input and edits. You can email any inserts of text that will help make this document more accurately reflect the hazards, risks, and vulnerability of the planning area. Areas highlighted in green are areas for Foster Morrison to finish.
2. Keep in mind that the data sources relied on are generally "Best Available Information" based on what has been reported, existing documentation, and information obtained to date from the planning team. If you have more accurate information, additional details, etc. of how identified natural hazards in general or a past hazard event affected the planning area or input on any other areas of the plan, please provide.

The deadline to turn around comments on this Planning Team Draft LHMP is Friday, September 23.

Please have everyone send their input directly to me at the below email. We realize this is a large document, please focus your review efforts on those areas which you have the most knowledge and input. Everyone does not need to provide a complete review, especially for the Annexes.

If anyone has questions or would like to discuss, please have them call or email me. The individual Annexes in a word version will also be sent over the next couple of days directly to the responsible agency for their review and input.

Thanks very much for everyone's help!

Jeanine

Hi Jeanine.

These are photos of the materials handed out and discussed at the EAP meeting that George and I attended last week, on November 4th.

The photo shows the flyer that Kelly put together and I didn't have time to add our logo. The photo shows the side with the Draft document discussed (website and libraries to review it) and the other side has the meeting dates noted.

Also, I took various shots of the sign in to be certain that all the names were legible.

I'm in all day so hope to get all the County pieces caught up on this.
Thank you. Celine

AGENDA

Sacramento County
Local Hazard Mitigation Plan (LHMP) Update
Mitigation Strategy Meetings
July 12 & 13, 2016

HMPC Meeting #3

1. Introductions
2. Watershed Management Plan (WMP) Status
3. Status of the DMA Planning Process
4. Risk Assessment Update
5. Develop Updated Plan Goals and Objectives
6. Identify and Review Mitigation Alternatives/Projects

HMPC Meeting #4

1. Introductions
2. Watershed Management Plan (WMP) Status
3. Identify and discuss Mitigation Alternatives/Projects
4. Review Mitigation Selection Criteria
5. Prioritize Mitigation Projects
6. Review of Schedule/Data Needs

Risk Assessment & Mitigation Strategy Meetings

Day 1

Hazard Identification & Profiles

Table 1 Sacramento County Hazard Identification Table

Hazard	Geographic Extent	Probability of Future Occurrences	Magnitude/ Severity	Significance	Climate Change Influence
Agricultural Hazards	Significant	Highly Likely	Critical	Medium	Medium
Bird Strike	Limited	Highly Likely	Critical	Medium	Low
Climate Change	Extensive	Highly Likely	Critical	High	N/A
Dam Failure	Significant	Unlikely	Catastrophic	Med-High	High
Drought and Water Shortage	Extensive	Likely	Limited	Med -High	High
Earthquake	Limited	Occasional	Critical	Medium	None
Earthquake: Liquefaction	Significant	Occasional	Limited	Medium	None
Flood: 100/200/500-year	Significant	Occasional	Catastrophic	High	High
Flood: Localized Stormwater Flooding	Limited	Highly Likely	Limited	Med-High	High
Landslides	Limited	Unlikely	Negligible	Low	Medium
Levee Failure	Significant	Occasional	Catastrophic	High	High
River/Stream/Creek Bank Erosion	Limited	Highly Likely	Limited	Medium	High
Severe Weather: Extreme Temperatures – Cold/Freeze	Extensive	Highly Likely	Limited	Low	High
Severe Weather: Extreme Temperatures - Heat	Extensive	Highly Likely	Critical	High	High
Severe Weather: Fog	Extensive	Highly Likely	Limited	Low	Medium
Severe Weather: Heavy Rains and Storms (Thunderstorms/Hail, Lightning)	Extensive	Highly Likely	Critical	Med-High	High
Severe Weather: Wind and Tornadoes	Limited	Highly Likely	Limited	Medium	Medium
Subsidence	Significant	Highly Likely	Limited	Low	Medium
Volcano	Limited	Unlikely	Limited	Low	None
Wildfire:(Burn Area/Smoke)	Significant	Highly Likely	Limited	Med-High	High

Geographic Extent
Limited: Less than 10% of planning area
Significant: 10-50% of planning area
Extensive: 50-100% of planning area

Probability of Future Occurrences
Highly Likely: Near 100% chance of occurrence in next year, or happens every year.
Likely: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
Occasional: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
Unlikely: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Magnitude/Severity
Catastrophic—More than 50 percent of property severely damaged; shutdown of facilities for more than 30 days; and/or multiple deaths
Critical—25-50 percent of property severely damaged; shutdown of facilities for at least two weeks; and/or injuries and/or illnesses result in permanent disability
Limited—10-25 percent of property severely damaged; shutdown of facilities for more than a week; and/or injuries/illnesses treatable do not result in permanent disability
Negligible—Less than 10 percent of property severely damaged, shutdown of facilities and services for less than 24 hours; and/or injuries/illnesses treatable with first aid

Significance
Low: minimal potential impact
Medium: moderate potential impact
High: widespread potential impact

Risk Assessment Methodology

Calculating Likelihood of Future Occurrence

The frequency of past events is used in this section to gauge the likelihood of future occurrences. Based on historical data, the likelihood of future occurrence is categorized into one of the following classifications:

- **Highly Likely**: Near 100% chance of occurrence in next year, or happens every year.
- **Likely**: Between 10 and 100% chance of occurrence in next year, or has a recurrence interval of 10 years or less.
- **Occasional**: Between 1 and 10% chance of occurrence in the next year, or has a recurrence interval of 11 to 100 years.
- **Unlikely**: Less than 1% chance of occurrence in next 100 years, or has a recurrence interval of greater than every 100 years.

Calculating Vulnerability

Vulnerability is measured in general, qualitative terms, and is a summary of the potential impact based on past occurrences, spatial extent, and damage and casualty potential:

- **Extremely Low**: The occurrence and potential cost of damage to life and property is very minimal to non-existent.
- **Low**: Minimal potential impact. The occurrence and potential cost of damage to life and property is minimal.
- **Medium**: Moderate potential impact. This ranking carries a moderate threat level to the general population and/or built environment. Here the potential damage is more isolated and less costly than a more widespread disaster.
- **High**: Widespread potential impact. This ranking carries a high threat to the general population and/or built environment. The potential for damage is widespread. Hazards in this category may have already occurred in the past.
- **Extremely High**: Very widespread and catastrophic impact.

Defining Significance (Priority) of a Hazard

Defining the significance or priority of a hazard to a community is based on a subjective analysis of several factors. This analysis is used to focus and prioritize hazards and associated mitigation measures for the plan. These factors include the following:

- **Past Occurrences**: Frequency, extent, and magnitude of historic hazard events.
- **Likelihood of Future Occurrences**: Based on past hazard events.
- **Ability to Reduce Losses through Implementation of Mitigation Measures**: This looks at both the ability to mitigate the risk of future occurrences as well as the ability to mitigate the vulnerability of a community to a given hazard event.

Risk Assessment Summary: Placer County Planning Area

Agricultural Hazard

- Most agricultural disasters in Sacramento County associated with severe weather events, including heavy rains, floods, heat, and drought; insects and noxious weeds also a concern.
- According to the 2014 crop report, despite the severe drought conditions of 2014, Sacramento County's 2014 crop production value of $495,379,000 is the highest ever recorded for the county and represents a 7. 7% increase over the 2013 crop production value.
